"The *jang* was made of wood; its fore part was broad and aft part pointed. In shape it was like a shoe 1 foot 3 inches long. When the game began, a *jang* was first put on the ground, and from a distance of 3 or 4 paces a *jang* held in the hand was thrown upon the one on the ground. Anyone hitting it won."—*Chou ch'u fêng t'u chi, ibid.* p. 9*a*.

"In Jui Tsung's time, among the sports of the Po Lo Mên country was one in which a man walked on his hands and gesticulated with his feet. A sharp sword being planted in the ground he stooped his body close to the sharp point, then his face, and then turned his back towards it. At last he contracted and stretched out his hands, which were grasped by two men while he turned his body round 100 times."—*T'ang yüeh chih, ibid.* p. 13*a*.

"'Cash-playing' (*ch'ien hsi*) was to try to put every 4 cash in a row; it is what is referred to in the histories as 'Cash-guessing' (*i ch'ien*), but was commonly called 'spreading cash' (*t'an ch'ien*)."—*Ibid.* p. 3*a*.

[Mask-wearing is referred to in *ibid.* p. 11*b*.]

"The first historical proof of an elephant chess almost identical with the game of the present day occurs in . . . *Niu Sêng Ju's Hsüan Kuai Lu*, written at the end of the 8th century of our era."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 109.

[The chessboard now had sometimes 18 rows.]—*Ko chih ching yüan, c.* 59, *Wan hsi ch'i wu lei*, p. 1*b*.

"Polo seems to have become known to the Chinese under the T'ang dynasty. . . . The earliest mention of the game is by Shên Ch'üan-chi, a poet who died in 713." It was played before the Court as well as by members of the imperial family. It was "a sufficiently dangerous game." Hsi Tsung was wholly given up to polo, football, and cockfighting, and in 881 put to death a loyal minister for venturing to remonstrate on the subject.—*Nineteenth Cent.*, Mar. 1906.

"The Prince of Ting-hsiang, under the T'ang dynasty, 'taught his ladies to play polo on donkey-back, providing them with inlaid saddles and jewelled bridles, together with the clothes and other paraphernalia required.' . . . So great, indeed, was the enthusiasm for polo, that it was played even by night, the ground being illuminated by a huge display of candles. Extravagant rewards where heaped upon polo-players and also upon footballers, who were actually received in audience by admiring Emperors. In 881, when there was a question of certain official posts to be filled up, the Emperor caused the four candidates to play a polo tournament, and allotted the chief post to the winner. The climax is perhaps reached when a maker of polo clubs, as duly recorded in the *Book of Marvels*, was taken up to heaven in broad daylight."—*Ibid.*

"Marionettes (傀儡) were introduced into China in the year A.D. 633 by a statesman 段綸, whose only reward was degradation for recommending so uselessly ingenious a workman into the palace."—*Ch. Rev.*, xiii. 401. *Cf.* preceding Period.

"Well-organised theatrical performances only came into use during the T'ang dynasty. The dances which had prevailed up to that time had become so licentious that the Emperor Yüan Tsung (A.D. 720) thought it necessary to prohibit them; and in their place proper theatrical representations were instituted."—*Van Aalst, Ch. Music*, p. 37.

Private.—[After New Year's Day the people of the market-towns and villages invited each other to dine out.]—*Yüeh Ya T'ang ts'ung shu, Nan pu hsin shu i*, p. 6*a*.

"The 3rd day of the 1st moon was the day on which all the gods met, and on that day husbands and wives should sleep in separate rooms."—*Chia li ta ch'êng, c.* 8, *Nien chieh ku shih*, p. 19*b*.

"On the 9th day [of the 9th moon] people used to put unleavened cakes on the head of a child, while the nurse prayed and said: 'May it become higher.'"—*Ko chih ching yüan, c.* 25, *Yin shih lei*, p. 3*b*.

Suleyman says that if a provincial governor rebels against the Emperor, "they cut his throat and eat him," and adds that "the Chinese eat the flesh of all men who are slain by the sword." Abu Zeyd says that, in the state of anarchy which followed Hwang-chao's rebellion in A.D. 878, when one provincial governor had defeated another and seized his territory, "he left nothing standing in the country, and ate all its inhabitants. In fact, the Chinese law permits human flesh to be eaten, and this flesh is publicly sold in the markets." On page 69 it is stated that criminals are eaten.—*Reinaud, Relations*, pp. 52, 53, 68, 69. M. Reinaud, in a note to the passage on p. 68 (Vol. II, pp. 41–2), suggests that this was an exceptional circumstance, due to the anarchy of the times, or that Abu Zeyd misunderstood his informants.

[Friendships were formed.]—*Kuang shih lei fu, c.* 18, p. 7*a*.

"In the time of Su Tsung the royal relatives were more extravagant than the king. At their marriages servants on horseback and attendant boys were employed to accompany and support the bridal carriage." [They supported it with their hands as it was being drawn along, as a sign of the wealth of the occupant.]—*T'ang shu, P'ei wên yün fu, c.* 1, p. 25*b*.

[The bridegroom going to welcome the bride rode in a *yao* carriage (one in which the occupant stood up) with a pair of horses. This was an innovation (*Ko chih ching yüan, c.* 29, *Chou chü lei*, p. 19*b*). In the north a tent made of black cotton awning, called "black house," was set up, and in this the bride and bridegroom exchanged salutes (*ibid. c.* 53, *Chü ch'u ch'i wu lei*, p. 22*a*. The *po tzŭ chang*, "curtain of 100 sons," embroidered with the figures of 100 children playing, is mentioned in several works as in use in the palace. The *Yen fan lu* (*ibid.* p. 18*b*) says the idea had no connection with that of having plenty of offspring, but was merely regarded as being appropriate for marriage. The third day after marriage the parents presented her with victuals. This was called "feasting the daughter" (*ibid. c.* 21, *Yin shih lei*, p. 3*a*).]

[The phrase *tien hsin* for the slight repast taken in the morning originated in the T'ang dynasty.]—*Ko shih ching yüan, c.* 21, *Yin shih lei*, p. 3*a*.

[Farewell banquets were occasionally given to retiring officials, and poems bestowed on them by the emperor.]—*P'ei wên yün fu, c.* 60, p. 1*a*.

[Picnics, at which oil-skin tents were used in case of rain, are mentioned in *Ko chih ching yüan, c.* 53, *Chü ch'u ch'i wu lei*, p. 22*b*.]

[The presenting of "condolence cakes" or "stone-baked cakes" originated in the habit of people taking these cakes with them when they went to law to provide food for themselves in prison. Later on, spicing was added, and the name changed, and they were used for making presents.]—*Ibid. c.* 25, *Yin shih lei*, p. 7*a*.

907–960.

"At the hill, sacrificing [at the tombs] on the *Han Shih* Festival they burnt paper money."—*Shih lei t'ung pien, c.* 5, *Sui shih pu*, p. 25*b*.

"In Chiang and Huai, at the same festival, every family gathered willow twigs to stick up on the door."—*Ibid.* p. 25*a*.

"The emperor Fei of the T'ang dynasty wished to select a prime minister of the state. All applicants had to write their names on slips of paper and put them into a vitreous bottle. He used chopsticks to pick out the successful candidate."—*Wu tai shih, Shih lei t'ung pien, c.* 73, *Ch'i yung pu*, p. 18*b*.

[The playing of bands at weddings had been recently introduced. It was considered contrary to the ancient rites.]—*Hou Chou shu T'sai Yu chuan, Hai Shan Hsien Kuan ts'ung shu, Ku chung sui pi*, p. 64*b*. *Cf.* MARITAL.

[The game of *morra*, played for wine-forfeits (drunk by the loser), is mentioned in *Wu Tai shih Hung Chao chuan, P'ei wên yün fu, c.* 22*b*, p. 38*a*.]

Sung Period (960 *to* 1280).—*Table VI.*

Public.—[On New Year's Day and at the Winter Solstice punishments were interdicted for 3 days.]—*Sung shih Jên Tsung chi, P'ei wên yün fu, c.* 24*a*, p. 67*a*. *Cf.* LAWS.

"By the system of the Sung dynasty the local official on the 'flower-birthday' (15th day of 2nd moon) went to the waste to encourage cultivation."—*Fêng t'u chi, Shih lei t'ung pien, c.* 5, *Sui shih pu*, p. 18*a*.

"In the western capital, one day before and one day after the 15th of the 1st moon, people went out to see the lanterns. In the Sung dynasty the festival was increased to 5 nights. The common people said that when Ch'ien Chung-hsi obtained his Doctor's degree he bought two extra nights, so the limit was now extended to the 17th and 18th."—*Ibid.* p. 17*a*.

[Trophies in the shape of the armour and personal spoils of Ninkiassu were offered up by Li Tsung in the temple of his ancestors.]—*Boulger, Short Hist.*, p. 57.

[Restoration of peace was celebrated by public rejoicings.]—*Simcox*, ii. 168.

Games.—"Polo (*ta ch'iu chih hsi*) in the army was played by striking the ball with a club and making it run. Then one rode after it on a swift horse. It still exists at the present day."—*Yen fan lu, Ko chih ching yüan, c.* 60, *Wan hsi ch'i wu lei*, p. 7*b*.

[In 1163 Hsiao Tsung, who encouraged athletics, had an accident whilst playing polo.]—*Nineteenth Cent.*, Mar. 1906.

"Over a hundred young men dressed up as women, with bound feet and ornamented veils hanging down their backs, half of them in red and half in green brocaded robes, with elegant girdles and silken shoes, mounted on donkeys with carved saddles and ornamental trappings. Then they divided into two sides under their respective captains, and played polo for the amusement of the Court."—*Ibid.*

"At the *Han Shih* Festival in the Sung dynasty they played the game of 'putting the weight' (*p'ao t'o chih hsi*), and children also played at the game of 'flying tile' (*fei wa shih chih hsi*)."—*Tz'ŭ lin hai ts'o, Ko chih ching yüan, c.* 60, *Wan hsi ch'i wu lei*, p. 9*b*.

"Card-playing (*yeh tzŭ hsi*) and 'night-passing chart' (*hsiao yeh t'u*), as at present played, were reported to have been introduced by T'ai Tsu of the Sung dynasty, who ordered the people

in the palace to practise them in order to pass the night."—*Nung t'ien yü hua, ibid.* p. 2*a*.

"A hermit of the Sung dynasty, speaking of the art of playing at dice (*chih shai tzŭ*), referred to the incantation, '*Yi ti mi ti, mi chieh lo ti*,' [and said] that if one repeated this a million times the dice would turn themselves."—*Chên chu ch'uan, ibid. c.* 59, p. 16*b*.

"In the 2nd year [1120] of the period *Hsüan Ho* a minister memorialized the Throne requesting sanction to make 32 ivory dominoes."—*Chu shih yin k'ao, ibid. c.* 50, p. 1*a*.

[The chessboard was the same as in the Ming Period.]—*Ibid. c.* 59, p. 1*b*.

Private.—"As regards the pagodas in the Chên La country—if two families quarrelled and could not decide which was right, each sat in one of the 12 small stone pagodas on opposite sides of the palace. Outside the pagodas the relatives of both families stood guard. This sometimes lasted one, two, three, or four days. Those who acted unreasonably would have boils, coughs, or fevers, but to the righteous man nothing would happen. It was accordingly called 'Heaven's Prison' (*t'ien yü*)."—*Ch'i hsin lei kao, ibid. c.* 19, *Kung shih lei*, p. 27*a*.

"When an infant was a full year old his neck was tied with a 5-coloured variegated cord. The meaning was not known."—*Ibid. c.* 17, *Kuan fu lei*, p. 13*b*.

"When Tsao Pin was a full year old his parents put all sorts of toys before him. Pin took a weapon in his left hand and a worshipping-basin in the other; a short time after he also took hold of a seal. Afterwards he became President of the Board of War."—*Sung shih, Yüan chien lei han, c.* 244, p. 6*a*.

"On the 30th of the 10th moon the people in the capital warmed wine and roasted sliced meat upon a stove, the people sitting around it ate and drank. This was the custom called 'warming the stove.'"—*Ko chih ching yüan, c.* 21, *Yin shih lei*, p. 3*a*.

"On the 24th of the last month of winter, under the bed a lantern was lit, [which custom was] called 'to light want' (*i.e.*, to secure prosperity in the new year)."—*Ibid. c.* 50, *Jih yung ch'i wu lei*, p. 10*b*.

[The custom of cracker-firing in China is said to date from the time of Li T'ien 李畋 of the Sung dynasty, who fired a cracker at a dangerous demon, named 山臊 Shan Sao, and put him to flight.]—*Giles, Bio. Dic.*, p. 468.

"There is some reason to believe that cannibalism was in the Middle Ages . . . an idea tolerably familiar in China. M. Bazin, in the 2nd part of *Chine Moderne*, p. 861, after sketching a Chinese drama of the Mongol era ('The Devotion of Chao-li'), the plot of which turns on the acts of a body of cannibals, quotes several other passages from Chinese authors which indicate this. . . . We are told in sober history that the force of Tului in Honan, in 1231–32, was reduced to such straits as to eat grass and human flesh. At the siege of the Kin capital of Kaifongfu, in 1233, the besieged were reduced to the like extremity; and the same occurred the same year at the siege of Tsaichan; and in 1262, when the rebel general Litan was besieged in Tsinanfu. The Taiping wars the other day revived the same horrors in all their magnitude. And savage acts of the same kind by the Chinese and their Turk partisans in the defence of Kashgar were related to Mr. Shaw."—*Yule, Marco Polo*, ii. 304, note (2nd ed.).

[The walls of wine-shops in Ho Tung were painted red. The origin of the custom is unknown.]—*Ko chih ching yüan, c.* 20, *Kung shih lei*, p. 14*b*.

Liao.

"The Kitan Tartars were great archers and polo-players, and we are told that their successors, the Nü-chên Tartars, carried on the tradition. On festival days the whole Court would appear in full dress on the polo ground, and after worshipping God with offerings of food and wine and other ceremonies, the Emperor would change his dress for the various sports."—*Nineteenth Cent.*, March, 1906.

"The Tartars put a pigeon in a gourd hung on a willow tree and shot at it with bow [and arrow]. When the arrow struck the gourd the pigeon flew out. According as it flew high or low so did they decide whether [the shooter] had won or lost."—*Ko chih ching yüan, c.* 41, p. 25*b*.

Kin.

"An old custom of the people of Chin was that after 3 cups of wine had been taken, large and small *jüan chih*, fried cakes, were served. They were like the Chinese *han chü*, food prepared for the day before the *Ch'ing Ming* festival."—*Ibid. c.* 25, *Yin shih lei*, p. 9*b*.

Mongol Period (1280 *to* 1368).—*Table VII.*

Sports and Games.—"Under Mongol rule very frequently games accompanied the worship of heaven and earth, such as riding and shooting at willows while riding, or hitting a ball with sticks while riding at a great rate (something like the game called polo in the West). At these games music was played, accompanied by much beating of drums, to encourage the players."—*Ch. Rec.*, xxi. 345.

[Gay water parties and picnics were the favourite amusement.]—*Marco Polo*, quot. *Simcox*, ii. 223.

"The present game [of chess] came into general use after the Sung dynasty."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 120.

[Female parts in theatricals were taken by women.]—*Tcheng-Ki-Tong, Le Théâtre des Ch.*, p. 30.

Private.—"[In North China coal was used as fuel for hot baths] for every one has such a bath at least three times a week, and in winter if possible every day, whilst every nobleman and man of wealth has a private bath for his own use."—*Yule, Marco Polo*, i. 428 (2nd ed.).

"[At Hangchow there were] some 3,000 baths, the water of which is supplied by springs. They are hot baths, and the people take great delight in them, frequenting them several times a month, for they are very cleanly in their persons. They are the finest and largest baths in the world; large enough for 100 persons to bathe together."—*Ibid.* ii. 173 (2nd ed.). This would also apply to the previous Period.

Friar Odoric says: "There is a custom in this city [Yang-chou] that if any one desire to give a great dinner or entertainment to his friends, he goes to one of the hostels which are established for this very purpose, and says to the host thereof: 'Make me a dinner for such a number of my friends, and I propose to expend such and such a sum upon it.' Then the host does exactly as ordered, and the guests are better served than they would have been in the entertainer's own house."—*Yule, Cathay*, i. 123–4.

"These people also have a custom which I must tell you. If a man is condemned to death and executed by the lawful authority, they take his body and cook and eat it. But if any one die a natural death then they will not eat the body."—*Yule, Marco Polo*, i. 292 (2nd ed.).

[Hotel-keepers put up notices that they would not be responsible for property left in the traveller's room unless the door was locked, and the key handed in at the bureau.]—*Marco Polo*, quot. *Simcox*, ii. 223.

[Young men used to pay money to be allowed to serve as waiters in fashionable restaurants, where fees were numerous and large.]—*Ibid.* p. 223.

Fashions.—[The long nails worn as a mark of gentility by both sexes and the small feet of the women have been referred to under *Concrete distinctions.*]

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

Public.—"The custom of conferring the Imperial surname prevailed even as late as the Ming dynasty. The Emperor 正德 gave the surname 朱 to a youngster named 錢寧 who had been a slave in the family of the eunuch 張能 (a sort of Chinese Narses)."—*Ch. Rev.*, x. 73.

At the new year "they do make many representations of great pastime according unto nature, with vestments that they have for the purpose."—*Mendoza, Hist.*, i. 140.

"They do celebrate all their festival days in the night, which is ordinarily their new moons; and they do solemnize them with much music and new inventions. But more particularly they do celebrate the first day of the year, which is, after their account, the first day of the month of March. . . . Their priests do assist them in these feasts very richly apparelled, and do offer sacrifices upon their altars to the heaven, and unto their idols, and they sing many songs."—*Ibid.* i. 139–40.

"All the days that these feasts do endure, their tables be full of divers sorts of meats. . . . All the day they and their priests do eat and drink so much that they can no more. They have it for a thing most certain among them, that look how they are in disposition that day, so shall they pass the whole year, either sorrowful or merry. I omit the feasts which they make at weddings, and at any good success."—*Ibid.* p. 140.

"Complaints of the growth of luxury and extravagance are met with from time to time, but at least as frequently at the beginning of the dynasty as later. For instance, we learn from a semi-political skit of the 14th century that persons who gave dinner parties, of pretensions beyond their means, used to hire fruit for dessert, to be looked at, not eaten. A costermonger was reproached for selling oranges a year old, which had been carefully kept so as to look fresh and bright outside, though dry and withered within, and 'only fit for show at banquets.' The dealer admits the imputation, and defends himself by observing that they are not more hollow and worthless than the degenerate rulers of the State! (*Giles, Gems*, p. 226). The author of this apologue was attached to the fortunes of Hung-woo, so the custom in question may have prevailed under the Mongols or earlier."—*Simcox*, ii. 252–3.

"As to the arrangement of native feasts, civilities, dress, new year's ceremonies, marriages, coffins, the duties of magistrates and censors, the superstitions of Feng-shuey or geomancy, the state of arts and manufactures, and similar topics, Trigault forestalls Samedo and Duhalde, to say nothing of the 19th century writers like Doolittle, Williams, and Archdeacon Gray, on most points as to which he and they had not already been forestalled by Da Cruz and Perera."—*Ibid.* ii. 268.

[v. Minnigerode says that, according to the Chinese tradition, the Emperor Ming Wang [? Hung Wu] introduced dramatic representations about the middle of the 14th century. The idea was suggested to him by the wish to show his Empress the beautiful scenes he had witnessed in a dream, in which he was transported to the moon. A temporary stage was erected in the Emperor's pear-orchard, and the actors were chosen from among the younger sons of the highest families, whence, to this day, amateur actors of rank are called "younger brothers of the pear-garden."]—*Ueber Chinesisches Theater*, pp. 1–2.

"They . . . represent plays and comedies before their idols, the which they do very naturally." "At these banquets and feasts . . . they have . . . players who do represent their comedies very perfectly and naturally."—*Mendoza, Hist.*, i. 41, 138.

Sports and Games.—"For the game of *ta ma*, horse-striking, counters were made of copper, ivory, or horn in the shape of cash. It consisted of 54 pieces, on the upper side of which were carved the names of good horses, which were put on a 4-sided cloth chart. It was played by throwing dice."—*Shih wu kan chu, Ko chih ching yüan, c.* 59, *Wan hsi ch'i wu lei*, p. 17*b*.

"The *Wei* chess of the present time had 19 rows and 361 roads, and the same number of chessmen."—*Ibid.* p. 1*b*. *Cf.* previous Periods.

"The pleasure boats which abound on the lake Si-hou seem by his [Semedo's] account to have been more usually private property than now."—*Simcox*, ii. 270.

Private.—"Among the Chinos, more than amongst any other people of the world, are used banquets and feasts. . . . Although they have a hundred guests, yet everyone must sit and eat at a table by himself. The victuals . . . [are] flesh of divers sorts, fowl and fishes, of the which they make divers manners of broths, passing well dressed. They eat . . . with little forks of gold or silver, with the which they eat so cleanly that, although it be very small that they eat, yet will they let nothing fall; they drink often, but a little at a time, and therefore they use small cups. . . . There are present always many women jesters, who do play and sing, using many pretty gestures to cause delight and make mirth to the guests; [and] men with other instruments, as tumblers and players, who do represent their comedies very perfectly and naturally: in these banquets they spend the greatest part of the day, by reason of so many diversities of meat that they serve." Sometimes more than a hundred dishes were served. Several extra tables were set before each guest, the number varying with his rank, on which are placed uncooked joints of meat, fowls, etc., to be carried home for him, when he leaves, by the host's servants. Banquets to viceroys or ambassadors commonly lasted 20 days.—*Mendoza, Hist.*, i. 137–9.

"They give great entertainment unto their guests, and make them straightway a bever or collation with many sorts of conserves and fruits and good wine, and another kind of drink that is generally used throughout the whole kingdom, and is made of divers physical herbs, good to comfort the heart, the which they warm when they drink thereof." This is "when one neighbour doth visit another," but strangers are entertained to dinner at inns. "In every town . . . there is great store of victualling houses, that do keep tabling orderly, and for little cost."—*Ibid.* i. 143.

"They are very secret and honest, in such sort that you shall not see at any time a woman at her window nor at her doors, and if her husband do invite any person to dinner, she is never seen . . . except the guest be a kinsman or a very friend. When they go abroad to visit their father, mother, or any other kinsfolks, they are carried in a little chair by four men, the which is made close, and with lattices round about made of gold wire . . . and curtains of silk, that although they do see them that be in the street, they cannot be seen. They have many servants waiting on them. . . . It is [rare to] meet a principal woman in the street, yea, you will think there are none in the city, their keeping in is such; the lameness of their feet is a great help hereunto."—*Ibid.* i. 32.

[A "certain beverage" was drunk on the taking of an oath.]—*Ibid.* i. 113.

Letters of all sorts and on all subjects, and suited to persons in all positions, "are to be sold at the bookbinders' . . . so that the buyer hath no more to do but to close it up and seal it to send it whither his pleasure is."—*Ibid.* i. 124.

Fashions.—"All that can be said of the origin of the pigtail is that it was first enforced as a badge of subjugation by the Manchus at the siege of Leaouyang, and that thenceforward, until the whole of China was conquered, it was made the one condition of immunity from massacre."—*Boulger, Short Hist.*, p. 109.

Manchu Period (1644 *to* —).—*Table IX.*

Public.—"When a monarch ascends the throne, or as it is expressed in Chinese, 'when he receives from Heaven and revolving nature the government of the world,' he issues an inaugural proclamation. There is not much change in the wording of these papers" [for example *v.* p. 399–401]. . . . "The programme of ceremonies to be observed when the Emperor 'ascends the summit,' and seats himself on the dragon's throne . . . details a long series of prostrations and bowings, leading out and marshalling the various officers of the court and members of the imperial family." When the Emperor has seated himself on the throne, "all present come forward and again make the nine prostrations, after which the proclamation of coronation, as it would be called in Europe, is formally sealed, and then announced to the Empire with similar ceremonies. There are many lesser rites observed on these occasions, some of them appropriate to such an occasion, and others, according to our notions, bordering on the ludicrous; the whole presenting a strange mixture of religion, splendour, and farce, though as a whole calculated to impress all with a sentiment of awe toward one who gives to heaven, and receives from man such homage and worship."—*Williams, Midd. King.*, i. 399–402.

"*Chü-jên* graduates are entitled by regulation to an official entertainment at which an ode of the Book of Poetry, entitled the *Lu Ming* 鹿鳴, should be chanted. The banquet is accordingly known by this name. As a special mark of respect for old age, it is farther ordained that a *chü jên* graduate who shall reach the sixtieth anniversary of his examination, thus completing an entire cycle according to the Chinese reckoning, shall 'repair a second time to the *Lu Ming* banquet,' for which purpose certain ceremonies and imperial donations are prescribed."—*Mayers, Ch. Gov.*, p. 72.

"The new *chin-shih* or Metropolitan Graduates used to be entertained at a banquet given in their honour by the Board of Ceremonies, and on such occasion a piece of music, styled 'The Opening of Heaven's Door,' is to be played."—*Ch. Rev.*, xii. 512.

"The family rejoicings [on the success of one of its members at the official examinations] are as pompous as on the occasion of a marriage. The relations meet first of all in the temple of their ancestors, for the purpose of making them the offering of the acquired distinction; then, magnificent feasts are given to all the members of the family, and all the friends. Several days are given up to the most lively manifestations of joy. The successful candidate is carried in triumph. When he goes to announce the tidings of his success to his acquaintance and the members of the family, a band of music accompanies him, his friends surround him, carrying red silk flags, and form a guard of honour. He is acclaimed by the people like a king who has gained a great victory. On the walls of his dwelling are posted letters notifying all of the success he has attained, and the same letters are sent to all the families with whom he maintains relations. Of course the splendour of these fêtes and honours is not calculated to damp the ardour of aspiring candidates. All these solemnities kindle emulation, and incite those who have succeeded in the first examination to attempt the second. The fêtes on the occasion of a successful examination for the doctorate assume the proportions of a public rejoicing, shared by all the inhabitants of the candidate's birthplace."—*Tcheng-ki-tong, Chinese Painted by Themselves*, p. 70.

"The governor of Kuangtung in 1833, Chu, was a very popular officer, and when he obtained leave to resign his station on account of age, the people vied with each other in showing their hearty regret at losing him. The old custom was observed of retaining his boots and presenting him with a new pair at every city he passed through, and many other testimonials of their regard were adopted."—*Williams, Midd. King.*, i. 462.

"The Chinese have some singular modes of demonstrating their respect and regard on the departure of any public magistrate, whose government has been marked by moderation and justice. A deputation sometimes waits on him with a habit composed of every variety of colour, 'a coat of many colours,' as if made by a general contribution from the people. With this he is solemnly invested, and, though of course the garment is not intended to be worn, it is preserved as an honourable relic in the family. On quitting the district, he is accompanied by the crowds that follow his chair, or kneel by the wayside, while at intervals on the road are placed tables of provisions and sticks of incense burning." "His old boots are also preserved as a valuable relic by the citizens."—*Davis, Chinese*, i. 354.

"When villages have been in bloody encounter with one another, which in many parts of the empire is a matter of almost

daily occurrence, the same line of conduct [leaving the dead unburied] is followed with regard to the slain outnumbering those who have fallen on the other side, because, should peace and mutual understanding be afterwards restored, a retribution will have to be paid for that surplus."— *De Groot, Rel. Syst.*, i. i. 138.

"In order that none should plead ignorance in excuse for not knowing the sacred commands [*Sacred Edict*], it is by law required that they be proclaimed throughout the Empire by the local officers in the first and fifteenth day of every month, in a public hall set apart for the purpose, where the people are not only permitted, but requested and encouraged, to attend. In point of fact, however, this *political preaching*, as it has been called, is neglected except in large towns."— *Williams, Midd. King.*, i. 687.

"The Chinese are fond of processions, and if marriages and funerals be included, have them more frequently than any other people. Livery establishments are opened in every city and town where processions are arranged and supplied with everything necessary for bridal and funeral occasions as well as religious festivals. Not only are sedans, bands of music, biers, framed and gilded stands for carrying idols, shrines, and sacrificial feasts, red box for holding the bride's trousseau, etc., supplied, but also banners, tables, stands, curiosities, and uniforms in great variety. The men and boys required to carry them and perform the various parts of the ceremony are hired, a uniform hiding their ragged garments and dirty limbs. Guilds often go to a heavy expense in getting up a procession in honour of their patron saint, whose image is carried through the streets attended by the members of the Corporation dressed in holiday robes and boots. The variety and participators of these shows are exceedingly curious and characteristic of the people's taste. Here are seen splendid silken banners worked with rich embroidery, alternating with young girls bedizened with paint and flowers, and perched on high seats under an artificial tree or apparently almost in the air, resting upon frames on men's shoulders; bands of music; sacrificial meats and fruits adorned with flowers; shrines, images, and curious rarities laid out upon red pavilions; boys gaily dressed in official robes and riding upon ponies, or harnessed up in a covered framework to represent horses, all so contrived and painted that the spectator can hardly believe they are not riding Lilliputian ponies no bigger than dogs. A child standing in a car and carrying a branch on its shoulder, on one twig of which stands another child on one foot or a girl holding a plate of cakes in her hand, on the top of which stands another miss on tiptoe, the whole borne by coolies, sometimes add to the diversion of the spectacle and illustrate the mechanical skill of the exhibitors. Small companies dressed in a great variety of military uniforms, carrying spears, shields, halberds, etc., now and then volunteer for the occasion, and give it a more martial appearance. The carpenters at Canton are famous for their splendid processions in honour of their hero, Lu Pan, in which also other craftsmen join; for this demi-god corresponds to the Tubal Cain of Chinese legends, and is now regarded as the patron of all workmen, though he flourished no longer ago than the time of Confucius."—*Ibid.* i. 819–20.

"The general and local festivals of the Chinese are numerous, among which the first three days of the year, one or two about the middle of April to worship at the tombs, the two solstices, and the festival of dragon-boats, are common days of relaxation and merry-making, only on the first, however, are the shops shut and business suspended." "The return of the year is an occasion of unbounded festivity and hilarity. . . . The evidences of the approach of this chief festival appear some weeks previous. The principal streets are lined with tables, upon which articles of dress, furniture, and fancy are disposed for sale in the most attractive manner. Necessity compels many to dispose of certain of their treasures or superfluous things at this season, and sometimes exceedingly curious bits of bric-à-brac, long laid up in families, can be procured at a cheap rate. It is customary for superiors to give their dependents and employees a present, and for shopmen to send an acknowledgment of favours to their customers; one of the most common gifts among the lower classes is a pair of new shoes. Among the tables spread in the streets are many provided with pencils and red paper of various sizes, on which persons write sentences appropriate to the season in various styles, to be pasted upon the doorposts and lintels of dwellings and shops, or suspended from their walls. The shops also put on a most brilliant appearance, arrayed in these papers interspersed among the *kin hwa*, or 'golden flowers,' which are sprigs of artificial leaves and flowers made in the southern cities of brass tinsel and fastened upon wires; the latter are designed for an annual offering in temples, or to place before the household tablet. Small strips of red and gilt paper, some bearing the word *fuh*, or 'happiness,' large and small vermilion candles, gaily painted, and other things used in idolatry, are likewise sold in great quantities, and with the increased throng impart an unusually lively appearance to the streets. Another evident sign of the approaching change is the use of water upon the doors, shutters, and other woodwork of houses and shops, washing chairs, utensils, clothes, etc., as if cleanliness had not a little to do with joy, and a well-washed person and tenement were indispensable to the proper celebration of the festival. Throughout the southern rivers all small craft, tankia-boats, and lighters are beached and turned inside out for a scrubbing."—*Ibid.* i. 809–11.

"A still more praiseworthy custom attending this season is that of settling accounts and paying debts; shopkeepers are kept busy waiting upon their customers, and creditors urge their debtors to arrange these important matters. No debt is allowed to overpass new year without a settlement or satisfactory arrangement, if it can be avoided; and those whose liabilities altogether exceed their means are generally at this season obliged to wind up their concerns and give all their available property into the hands of their creditors. The consequences of this general pay-day are a high rate of money, great resort to the pawnbrokers, and a general fall in the price of most kinds of produce and commodities. Many good results flow from the practice, and the conscious sense of the difficulty and expense of resorting to legal proceedings to recover debts induces all to observe and maintain it, so that the dishonest, the unsuccessful, and the wild speculator may be sifted out from amongst the honest traders."—*Ibid.* i. 811–2.

"It is a common practice among devout persons to settle with the gods, and during a few days before the new year, the temples are usually thronged by devotees, both male and female, rich and poor. Some persons fast and engage the priests to intercede for them that their sins may be pardoned, while they prostrate themselves before the images amidst the din of gongs, drums, and bells, and thus clear off the old score. On new year's eve the streets are full of people hurrying to and fro to conclude the many matters which press upon them. At Canton some are busy pasting the five slips upon their lintels, signifying their desire that the five blessings which constitute the sum of all human felicity (namely, longevity, riches, health, love of virtue, and a natural death) may be their favoured portion. Such sentences as 'May the five blessings visit this door,' 'May heaven send down happiness,' 'May rich customers ever enter this door,' are placed above them; and the door posts are adorned with others on plain or gold sprinkled red paper, making the entrance quite picturesque. In the hall are suspended scrolls more or less costly, containing antithetical sentences carefully chosen."—*Ibid.* i. 812.

"The stillness of the streets and the gay inscriptions on the closed shops on new year's morning present a wonderful contrast to the usual bustle and crowd. . . . The red papers of the doors are here and there interspersed with blue ones, announcing that during the past year death has come among the inmates of the house. . . . In certain places, white, yellow, and carnation colored papers are employed, as well as blue, to distinguish the degree of the deceased kindred. Etiquette requires that those who mourn remain at home at this period. By noontide the streets begin to be filled with well-dressed persons, hastening in sedans or afoot to make their calls; those who cannot afford to buy a new suit hire one for this purpose, so that a man hardly knows his own domestics in their finery and robes. The meeting of friends in the streets, both bound on the same errand, is attended with particular demonstrations of respect, each politely struggling who shall be most affectedly humble. On this day parents receive the prostrations of their children, teachers expect the salutations of their pupils, magistrates look for the calls of their inferiors, and ancestors of every generation, and gods of various powers are presented with the offerings of devotees in the family hall or public temple. Much of the visiting is done by cards, on which is stamped an emblematic device representing the three happy wishes—of children, rank, and longevity; a common card suffices for distant acquaintances and customers. . . . Persons, as they meet, salute each other with *Kung hi! Kung-hi!* 'I respectfully wish you joy!'—or *Sin-hi! Sin-hi!* 'May the new joy be yours,' either of which, from its use at this season, is quite like the *Happy New Year!* of Englishmen." "Toward evening, the merry sounds proceeding from the closed doors announce that the sacrifice provided for presentation before the shrines of departed parents is cheering the worshippers; while the great numbers who resort to gambling-shops show full well that the routine of ceremony soon becomes tiresome, and a more exciting stimulus is needed. The extent to which play is now carried is almost indescribable. Jugglers, mountebanks, and actors also endeavour to collect a few coppers by amusing the crowds. Generally speaking, however, the three days devoted to this festival pass by without turmoil, and business and work then gradually resume their usual course for another twelvemonth."—*Ibid.* i. 815–6.

[For a full description of the observances at the New Year see *N.-C. Daily News*, Feb. 20, 1891. A great diversity of local usages was observed at this period in different parts of the country (*Williams, Midd. King.*, i. 814–5).]

[Giles says that at the New Year, when public business is suspended, magistrates and others give their official seals into the keeping of their wives.]—*Ch. Sketches*, p. 102.

[When the sun is in the 15° of Aquarius (2nd moon) is the festival *Li Ch'un*, "Opening of Spring." Families worship at the temples, and ramble about the country for amusement. The abours of agriculture are officially inaugurated. The season of festivity continues for ten days.]—*Morrison, View*, p. 105.

"Every year on that day [Feast of Lanterns, *Sai Têng*, or *Hua Têng:* 1st moon, 15th day] it is the custom, in the country districts, for each clan to promenade the neighbourhood with a fiery dragon, and if two dragons chance to meet there is always a fight as to which shall have the precedence. As this fight is regarded as the best part of the day's fun, the rival dragons only too frequently come in each other's way."—*N.-C. Herald*, April 18, 1900, p. 695. And see *ibid.* for a description of a clan-fight and the impersonation of murderers.

"One of the prettiest shows of lanterns is seen in a festival observed in the spring or autumn by fishermen on the southern coasts to propitiate the gods of the waters. An indispensable part of the procession is a dragon fifty feet or more long, made of light bamboo frames of the size and shape of a barrel, connected and covered with strips of coloured cotton or silk; the extremities represent the gaping head and frisking tail. This monster symbolizes the ruler of the watery deep, and is carried through the streets by men holding the head and each joint upon poles, to which are suspended lanterns; as they follow each other their steps give the body a wriggling, waving motion. Huge models of fish, similarly lighted, precede the dragon, while music and fireworks—the never-failing warning to lurking demons to keep out of the way—accompany the procession, which presents a very brilliant sight as it winds in its course through the dark streets."— *Williams, Midd. King.*, i. 818.

[On the 2nd day of the 2nd moon was the *Fu Shên Tan*, or *T'u Ti Tan*, Birthday of the Local Gods. In the 3rd moon was the *Ch'ing Ming* festival, or Feast of all Souls. The 8th day of the 4th moon was the Birthday of Buddha. The 5th day of the 5th moon was the Dragon Boat Festival (*Tuan Yang*), and the 6th day of the 6th moon was called *T'ien Kuang*, when clothes were aired. The chief of the above festivals have been described under previous Periods or ECCLESIASTICAL.]

"In the middle of the sixth moon lanterns are hung from the top of a pole placed on the highest part of the house. A single small lantern is deemed sufficient, but if the night be calm, a greater display is made by some householders, and especially in boats, by exhibiting coloured glass lamps arranged in various ways."—*Ibid.* i. 818-9.

[The 15th (or 1st to 15th) of the 7th moon is the *Yü Lan Shêng Hui*, or *Shao I Chieh*, "Burning Clothes Festival," on which paper clothes are burned to help disconsolate spirits to rise to higher regions.]—*Morrison, View*, pp. 106–7.

At the mid-autumn festival, "the Cantonese assemble on their roofs and on the walls to worship the moon, and eat pumelos, boiled taro, and moon cakes, these last commemorating Hao I's cakes. There are no moon temples, and the worship is very informal; but no doubt some of the worshippers hope, with San Toy, that the moon will 'drop a gift from her fairy balloon.' Altogether it is a pretty and harmless custom."—*Hong Kong Daily News*, Oct. 7, 1903.

[The 9th day of the 9th moon is called *Chung Yang Chieh*, or *Têng Kao*, "Ascending high," when people went to high places and flew kites, to avoid calamity (see PER. OF DISRUPTION). The 9th day of the 11th moon was *Tung Chih*, shortest day, worship of the Winter Solstice. The 12th moon was *Nien Chin*, the close of the year, when preparations were made for the approaching new year. On the 24th every family worshipped the *Tsao Shên*, god of the Furnace, or Kitchen, and on the 30th crackers were let off, feasts held, and deities worshipped to *Sung Nien*, "see out the old year."]—*Morrison, View*, pp. 107–8.

[For an account of the annual Black Miao festival in Ssŭ Ch'uan, comprising music and dancing, horse-racing and bull-fighting, see *N.-C. Daily News*, Jan. 26, 1909.]

"Shops are closed at nightfall and persons going abroad carry a lantern or torch. . . . Few persons are met in the streets at night, and the private watch kept by all who are able greatly assists the regular police in preserving order and apprehending thieves. These watchers go up and down their wards, bearing large bamboos, to let 'thieves know they are on the lookout.' Considering all things, large Chinese cities are remarkably quiet at night."—*Ibid.* i. 742.

"A smart visiting-card was handed to me after my frugal repast; but, as I did not feel at all like 'receiving,' I sent word to 'call again,' or to 'stay the chariot' (= not at home). The 'boy' came in holding the card once more, with the surprising statement that the 'head thief' wished to see me. The writer . . . was at once sent for and he promptly explained to me what a respectable man the head thief was. For the consideration of one dollar a month's subscription, my predecessor had always been exempt from robbery, and on the whole the writer thought I had better close with the man at once. Of course, there was no threat; it was only ancient local custom, as with the 'King of the Beggars': probably I should never be robbed in any case." The "head thief" had come in his coat and hat of ceremony. "And so it was. For one Mexican dollar a month I was guaranteed immunity, and, as I intended to travel about for some months at a time, I was not sorry to obtain this security for my property."—*Parker, John Chinaman*, pp. 157–8.

"The 'King of the Beggars' above mentioned is always prepared in most large Chinese towns to guarantee (according to subscription paid) either that no 'asker' will come at all, or that one copper cash *per diem* only need be given for each full ten minutes every beggar is kept howling. If no arrangement at all be made, the mendicant bangs gridirons and howls incessantly until he is bought off personally and individually; this often leads to altercations, 'rows,' and false charges, for the beggar will die on your door-step 'as soon as look at you,' even leaving written 'evidence' behind."—*Ibid.* p. 159.

[Lepers in the south lived in "leper villages," but were not forced to live apart.]

[Advertisements and street cries are described under DISTRIBUTION.]

Sports, Games, etc.—"Notwithstanding his [K'ang Hsi's] enfeebled health and the many illnesses from which he had suffered in later life, he persisted in following his usual sporting amusements, and he passed the winter of 1722 at his hunting-box at Haidsu."—*Boulger, Short Hist.*, p. 152.

"Priests in China have long practised military and calisthenic exercises, for defending their temples and persons on their journeyings, and to mortify the flesh. A monastery near *Hwan-pi*, in the prefecture of *Han-yang*, contains four hundred priests, of whom more than a hundred are skilled in military arts, fencing, boxing, and the use of the *nu* 弩 or ballista, with which they defend their neighbourhood from marauders." "From the *Shan lin kwan p'u* we learn that the priests of the monastery of *Shan lin*, in Honan, have been long celebrated for their skill in single-stick exercise. *Kung-fu* 工夫 is a species of disciplinary calisthenics, practised by Tauist priests. *Kiau-ta* 教打, is the name of the *maître d'armes*, or *kiau-sz'* 教師, who teaches boxing, fencing, and sword-exercise. . . . *Shwa kwun* 耍棍, to fence with quarter-staves, and *Shwa teng pai* 耍藤牌, to play with foils and shields, are other terms used."—*N. and Q. on C. and J.*, iii. 88.

"In one of the guard-houses on the walls [of Foo Chow] we [saw] some of the [Chinese soldiers] practising with bow and arrow, not for aim, but for strength of arm to pull the bow. They had a target consisting of several thick sheets of soft leather hung from a beam, and fired at this with the arrow-point within a yard of the target, the arrow merely throwing the leather back and then falling. One of the men could draw the bowstring to his ear, with the bow outstretched in his left hand; we could not get it half the distance. This man exercised his arms by lifting up and twisting about over his head a heavy beam loaded at each end with two large pieces of stone. . . . The Canton coolies amuse themselves in this way, but I never saw them use an instrument nearly as heavy as the one described."—*Scarth, Twelve Years*, pp. 41–2.

"Active, manly plays are not popular in the south, and instead of engaging in a ball-game or regatta, going to a bowling alley or fives court to exhibit their strength and skill, young men lift beams headed with heavy stones, like huge dumb-bells, to prove their muscle, or kick up their heels in a game of shuttlecock. The outdoor amusements of gentlemen consist in flying kites, carrying birds on perches and throwing seeds high in the air for them to catch, sauntering through the fields, or lazily boating on the water. Pitching coppers, fighting crickets or quails, tossing up several balls at once, kicking large leaden balls against each other, snapping sticks, chucking stones, or guessing the number of seeds in an orange, are plays for lads."—*Williams, Midd. King.*, i. 824–5.

[In the game of throwing the weight a heavy stone with a piece cut out and a handle inserted was thrown from one to another.]—*Giles, Dic.*, No. 11351.

[An equestrian feat (called *Ch'ao t'ien têng*, "facing the sky stirrup") consisted in the rider lying on his back on the horse and throwing his legs in the air.]—*Ibid.* No. 478.

[Letter-carriers practised striking suspended sandbags so as to be able to defend themselves against robbers.]—*Ibid.* No. 9624.

"In the section of the 番禺縣志 (Gazetteer of the Pwan-yü District), describing the popular customs of the district, two or three paragraphs are devoted to quail-fighting. This practice appears to be a very old one, and . . . notorious enough to have given its name to a song (the 鬪鶴鶉). Quails, on the authority of the Gazetteer, are exhibited for sale in the 鬼巷 (Devil Lane) in the western part of Canton, and this is described as so crowded during the height of the sale as to be almost impassable. Good birds, when young,

are sold at high prices, and noted fighters will procure even several hundred taels, while the fight itself causes the attendance of a huge crowd, and the circulation of large sums of money."—*N. and Q. on C. and J.*, iii. 22.

"Combats between crickets are oftenest seen in the south, where the small field sort is common. Two well-chosen combatants are put into a basin and irritated with a straw until they rush upon each other with the utmost fury, chirruping as they make the onset, and the battle seldom ends without a tragical result in loss of life or limb. Quails are also trained to mortal combat; two are placed on a railed table, on which a handful of millet has been strewn, and as soon as one picks up a kernel the other flies at him with beak, claws, and wings, and the struggle is kept up till one retreats by hopping into the hand of his disappointed owner. Hundreds of dollars are occasionally betted upon these cricket or quail fights, which if not as sublime or exciting, are certainly less inhuman than the pugilistic fights and bull-baits of Christian countries, while both show the same brutal love of sport at the expense of life."—*Ibid.* i. 825–6.

"A favourite amusement is the flying of kites. They are made of paper and silk, in imitation of birds, butterflys, lizards, spectacles, fish, men, and other objects; but the skill shown in flying them is more remarkable than the ingenuity displayed in their construction. The ninth day of the ninth moon is a festival devoted to this amusement all over the land. . . . On this day . . . as many as thirty thousand people assemble on the hills around Fuhchau to join in this amusement if the weather be propitious. Many of the kites are cut adrift under the belief that, as they float off, they carry away with them all impending disasters."—*Ibid.* i. 826–7.

"Parties of actors and acrobats can be hired cheaply, and their performances form part of the festivities of rich families in their houses to entertain the women and relatives who cannot go abroad to see them. They are constituted into separate corporations or guilds, and each takes a distinguishing name, as the 'Happy and Blessed company,' the 'Glorious Appearing company,' etc."—*Ibid.* i. 821.

[Swinging was a form of amusement. Ladies stood up in the swing.]—*Giles, Dic.*, No. 2307.

"*Waising.*—'Circuit-names,' or 'hall-names.' The sport consists in selecting a dozen or so out of several hundred family names: whoever guesses most 'wranglers' wins an enormous prize."—*Parker, John Chinaman*, p. 365.

[*Fan tan*, or "quadrating cash," was the most common game of chance played at Canton; v. *Williams, Midd. King.*, i. 825.]

[For details as to games with dice and dominoes see *Culin, Ch. Games with Dice and Dominoes.*]

[Nursery rhymes showed keen and tender parental affection. Moral teaching various, but most, though not all, of high character. Food element a prominent feature, as in the West. There were more than 600 rhymes of the "Mother Goose" type, and numerous others of various kinds, such as "The Brown Mouse," "This little pig went to market," etc. Nicknames were freely given, and embodied in rhymes. "Tongue-twisters" and nonsense rhymes much appreciated by children.]—*Headland, Ch. Boy and Girl*, pp. 1–30. See also pp. 33–48.

[The games played by boys included "Forcing the City Gates," "Blind Man," "Man Wheel," "Striking the Stick" (similar to "Tip-cat"), "Select Fruit,"—these requiring strength, skill, or curiosity,—"Point at Moon and Stars," "Queue," "Honour," "Hockey," "Pounding Rice,"—requiring quickness of action,—"Host and Guest," "Roast Dog-meat," "Skin the Snake," "The Hawk catching the Young Chicks," "Strike the Poles,"—developing the parental or protective instinct,—"Throw Cash," "Pitch Brickbats," "Kick the Marbles," "Kick the Shoes," "Cat catching Mice,"—tests of accuracy and agility.]—*Ibid.* pp. 51–76.

[Of games played by girls, "Going to Town," "Turning the Mill" and "Flower-pot" tended to develop strength, "Meat or Vegetables" and "Seek for Gold" required accuracy of aim, "Water the Flowers" tended to develop the inventive faculty, "The Flower Seller" inculcated honesty, "The Cow's Tail" and "Let out the Doves" were tests of agility, and the "Cow's Eye" of bearing pain. There were more than seventy-five games played in Peking alone. The above boys' and girls' games, played in the north, differed from those played in the centre and south, owing to differences of climate and character. Games generally were re-productions of the employments of parents—farming, carpentry, house-keeping—and many local occupations were reflected in the local games of children. Analysis of the games mentioned above tends to rebut the assertions of several writers (*cf. supra*) that "The Chinese are not much given to athletic exercises," "Their sports do not require much physical exertion, nor do they often pair off, or choose sides and compete, in order to see who are the best players," "Active, many sports are not popular in the South," etc. For details of the games and methods of play see *ibid.* pp. 51–94, and for a description of block-games (*kindergarten*), which illustrated such facts of history as would have a moral influence, or be an intellectual stimulus to the child, pp. 115–30.]—*Ibid.* pp. 79–94.

[Toys were less varied, less complicated, less true to the original, and less expensive than those of the West. They involved no intricate scientific principle, though a knowledge of the production of air-currents by heat was shown in the "merry-go-round" lantern. The majority of toys were made of clay, cloth, wood, or tin, and they included various kinds of rattles, whistles, drums, horns, knives, animals and insects, tops, dolls and dancing dolls, buzzers, music balls, clay beggars, jumping jacks, carts, barking dogs, and "candy-blown" toys.]—*Ibid.* pp. 97–112.

[For children's shows and entertainments, juvenile juggling, and stories told to children, see *ibid.* pp. 133–76.]

"The Thespian band still retains its original strolling character, and stands ready to pack up its trappings at the first call. . . . One large shed contains the stage, and three smaller ones before it enclose an area, and are furnished with rude seats for the paying spectators. The subscribers' bounty is acknowledged by pasting red sheets containing their names and amounts upon the walls of the temple. The purlieus are left as stands for the sale of refreshments, for gambling tables, or for worse purposes, and by all these means the priests generally contrive to make gain of their devotion."—*Williams, Midd. King.*, i. 820–1.

"We have no permanent theatres, and, consequently, no yearly agreements. A theatre is constructed in a few hours: some planks placed on trestles and raised seven or eight feet above the ground; some bamboos supporting a roof of mats; some painted cloths serving as partitions at the end and on each side of the stage; then all about benches placed with the same amount of regard for architectural science: such are the theatre and the auditorium."—*Tcheng-Ki-Tong, Le Théâtre des Ch.*, p. 18.

"Edifices for the enacting of plays are of a temporary kind, pitched like a tent in a field, and struck as soon as the engagement between the actors and their patrons has terminated. They differ widely in their dimensions, though constructed nearly upon the same plan, and consist generally of four separate buildings, planted upon the four sides of a large quadrangle. One side is occupied by the stage, which consists merely of a robing-room and platform for the actors: the opposite side is distinguished by a large gallery set apart for the ladies, who are thus indulged with a position corresponding to our front boxes. . . . The two side galleries are intended for gentlemen who pay for their places: the area or pit is filled with persons of all ranks, who are admitted without payment of any fee."—*Lay, Ch. as They Are*, p. 73.

Chinese comedies and tragedies "are universally performed and encouraged from the court to the cottage; . . . the Chinese are so passionately fond of scenic representations that, in most houses of the great, a hall is set apart for the performance of plays; . . . no entertainment is ever given without a company of comedians to amuse the guests; . . . they constitute a part of all public festivals; and . . . foreign ambassadors are invariably entertained with theatrical representations; . . . it is not true . . . that public theatres are put on a level with houses of prostitution and confined to the suburbs of cities. There is no such thing, in fact, as a public theatre in all China."—*Laou-seng-urh*, pp. ix–x.

"Though dramatic writing is considered to be a very inferior branch of literature, and though actors are looked down upon as the very refuse of society, being one of the few classes which are excluded from competing in the open examinations, the national taste for the theatre is universal and absorbing. At all the great court ceremonies, at all the principal religious festivals, and on all occasions of general rejoicing, theatrical displays bear a part; and so completely is the drama a national institution, that on the death of the Emperor all the theatres throughout the realm are by law ordered to be closed during the time appointed for public mourning."—*Contemp. Rev.*, xxxvii. 124–5.

"In the north of China every town and every large village boasts its permanent theatre, while the inhabitants of other villages, too small to be so fortunate, find little difficulty in extemporizing theatres of mat and bamboo on any chance arrival of an itinerant troupe of actors. As long as the visit of these wandering players lasts the people of the district give themselves up to the enjoyment of the holiday. Early each morning the roads from all the country round may be seen crowded with people, the poorer ones on foot and—if in the north of China—the wealthier classes on mules or in carts, all tending to the one point of attraction; the women gay in blue, red, or green silks, and the men in their best and brightest attire. If we follow this pleasure-seeking crowd we enter a theatre built in the form of a parallelogram at one end of which is a platform, generally, though not always, as wide as the building. This platform is divided breadthwise by a wooden partition with two entrances, the front part forming the stage, and the rear portion serving the purposes of green-room, property-room, and abode of the troupe. The body of the theatre, answering to our pit and stalls, is without seats or partitions; whilst above and encircling the whole are the boxes, in which the women and principal subscribers have their places. If the district should be a poor one the probability is that we find ourselves opposite a covered stage on an open piece of ground, in front of which the carts of the visitors, full of their occupants, are ranged in a semi-circle thus forming the walls of a truly Thespian theatre. Within this enclosure stands a densely packed, good-natured, eager crowd, whose power of standing is only equalled by their power of unflagging enjoyment."—*Ibid.* p. 125.

"No money is taken at the doors [but *v. supra*]. The troupe is generally hired either by a private individual or by a public subscription for a certain number of days, and free admission is granted to everyone. The performances last from the early morning until late in the evening, with short intervals between each of the four or five pieces."—*Ibid.* xxxvii. 125; see also *Douglas, Soc. in Ch.*, pp. 375–6.

"The dramatic entertainments appear to be connected in many instances with their idolatrous worship."—*Gray, China*, i. 377. "Every temple, with few exceptions, has a stage erected in a convenient part, devoted to the performance of theatrical representations. There are several hundreds of such temples in this city [Foochow] and suburbs. Platforms are also oftentimes extemporized in the street during an evening—seldom during the day—for the performance of plays. . . . Bands are also frequently employed to perform in the houses of the rich, and in the official residences of mandarins. Sometimes theatrical companies are employed for eight or ten days in succession by mandarins in the first and second months of the Chinese year."—*Doolittle, Social Life*, ii. 295–6.

"Plays are acted in the large cities of China at public theatres all the year round, except during one month at the New Year, and during the period of mourning for a deceased Emperor. There is no charge for admission, but all visitors must take some refreshment. The various Trade-Guilds have raised stages upon their premises, and give periodical performances free to all who will stand in an open-air courtyard to watch them. Mandarins and wealthy persons often engage actors to perform in their private houses, generally while a dinner party is going on. In the country performances are provided by public subscription, and take place at temples or on temporary stages put up in the roadway. These stages are always essentially the same. There is no curtain, there are no wings, and no flies. At the back of the stage are two doors, one for entrance and one for exit. The actors who are to perform the first piece come in by the entrance door all together. When the piece is over, and as they are filing out through the exit door, those who are cast for the second piece pass in through the other door. There is no interval, and the musicians who sit on the stage, make no pause; hence many persons have stated that Chinese plays are ridiculously long, the fact being that half-an-hour to an hour would be about an average length for the plays usually performed, though much longer specimens, such as would last from three to five hours, are to be found in books. Eight or ten plays are often performed at an ordinary dinner-party, a list of perhaps forty being handed round for the chief guests to choose from."—*Giles, Hist. of Ch. Lit.*, pp. 258–9. *Cf. infra.*

"The actors undergo a very severe physical training, usually between the ages of nine and fourteen. They have to learn all kinds of acrobatic feats, these being introduced freely into 'military' plays. They also have to practise walking on feet bound up in imitation of women's feet, no woman having been allowed on the stage since the days of the Emperor Ch'ien Lung (A.D. 1736–96), whose mother had been an actress. They have further to walk about in the open air for an hour or so every day, the head thrown back and the mouth wide open in order to strengthen the voice; and finally, their diet is carefully regulated according to a fixed system of training. Fifty-six actors make up a full company, each of whom must know perfectly from 100 to 200 plays, there being no prompter. These do not include the four or five-act plays as found in books, but either acting editions of these, cut down to suit the requirements of the stage, or short farces specially written. The actors are ranged under five classes according to their capabilities, and consequently everyone knows what part he is expected to take in any given play. Far from being an important personage, as in ancient Greece, the actor is under a social ban; and for three generations his descendants may not compete at the public examinations. Yet he must possess considerable ability in a certain line; for inasmuch as there are no properties and no realism, he is wholly dependent for success upon his own powers of idealisation. There he is indeed supreme. He will gallop across the stage on horseback, dismount, and pass his horse on to a groom. He will wander down a street, and stop at an open shop-window to flirt with a pretty girl. He will hide in a forest, or fight from a battlemented wall. He conjures up by histrionic skill the whole paraphernalia of a scene which in Western countries is grossly laid out by supers before the curtain goes up. The general absence of properties is made up to some extent by the dresses of the actors, which are of the most gorgeous charactor, robes for Emperors and grandees running into figures which would stagger even a West-end manager."—*Ibid.* pp. 259–60.

"It is obvious that the actor must be a good contortionist, and excel in gesture. He must have a good voice, his part consisting of song and 'spoken' in about equal proportions. To show how utterly the Chinese disregard realism, it need only be stated that dead men get up and walk off the stage; sometimes they will even act the part of bearers and make movements as though carrying themselves away. Or a servant will step across to a leading performer and hand him a cup of tea to clear his throat."—*Ibid.* pp. 260–1.

"Plays usually relate to ancient times, and the actors attempt to imitate the dress and the customs of those times. The masks worn are very imperfect and coarse. The usual dress of the actors is retained while playing, the peculiar costume designed to be worn while performing on the stage being simply put on over the common dress. The dresses intended to represent ancient customs are often too short or too long, too large or too small, and, being put on over the other clothes of the wearer, oftentimes make him present a very ludicrous appearance, as his ordinary clothing may be seen peeping out. An abundance of music always accompanies theatrical shows, consisting principally of beating gongs and drums, which, in the estimation of the unappreciative foreign ear is most discordant, and anything but musical and entertaining. Before mandarins and the rich gentry, actors who speak the mandarin dialect are almost invariably employed; while, for exhibitions in temples and in the streets, those generally are engaged who speak the common language of the people, the vernacular of the place. The acting is very often coarse and sensual, and the plays abound in indelicate allusions and obscene phrases. The females who are not of the highest rank living in the neighbourhood numerously attend the plays which are performed in the street and in temples."—*Doolittle, Social Life*, ii. 297.

"On the evening preceding the day of representation, the dresses of the actors are removed from the boat or house which is the ordinary abode of the company to the place where the play is to be performed. The principal piece, usually an historical tragedy, opens about the middle of the day, and continues during two or three hours; but on some occasions it commences sooner, and, a long piece having been selected, the whole performance continues for five or six hours. The tragedy or comedy ended, tumbling and various feats of agility succeed. These are then followed by a short piece, wherein, in most cases, the dramatis personæ do not exceed two or three. . . . These pieces . . . are usually of a farcical (though not uncommonly of an indecent) character. . . ." They contain "impromptu allusions to passing occurrences, and . . . often powerful pantomimic action. . . . The dresses, which, in the more regular dramatic performances, are rich and gaudy, but no way resembling those that we every day see in use, are, in these pieces, different from the dresses of the present time only in occasional additions intended to aid the drollery of a comic actor. One great advantage . . . that these pieces have to European ears, is, the absence of the deafening crash of the gong and the excruciating sounds of some of the other instruments peculiar to the Chinese."—*Ch. Repos.*, vi. 575–6.

"The performances usually extend through three entire days, with brief recesses for sleeping and eating, and in villages where they are comparatively rare, the people act as if they were bewitched, neglecting everything to attend them. The female parts are performed by lads, who not only paint and dress like women, but even squeeze their toes into the 'golden lilies,' and imitate upon the stage, a mincing wriggling gait. These fellows personate the voice, tones, and motions of the sex with wonderful exactness, taking every opportunity, indeed, that the play will allow to relieve their feet by sitting when on the boards, or retiring into the green-room when out of the acts. The acting is chiefly pantomime, and its fidelity shows the excellent training of the players. This development of their initiative faculties is probably still more encouraged by the difficulty the audience find to understand what is said; for owing to the differences in the dialects, the open construction of the theatre, the high falsetto or recitative key in which many of the parts are spoken, and the din of the orchestra intervening between every few sentences, not one quarter of the people hear or understand a word."—*Williams, Midd. King.*, i. 821.

"Our annals show us that, during the reign of the Mongol emperors, women took part in theatrical plays . . . " but "at length the actresses drew down upon themselves a decree of expulsion as a cause of exciting hatred and contempt of good manners. . . . It was in the last century that this measure was taken."—*Tcheng-Ki-Tong, Le Théâtre des Ch.*, p. 30.

"The condition of actors is associated by the law with that of courtesans."—*Ampère, La Science et les Lettres en Orient*, p. 225.

"The scenery is very simple, consisting merely of rudely painted mats arranged on the back and sides of the stage, a few

tables, chairs, or beds, which successively serve for many uses, and are brought in and out from the robing-room. The orchestra sit on the side of the stage, and not only fill up the intervals with their interludes, but strike a crashing noise by way of emphasis, or to add energy to the rush of opposing warriors. No falling curtain divides the acts or scenes, and the play is carried to its conclusion without intermission. The dresses are made of gorgeous silks, and present the best specimens of ancient Chinese costume of former dynasties now to be seen. The imperfections of the scenery require much to be suggested by the spectator's imagination, though the actors themselves supply the defect in a measure by each man stating what part he performs, and what the person he represents has been doing while absent. If a courier is to be sent to a distant city, away he strides across the boards, or perhaps gets a whip and cocks up his leg as if mounting a horse, and on reaching the end of the stage cries out that he has arrived, and there delivers his message. Passing a bridge or crossing a river are indicated by stepping up and then down, or by the rolling motion of a boat. If a city is to be impersonated, two or three men lie down upon each other, when warriors rush on them furiously, overthrow the wall which they formed, and take the place by assault. Ghosts or supernatural beings are introduced through a wide trap-door in the stage, and, if he thinks it necessary, the impersonator cries out from underneath that he is ready, or for assistance to help him up through the hole."—*Williams, Midd. King.*, i. 821–2.

"The acting, generally speaking, is good, for the Chinese are naturally quick of observation, and are thus able in every-day life to catch easily the tone of those with whom they associate and on the stage to assume the characters they wish to represent. The possession of these faculties is the more important, as the actors get very little guidance from the play-books, which almost entirely confine their directions to 'enter,' 'exit,' and 'aside,' or, as the Chinese literally translated means, 'ascend,' 'descend,' and 'turn the back and say.'"—*Contemp. Rev.*, xxxvii. 125–6.

"The acting throughout was so perfect in its kind, that the eye could not detect a single fault. The performance lasted about six hours without any relief, but such was the interest which the players and the spectators felt in it, that neither seemed to be tired of the sport."—*Lay, Ch. as They Are*, p. 76.

"The Chinese, to render the picture exact and striking, are minutely circumstantial in all their scenes, and it is astonishing to see the vanity of minor incidents that are crowded within the compass of a short passage. The rehearsal is of a perfunctory kind—the manager takes his place behind a curtain upon the stage, and, holding a book in his hand, calls each of the actors in their turn, and briefly reminds them of their part by pointing to some sentence to be pronounced with significance, or some particular feature in the acting."—*Ibid.* p. 77.

"The performers are usually three, four, or five. Three is very common."—*Journ. N.-C.B.R.A.S.*, N.S. xx. 195.

"The characters in Chinese plays are arranged under five denominations, *viz.*, *shêng* 生, *tan* 旦, *ching* 淨, *mo* 末, and *ch'ou* 丑. The hero is *shêng*. He wears a black beard, but his face is not concealed. The style of dress varies according to the age, rank, and character of the hero. *Tan* is a female character, and varies also according to age and other circumstances. If young, kingfisher feathers are put in requisition as ornaments. Youths and boys always perform the female parts. It is forbidden by law for women to go on the stage. The *ching* is a less important character, and *mo* and *chou* are quite subordinate. (See also *N. and Q. on C. and J.*, ii. 56.) Whether these names of costumes are of Chinese or foreign origin is uncertain. In the printed text of the plays, each character has assigned to it that one of the five names which suits it. The play is altered, but the costumes remain. The hero of one appears like the hero of another. The name of the melody to be used in the choral passages is also printed. The music, therefore, is just that which pleased the ears of people in the Yuen dynasty or the early Ming. Neither a new melody nor a new play has been made for several centuries past. Probably all the plays were made within a period amounting to 200 years, and after that time had expired the dramatic genius of China went to sleep, to wake again at intervals down to this century, but never to sing again with such vigour as six hundred years ago. The two store-houses affording materials to the plays are Chinese history and biography and the comedy of common life. The authors of the plays study brevity, and have one main object in each play. The aim of all good plays is moral, and some one noble characteristic of man in society is strikingly represented. No prompting is allowed, and the actors do not require it. They are permitted, however, to add to the text or gag, as they sometimes do."—*N. C. Daily News*, 15th December, 1885. The play to be performed was often chosen by prominent members of the audience (as formerly the songs in English music-halls, by a majority vote), who ticked the title of the play they preferred on the programme.

"The curious posturing which is sometimes seen abruptly intervening in the course of a play represents a dance of salutation to visitors of distinction on their entering the theatre, and is called *t'iao kia kwan* 跳加官—lit., 'dancing [to express the wish of] promotion.' When Mandarins, for instance, invite a select circle of officials to a theatrical feast, the performance is interrupted by this dance, as each guest arrives."—*N. and Q. on C. and J.*, ii. 178.

"No nation has such a store of plays in constant use, although . . . comedians have suffered contempt, and have even been persecuted by special edict. Many plays have been written by women, though the sex is forbidden to act, and the female parts are taken by boys."—*Johnson, Or. Rel.—Ch.*, p. 445.

"The great Manchu, Kien-lung, did not share the prejudices of his scholars, who are said to have excluded plays from his library: he even took a player for a second wife [*v. supra*]. This passion for the stage has grown with time: the superstitions of Buddhists and Tao-sse have furnished machinery, and the history of China is quarried for material. Such is the force of nationality in the popular mind. Plays are the cheapest things circulated, and are even sometimes used as currency (*Gerard*, ii. 301). Troops of comedians are in demand, on all occasions, from rude country *fêtes* to city dinners, court receptions, and public and private reunions."—*Ibid.* p. 446.

"The morals of the Chinese stage, so far as the sentiments of the pieces are concerned, are better than the acting, which sometimes panders to depraved tastes, but no indecent exposure, as of the persons of dancers, is ever seen in China. The audience stand in the area fronting the stage, or sit in the sheds around it; the women present are usually seated in the galleries. The police are at hand to maintain order, but the crowd, although in an irksome position, and sometimes exposed to a fierce sun, is remarkably peaceable. Accidents seldom occur on these occasions, but whenever the people are alarmed by a crash, or the stage takes fire, loss of life or limb generally ensues."—*Williams, Midd. King.*, i. 824.

"In modern times a theatrical performance is given under the name of 採台, on inaugurating a new building."—*Ch. Rev.*, x. 71. *Cf.* LATER FEUDAL PERIOD.

"Music is little practised as a recreative amusement among the Chinese lower classes."—*Van Aalst, Ch. Music*, pp. 36–7.

Private.—"The birth of a child, like every other important social event in China, sets a long train of observances in motion. So soon as the midwife's care begins—for the Chinese consider that the obstetric art ought only to be practised by females—some of the members of the family engage in the worship of Kum-Fa. In cases of severe labour, a Taouist priest is called in, who repeats certain prayers and traces a mystic character with a new pen upon a piece of yellow paper. The scroll is burned, and the ashes of it are given to the patient in a cup of water. So soon as the child is born, the exact hour is noted, to enable the fortune-teller to cast its horoscope. The midwife puts the umbilical cord into an urn containing charcoal ashes, which is carefully sealed and kept. At the end of 10 years it is usually thrown away; but in some cases it is kept during the lifetime and interred with the remains. Parents believe that if they were to commit any portion of the body to the ground, the interment of the child would soon follow. Should the child die shortly after birth, it is customary to expose the urn on a neighbouring hill, or in a cemetery. I have occasionally stumbled upon such urns in my walks near Canton. The child is at once washed with water, in which a herb, called by the Chinese Kum-Ngan-Fa, or the gold and silver plant, the rind of green ginger, and the leaves of the whampu and pomeloe trees have been boiled. . . . The child is then wrapped in swaddling clothes. . . . These are simply bands that closely confine the limbs. On the third day, the infant is again washed in aromatic water. On this occasion the near relatives are invited to attend, and when 'baby' has been washed, they sit down to a repast, the especial feature of which is pork-patties, and balls of flour with sugar in the centre. The food of the patient consists chiefly of fowls, fine rice, and ginger-wine. Duck's eggs also form an item of her diet. These are also given, together with jars of ginger-wine, as birth-gifts to her relatives and friends."—*Gray, China*, i. 229–30.

"Sometimes the umbilical cord is baked, and given in the form of a powder to the infant as an antidote against small-pox. Several years ago a physician in Sze-chuen wrote a treatise recommending its use in this way."—*Ibid.* i. 229, note.

["No red eggs are sent by friends and relatives on the birth of a daughter," as at the birth of the first boy . . . "but in other respects the customs and ceremonies practised on these occasions are very much the same. On the 3rd day, the milk-name is given to the child, and if a girl, her ears are pierced for earrings. A little boiled rice is rubbed upon the lobe of the ear, which is then subjected to friction between the finger and thumb until it gets quite numb: it is next pierced with a needle and thread dipped in oil, the latter being left in the ear. No blood flows. Boys frequently have one ear pierced, as some people say, to make them look like little girls; and up to the age of 13 or 14, girls often wear their hair braided in a tail to make them look like little boys. But the end of the tail is always tied with *red* silk—the differentiating colour between youths and maids in China. . . . The first person who comes to the house where a child has been born, "ignorant that such an event has taken place, is on no account allowed to go away without having first eaten a full meal"—it being thought that without this the child would not sleep well at night.]—*Giles, Chinese Sketches*, pp. 157–60.

"There are a few *accoucheurs* in China, men who have resorted to this means of livelihood in their old age; but, as a rule, midwives are employed."—*Gray, China*, i. 229, note.

"The first day of the year is also regarded as the birthday of the entire population, for the practice among the Hebrews of dating the age from the beginning of the year prevails also in China; so that a child born only a week before new year, is considered as entering its second year on the first day of the first month. This does not, however, entirely supersede the observance of the real anniversary, and parents frequently make a solemnity of their son's birthday."—*Williams, Midd. King.*, i. 813.

"Among the upper classes it is not usual for the husband to have an interview with the wife until a month after the birth of the child; and no visitor can be received at the house during this time. A large bunch of evergreens is suspended above the principal entrance of the house to intimate this; and visitors upon seeing it do not stop even to leave their cards. All persons residing in the house are regarded as unclean till the month has expired. The same rule applies to persons entering the house during the period in question. The members of such a family are, of course, not allowed to enter any of the public temples. At the close of the month, the mother washes her body, as a rite of purification, with water in which leaves of the pomeloe tree have been boiled. The father, having worshipped the tablets of his ancestors, repairs, together with one of his wife's handmaidens, to a temple—the Temple of Longevity is frequently selected—to thank the gods for having given him a son. Until 100 days have expired, the mother is required to remain at home. . . . At the close of this period, she repairs with her child to a temple. Very often, the temple is one in honour of Kum-Fa, and the child is dedicated to the goddess. If the mother has previously prayed for offspring to Koon-Yam or to Tien-How, she repairs of course to the temple where her prayers were offered."—*Ibid.* i. 230–1.

[For shaving of child's head at one month old (here called Mun Yut), see *Doolittle*, i. 122, *seq.* Gray (*China*, i. 231) says it is considered lucky for the barber to be an old man; but it is sometimes done by the mother or grandmother. "The hair is wrapped up in paper and carefully preserved." After the shaving, an old man, hired for the purpose, places his hand on the infant's head, and says: "May long life be thy portion."]

"The child is not permitted to rest on the bedstead until the father has consulted the calendar and selected a lucky day for the purpose. A coat of many colours is presented to a favourite child by its parents. It is supposed to protect the infant from evil spirits by diverting attention from the wearer. The almanac is also consulted to ascertain what things must be kept out of the child's sight. It sometimes sets forth that it is unlucky for infants to touch or see articles made of bamboo during a certain month. Sometimes the prohibited articles are of iron or copper. Whatever the almanac prescribes is either removed or covered up."—*Gray, China*, i. 231–2.

"The first visit the child pays is to its grandmother, often [on] the day after the Mun-Yut. [She gives it] 4 chickens, 4 onions, sticks of sugar-cane, 2 cabbages, and a quantity of rice-husks. The vegetables enumerated being very quick in attaining maturity, imply her desire for the rapid growth of the little one. The rice-husks signify her wish that the mind of her grandchild may readily receive instruction, and that education may result in scholarship. When the child is 1 or 2 years of age, or at the time when it first begins to walk, it is presented with a pair of shoes called Mow Yee-Kai, or kitten shoes. They resemble a cat's face at the toes, and are supposed to render the child as sure-footed as a cat."—*Ibid.* i. 232.

"Fathers give their sons the *ju ming*, or 'milk name,' about a month after birth. The mother, on the day appointed for this ceremony, worships and thanks the goddess of mercy, and the boy, dressed and having his head shaved, is brought into the circle of assembled friends, where the father confers the name and celebrates the occasion by a feast. The milk name is kept until the lad enters school, at which time the *shu ming*, or 'school name,' is conferred upon him. . . . The *shu ming* generally consists of two characters, selected with reference to the boy's condition, prospects, studies, or some other event connected with him; sometimes the milk name is continued, as the family have become accustomed to it. Such names as *Ink-grinder*, *Promising-study*, *Opening-olive*, *Entering-virtue*, *Rising-advancement*, etc., are given to young students at this time. Though endearing or fanciful names are often conferred, it is quite as common to vilify very young children by calling them *dog*, *hog*, *puppy*, *flea*, etc., under the idea that such epithets will ward off the evil eye. Girls have only their milk and marriage names; the former may be *a flower*, *a sister*, *a gem*, or such like; the latter are terms like *Emulating the Moon*, *Orchis Flower*, *the Jasmine*, *Delicate Perfume*, etc. A mere number at Canton, as *A-yat*, *A-sam*, *A-luk* (No. 1, No. 3, No. 6), often designates the boys till they get their book names."—*Williams, Midd. King.*, i. 797.

"Singular or superstitious customs relating to children observed usually after they are one year old." They refer, as a rule, to boys and girls alike. They include: "Burning paper to mother," on the child's birthday; "cutting the cords of his feet," when learning to walk; "Passing through the door." This ceremony is very fully described. It is sometimes performed before the child is a year old, and after that at various intervals (in some families every year, in others every second or third) till the child is 16. It is always done by Taoist (never by Buddhist) priests. In this ceremony a wooden image, about a foot high, is always used to represent the child, and carefully preserved during the intervals; if the child dies before 16, the image is buried with it; if not, it is often (after the ceremony of "passing out of childhood" has been performed) used as a plaything by the younger children. Many parents, after the first shaving of the head, allow the child's hair to grow in a small patch—if a boy, on the top of the head; if a girl, on one side, or one on each side. When an only son is vowed to be a Buddhist priest, etc., his hair is not allowed to grow till he is six or eight. Families with few and sickly children burn paper money, incense, and candles on the 1st and the 15th of each month to the "god and goddess of the bedstead," the "goddess of the eaves," and the "goddess of the bedroom." On the birthday of the goddess "Mother" (15th day of 1st month) the midwife performs in her own house, before "Mother's" image, the ceremony of "passing through the door" for the children of all the families where her services have been required in the last 16 years—having previously collected contributions from these families. On the 14th or 15th day of the 8th month a ceremony called "worshipping the measure" (the North measure, or God of longevity = the constellation Ursa Major) is performed, to ensure health and long life to the children. It is also performed every year on the birthdays of sickly children. (The Chinese explain this ceremony by a tradition, here related, about a lad who, hearing he was to die at the age of 19, by the advice of the fortune-teller Kuan-lo, went to the top of a mountain, where he found the North and the South measure playing chess. On hearing his story, they added the character 九 in the record of his life, thus making his term 99 years 九十九). In spring (usually the 8th month) schoolmasters invite their pupils to a feast in honour of Confucius. Pupils entering school for the first time bring with them candles, incense, and paper-money, to be burned before a slip of paper with some title of Confucius written on it—this is called "entering school" or "worshipping the sage." The ceremony of "passing out of childhood" (very similar to "passing through the door," but usually more imposing) is performed at the age of 16. Children are then supposed to pass out of the control of "Mother" and into that of the gods in general.—*Doolittle, Social Life*, i. 127–37.

"In our town of Hsinchen [Honan], and within a few miles around, almost all the children are called some kind of 'cow,' *e.g.*, '*Ling Niu*' would mean the Leader Cow, '*Kên Niu*,' Follow Cow, and so on."—*Exchange* (Hsinchen, Honan), quoted in *N.-C. Herald*, Aug. 28, 1899, p. 438.

"As to names . . . children may be called after any circumstance or thing. For instance, if a child were born during a snowstorm, or during a fair, it might be called 'Snow Cow,' or 'Fair Cow.' Or again, if the river overflows its banks and floods the country, a child born at that time is liable to be called 'Water Cow.'"—*Ibid.* p. 438.

[For the custom of compressing the feet of female children, see BODILY MUTILATIONS.]

"At the time of sending the cards [see MARITAL—*Betrothal*] a pair of silver or gold wristlets are sent to the girl, and presents of food to the family, and the latter when returning the girl's card, send artificial gilt flowers, some vermicelli, and bread cakes. These articles are supposed to be of good omen. The use of the red thread is explained by a popular story of events supposed to have happened in the time of the Tang dynasty. The popular idiom says of the betrothed couple, 'their feet have been tied together.' Some say these threads are kept till the wedding and used to tie the goblets together out of which the bride and bridegroom drink wine. Sometimes they are so used, but more frequently a new red string is taken and the old ones put into the bridegroom's queue, or worked into the shoes worn by the bride, as omens of good." The time between betrothal and marriage varies, according to the age of the parties, from a month or two to 2 years. "From one to three months before the marriage, a fortunate day is selected. . . . Generally a member of the bridegroom's family, or a trusty friend, takes

the 8 horory characters which denote the birth-time for each of the affianced parties, and for each of their parents, if living, to a fortune-teller, who selects lucky days and times for the marriage, for the cutting of the wedding garments, for the placing of the bridal bed in position, for the finishing of the curtains of the bridal bed, for the embroidering of the bride's pillows, and for the bride's entering the sedan on the wedding-day. These items are written out on a sheet of red paper, which is sent to the girl's family by the go-between."—*Doolittle, Social Life*, i. 69–70.

Presenting the wedding cakes and material for bridal dress to the family of the bride is next in order (see *Gray, China*, i. 196). This happens about one month before the wedding day. The number of "cakes of ceremony," varies from several score to several hundreds. "They are round and about an inch thick, weighing about 1 to 10 or 12 oz. each, and measure nearly a foot in diameter. They are made out of wheat flour, and contain in the middle some sugar, lard, and small pieces of fat pork, mixed together in a kind of batter, and then cooked." . . . There is also sent a sum of money, previously agreed on, 5 kinds of red cloth or silk, for the bride's use, "5 kinds of dried fruits, several kinds of small cakes, a cock and a hen, and a gander and a goose. The top of one of the various stacks of these wedding cakes, as they are carried through the streets, has several small doll-like figures, made out of wheat flour, each a few inches high, and fastened upon slips of bamboo, stuck into it." These cakes are distributed among relatives and intimate friends; the money is spent on the bride's outfit.—*Ibid.* i. 70.

Rich people make much more valuable presents than the dress, and they are carried through the streets so that they can be seen by everyone—costly head-dresses, wristlets, and other ornaments—two jars of wine—a pair of goats—ten or more pieces of silk, satin, or crape, of five different kinds of colours. "Presents of money are also sent for one of the bride's maternal uncles, and for one of her paternal uncles, if she have such relatives living. On some of these parcels done up in red paper, are written propitious words or sentences." Two large red cards are also sent, being respectively the dragon and the phœnix and the ancestral names of the bride's and the bridegroom's parents, with that of the go-between, and felicitous sentences.—*Ibid.* i. 71.

The parents or guardians of the bride accept all the money and all the silks and satins, but only the male of each pair of animals, one of the jars of wine, and part of the cakes and other things, the rest being returned to the bridegroom's parents together with the card of the bride's family, 2 large red candles, a pair of pewter candlesticks, 2 packages of white Chinese vermicelli, a pair of satin boots, a red official cap, and material for a dress-coat, and a large quantity of artificial flowers made out of velvet or of pith paper, generally called "rice-paper." . . . [The large cakes returned are divided into 4 or 8 pieces, one given to each family of near relatives or intimate friends of the bridegroom's family, together with a little vermicelli and one of the artificial flowers, as intimation that a member of the family is about to be married and a formal invitation may be expected.]—*Ibid.* i. 72.

A few days before the wedding-day the bridegroom's family again sends presents, viz., a cock and hen, a leg and foot of a pig and of a goat, 8 small cakes of bread, 8 torches, 3 pairs of large red candles, a quantity of vermicelli, and several bunches of fire-crackers; also a girdle, a silk veil, and several articles of ready-made clothing, usually borrowed or hired for the occasion, to be worn by the bride when carried to her husband's home. The food, or a part of it, including the cock, is to be eaten by her on that morning; the fire-crackers are for explosion on the road, and the torches to be burnt at the same time. Each of the bread-cakes bears an auspicious character in red, in an ancient form of writing; or 4 of them bear 4 characters, meaning "the phœnixes are singing in concert," or "the ducks are seeking their mates." Four loaves are accepted, the other 4, and the hen, returned.]—*Ibid.* i. 72.

[Two or three days before the wedding, the bride's family send a list of the furniture she is to bring as dowry, and let them know when it is coming. The money to pay the bearers is prepared beforehand, done up in red paper, or tied with red strings, and is, if the families are wealthy, several times as much as they would get for ordinary work.]—*Ibid.* i. 73.

"It is the custom for brides not to open their lips till the marriage ceremony is performed. . . . Besides not speaking, the bride is supposed not to eat. . . . The bride has to serve all the ladies with wine, the bridegroom to go round the men's tables and do likewise."—*Little* (*Mrs. A.*), *Int. Ch.*, pp. 186–7.

The custom of *sifting four eyes* is observed by the bride and one or two women employed to help her, on the afternoon or evening before sending off the outfit. "A large, round, sieve-like utensil, made out of bamboo splints, in diameter about 3 or 4 feet, is procured, also a brass vessel, 2 or 3 feet in diameter and about 1 foot high, which is placed on a pedestal. After having placed in this vessel a quantity of burning coals, they take the wedding garments one by one, or in convenient quantities, and having laid them on this sieve, the women hold it, with its contents, for a moment or two over the vessel, with a slight, sifting movement." All the clothes, shoes and ornaments, and sometimes small articles of household furniture, are similarly treated. Among the words repeated on this occasion, are:—

"A thousand eyes, 10,000 eyes, we sift out,
Gold and silver, wealth and precious things, we sift in."

Ten chopsticks are placed on the sieve, to indicate that, though so much is being given away with the girl, yet clothing and food will remain for her parents. (Arising from a poem in the Foo-chow dialect with the words for "chop-sticks" and "remaining.") "The Chinese differ as to the meaning of this ceremony, but in general it is regarded as having a cleansing and purifying effect and warding off evil influences. Everything sifted is carefully packed away, and the female members of the bride's family carefully avoid touching the things before they are sent to the bridegroom's house. It is counted specially unlucky should they be touched by a pregnant woman or any one in mourning."—*Doolittle*, i. 73–4.

A similar ceremony, called "expelling the filth" is sometimes performed at the bridegroom's house a few days before the wedding. "At the time indicated on the card, the dowry of the bride is carried in procession through the streets, with as much parade and show as the amount of the furniture will admit." This outfit is generally bought with the money sent by the bridegroom's family for that purpose; the wealthy families do not depend on this, but supplement it from their own means. "It is customary for friends and relatives of the bride's family, who have received 'cakes of ceremony,' to make presents of materials for clothing, artificial flowers, or other ornaments for the head, to her family. These presents are designed to constitute a part of the bride's outfit." A few days before the wedding, the bedstead is placed in the bride's chamber, and must not be moved for some time, for fear of ill luck. "Five coins belonging to the reigns of 5 different emperors are usually scattered around on the bottom of the bedstead, that is under the piece of matting with which such a bedstead is provided. Sometimes 4 other similar sets of coins are placed under the bedstead, one set being put near the foot of each bed-post. Five bunches of boiled rice, each consisting of 5 bundles, made in shape like a cone, from 4 to 6 inches in length, and done up in leaves, and bound round with a red cotton string, are hung up from the frame provided for suspending the curtains of the bed. One of these bunches is larger than the others, and is hung up from the middle of the curtain frame, 4 smaller bunches being suspended at the 4 corners. The middle one is called the 'mother,' and the 4 at the corners are called the 'children.' Usually the middle conical rice pyramid in each of these 5 bunches is larger than the other pyramids of the bunch. In such a case, the middle one of each bunch is called the 'mother,' and the smaller . . . 'the children.' Five taros, one large and 4 small, are sometimes arranged on the floor under the bedstead, and near each of its feet, the large one occupying the central position of each set. A square wooden vessel, neatly painted and larger at the top than at the bottom, holding about a peck, is placed on the very centre of the bedstead, and about half filled with uncooked rice; on the top is spread a sheet of thin paper, and on this arranged a variety of articles, among which are 10 pairs of chopsticks, a brass mirror, a pair of shears, a foot measure, a small case containing money-scales, 5 kinds of dried fruits, a loose-skinned orange (if in season), some fresh flowers, a glass lamp containing oil, and 2 candles, placed one near each of the front corners of the vessel. The lamp and candles are lighted, and the vessel is left untouched on the bedstead" until they have burned out, when it is removed. If these lights were extinguished by accident, it would be a bad omen. The object of all this ceremony is to secure prosperity for the marriage, especially the bearing of children in successive generations; and the light of the lamp and candles is believed to keep away evil spirits. On the day before the wedding, the bride has her hair done up in the style of married women, and tries on her wedding clothes. When dressed (except for the veil) she lights incense before the ancestral tablets of the father's family, and worships them for the last time. She also kneels down before her parents, grandparents (if living), and uncles and aunts (if present). The bridal chair is chosen by the bridegroom's family and sent to the bride's house the afternoon before the wedding-day, with a band of music, men carrying lighted torches, 2 large red lanterns, and a red umbrella. "The bridal chair is always red, and is generally covered with broadcloth, or some rich, expensive material, and borne by 4 men, who wear caps having red tassels." Those who accompany it are feasted by the bride's family, and provided with lodgings, so as to be ready for the duties of next day.—*Ibid.* i. 75–8.

"It is . . . customary for well-to-do fathers, at the marriage of a daughter, to add to the outfit wherewith she is sent to the house of the partner of her future joys and sorrows, a coffin of gilded silver, a few inches in size. This is to signify the old man's willingness to provide his child not only with all the requisites of life in the form of a trousseau, but also with those of death, amongst which none is so important as the coffin."—*De Groot, Rel. Sys.*, i. i. 325.

"*Ceremonies observed on the day of marriage.*—Very early on the morning of her marriage, the bride, or the 'new woman,' arises, bathes and dresses. While she is bathing, the musicians are required to play. Her breakfast consists theoretically of the fowl, vermicelli, &c., sent by the family of the affianced husband. In fact, however, she eats and drinks very little of anything on the morning or during the day of her wedding, according to the very singular, if not superstitious notions of this people, which it is not proper to detail. . . . The outer garments, including the veil, are richly embroidered with a likeness of the dragon. In ancient times a certain empress granted the privilege of wearing such apparel to brides on the morning of their marriage, and also permitted them to be borne by 4 bearers, as well as to wear temporarily a very gaudy head-dress, worn generally by the wives of high officers. When the precise time approaches for taking her seat in her sedan, usually between 5 and 8 a.m., previously fixed by the fortune-teller, her toilet is completed by one of her parents taking the thick veil and placing it over her head, completely covering her features from view. She is now led out of the room by one of her female assistants, and takes her seat in the sedan, which has been brought into the reception room. . . . The floor from her room to the sedan is covered for the occasion with a kind of red carpeting, so that her feet may not touch the ground. She takes her place in the sedan amid the sound of fire-crackers and music by the band. The bride, her mother, and the various members of the family are required by custom to indulge during this morning in hearty and protracted crying."—*Doolittle*, i. 78–9.

[While she is seated in the sedan, but before starting, her parents, or some of the family, take a quilt and hold it out by the corners, and one of the bridesmaids tosses 4 bread cakes into the air so that they fall into the quilt—(these were sent at the same time as the cock and vermicelli)—the bride repeating felicitous sentences. The quilt is then gathered up and carried into another room. This is supposed to be an omen for good, because the local sound of the word for bread and one meaning "to secure" are the same.]—*Ibid.* i. 79–80.

"In the front of the procession go two men carrying two large lighted lanterns, having the family name of the groom cut out in red paper pasted upon them. Then come two men carrying similar lanterns, having the family name of the bride in a similar manner pasted on them." (These last only go part of the way.) "Then comes a large red umbrella, followed by men carrying lighted torches, and by the band. Near the bridal chair are several brothers of the bride, or friends of her family, and several friends or brothers of the groom. These latter are despatched from the house of the groom early in the morning for the purpose of . . . escorting the bride to her home. . . . About midway . . . the procession stops in the street, while the important ceremony of *receiving the bride* is formally transacted. The friends of the bride . . . produce the large red card having the ancestral name of the bride's family written on it; the latter produce a similar card, bearing the ancestral name of the groom. These they exchange, and each, seizing his own hands *à la Chinoise*, bows toward the members of the other party. The two men in the front of the procession who carry the lanterns having the name of the groom now turn about, and going between the sedan chair and the two men who carry the lanterns with the name of the bride, come back to their former position in the procession. . . . The latter party, while the other is thus encircling it, turns round in an opposite direction and starts for the bride's house, accompanied by her kinsmen, the rest of the procession going on to the bridegroom's house." "It is said that, from the precise time when the two parties carrying lanterns . . . separate from each other in the street, the name of the bride is changed into the name of her betrothed; the lanterns having his name attached remaining in the procession, while those which have her (former) name are taken back to the residence of her father's family. From this time, during the day, she is generally in the midst of entire strangers, except the female assistants, who keep with her wherever she goes."—*Ibid.* i. 80–1, 83.

"On arriving at the door of the bridegroom's house, fire-crackers are let off in large quantities, and the band plays very vigorously. The torch-bearers, lantern bearers and musicians stop near the door. The sedan is carried into the reception room, and a sieve, such as was used in the ceremony of 'sifting 4 eyes,' is put on the top of it, over its door. The floor, from the place where the sedan stops, to the door of the bride's room is covered with red carpeting, lest her foot should touch the floor. A woman who has borne . . . male children and who lives in harmonious subjection to her husband approaches the door of the sedan, and utters various felicitous sentences. If she is in good pecuniary circumstances, and if her parents are living and of a learned family, so much the more fortunate. A boy 6 or 8 years old, holding in his hands a brass mirror, with the reflecting surface turned towards the chair, also comes near and invites the bride to alight. . . . The married woman who has uttered propitious words, advances as if to open the door of the sedan, when one of the female assistants of the bride . . . steps forward and opens it." The bride is helped out by the bridesmaids; the sieve is sometimes held over her head, sometimes placed before the door of the sedan so that she steps into it. She is led to her room, where the bridegroom awaits her, standing by the side of the bedstead, with his face *towards* it. When the bride enters the room he turns round and remains standing. "As soon as she has reached his side, both simultaneously seat themselves, side by side, on the edge of the bedstead. Oftentimes, the groom manages to have a portion of the skirt of her dress come under him as he sits down by her . . . a kind of omen that she will be submissive. Sometimes the bride is very careful . . . not only to prevent this, but also to sit down, if possible, in such a manner that some of his dress will come under her, thus manifesting her determination to preserve a proper independence. . . . After sitting thus in profound silence together for a few minutes, the groom arises and leaves the room." Sometimes the bridesmaids ask him to rub the bride's feet before leaving, in order to prevent them from ever aching in the future.—*Ibid.* i. 83–4. *See* also *Ch. Rec.*, xxiii. 377.

"*Worshipping the Temple.*"—The bride joins the bridegroom in the reception room, where a table has been set out "before heaven." On it are two candlesticks with lighted candles, a censer, with lighted incense, two white cocks, made of sugar, five kinds of dried fruit, a bundle of chopsticks, a foot-measure, a mirror, a pair of shears, and a case containing money-scales. Some or all of these are sometimes placed on a willow-wood platter. There are also two goblets, tied together by a red cord of silk or cotton several feet long. The bride takes her place by the table, on the right of the groom. "*The faces of both parties are turned towards the table*, that is, towards the open light of the heavens." Both parties kneel down four times, then rise to their feet and change places, then kneel four times, bowing their heads as before; this is called "worshipping heaven and earth." Then they turn round so as to face the inner side of the room, where the ancestral tablets have been arranged, with lighted candles and incense, and bow down and worship the tablets eight times. (This is not always done on the first day.) They then turn so as to *face each other* and kneel four times, bowing their heads towards the ground. Then they rise and remain standing in silence; the goblets are brought by a bridesmaid, partly filled with a mixture of wine and honey, and held to the mouths of the couple, then changed, so that he sips from the one first used by her, and *vice versâ*. Sometimes they drink from the same cup. She then breaks off a piece of one of the sugar cocks and hands some to each, also, perhaps, a few of the dried fruits. The bridegroom then pretends to raise the bride's veil, but does not really do so, which concludes the ceremony. The matron who received the bride takes the lighted candles into the bride's room, where the latter remains with her assistants, to dress for dinner. The heavy embroidered outer garment, head-dress, &c., which she had on when she came are now removed, her hair is dressed—sometimes with pearls and gems—and she puts on her own wedding garments. The couple then sit down in her room to the wedding dinner, when he sees her face for the first time. He may eat, but she is not supposed to do so. Refreshments are sent by her parents several times in the course of the day, but custom does not allow her to partake of them. The male guests sit down to dinner some time during the afternoon. "Every invited guest is expected to make a present in money to the family of the bridegroom. This should be sent in to the family the day before the wedding, though sometimes brought by the guest himself when he comes to the feast. The amount is entirely optional, and varies from a few hundred cash to 15 or 20 dollars, according to the wealth of the guest and nearness of relationship." Even should the guest not come, it would be disreputable not to give the present. These presents in ready money help to pay wedding expenses.—*Doolittle*, i. 85–9.

"Except in case of marriages in the families of officers and the gentry, neighbours, uninvited friends, or even perfect strangers . . . are allowed to come in and see the bride during the evening. . . . She may not . . . absent herself from the gaze of the public, [but] is obliged to stand while a company of spectators observe her appearance and criticise her deportment. They indulge oftentimes in great liberty of remark about her, which she must hear with composure. She must conduct herself with decorum, neither laughing nor becoming angry, nor engaging in conversation with any but her assistants, who attend her constantly and aid her in walking and standing. . . . What at other times would . . . be regarded as insulting and highly indecent, must be passed over as though she heard it not. . . . Her

husband generally absents himself from the public room during this evening. [Sometimes] some of his intimate friends or neighbours stay very late, refusing to depart unless he pledges them a considerable sum of money with which to pay the expenses of a feast on the following day." Candles are burned all night long in the bridal chamber, those first brought from the reception room being exchanged for another pair, 2 feet long, of a bright red colour, and marked with the dragon and phœnix in gilt. It is considered unlucky if one or both should go out during the night or if they should gutter. If they burn out about the same time, it is supposed the married couple will die about the same time.—*Ibid.* i. 90.

"When the girl dies before the wedding-day, especially if nearly or quite of marriageable age, a custom called 'asking for her shoes' is observed. Her affianced husband goes in person to the residence of her parents, and with weeping approaches the coffin. . . . He soon after demands a pair of the shoes she has recently worn. These he carries home, having three lighted sticks of incense in his hands. . . . At the corners of the street, should there be any, he calls out her name, and invites her to follow. On arriving at his own home he informs her of the fact. The incense he puts in a censer, arranges a table in a convenient room, and puts behind it a chair. The shoes of the deceased girl are placed on the chair or under it. The censer . . . is placed on the table, together with a pair of lighted candles. Here he causes incense to be burned for two years, when a tablet to her memory is placed in the niche containing the ancestral tablets of his family. By all this he acknowledges her as his wife. Should he not [do so] her parents would be displeased."—*Ibid.* i. 102.

[Wedding festivities generally last two days, male friends and relatives of the bridegroom being invited on the first, and female on the second ("the women's day"). Where this is the case, the couple worship the ancestral tablets on the second day. Ceremony described—obeisance to bridegroom's parents; his mother presents the bride with ornaments or rings (p. 93). Soon after this they worship the god and goddess of the kitchen (p. 94). On the third day the bride's parents invite the couple to visit them, and send chairs to fetch them. They do not start together, and it is not considered proper for them to arrive at the same time. On the bride's chair is painted, as a charm against evil influences, the figure of a certain great magician seated on a tiger. The bride's chair is at once carried into the reception room, the bridegroom's stops a little distance from the house, and one of his brothers-in-law, or some other relation, goes out to meet and bring him in (p. 96). In the reception room he is offered three cups of tea, and three pipes of tobacco, and then he is asked to go and see his mother-in-law in her room, where he finds his wife. After paying this call he is asked into the reception room, where his wife joins him, and they pay homage to the ancestral tablets of her family and to her parents and grandparents, as was done on the previous day. After this the bride dines with her female relatives, while her husband is invited to partake of refreshments in the reception room, where he is joined by some of the men of the family. It is etiquette for him to eat very little. He then leaves in his chair, the bride following later. On the morning of the tenth day, the bride's parents invite her to spend the day, which she does, going and returning without her husband. At the end of a month, again, she may go and spend a few days, and, while there, her husband may call once or twice, in the daytime, but is careful neither to go with her nor return with her. Husbands and wives are never seen together in public. There are certain customary presents made at fixed times (p. 97): A month after marriage the bride's parents give her an image of the Goddess of Mercy, with a portable niche to put it in, a censer and pair of candlesticks for use in worshipping the same, a fan, 2 flower-vases, artificial flowers, cosmetics. "After the first year of his marriage, the bridegroom is expected every year to make presents of a pig's foot, vermicelli, wine, and large red candles, with, perhaps, some money, to his father and mother-in-law" on their birthdays, at the festivals of the 5th month, the 8th month, and the winter solstice, and at the New Year. "During the first year of his married life it is customary for his parents-in-law to make *him* more or less presents like the above, at the times of the great festivals, and especially at New Year's Day." "At various times between the periods of betrothal and of marriage, 3 incense sticks and a pair of candles are lighted and burned before the ancestral tablets of the families to which the affianced parties belong, for the purpose of informing their ancestors of what is being transacted on earth. . . . The person adding fresh incense to the censer on such occasions, usually clasps it, already lighted, in his hands, kneels down, and bows 3 times before these tablets; and then, while on his knees, or rising to his feet, having elevated the incense as high as his head, or higher, places it in the censer with a reverent air in profound silence. Some, however, do not kneel previous to placing incense in the censer. Oftentimes in connection with this burning of incense in the censer, a quantity of mock-money is also burned for the benefit of the dead ancestors."]—*Ibid.* i. 92–7.

"A ceremony called the 'Bloody Pond' ceremony, as some explain, relates to married women who die, it may be, several years subsequent to their having had children; others assert it refers to those women who, having borne a girl, die within 4 months, or who, having borne a boy, die within one month. These say that a woman's uncleanness, in the case of having given birth to a boy, extends only to one month, while it extends to 4 months in case of . . . a girl. The Chinese believe that, in the infernal regions, there is a pond of blood into which deceased married women generally, or, as some say, women who have died in childbirth, or within 1 to 4 months after confinement, are plunged on their entrance into that world. Virgins, and married women who have never borne children, on their death never have this ceremony performed on their account. The object . . . is to save the spirit of a deceased mother from the punishment of the *Bloody Pond*. Sometimes it is performed several times on the death of the mother of a family of children. This is one way by which they manifest their *filial love* for the deceased. The classic or formula, which is supposed to be peculiarly adapted to . . . the end desired, is repeated by each priest employed. Either Tauist or Buddhist priests may officiate at the ceremony, at the pleasure of the family. The very poor cannot afford the expense, but the rich often make a great display on the death of their mother, by having the ceremony now referred to performed several times, or at least once on a grand scale, before the conclusion of their public mourning ceremonies."—*Ibid.* i. 196–7. No particulars of the ceremony are given beyond the repeating of the "classic" (saying masses).

"A Strange Marriage Custom.—I have frequently noticed that the bridal chair in marriage processions has suspended over its door a pair of trousers. It would appear that if a man marries before his elder brother, or a woman before her elder sister, it is the correct thing to hang this article of clothing both over the door of the house where the marriage takes place and over that of the bride's chair. The trousers represent the elder brother and sister."—*Ch. Rev.*, i. 277.

"Widowhood is in itself meritorious, and as, year by year, this merit accumulates, if she chooses to presume upon it a widow may have her every wish gratified. When she reaches the age of fifty, she may, by application, receive a sum of money from the emperor, to purchase an honourable board with her virtue inscribed upon it, to be placed over the front entrance of her dwelling. The memorial to the capital and other expenses attending the putting up of such a tablet, however, are so great as to preclude all but the wealthy."—*Ch. Rec.*, v. 213.

[For the custom of "double marriages," see MARITAL.]

[A "Marriage Exchange and Mart," at Shanghai . . . "where wives can be bought, sold, or exchanged," is mentioned in *N.-C. Daily News*, Jan. 27, 1908.]

"It requires some local knowledge to be able to distinguish clearly between a Celestial funeral procession and a Celestial wedding. . . . It is the mourning costume (rather than any difference in the squeaky music distinguishable to the untrained ear) that forms the distinctive feature; but even the wailing concubines in their sedan-chairs crack pea-nuts and smoke pipes at intervals between their howls of simulated anguish."—*Parker, John Chinaman*, p. 282. Funeral ceremonies have been described under FUNERAL RITES.

"All Chinese (except opium-smokers and the over-married) are risers with the sun; usually before it. Until (in very recent years) kerosene was introduced, there was no artificial light worthy of the name; hence everyone was in bed by six or eight, according to season."—*Parker, China*, p. 277.

[In the north, clothes were rarely changed in the winter. In the south, the body was wiped with a wet rag. The Hakka Chinese properly washed the whole body every day.]—*Ibid.* p. 266.

"At his toilet a Chinese uses a basin of tepid water and a cloth, and it has been aptly remarked that he never appears so dirty as when trying to clean himself. Shaving is done by the barber, for no man can shave the top of his head. Whiskers are never worn, even by the very few who have them, and mustaches are not considered proper for a man under forty. Snuff bottles and tobacco pipes are carried and used by both sexes, but the practice of chewing betel-nut is confined to the men, who, however, take much pains to keep their teeth white. Among ornamental articles of dress, in none do they go to so much expense and style as in the snuff-bottle, which is often carved from stone, amber, agate, and other rare minerals with most exquisite taste. Snuff is put on the thumb-nail with a spoon fastened to the stopper—a more cleanly way than the European mode of 'pinching.'"—*Williams, Midd. King.*, i. 771.

"A Chinese is seldom seen without his snuff-bottle, which is of oval construction, and less than two inches in length, the stopper having a small spoon attached, similar to that for cayenne-pepper, with which a portion of snuff is laid on the left hand, at the lower joint of the thumb, and thus lifted to the nose."—*Davis, Chinese*, i. 353.

"Public baths are found in all Chinese cities. Many of the people take a bath once a week. They invariably have recourse to the bath when they feel out of sorts. They rub down frequently with their coarse, loosely woven cotton cloths. When working, they usually have one such towel hanging over their bare shoulders, which is used as often as necessary in wiping off the perspiration. In their morning ablutions, in the absence of flannels and shirts, they are, of course, naturally stripped to the waist. Hot water baths exist for the poorer people, where the water is changed not more frequently than once daily. The poor people strive to go early to get comparatively clean water. The keepers of such baths are particular, however, not to allow any person with skin diseases to enter. The price, cheap though it be, precludes the beggars and the very lowest. . . . Private baths are always to be had. Baths where the morning ablution is obtained with the shaving and plaiting of the queue are well patronised. Public baths are recognised by a lantern, lighted at night, suspended from a high pole. . . . In the barber's shops, which are extensively found in Chinese cities and patronised at night, the various forms of massage are practised. Similar practices also obtain in the homes of the well-to-do, who have boys or young female slaves, who perform for them these soothing operations, before retirement for the night."—*Dudgeon, Diet, Dress, &c.*, pp. 273–4.

"'There are numerous public baths at Hangchau, as at every Chinese city I have been in. In my experience, the natives always take *hot* baths. But only the poorer classes go to the public baths; the tradespeople and middle classes are generally supplied by the bath houses with hot water at a moderate charge.'"—*Yule, Marco Polo*, ii. 181 (2nd ed.).

"At the east side of the city [Foo-chow] are hot springs which the Chinese use for baths. . . . There are tea-houses built over the largest of the springs, and a number of bathing-rooms are attached; but these have a seedy, deserted appearance. The baths most used are square tanks in the open air; the poor people take the benefit of them. They are sometimes thickly packed. . . . There was some satisfaction in seeing Chinamen made thoroughly clean, for nine-tenths of them are contented with a hot, damp cloth being passed over their face and neck, as the sole ablution."—*Scarth, Twelve Years*, p. 46.

"Much time and care is bestowed, or said to be, by females upon their toilet, but if those in the upper classes have anything like the variety of domestic duties which their sisters in common life perform, they have little leisure left for superfluous adorning. If dramas give an index of Chinese manners and occupations, they do not convey the idea that most of the time of well-bred ladies is spent in idleness or dressing."—*Ibid.* i. 770–1.

"Except among the poorest of the poor, who do field-work or carry water, the women of China do little beyond suckling children and making shoes, except in the treaty ports, where now large numbers of them are employed in the factories lately started. They smoke and gossip, give and go to dinner parties, and one of their great delights is to go on pilgrimages to distant shrines. It is sometimes stipulated before marriage that a woman shall go on so many pilgrimages during the year. Even when nuns invite ladies to come and enjoy themselves with them, it means drinking wine, smoking and playing cards; and not uncommonly, in the west of China at all events, smoking includes opium-smoking. The ladies who are regular opium-smokers sit up late at night, and do not get up till five or six in the evening." This custom varied in different parts of the empire.—*Little (Mrs. A.), Int. Ch.*, pp. 178–9.

"The women in this province follow the Tartar custom, and are inveterate smokers. . . . At a station twelve miles from this I have known as many as forty women present in the school-room, all of whom were smokers, and during the interview the pipe would pass freely from grandmother to grand-daughter."—*Woman's Work*, ii. 18.

"There are only two principal meals in the day, at ten o'clock in the morning and about five in the afternoon."—*Mossman, China*, p. 262. Or, nine and four (*Williams, Midd. King.*, i. 808).

[Servants on a farm had their meals at the same time as the family, and of the same food, but at separate tables.]—*Simon, Cité chinoise*, 354.

"The use of the *kwae tsze*, or chopsticks, is peculiar to the Chinese, and a very ancient practice. They lead us to infer that the Chinese once ate with their fingers, as the Turks do still, and that the two sticks are intended as a prolongation of the thumb and forefinger."—*Mossman, China*, pp. 260–1.

"The Chinese are both a social and a sensual people, and the pleasures of the table form a principal item in the list of their enjoyments; nor are the higher delights of mental recreation altogether wanting, though this part of the entertainment is according to their taste and not ours. . . . In China each sex is of the opinion that the meal is more enjoyable without interference from the other."—*Williams, Midd. King.*, i. 806.

"One considerable source of income to innkeepers is the preparation of dinners for parties of men, who either come to the house or send to it for so many covers; for when a gentleman invites his friends to an entertainment it is common to serve it up at his warehouse, or at an inn. In towns and cities thousands of men eat in the streets; the number of eating and cooking-stalls produces a most lively impression upon a stranger. This custom has had a good effect in promoting the general courtesy so conspicuous among the people, and is increased by great numbers of street story-tellers."—*Ibid.* i. 739–40.

"An invitation to dinner is written on a slip of red paper like a visiting card, and sent some days before. It reads, 'On the —— day a trifling entertainment will await the light of your countenance. Tsau San-wei's compliments.' Another card is sent on the day itself, stating the hour of dinner, or a servant comes to call the guests. The host, dressed in his cap and robes, awaits their arrival, and after they are all assembled, requests them to follow his example and lay aside their dresses of ceremony. [If the invitation is by informal 'chit' (*tan*), acceptance is signified by writing the word *tao* under one's name. If acceptance is not certain, the word *chih* answers to our 'received' (*Ch. Rev.*, xiii. 125).] The usual way of arranging guests is by twos on each side of small uncovered tables, placed in lines; an arrangement as convenient for serving the numerous courses which compose the feast, and removing the dishes, as was the Roman fashion of reclining around a hollow table; it also allows a fair view of the musical or theatrical performances. On some occasions, in the sunny south, however, a single long or round table is laid out in a tasteful manner, having pyramids of cakes alternating with piles of fruits and dishes of preserves, all covered more or less with flowers, while the table itself is partly hidden from view by nosegays and leaves. If the party be large, ten minutes or more are consumed by the host and guests going through a tedious repetition of requests and refusals to take the highest seats, for not a man will sit down until he sees the host occupying his chair."—*Ibid.* i. 806–7.

"On commencing, the host, standing up, salutes his guests, in a cup, apologizing for the frugal board before them, his only desire being to show his respects to them. At a certain period in the entertainment, they reply by simultaneously rising and drinking his health. The Western custom of giving a sentiment is not known; and politeness requires a person when drinking healths to turn the bottom of the tiny wine-cup upward to show that it is drained (*cf. infra*). Glass dishes are gradually becoming cheap and common among the middle class, but the table furniture still mainly consists of porcelain cups, bowls, and saucers of various sizes and quality, porcelain spoons shaped like a child's pap-boat, and two smooth sticks made of bamboo, ivory, or wood, of the size of quills, well known as the *chop-sticks*, from the native name *kwai tsz'*, *i.e.*, 'nimble lads.' Grasping these implements on each side of the forefinger, the eater pinches up from the dishes meat, fish, or vegetables, already cut into mouthfuls, and conveys one to his mouth. The bowl of rice or millet is brought to the lips, and the contents shovelled into the mouth in an expeditious manner, quite suitable to the name of the tools employed. Less convenient than forks, chop-sticks are a great improvement on fingers, as everyone will acknowledge who has seen the Hindus throw the balls of curried rice into their mouths."—*Ibid.* i. 807.

"The succession of dishes is not uniform; soups, meats, stews, fruits, and preserves are introduced somewhat at the discretion of the major-domo, but the end is announced by a bowl of plain rice and a cup of tea. The fruit is often brought in after a recess, during which the guests rise and refresh themselves by walking and chatting, for three or four hours are not unfrequently required even to taste all the dishes. It is not deemed impolite for a guest to express his satisfaction with the good fare before him, and exhibit evidences of having stuffed himself to repletion; nor is it a breach of manners to retire before the dinner is ended. The guests relieve its tedium by playing the game *chai mei*, or morra (the *micare digitis* of the old Romans), which consists in showing the fingers to each other across the table, and mentioning a number at the same moment; as, if one opens out two fingers and mentions the number four, the other instantly shows six fingers and repeats that number. If he mistake in giving the compliment of ten, he pays a forfeit by drinking a cup. This convivial game is common among all ranks, and the boisterous merriment of workmen or friends at their meals is frequently heard as one passes through the streets in the afternoon."—*Ibid.* i. 807–8.

"The Chinese are comparatively a temperate people. This is owing principally to the universal use of tea, but also to taking their arrak very warm and at their meals, rather than to any notions of sobriety or dislike of spirits. A little of it flushes their faces, mounts into their heads, and induces them when flustered to remain in the house to conceal the suffusion, although they may not be really drunk. . . . Chinese moralists have always inveighed against the use of spirits, and

the name of I-tih, the reputed inventor of the deleterious drink, more than two thousand years before Christ, has been handed down with opprobrium, as he was himself banished by the great Yu for his discovery."—*Ibid.* i. 808. *Cf.* FOOD.

"Sobriety is so universal in China that it is not only not considered a vice to get drunk at a dinner, but it is positively held to be a compliment to the host to be, or at least pretend to be, a little tipsy. This, to our ideas, somewhat uncleanly way of looking at things is on a par with 'complimentary eructation.' Well-bred Chinamen are certainly not so coarse as actually to revel in this luxury, but it is a graceful way of acknowledging exuberant hospitality to indulge in it a little."—*Parker, John Chinaman*, pp. 167–8.

"Invitations to dinner followed by a theatrical representation are very frequent in Chinese society, and very *recherchées* when the host combines with the reputation of an amiable man that of a refined littérateur."—*Tcheng Ki-Tong, Le Théâtre des Chinois*, p. 33.

"Ceremonial dinners . . . last longer than banquets in Europe. They are given in the hall where theatrical representations are held. The furnishing of the feast is done in great luxury. Certainly Europeans who like dainty things would find much that pleases in examining the articles which adorn the tables, vermilion cups of an ancient pattern and of a great variety of styles, the precious vessel which, according to our customs, we bring out of the cupboard where it is useless, to make it figure in splendour on the table on the day when we wish to receive and honour our friends."—*Ibid.* p. 36.

"The ceremonies at a banquet differ a little from those which are in use in Western countries, but have, however, many points of resemblance. The guests are seated in pairs at each table, in such a way that they can see what takes place on the stage. The servants bring the courses in proper order, which generally consist of sixteen or eighteen dishes containing meats of great variety and which have been prepared with great care by cooks proficient in their art. So many amusing things have been related with regard to our banquets, that I feel a certain regret in showing that they are untrue. According to globe-trotters, the dog, cat, and snake are met with on our tables in company with animals still less digestible, such as worms and rats. In truth, like many others, we prefer game and chicken to these fantastical specimens. We have, however, some special dainties —otherwise it would not be worth while to be Chinese—such as birds' nests, sharks' fins, deers' brains, and other foods *di primo cartello* which are very presentable. I will add, moreover, in order to confound the relaters of marvels, that Chinese tables are provided, besides the celebrated ivory chop-sticks, with porcelain spoons and silver forks, and that it is quite easy to do justice to the feast without making use of one's fingers."—*Ibid.* pp. 38–9.

"Diverse customs that I only find in our East relate to the control of the banquet. Thus, before the guests have touched the meats placed before them, they rise and drink to the health of the host, who then invites them to help themselves. Towards the end of the repast, the host rises in his turn and drinks to the health of his guests, but without making any speech; he only excuses himself for having offered them such a simple dinner." Toasts are unknown to Chinese rules of ceremony, but, "when one wishes to honour someone with this mark of politeness, one sends notice of it by a servant; then, taking the full cup in both hands, the toaster in silence lifts it to his mouth, and empties it at a draught. The person who has thus been toasted must, in return, empty his glass and then hold it upside down to show that it is entirely empty."—*Ibid.* p. 42.

"All of a sudden a movement takes place in the assembly and conversation ceases. Actors richly clothed enter the banqueting hall; they all bow together and one of them, led into the presence of the most distinguished guest, presents him with a book in which are inscribed in letters of gold the names of fifty or sixty comedies which the actors know by heart and which they are ready to present forthwith. The list is then circulated to all the tables, and when the choice of a piece has been made, is returned to the chief of the troupe. Then the outer doors are open to admit the public; the wife of the host and her friends, invited by her, take their places in a gallery, on an upper story, hidden behind a bamboo trellis-work, and the performance begins."—*Ibid.* p. 43.

"Garden dinner parties are frequent, at which singing men and women usually sing and play popular Chinese airs for the entertainment of the guests. Occasionally, these banquets are enlivened by the performance of dramas by professional actors."—*Gray, China*, ii. 197.

"Blind women . . . are professional singers, and are invited into the houses and shops of the citizens, where, for small sums, they will sing nearly the whole night long. As artificers of all kinds are very industrious, and often work up to a late hour, their employers sometimes call these women into the shops to amuse them. I have seen a number of cobblers diligently plying their task, with a singing woman seated in the corner of the shop, lightening their labour by her songs."—*Gray, China*, i. 383.

"In order to work through the night and keep themselves awake, the labourers, who appeared to have a Miao-tsz tinge in their composition, set up in turn a peculiar melancholy dirge, which every now and again broke out into a loud howl, having the effect of ventriloquial sounds darting to and fro about the roof. Once or twice a female voice, apparently from some house in the far distance, responded to that of a sturdy young workman sitting near the door."—*Parker, John Chinaman*, p. 267.

"Open tea-houses, somewhat on the principle of the continental restaurant, abound in every street and public garden, and these are frequented not only by the thirsty passers-by, but by persons wishing to have a half-hour's friendly or business chat. In some of these public readers or lecturers may be found, for the attraction or amusement of customers."—*Medhurst, For. in Far Cathay*, pp. 99–100.

In the "parks and gardens it is usual to find one or two deer."—*Gray, China*, ii. 199.

"An aquarium with gold-fish of various kinds is another very general and interesting feature of Chinese gardens."—*Ibid.* ii. 201–2.

[Lap-dogs were kept as pets.]—*Giles, Dic.*, No. 12687.

"Dr. Rennie mentions a superstitious practice, the continued existence of which in our own day he has himself witnessed, and which might perhaps have given rise to some such statement as that of the Arab travellers, if it be not indeed a relic, in a mitigated form, of the very practice they assert to have prevailed. After an execution at Peking, certain large pith balls are steeped in the blood, and under the name of *blood bread* are sold as a medicine for consumption. *It is only to the blood of decapitated criminals that any such healing power is attributed.* It has been asserted in the annals of the *Propagation de la Foi* that the Chinese executioners of M. Chapdelaine, a missionary who was martyred in Yünnan in our own day, were seen to eat the heart of their victim; and M. Huot, a missionary in the same province, recounts a case of cannibalism which he witnessed. Bishop Chauveau, at Tatsian-lu, told Mr. Cooper that he had seen men in one of the cities of Yünnan eating the heart and brains of a celebrated robber who had been executed. Dr. Carstairs Douglas, of Amoy, also tells me that the like practices have occurred at Amoy and Swatau. Hayton, the Armenian, . . . says [that it] "was in accordance with the custom of the Tartars," [to eat the flesh of a criminal. The same story is related, in a different form, by Friar Ricold.]—*Yule, Marco Polo*, ii. 303, note (2nd ed.).

"The Chinese in their oaths have a decidedly Spanish tendency; the *carambas, carajos*, and *harto de ajos'*, which come so readily to the Spanish tongue, are not by any means as innocent as they look. In Peking objurgations usually take the form of insinuations about your younger sister, or about 'turtles' eggs.' In Canton the mother, or, in an ascending scale, both the parents, or even ancestors to the eighteenth degree, have imaginary assaults delivered at their invisible anatomy."—*Parker, John Chinaman*, p. 213.

"It is common to affix [to letters] a cipher instead of the name, or to close with a periphrasis or sentence well understood by the parties, and thereby avoid any signature; this . . has gradually become a common mode of subscribing friendly epistles."—*Williams, Midd. King.*, i. 600.

Fashions.—"I have seen Chinese fashions change, long before the present craze for something new. When we arrived in Ningpo in 1861, and long after, all Chinese girls of fifteen or sixteen or married women wore their hair set off behind by what looked like dragon-fly wings, great folding frames of whalebone with artificial hair affixed to the head, and sometimes reaching nearly half-way down the back. These suddenly disappeared; and are never seen now except on the hands of female barbers and go-betweens."—*N.-C. Daily News*, Jan. 27, 1908.

"The minute changes going on in China do not touch the dress as a whole, and they do not receive acknowledgment as inherent and essential changes of fashion. We admit some small change in the make of a cap, the ornamentation of a shoe, difference in the shade of the materials composing the dress, or even the width of a sleeve, but these amount to so little as hardly to be entitled to the name of change, or to compare with the yearly or more frequent fashions of the West. If we glance over a period of 200 years, the average life of a dynasty in China, we may detect, perhaps, some changes, and particularly between one dynasty and another, but practically, and to all intents and purposes, it may be said that fashions in China are like the laws of the Medes and Persians, which change not. . . . In China the great principle of dress in regard to health, comfort, etiquette, climate, and the eternal fitness of things, never varies. A little more embroidery here or there does not begin to touch the hem of the garment of Chinese dress in the way of change of fashion."—*Dudgeon, Diet, Dress, etc.*, pp. 154–5.

"New patterns of silks came out nearly every year . . . and" were "much sought after."—*Little* (*Mrs. A.*), *Int. Ch.*, p. 441.

"The queer custom of wearing long nails is practised by comparatively few; and although a man or woman with these appendages would not be deemed singular, it is not regarded as in good taste by well-bred persons. Pedantic scholars wear them more than other professions, in order to show that they are above manual labour; but the longest set the writer ever saw was, oddly enough, on a carpenter's fingers, who thereby showed that he was not obliged to use his tools. Fine ladies protect theirs with silver sheaths."—*Williams, Midd. King.*, i. 766.

"In the West of China it is . . . still not etiquette to carry such a fan [folding-fan] to a party; for it looks as if you had no servant to stand behind your chair and hold it for you when you do not want it."—*Little* (*Mrs. A.*), *Int. Ch.*, p. 441.

Every Chinese of any station wears by his side a fan enclosed in a worked silk sheath, a leather bag suspended to the belt, with flint and steel for lighting his pipe, and an embroidered purse or pouch containing tobacco. "Arms are . . . never worn on the person except by soldiers on parade, and even the military mandarins do not wear swords on ordinary occasions of ceremony. The common people are not allowed to be seen with arms except for specific purposes of self-protection, as when carrying off their property from a fire, or as a defence against river pirates, and the like." "The possession of *fire-arms* is altogether forbidden by the jealous Government."—*Davis, Chinese*, i. 343–5.

"Cosmetics are used by females to the serious injury of the skin. On grand occasions the face is entirely bedaubed with white paint, and rouge is added to the lips and cheeks, giving a singular starched appearance to the physiognomy. . . . The eyebrows are blackened with charred sticks, and arched or narrowed to resemble a nascent willow leaf, or the moon when first seen."—*Williams, Midd. King.*, i. 770.

"Their faces at parties are often so rouged as to look like masks, their lips coloured, their eyebrows darkened, and their hair so anointed as to give a shining, semi-metallic setting to the face."—*Little* (*Mrs. A.*), *Int. Ch.*, p. 182.

ÆSTHETIC SENTIMENTS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

[The early poetry shows a developed æsthetic sense; see *Shih Ching*, passim.]

"The influence of the rites and music reaches to heaven, and pervades the earth; it runs through the *yin* and *yang*—the inferior and the superior principles of nature,—and even pervades the invisible world of souls and spirits; it reaches to the highest elevation and most extreme distance, and sounds the most impenetrable depths."—*Journ. N.-C.B.R.A.S.*, N.S. v. 38.

"Music is one of those things in which men of the highest virtue and endowments find pleasure, for it has the power of making the people good, of moving men in their inmost depths, and of changing the entire manners of the age. Therefore the ancient emperors promulgated music as a branch of instruction."—*Ibid.* v. 40.

"When music prevails, then all reproaches cease. When the rites flourish, then there are no contentions. When the Empire is governed by condescension, it may be said that it is by music and the rites that such a result is attained. When oppressors of the people do not arise; when the feudal lords assist, and submit to, the Emperor; when the implements of warfare are laid aside; when the five kinds of punishment fall into disuse; when there are no grievances on the part of the people, and the Emperor is not irritated,—in such a state of things, it is because music generally pervades the nation."—*Ibid.* v. 34.

"'In older time,' says Pan-kou, 'the sages themselves did not compare with the poets in estimation.'"—*Johnson, Or. Rel.—Ch.*, p. 511.

"The love of nature and the appreciation of delicate effects of sky and foliage, to which the national arts bear witness, show themselves . . . in the short but significant and graceful refrains with which most of the stanzas [of the Odes] begin, like the Italian *stornelli*."—*Simcox*, ii. 65.

[Slender eyebrows, "like the antennæ of the silkworm moth," eyes "with the black and white well defined," tapering fingers, slender neck, teeth "like melon seeds," white rounded temples, black hair, in masses like clouds, tallness, and a countenance "like the flower of the ephemeral hedge-tree," were traits of female beauty.]—*Shih ching*, I. v. III. etc.; *Legge*, IV. i. 95, 136.

"In men they admired a high-coloured complexion, as if the face had been rouged."—*Biot*, quot. *ibid.* IV. Prol. p. 144; and see *Shih ching*, I. xi. V. i.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

"Odes of the Shi-king and elaborate treatises on floriculture testify to a constitutional delight in flowers, like the taste of the country people for having their rude hills covered with the beauty of the white azalea, with the honeysuckle, clematis, and brilliant shrubs. 'This love of flowers,' says St. Denys, 'is a real worship, a mystic affection.' Travellers descant on the . . . splendor of the flower boats; on wide areas of pleasant villages and cultivated fields; on the patriarchal simplicity of farm-life in portions of Northern China, where, as in Swiss villages, good wishes and counsels are inscribed on the doors. Romances deal largely in sentimental meanings of flowers; effusions of lovers are hung in conspicuous places under the title of 'Flowery Scrolls.' China is itself the 'Flowery Kingdom.' . . . Utilitarian limits are escaped in this line, and even with a protest; for the mulberry is banished from the gardens of the rich because it is industrially profitable, and useful trees are admitted only when they yield perfume, fine foliage, or exquisite table fruit."—*Johnson, Or. Rel.—Ch.*, pp. 76–7.

"However small their attainments in the theory and practice of music, no nation gives to this art a higher place. It was regarded by Confucius as an essential part in the government of a state, harmonizing and softening the relations between the different ranks of society, and causing them all to move on in consentaneous accord."—*Williams, Midd. King.*, ii. 94.

"The Chinese philosopher [Confucius] is stated to have been an enthusiastic lover of music, and to have done something to improve it."—*Davis, Chinese*, ii. 52.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

[Paintings of this and subsequent periods showed high æsthetic sense. Poetry also often of great beauty. See ÆSTHETIC PRODUCTS.]

Period of Disruption (221 *to* 589).—*Table IV.*

"It seems as if in China, unlike Europe, the taste for wild scenery had preceded that for tame and cultivated country. In China, as in Egypt, the enjoyment of natural beauty seems to have been frank and keen. . . . We should undervalue the degree of civilization attained . . . , even during these dark ages, if we did not realize that the modern taste for flowers and scenery was already developed."—*Simcox*, ii. 128.

"The hereditary prince while out hunting admires the beauty of a waving corn-field—the sight which filled Keats with ecstasy—and he is at once reminded of the labours that have been spent on it and, by implication, of the wickedness of destroying their fruits by letting the hunt sweep over them."—*Ibid.* ii. 127–8.

[Ornamental plants were brought from Central Asia and Arabia.]—*Journ. P.O.S.*, ii. 149.

"They strolled in the forest and took pleasure in the hills and streams, and in books."—*P'ei wên yün fu*, *c.* 66*b*, p. 169*b*.

[Liu Chiao and his son preferred death from hunger to obtaining money by pawning literary works.]—*Shih lei t'ung pien*, *c.* 58, *Hên shih pu*, p. 5*b*.

From the Restoration of Unity to the end of the Five Dynasties (589 *to* 960).—*Table V.*

[The Arab traveller Suleyman says that the Chinese are not particular about cleanliness, but rub themselves with paper, instead of washing (p. 23, see also p. 56). They do not use toothpicks (p. 57). "They eat dead bodies [animals?] and other things of the same sort, as do the Magi."] —*Relation des Voyages, etc.*, i. 23, 56, 57.

Sung Period (960 *to* 1280).—*Table VI.*

"The Imperial panderers now at Soochow and Hangchow date from A.D. 1102, when a eunuch named 童 貫 was sent to establish *objets d'art et de vertu* at those places. It is interesting to account for peculiarities in Chinese life. In the year 1104 every curious or valuable article owned by any private person was swept off to the Court by an army of Imperial harpies. Hence modern secretiveness."—*Ch. Rev.*, xv. 53.

Mongol Period (1280 *to* 1368).—*Table VII.*

"The people [of Cathay] have an ornate style of speech; they salute each other with a cheerful countenance, and with great politeness, they behave like gentlemen, and eat with great propriety."—*Yule, Marco Polo*, i. 438 (2nd ed.).

"The European standard of cleanliness was not high in the Middle ages, so we need not suppose Chinese manners to have changed for the worse since their love of hot baths led" Marco Polo "to describe them as 'very cleanly in their persons.'"—*Simcox*, ii. 220.

"The description [by Odoric] of the artificial wooded hill, the 'Green Mount' planted by Kubla's orders with large trees of various kinds brought from afar, with the earth around their roots, carries us forward to the horticultural triumphs of a modern *Jardin d'acclimatation*."—*Ibid.* ii. 233.

Ming Period (Restoration of Chinese Supremacy) (1368 *to* 1644).—*Table VIII.*

"Their tables be very fine, gilt and painted full of birds and beasts and other varieties very pleasant to the eye. They do not use to put table-cloths on them, but only a fore-front of damask, or some other silk, on every one of them, which hangeth down to the ground; and on the four corners they do set many little baskets curiously wrought with gold and silver wire, full of flowers and knacks of sugar, made with great curiosity, as . . . all kinds of beasts and fowls, gilt and painted: in the midst of the table they do set the victuals in marvellous good order . . . served in fine earthen dishes of great curiosity, and of silver (although these they use very seldom except for the viceroys): they have no need of table-cloths nor napkins, for they eat so delicately that they do not touch the meat with their hands, but with little forks of gold or silver, with the which they eat so cleanly that . . . they let nothing fall: they drink often, but a little at a time, and therefore they use very little cups."—*Mendoza, Hist.*, i. 137–8.

Manchu Period (1644 *to* —).—*Table IX.*

"The æsthetic gift of the Chinese is a fine sense of touch. The tender and watchful art required for protecting their silk-worms, and for preserving the vitality of continually exfoliated trees; the frequent removal of leaves by careful selection; the perfect stillness, so needed for the whole process, that the worms are kept apart in quiet groves; the similar delicacy of their tea-culture, of porcelain manufacture, and of their lacquer-work, so guarded from dust that the workmen do not enter the room in their clothing; their paper, too delicate for presswork, or made of softest pith resembling rice; their damasks of royal tints and strange intricate pattern; their screens and scrolls, too fine for furniture; their rosewood chairs with silk cushions; their fanciful lanterns, curiously-wrought cabinets, and variegated vases—are all instances of a delicate, if not fully cultured, æsthetic taste. No importations have been so refining to European civilization as the tea, silk, porcelain, embroidery, which Chinese industry has contributed."—*Johnson, Or. Rel.—Ch.*, p. 515.

"What æsthetic progress, if we compare the Shu-king descriptions of public and private buildings,—wooden frames filled in with earth or stones, a rude art still prevailing in the interior of China,—with the modern Chinese mansion; its rich vases, gay satin curtains covered with scenery and animal painting, quaintly carved furniture of ebony and rosewood, trellis-work in galleries, tiled walks, marbles, stuccoes, scrolls, delicate pencil-work, and writing materials. The primitive tent-shape is scarcely suggested by the infinite modifications to which it has been subjected,—rising to their perfection in the three-fold azure roof and the exquisite trellis-finish of the vermilion Temple of Heaven,-lifting tent above tent from its three marble terraces, out of nearly a mile square of groves and lawns. The temples are apt to be most like garden retreats or country residences: such happy love of art is expended on their surroundings. This daintiness is often replaced by a taste for the rude and colossal."—*Ibid.* p. 515.

"Elegance or ornament, orderly arrangement and grandeur of design, cleanliness, or comfort, as these terms are applied in Europe, are almost unknown in Chinese houses, cities, or gardens. Commanding or agreeable situations are chosen for temples and monasteries, which are not only the abode of priests, but serve for inns, theatres, and other purposes."—*Williams, Midd. King.*, i. 40.

"It is to be feared that his Majesty has no higher ideas of cleanliness and order than his subjects."—*Ibid.* i. 72.

"Chinamen are always regarded as being dirty. . . . In the warm parts of China a Chinaman, clothes and all, is much less offensive to the senses . . . than an Englishman of the same class, clothes and all. In the cold north, where fuel is dear and scarce, the custom prevails in winter of piling on clothes, and rarely changing them. . . . I noticed everyone else near me, Chinese and European, 'grew vermin,' to use the local term. . . . The others all employed their energies, at leisure moments, in the same way that monkeys do, with a view to retaining the exclusive use of their own skin for themselves. In the south of China it is the custom amongst the working classes to swab as much of the body as can be got at without taking the trousers off with a wet rag or dishcloth. . . . The Hakka Chinese, in the extreme south, male and female, properly wash the whole body every day of their lives. . . . The saying: 'The Japanese wash their bodies, the Chinese wash their clothes' is fairly true. . . . I do not call them dirty beyond the ordinary rancidity of poverty all over the world."—*Parker, China*, pp. 266–7.

"In the metropolis, as in all Chinese cities, the air is constantly polluted by the stench arising from private vessels and public reservoirs for urine and every kind of offal, which is all carefully collected by scavengers. By this means, although the streets are kept clean, they are never sweet; but habit renders the people almost insensible to this as well as other nuisances."—*Williams, Midd. King.*, i. 83.

"The streets [of Fuhchau] are full of abominations, for which the people seem to care very little."—*Ibid.* i. 132.

"They spread neither sheets upon their beds nor cloths on their tables, and the want of personal cleanliness has of course a tendency to promote cutaneous and leprous complaints."—*Davis, Chinese*, i. 351.

"Men and women of all classes take great delight in recitation and singing, hearing street musicians or strolling play-actors."—*Williams, Midd. King.*, i. 708.

"It is a great treat to villagers when a band of these [troubadours] come to their village of an evening. The musicians find some suitable place, and the villagers, finished with their day's work, gather round them and enjoy an hour or two's entertainment of story and song, stories generally of famous men and women, with accompaniment of two, three, or more instruments—a kind of guitar, the fiddle (*hoo kin*), the flute (*ti tz*) and the bones and drums." "These Chinese troubadours, judging by their appearance, seem to be well entertained wherever they go."—*Ch. Rec.*, xxi. 345.

"On all great occasions, such as coronations, receptions, receptions of foreign ministers, and the like, music was played, choirs of women sometimes taking part." "On birthdays, and particularly on the coming of age of the eldest son, musicians are called in. . . . The eunuchs were sometimes trained as singers."—*Ibid.* xxi. 344.

"According to Chinese views, music and poetry rank far above the plastic arts."—*Ch. Rev.*, xvii. 72.

"There can be no doubt that the Chinese have their own peculiar musical taste, and show in general as little appreciation of our Western music as we do of theirs."—*Ibid.* ii. 49.

"Though they show indifference and even contempt for European music, they seemed perfectly well aware of what ought to be the effect of music: for one of them said, after the performance was over, 'Our melodies go from the ear to the heart, and from the heart to the mind (*et du cœur jusqu'à l'âme*); we feel them; we understand them; but the music which you have just played we neither feel nor understand, it does not move us.' He further observed, 'Music is the language of feeling; all our passions have their corresponding tones and proper language; and therefore music, to be good, must be in accord with the passion it pretends to express.'"—*Stafford, Hist. of Music*, p. 30.

"The populace . . . delights in the deafening noise of the gong, accompanied by the shrieking tones of the clarionet. . . . Who has not met a funeral or a wedding procession where four or five clarionet-players blow their souls out with furious accompaniment of drums and gongs? Let it not be thought that the present Chinese do not like music. They do everything in music: they are born, they worship, they marry, and they die in music. Only they do not find it dignified to perform it themselves, not even as 'amateurs.' The streets are continually paraded by bands of two, three, or four musicians, mostly blind men, who go from gate to gate offering their services."—*Van Aalst, Chinese Music*, p. 6.

"That music is much liked in China is proved by the numerous bands of musicians which parade the streets; by the least important festival being never celebrated without music of some kind; by the constant singing in the streets of children, domestics, hawkers, and passers-by."—*Ibid.* p. 37.

"A curious form of this passion for parallelism is to hang corresponding rhymes side by side, or on opposite walls, on paper or wood, and always in pairs. Chinese gymnastics are feats of versification in this style; 'tis a dainty civilization, whose amusement is capping verses and constructing measures. Even geographies march in rhyme. The 'Two Literary Maidens' presents a literary tournament, in which one of the verses to be paralleled combined artfully the titles of the seven books of Mencius; and most of the themes were questions in mythology or history."—*Johnson, Or. Rel.—Ch.*, p. 513.

"Every thing is . . . brought to fixed symbolic meaning. The animal world has functional relations with life. The dragon, phœnix, *ki-lin*, and tortoise are complex emblems of power, good fortune, and occult destiny, as familiar to domestic art as to mythic lore. The fox symbolizes official life; the wild goose is conjugal fidelity, in songs, dramas, tales. Goose and duck hold the same place as the stork in German folklore; and there seems no good reason why our preferences for lions and eagles should despise these less brutal images of perseverance, loyalty, and love. The magpie, a mystic newsbearer and Chinese Hermes, plays the part of prophet in the legends of royal and race origins. The wild-ox tail floats from the Manchu standard in wars and hunts. Clay figures of the cow are divided at agricultural fêtes; painted sea-monsters are guardian figure-heads for the junks; boats resemble fishes. The peach-tree is undying truth; its stone, long life; its blossom, opening love. The *fung*-tree, of white flower, scented leaf, and healing gum, is the dwelling of genii; and its autumnal splendor chants with hundred tongues the lesson that beauty is most beautiful in decay (*Notes and Queries*, iii. No. 2). The poets have found a bird that celebrates the changes of life, singing twice a year, when the flowers open and when they fade (*St. Denys*, p. 175). And songs describe an enchanted ash in sympathy with national destiny, that moans when a dynasty is failing, and sings when heroic deeds are done (*Stent, Jade Chaplet*, p. 49)."—*Ibid.* pp. 514–5.

"Colors are symbolic, and yield a pictorial register of offices and personal relations (red is virtue; a red heart is the moral, a vermilion pencil the political, ideal. White is purity and mourning; yellow, supremacy; purple, for grandsons; green, for princesses). The Tcheou-li is a digest of forms and ceremonies, in which every thing seems to be taken up into symbolism and gifted with a functional meaning beyond itself. Doubtless this taste for an inner sense in things adds suggestiveness to the ideographs, and gives charm to poetic composition with their visible types."—*Ibid.* p. 515.

[The Chinese carefully burn every unwanted scrap of paper inscribed with written characters, to save it from being trodden under foot, or otherwise treated with disrespect. Rich people pay men to collect such scraps in the streets, and most Chinese towns have receptacles for them, in frequented thoroughfares. An essay, published in 1870 by a native scholar, and distributed gratis, insisting on the honour which ought to be paid to the art of writing, and inveighing against the way it is insulted by those who "use old books for wrapping parcels, or papering windows, for boiling water or wiping the table." It concludes by saying, "For happiness, wealth, honours, distinctions, and old age, may be one and all secured by a proper respect for written paper."]—*Giles, Ch. Sketches*, pp. 92–4.

"One reason for the popular reverence for written paper is that writing is not a mere utility, but the most attractive of fine arts."—*Johnson, Or. Rel.—Ch.*, p. 78.

"A poetic impulse is apparent, also, in the national passion for floriculture, which often reaches delicate and tender sentiment; in the selection of proper names from natural objects; in the metaphorical shop signs; in the flowery titles of books, and the scribbling of impromptu verses on everything that will carry them. If this love of endowing things with human meaning does not unfold into high poetic power, it is because of a too close contact with concrete details."—*Ibid.* p. 515.

"The passionate love of flowers which prevails among all classes is quite a national characteristic. A Chinaman, however, has his own particular standpoint. The vulgar nosegay or the plutocratic bouquet would have no charms for him. He can see, with satisfaction, only one flower at a time. His best vases are made to hold a single spray, and large vases usually have covers perforated so as to isolate each specimen. A primrose by the river's brim would be to him a complete poem. If condemned to a sedentary life, he likes to have a flower by his side on the table. He draws enjoyment, even inspiration from its petals. He will take a flower out for a walk, and stop every now and again to consider the loveliness of its growth. So with birds. It is a common thing on a pleasant evening to meet a Chinaman carrying his bird-cage suspended from the end of a short stick. He will stop at some pleasant corner outside the town, and listen with rapture to the bird's song."—*Giles, Hist. of Ch. Lit.*, pp. 413–4.

"The paths leading to [Buddhist] temples are often disposed with much taste and art, winding through beautiful groves of pine and bamboo, over fine arched bridges, along luxuriant hedges and fish-ponds, and affording oftentimes beautiful views of natural scenery."—*Nevius, China*, p. 86.

"The images [in Buddhist temples] are generally well executed as to their forms and postures. . . . There is nothing horrid or indecent in the appearance of any of the idols of China, and none are represented as influenced by debasing passions; all are supposed to be virtuous men, or heroes of the past. They have also less of sameness in their appearance than might be expected, as they present in different degrees and combinations the expressions of love, pity, mirth, thoughtfulness, fierceness and anger." "The general appearance of a large Buddhist temple or monastery is grand and imposing. . . . The structure of the buildings indicates also not a little architectural taste and skill. They are well-proportioned, . . . the large roof is generally made of the best tiling materials, and will last more than half a century without repair. It is covered with fretted work and grotesque figures of elephants, lions, horses, men, etc. The interior is ornamented with elaborate carvings in wood and stone; and a great variety of inscriptions on the walls and pillars . . . in large, gilt letters, serve at the same time the purposes of decoration, and of setting forth the names, characters and powers of the different divinities."—*Ibid.* pp. 93–4.

"The Chinese love of beautiful curves, spending time and money on the roof-cornices and outside ornaments of even quite a poor cottage, indicates a deep-seated sentiment for the beautiful, as do also the trees in their towns, some of which have almost as many trees as houses, as also their love of flowers. In the flowering season a bough of blossom may be seen in a vase on the counter of even the darkest little shop; whilst no literary man would think his writing-table complete without a vase for one lovely blossom, and no woman would think herself dressed until she had stuck a flower on one side of her glossy hair."—*Little (Mrs. A.), Int. Ch.*, pp. 387–8.

Cobbold says that the blocks hewn at Da-ying quarries for the foundations of houses are often ornamented in a manner "by no means devoid of taste in design or finish in execution."—*Pictures*, 119.

"The Chinese have a sense of the ridiculous, and exhibit it both in their sculpture and drawing in many ways. Lampoons, pasquinades, and caricatures are common, nor is any person below the dragon's throne spared by their pens or pencils, though they prefer subjects not likely to involve the authors."—*Williams, Midd. King.*, ii. 115.

[Père Benoit, writing from Peking, Nov. 4, 1773, says that Chinese taste requires portraits to be drawn full face, so that both sides of the countenance may appear symmetrically in the picture.]—*Lettres Edif.*, xxiv. 289.

"We must beware of inferring from the utilitarian reputation of the Chinese an absence of sentiment or emotional aspiration. The poet is for them the ideal of genius, and 'primus inter pares' in the literary and governing classes. His gift has always been the passport to high office and prince and people alike bend before the lines of his pencil."—*Johnson, Or. Rel.—Ch.*, p. 517.

The "defects (p. 518) in the poetic ideal must not hide its peculiar charm of refined and tender sentiment, the unmistakable sign of which is the special association of poetic honors with woman. In the long lists of learned women, a great proportion are poets (*Williams*, i; *Wylie, passim*). Tributes to female genius are a common-place of the romances."—*Ibid.* p. 518.

"Of all nations the Chinese seem to be fondest of poetry. All the educated write verses. As the hero of their novels carries the heart of the heroine by poetic skill, so in public office it is almost a necessity that the talent for statesmanship should be united with the gift of song (*Ampère*)." "Rhyme-hunting is an

antiquarian mania among these knights of the treadmill. The delight with which every ballad of the T'ang or Sung has been set to an air of its own is as intense as that of their fathers in their *kin*, or lyre of silken cords. Rhymed improvisation is a national amusement."—*Ibid.* p. 512.

The people "possess their full share of oriental imaginativeness, delighting in nothing more than in tales of the marvellous, whether true or not." "There is scarcely a place in China but possesses *some* legend attached to it."—*Journ. N.-C.B.R.A.S.*, N.S. vii. 184-5.

"The seals of the Boards are in many instances cut on valuable stones, and private persons take great pride in quartz or jade seals, with their names carved on them; lignite and jet are likewise employed for cheaper ornaments, of which all classes are fond."—*Williams, Midd. King.*, i. 310.

"Women [go to the temples] in small companies, having with them a little basket containing candles and incense-sticks. They are always dressed in their best clothes, or clothes hired for the purpose, as it would be considered disrespectful to the gods to appear before them in their every-day apparel; and they hope, also, by their dress and behaviour, to produce the impression upon the gods that they are persons of better circumstances than they really are."—*Nevius, China*, p. 108.

[Height is said to be much admired in women, and they wear thick-soled shoes for this reason.]—*Lay, Chinese as They Are*, p. 273.

"The flowers grown on pots on the boats [on the Ming river], and those usually worn by the boatwomen on their hair, all assist in imparting a pleasing aspect to the lively sight."—*Midd. King.*, i. 130.

LIBRARY OF THE BOMBAY BRANCH OF THE ROYAL ASIATIC SOCIETY

MORAL SENTIMENTS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

General.—"There were few laws, but never any occasion to exact the penalties attached to misconduct. It was considered superfluous to close the house-door at night, and no one would even pick up any lost property that lay in the high road (*cf.* following Period). All was virtue, happiness, and prosperity, the like of which has not since been known. The Emperor Shun was raised from the plough-tail to the throne, solely because of his filial piety, in recognition of which wild beasts used to come and voluntarily drag his plough for him through 'the channelled fields,' while birds of the air would hover round and guard his sprouting grain from the depredations of insects. This of course is not history; and but little more can be said for the accounts given of the two dynasties which ruled China between the above-mentioned golden age and the opening reigns of the House of Chow."—*Giles, Historic China*, pp. 2–3.

"These rulers [Yao, Shun, and Yü] seem to have passed their leisure from practical work in framing moral maxims, and in carrying out a model scheme of government based on the purist ethics. They considered that 'a prince entrusted with the charge of a State has a heavy task. The happiness of his subjects absolutely depends upon him. To provide for everything is his duty; his ministers are only put in office to assist him,' and also that 'a prince who wishes to fulfil his obligations, and to long preserve his people in the ways of peace, ought to watch without ceasing that the laws are observed with exactitude.'"—*Boulger, Short Hist.*, p. 2.

"In fact the reigns of Yao, Chun [Shun], and Yü are the ideal period of Chinese history when all questions were decided by moral right and justice, and even now Chinese philosophers are said to test their maxims of morality by the degree of agreement they may have with the conduct of those rulers."—*Ibid.* p. 2.

Shun, on his accession, removed "every hindrance obstructing the access of worth and ability, wherever situated, to the notice of the sovereign and his service."—*Legge, Ch. Class.*, III. i. 42, note.

The idea of "the certain connection between the right and happiness and between the wrong and misery" is shown by Yü's proposition in the *Shu ching*, Pt. II. Bk. II. ch. I. 5. See also Yih's exhortation founded on Yü's proposition, *Legge, Ch. Class.*, III. i. 54–5. See also *Shu ching*, Pt. V. Bk. I. Pt. ii. 5.

The "nine virtues" are stated in the *Shu ching* (*Counsels of Kaou-Yaou*) to be: "Affability combined with dignity; mildness combined with firmness; bluntness combined with respectfulness; aptness for government combined with reverence; docility combined with boldness; straightforwardness combined with gentleness; easiness combined with discrimination; vigour combined with sincerity; and valour combined with righteousness." "The pairs of different qualities specified are understood to constitute the unity of the virtue; it is not that the one compensates for the other."—*Legge, Ch. Class.*, III. i. 71, and note.

"Kĕĕ was the impersonation of all the wickedness of Hea." "Heaven [in consequence] sent down calamities." "Lin Che-k'e illustrates this by saying that 'the spirits of the hills and rivers could no longer be in tranquility. Hills fell; rivers were dried up; strange sounds were emitted. Birds and beasts, fishes and tortoises, no longer followed their nature, and many of them were changed into monstrous and prodigious things.' I quote this, as showing how the Chinese share in the feeling of a sympathy between the course of nature and the character and doings of men, so that 'the whole creation groans' and writhes to be delivered from the curse of human wickedness."—*Ibid.* III. i. 194, note.

"The public morality deteriorated very much under this family [Shang dynasty], and it is said that when one of the Emperors wanted an honest man as minister he could only find one in the person of a common labourer."—*Boulger, Short Hist.*, p. 3.

Special.—"The minds of the ancient kings were just, generous, and enlarged, not like those of the sovereigns of future times, who on the extinction of a kingdom would extirpate all the members of its royal House, fearing that the preservation of them might be injurious to their own posterity."—*Ts'ai Ch'in*, quot. *Legge, Ch. Class.*, III. ii. 378, note.

[The prevalent state of morality is indicated by Wên Wang's having never ceased, to his dying day, to remonstrate against the cruelty and corruption of the age.]—*Giles, Bio. Dic.*, p. 876. The wanton cruelty was shown especially in warfare. Cannibalism also prevailed.

[The shameless lust and cruelty of the emperor Chou Hsin and Ta Chi are described in *Legge, Ch. Class.*, III. i. 269–70, notes. See also LAWS—*Punishments.*]

"He [Chou Hsin] cut through the leg-bones of those who were wading in the morning [to examine the marrow]; he cut out the heart of the worthy man. By the use of his power of killing and murdering, he has poisoned and sickened all within the four seas. His honour and confidence are given to the villainous and bad. He has driven from him his instructors and guardians. He has thrown to the winds his statutes and penal laws. He has imprisoned and enslaved the upright officer. He neglects the sacrifices to Heaven and Earth. He has discontinued the offerings in the ancestral temple. He makes contrivances of wonderful device and extraordinary cunning, to please his women."—*Shu ching*, Pt. V. Bk. I. Pt. iii. 3; *Legge*, III. ii. 295.

"Let not the emperor set to the rulers of States an example of indolence or dissoluteness. Let him be wary and fearful, remembering that in one day or two days there may occur ten thousand springs of things."—*Ibid.* Pt. II. Bk. III. Ch. III. 5; *Legge*, III. i. 72–3.

[The disobedient prince of Meaou, having successfully resisted the warlike operations of Yü and Yih, was eventually brought to submission by "an exemplification of the blessings of peace" (*Shu Ching*, Pt. II. Bk. II. ch. III. 21).]

[Justice was to be "tempered with forbearance" in the punitive expedition of Yin, *circ.* 2159 B.C.]—*Legge, Ch. Class.*, III. i. 168.

"Chin Tih-sew observes that here [*Shu ching*, Pt. IV. Bk. V. Pt. iii. 1] for the first time we have the virtues of reverence, benevolence, and sincerity announced distinctly and in their connection and references—a step in the development of the doctrine of Yaou and Shun, Yu and T'ang. The observation is correct. In later times Confucius, Mencius, and others made much of E's lessons."—*Ibid.* III. i. 210, note.

"Do not employ men of artful speech and insinuating looks, men whose likes and dislikes are ruled by mine, one-sided men and flatterers; but employ good men."—King Mu's charge to Keung.—*Ibid.* III. ii. 586.

"The officers of Yin had long relied on the favour which they enjoyed. In the confidence of their prideful extravagance they extinguished their sense of righteousness. They displayed before men the beauty of their robes, proud, licentious, arrogant, and boastful."—*Shu ching*, Pt. V. Bk. XXIV. 10; *Legge*, III. ii. 575.

"They [Yao, Shun, and Yü] were staunch upholders of temperance, and they banished the unlucky discoverer of the fact that an intoxicating drink could be obtained from rice."—*Boulger, Short Hist.*, p. 2.

"When the palace is a wild of lust,
And the country a wild for hunting:
When wine is sweet, and music the delight;
When there are lofty roofs and carved walls,—
The existence of any one of these things,
Has never been but the prelude to ruin."
—*Shu ching*, Pt. III. Bk. III. ch. I. 6; *Legge*, III. i. 159.

T'ang "warned them who were in authority, saying, 'If you dare to have constant dancing in your palaces, and drunken singing in your chambers,—that is called sorcerers' fashion; if you dare to set your hearts on wealth and women, and abandon yourselves to wandering about or to hunting,—that is called the fashion of dissipation; if you dare to contemn the words of sages, to resist the royal and upright, to put far from you the aged and virtuous, and to be familiar with precocious youths,—that is called the fashion of disorder. Now if a high noble or officer be addicted to one of these fashions with their ten evil ways, his Family will surely come to ruin; if the prince of a country be so addicted, his State will surely come to ruin."—*Ibid.* Pt. IV. Bk. IV. ch. III. 7; *Legge*, III. i. 196–7.

"Two of the documents which form the Book of History are directed against luxury and drunkenness, to both of which the people seemed like to give way, even within measurable distance of the death of Wên Wang. The latter had enacted that wine (that is to say, ardent spirits distilled from rice) should only be used on sacrificial occasions, and then under strict supervision; and it is laid down, almost as a general principle, that all national misfortunes, culminating in the downfall of a dynasty, may be safely ascribed to the abuse of wine."—*Giles, Hist. of Ch. Lit.*, p. 12. See also *Legge*.

'The king [Ch'êng, of Chou] says, 'O Fung, I have heard it said that formerly the first wise sovereign of Yin manifested a reverential awe of the bright principles of Heaven, and of the lower people, steadfast in his virtue, and holding fast his wisdom. From him, T'ang the Successful, down to the emperor Yih, the sovereigns all completed their royal virtues, and revered their chief ministers, so that their managers of affairs respectfully discharged their helping duties, and dared not to allow themselves to indulge in idleness and pleasure;—how much less would they dare to indulge in drinking! Moreover, in the exterior domains, the princes of the States of the How, Teen, Nan, and Wei, with their chiefs; and in the interior domain, all the various officers, the directors of the several departments, the inferior officers and employés, and the Heads of great Houses, with the men of honoured name living in retirement, all eschewed indulgence in spirits. Not only did they not dare to indulge in them, but they had not leisure, being occupied with helping to complete their king's virtue and make it more distinguished, and helping the directors of affairs reverently to attend to the service of the sovereign."—*Shu ching*, Pt. V. Bk. X. 9–10; *Legge*, III. ii. 406–7.

"King Wân admonished and instructed the young and all who were charged with office and in employment, that they should not ordinarily use spirits. Throughout all his States, he required that they should be drunk only on occasion of sacrifices, and then that virtue should preside so that there might be no drunkenness."—*Ibid.* Pt. V. Bk. X. 4; *Legge*, III. ii. 403.

"I have heard it said . . . that in these times the last successor of those kings [Chou Hsin of the Yin dynasty] was addicted to drink, so that no charges came from him brightly before the people, and he was reverently and unchangingly bent on doing and cherishing what provoked resentment. Greatly abandoned to extraordinary lewdness and dissipation, for pleasure's sake he ruined all his majesty. The people were all sorely grieved and wounded in heart, but he gave himself wildly up to spirits, not thinking of ceasing, but continuing his excess, till his mind was frenzied, and he had no fear of death. His crimes accumulated in the city of Shang, and though the extinction of the dynasty of Yin was imminent, this gave him no concern, and he wrought not that any sacrifices of fragrant virtue might ascend to heaven. The rank odour of the people's resentments, and the drunkenness of his herd of creatures, went loudly up on high, so that Heaven sent down ruin on Yin and showed no love for Yin,—because of such excesses. There is not any cruel oppression of Heaven; people themselves accelerate their guilt, and its punishment."—*Ibid.* Pt. V. Bk. X. 11; *Legge*, III, ii. 408–9.

"In the time of the Three Dynasties [Hsia, Shang, and Chou] the people exceeded in lewdness."—*Hou Han shu Hsün Shuang chuan, P'ei wên yün fu, c.* 105, p. 57. Ref. MARITAL.

[The last Emperor of the Hsia dynasty made a night palace, where men and women lived promiscuously together, and where he once remained himself for a whole month.]—*Legge, Ch. Class.*, III. i. 84, note.

"The prostitute Hung Yai was a person of the time of the *San Huang* (Three Emperors). The prostitute was then introduced."—*Wan wu yüan shih, K'ang Hsi Tzŭ tien, Ch'ou chi hsia, Nü pu*, p. 28*a*.

"In the *Book of Miscellanies* (*Tsa shuo*) it says: 'The *luan* boy (孌童 *luan*³ *t'ung*), sodomite, began in the time of the Emperor Huang, being probably used as a pretext. The 'stupid youth' (頑童 *wan*² *t'ung*) is mentioned in the Book of Shang, but it was written of by Mei Tse in his *Wei ku wên* and is not sufficient as evidence. In the Chou Book of Yi it says: 'The handsome boy would nourish the aged,' which probably alluded to the unnatural crime. In the *Chou li* it says: 'There was a case of accusation against an unnatural man.' The Commentary says: 'It was a natural eunuch who was unable to unite with a woman.' But from very ancient times down to the present it was impossible that being unable to unite with a woman could form the subject of an accusation. As the sentences in the classics are contracted it is thought the allusion is to an unnatural crime."—*Yüeh wei ts'ao t'ang, Huai hsi tsa chi*, ç. 2, p. 22*a*.

[For the moral powers ascribed to music, see *Shu ching*, Pt. II. Bk. IV. ch. II. 9–10.]

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

General.—"The demeanour of the Son of Heaven should be characterized by majesty; of the princes, by gravity; of the great officers, by a regulated composure; of (inferior) officers, by an easy alertness; and of the common people, by simplicity and humility."—*Li chi*, i. ii. ii. 5, 17; *Legge*, i. 112. See also *Lun yü*, i. 8; *Legge*, i. 5.

"The perfecting of virtue occupies a superior rank, while mere talent in the exercise of any art takes an inferior place. He who practises virtue always goes in advance, and the man of business follows. Wherefore it is that the ancient emperors placed the one above and the other below, putting the one before, and the other after; and thus it was that they succeeded in ruling the empire."—*Journ. N.-C.B.R.A.S.*, N.S. v. 46.

"The Master said, 'To rule a country of a thousand chariots, there must be reverent attention to business, and sincerity; economy in expenditure and love for men; and the employment of the people at the proper seasons."—*Lun Yü*, i. 5; *Legge*, i. 4. "A country of 1000 chariots is one of the largest fiefs of the Empire." "The last principle, 使民以時 means that the people should not be called from their husbandry at improper seasons, to do service on military expeditions and public works."—*Ibid.* note.

"The disciple Tsang said, 'Let there be a careful attention *to perform the funeral rites* to parents, and let them be followed when long gone *with the ceremonies of sacrifice*:—then the virtue of the people will resume its proper excellence.'"—*Ibid.* i. 9; *Legge*, i. 5.

"The Master said, 'A youth, when at home, should be filial, and, abroad, respectful to his elders. He should be earnest and truthful. He should overflow in love to all, and cultivate the friendship of the good. When he has time and opportunity, after the performance of these things, he should employ them in polite studies.'"—*Ibid.* i. 6; *Legge*, i. 4.

"The Master said, 'In the Book of Poetry are three hundred pieces, but the design of them all may be embraced in one sentence—Have no depraved thoughts.'"—*Ibid.* ii. 2; *Legge*, i. 10.

"The Master said, 'I will not be afflicted at men's not knowing me; I will be afflicted that I do not know men.'"—*Ibid.* i. 16; *Legge*, i. 9.

"At the base of the whole Shuking is the characteristically Chinese faith in an inherent moral sense in all men, whose sanctions are not found in fears of hell nor hopes of heaven, and whose acknowledged origin in the 'nature of things' leaves no room for an arbitrary divine will. In proof of its distinctions we may note that concubinage is fully recognized as a constant cause of public disorder, and together with intemperance as at the root of all great dynastic calamities."—*Johnson, Or. Rel.—Ch.*, pp. 492–3.

"'Remember,' says the Shuking, 'the proper end of punishment is to make an end of punishing.' 'Only the good should determine criminal cases.' 'Deal with evil as if it were a disease in your own person, and with the people as if you were guarding your own child.' 'Better run the risk of error than

put to death an innocent person.' 'Rewards, not punishments, should descend to one's children.' Principles like these, pervading the classics that form the basis of law, indicate at least the powerful hold which humane instincts have taken upon the national mind and conscience. The *Tcheouli* prescribes the teaching of eight leading rules and nine ties of mutual benefit, as essential for guiding the people and preserving them in harmony. The first of the eight is family affection; the second, reverence for age; the last, kindness to strangers. It prescribes also, as points to be aimed at by the Minister of Instruction, the diffusion of love for the young, care for the old, succor for the distressed and bereaved, pity for the destitute, consideration for the sick."—*Ibid.* pp. 45–6.

Confucius said to his disciples, "My children, remember this. Oppressive government is fiercer than a tiger."—*Legge, Ch. Class.*, i. Prol. p. 68.

[Confucius discountenanced oppressive government (*Li chi*, ii. ii. iii. 10) and preached righteousness, self-consecration, good faith, sincerity, and guilelessness as necessary on the part of a ruler to unite the people to him (*ibid.* ii. ii. iii. 11). He condemned a son who gave evidence against his father in case of theft.]

"In the highest antiquity they prized (simply conferring) good; in the time next to this, giving and repaying was the thing attended to. And what the rules of propriety value is that reciprocity. . . . Propriety is seen in humbling one's self and giving honour to others. . . . When the rich and noble know to love propriety, they do not become proud nor dissolute. When the poor and mean know to love propriety, their minds do not become cowardly."—*Ibid.* i. i. i. 6, 23, 25–6; *Legge*, i. 65.

"The Summary of the Rules of Propriety says:—Always and in everything let there be reverence; with the deportment grave as when one is thinking (deeply), and with speech composed and definite."—*Ibid.* i. i. i. i. i.; *Legge*, i. 61. See also 5, 20; *Legge*, i. 64.

"The constant efforts after self-rectification of the Chinese sage stand midway between the self-discipline required from the Christian saint and the purely secular *Bildung* or culture of which the greatest German poet was an apostle. The 'superior man' in China 'cultivates his person'; he 'internally examines his heart,' he keeps watch over himself when alone (*The Great Learning, S.B.*, xxviii. 413), and, for his own satisfaction simply, strengthens himself in gravity and reverence, because 'indifference and want of restraint lead to a daily deterioration.' The ceremonies of politeness are the outward and visible signs of goodwill and considerateness. 'Courtesy is near to propriety'; conduct cannot go very far wrong which is kept within the rules of good manners."—*Simcox*, ii. 74.

[In §§ 20–22 of the 'Announcement to the Prince of K'ang' (*Shu ching*, Pt. V. Bk. IX.), the king explains that the virtue of the sovereign is the most important thing in the government of the people, and that rulers should seek by virtue to supersede the necessity of using punishments. See *Legge, Ch. Class.*, III. ii. 395, note.]

"As magistrate of Chung-too he [Confucius] produced a marvellous reformation of the manners of the people in a short time. According to the 'Family Sayings,' he enacted rules for the nourishing of the living and all observances to the dead. Different food was assigned to the old and the young, and different burdens to the strong and the weak. Males and females kept apart from each other in the streets. A thing dropt on the road was not picked up. There was no fraudulent carving of vessels. Inner coffins were made four inches thick, and the outer ones five. Graves were made on the high grounds, no mounds being raised over them, and no trees planted about them. Within twelve months, the princes of the States all about wished to imitate his style of administration." When he was made Minister of Crime "there was no necessity to put the penal laws in execution. No offenders showed themselves."—*Ibid.* i. Prol. pp. 72–3.

The authority of Confucius in the State of Mang greatly increased. "A transforming government went abroad. Dishonesty and dissoluteness were ashamed and hid their heads. Loyalty and good faith became the characteristics of the men, and chastity and docility those of the women. Strangers came in crowds from other States" (see K'ung Ts'ung Tzŭ, quot. Keang Yung).—*Ibid.* i. Prol. p. 75.

Confucius, when in Wei, made the observation, "I have not seen one who loves virtue as he loves beauty." "Wei was no place for him. He left it, and took his way towards Ch'in."—*Ibid.* i. Prol. p. 79.

"At last came Yen Yuen, who said, 'I should like to find an intelligent king and sage ruler whom I might assist. I would diffuse among the people instructions on the five great points, and lead them on by the rules of propriety and music, so that they should not care to fortify their cities by walls and moats, but would fuse their swords and spears into implements of agriculture. They should send forth their flocks without fear into the plains and forests. There should be no sunderings of families, no widows or widowers. For a thousand years there would be no calamity of war. Yew would have no opportunity to display his bravery, or Ts'ze to display his oratory.' The master pronounced, 'How admirable is this virtue!'"—*Ibid.* i. Prol. p. 114.

"In the 12th chapter [of the Chung Yung] Tsze-sze . . . begins by saying that 'the way of the superior man reaches far and wide, and yet is secret,' by which he means to tell us that the path of duty is to be pursued everywhere and at all times, while yet the secret spring and rule of it is near at hand, in the Heaven-conferred nature, the individual consciousness, with which no stranger can intermeddle." "The sage of China [Confucius] has no higher utterances than those which are given in the 13th chapter.—'The path is not far from man. When men try to pursue a course which is far from the common indications of consciousness, this course cannot be considered *the path*; . . . the superior man governs men according to their nature, with what is proper to them; and as soon as they change what is wrong, he stops. When one cultivates to the utmost the moral principles of his nature, and exercises them on the principle of reciprocity, he is not far from the path. What you do not like when done to yourself, do not do to others.' 'In the way of the superior man there are four things, to none of which have I as yet attained.—To serve my father as I would require my son to serve me: to this I have not attained; to serve my elder brother as I would require my younger brother to serve me: to this I have not attained; to serve my prince as I would require my minister to serve me: to this I have not attained; to set the example in behaving to a friend as I would require him to behave to me: to this I have not attained. Earnest in practising the ordinary virtues, and careful in speaking about them; if in his practice he has anything defective the superior man dares not but exert himself, and if in his words he has any excess, he dares not allow himself such license. Thus his words have respect to his actions, and his actions have respect to his words;—is it not just an entire sincerity which marks the superior man?'" "We have here the golden rule in its negative form expressly propounded:—'What you do not like when done to yourself, do not do to others.' But in the paragraph which follows we have the rule virtually in its positive form. Confucius recognizes the duty of taking the initiative,—of behaving himself to others in the first instance as he would that they should behave to him. There is a certain narrowness, indeed, in that the sphere of its operations seems to be confined to the relations of society . . . but let us not grudge the tribute of our warm approbation to the sentiments." "This chapter is followed by two from Tsze-sze, to the effect that the superior man does what is proper in every change of his situation, always finding his rule in himself; and that in his practice there is an orderly advance from step to step,—from what is near to what is remote. Then follow five chapters from Confucius:—the first, on the operation and influence of spiritual beings, to show 'the manifestness of what is minute, and the irrepressibleness of sincerity'; the second, on the filial piety of Shun, and how it was rewarded by Heaven with the empire, with enduring fame, and with long life; the third and fourth, on the kings Wăn and Woo, and the duke of Chow, celebrating them for their filial piety and other associate virtues; and the fifth, on the subject of government." "The 20th chapter . . . contains a full exposition of Confucius' views on government, though professedly descriptive only of that of the kings Wan and Woo. Along with lessons proper for a ruler there are many also of universal application, but the mingling of them perplexes the mind. It tells us of 'the five duties of universal application,'—those between sovereign and minister, husband and wife, father and son, elder and younger brother, and friends; of 'the three virtues by which those duties are carried into effect,' namely, knowledge, benevolence, and energy; and of 'the one thing, by which those virtues are practised,' which is singleness or sincerity. It sets forth in detail the 'nine standard rules for the administration of government,' which are 'the cultivation by the ruler of his own character; the honouring men of virtue and talents; affection to his relatives; respect towards the great ministers; kind and considerate treatment of the whole body of officers; cherishing the mass of the people as children; encouraging the [resort of] all classes of artizans; indulgent treatment of men from a distance; and the kindly cherishing of the princes of the States.'"—*Ibid.* i. Prol. pp. 47–50.

"The aims should repose in what is right; words should be listened to according to their relation to right."—*Shu ching*, Pt. V. Bk. V. 7; *Legge*, III. ii. 349.

Mencius "lays himself open in one thing to severe censure. Afraid apparently of repelling the prince from him by the severity of his lessons, he tries to lead him on by his very passions. 'I am fond of beauty,' says the king, 'and that is in the way of my attaining to the royal government which you celebrate.' 'Not at all,' replies the philosopher. 'Gratify yourself, only do not let your doing so interfere with the people's getting similar enjoyment for themselves.' So the love of money, the love of war, and the love of music are dealt with. Mencius thought that if he could only get the good of the people to be recognized by Seuen as the great aim which he was to pursue, his tone of mind would be so elevated, that the selfish passions and gratifications of which he was the slave would be purified or altogether displaced. And so it would have been. Where he fails is in putting his points as if benevolence and selfishness, covetousness and generosity might exist together. Chinese moralists rightly find fault with him in this respect, and say that Confucius never condescended to such a style of argument."—*Ibid.* ii. Prol. pp. 26–7.

"We may sometimes recognize in what the sage [Confucius] says of himself the expressions of a genuine humility. He acknowledges that he comes short of what he knows he ought to be. We do not meet with this in Mencius. His merit is that of the speculative thinker. His glance is searching and his penetration deep; but there is wanting that moral sensibility which would draw us to him, in our best moments, as a man of like passions with ourselves. The absence of humility is naturally accompanied with a lack of *sympathy*. There is a hardness about his teachings. . . . The radical defect of the orthodox moral school of China, that there only needs a knowledge of duty to insure its performance, is in him exceedingly apparent. Confucius, Tsze-sze, and Mencius, most strangely never thought of calling this principle in question."—*Ibid.* ii. Prol. pp. 74–5.

"The duke Mu asked Tsze-sze saying, 'Can my State be made to flourish?' 'It may,' was the reply. 'And how?' Tsze-sze said, 'O prince, if you and your ministers will only strive to realize the government of the duke of Chow and of Pih-k'in; practising their transforming principles, sending forth wide the favours of your ducal house, and not letting advantages flow in private channels;—if you will thus conciliate the affections of the people, and at the same time cultivate friendly relations with neighbouring States, your kingdom will soon begin to flourish.'"—*Ibid.* i. Prol. p. 42.

Special.—"One anecdote of the mother of Mencius deserves notice. The boy on seeing some animals killed, asked her what was going to be done with them. She in jest said, 'They are killed to feed you'; but, on recollecting herself, she repented of this, because it might teach the boy to lie; so she bought some of the meat and gave it to him, that the fact might agree with what she had uttered."—*Davis, Chinese*, ii. 55.

"The Master said, 'I do not know how a man without truthfulness is to get on,' any more than a carriage can be drawn without the cross bar."—*Lun yü*, ii. 22; *Legge*, i. 17.

[Edkins (*Journ. P.O.S.*, i. 9) says that the "habit of inventing monstrous stories was subsequent to foreign intercourse and was the immediate effect of that intercourse."]

"To see what is right and not to do it is want of courage."—*Ibid.* ii. 24, 2; *Legge*, i. 18.

"Pride should not be allowed to grow; the desires should not be indulged; the will should not be gratified to the full; pleasure should not be carried to excess."—*Li chi*, i. i. i. 2, 2; *Legge*, i. 62.

Confucius said to his disciples, "A superior man will only receive reward for services which he has done."—*Legge, Ch. Class.*, i. Prol. p. 68.

[Fathers were enjoined to teach their sons righteous conduct, and to allow no pride, extravagance, licentiousness, or laziness.] —*Tso chuan*, quot. *Kuang shih lei fu, c.* 16, p. 1*b*. *Cf.* FILIAL.

[Affection towards parents manifested in filial conduct is insisted upon in the *Li chi, Hsiao ching*, etc. *passim.*]

"The Master said, 'While a man's father is alive, look at the bent of his will; when his father is dead, look at his conduct. If for three years he does not alter from the ways of his father, he may be called filial.'"—*Lun yü*, i. ii.; *Legge*, i. 6.

Moderation in the infliction of punishments, etc., was shown during certain seasons. In the first month of summer "they decide cases for which the punishments are light; they make short work of small crimes, and liberate those who are in prison for slight offences" [to save them from the effects of the heat in confinement]. In the second month of summer "leniency should be shown to prisoners charged (even) with great crimes, and their allowance of food be increased."—*Li chi*, iv. ii. i. 18; ii. ii. 13; *Legge*, i. 271, 275.

In the second month of summer "the gates of cities and villages should not be shut [to afford every facility for the circulation of air during the hot season], nor should vexatious inquiries be instituted at the barrier gates or in the markets."—*Ibid.* iv. ii. ii. 12; *Legge*, i. 274.

Confucius said to Tzŭ-kung, "In dealing with your subordinates, there is nothing like impartiality; and when wealth comes in your way, there is nothing like moderation. Hold fast these two things and do not swerve from them. To conceal men's excellence is to obscure the worthy; and to proclaim people's wickedness is the part of a mean man. To speak evil of those whom you have not sought the opportunity to instruct, is not the way of friendship and harmony."—*Legge, Ch. Class.*, i. Prol. p. 117.

"A boy should never be allowed to see an instance of deceit." —*Li chi*, i. i. ii. 5, 17.

"A common type of poem [in the Odes] expresses the sorrows of soldiers on a distant expedition, forced to leave their homes and families. Sometimes the anxious thoughts of the family about the absent one are expressed, but the commonest topics are his anxiety as to how his parents will get food when he is not there to plant rice and maize for them, his concern at the thought of his mother's having to cook the dinner, and his overwhelming grief if they both die when he is not there to bury them, or to requite that parental kindness, which, according to a famous line, is 'like great heaven, illimitable' (*Legge, Ch. Class.*, iv. 352)."—*Simcox*, ii. 66.

[Sons were frequently killed, and sometimes eaten, by their fathers.]—*Yü hsüeh hsü chih, c.* 1, p. 23; *Kang chien*, quot. *Yüan chien lei han, c.* 241, p. 32*b*.

[Ma-tsou, 400 B.C. protested against a barbarous custom of certain tribes in Shansi, who ate the first-born child (whether male or female), on the principle that the first produced was likely to be weakly and poor, like the first fruit of a young tree.] —*Matignon, Superstition, etc.*, p. 224.

"There is no such thing as a 'righteous war.' We can only assert that some wars are better than others" (Mencius). "A chief of Lu, dissuading from war, said, 'Do right, submission will follow. When the enemy is cold, clothe him; if hungry, feed him; be his true ruler in weariness and want, and he will of himself return to you' (Plath from Tscho-chi, *Bayer, Akad.*, x. 465). Confucius, Mencius, and Laotseu echo the strain of peace, and have no toleration for great conquerors, or expansion by force of arms."—*Johnson, Or. Rel.—Ch.*, p. 314.

[If a father had been wrongfully killed, revenge was permitted.] —*Kung-Yang chuan, P'ei wên yün fu, c.* 26*a*, p. 165*b*. *Cf.* FILIAL.

"With the enemy who has slain his father, one should not live under the same heaven. With the enemy who has slain his brother, one should never have his sword to seek (to deal vengeance). With the enemy who has slain his intimate friend, one should not live in the same state (without seeking to slay him)."—*Li chi*, i. i. v. 2, 10; *Legge*, i. 92.

"Without sufficient cause, a prince did not kill an ox, nor a Great officer a sheep, nor another officer a dog or a pig, nor a common person eat delicate food." "The various provisions (at a feast) did not go beyond the sacrificial victims killed; the private clothes were not superior to the robes of sacrifice; the house and its apartments did not surpass the ancestral temple." —*Ibid.* iii. iii. 10; *Legge*, i. 227.

"Not to hunt when there was no (special) business in the way was deemed an act of irreverence [in not making provision for sacrifices]. To hunt without observing the rules (for hunting) was deemed cruelty to the creatures of Heaven." "The Son of Heaven did not entirely surround (the hunting ground); and a feudal prince did not take a (whole) herd by surprise." "Until the insects had all withdrawn into their burrows, they did not fire the fields. They did not take fawns nor eggs. They did not kill pregnant animals, nor those which had not attained to their full growth. They did not throw down nests."—*Ibid.* iii. ii. 23–5; *Legge*, i. 220–1.

[The advantages of kindness to animals is illustrated in *Shan t'ang ssü k'ao, Yüan chien lei han, c.* 358, *Shou yeh pu*, p. 20*b*.]

"The word *liberty* is said to be 'unknown to the Chinese language' (*Williams, Midd. King.*, i. 321). This is of course applicable only to the definition of liberty as pure and simple political self-government. For inward freedom, for a higher law of conscience and reason on the ground of personal culture, for the spontaneity of virtue, the classics have not only many terms, but a constant zeal. The whole purpose of the Ta-hio is to teach the origin of all power in the disciplines of personal character. 'The point of rest is in the highest excellence' (*Tahio, c.* ii.). 'From the Emperor down, the root of everything is in the cultivation of the person' (*ibid. c.* vii.). 'Not to do what one's own sense of right tells him not to do, nor to desire what it forbids him to desire, is the sum of right action' (*Mencius*, vii. i. 17). 'He whose goodness is part of himself is a real man' (*ibid* ii. 25). 'Though poor, he does not let go all his virtue, nor, though prosperous, leave his own path' (*Mencius*, i. 9). 'Men have true honour within; but they do not think of it. The honour men confer is not honour. Whom Cheou ennobles, he can make mean again' (*ibid.* vi. i. 17). 'If a minister cannot correct himself, how can he correct others?' (*Lun yü*, xiii. 13). 'A true man will sacrifice his life to save his principles' (*ibid.* xv. 8). 'He is in the right way who naturally and easily does right: choosing and firmly holding what is good' (*Chung-yung*, XX)."—*Johnson, Or. Rel.—Ch.*, pp. 303–4.

[Much bravery shown in hunting wild animals; see *Legge, Ch. Class.*, IV. i. 13, 127–31.]

"The *Shu King* contains a discourse by the Duke of Chou on the abuse of spirits. His speech to his brother Fung, B.C. 1120,

is the oldest temperance address on record, even earlier than the words of Solomon in the Proverbs" [see previous Period].—*Williams, Midd. King.*, i. 808–9.

[The continued prevalence of drunkenness at this time is shown by king Ch'êng's "Announcement about Drunkenness," which forms Bk. X. of Pt. V. of the *Shu ching*. It deduces the examples of the past as a warning against similar vice in the present age. "We have seen how the drunken debauchery of Kĕĕ was the chief cause of the downfall of the Hea dynasty, and how that of Shang was brought to an end mainly by the same vice in Show. The people of Yin had followed the example of their sovereign, and the vice of drunkenness, with its attendant immoralities, extensively characterized the highest and the lowest classes of society" (*Legge, Ch. Class.*, III. ii. 400, note).]

The *Book of Poetry* "does not contain the slightest hint of an approach to indecency."—*Simcox*, ii. 65.

[Odes of a later date, during the decay of the Chou dynasty, deplore the relaxation of morality. The men are drunken and debauched, and the women are immodest (*Shih ching*, I. iii. VII. and IX.; iv. II.–V., VII. and VIII.; xii. IX.). One characteristic of the superior man was not to listen to lascivious or seductive airs (*Tso chuan*).]

"A man and woman should not bathe in the same bathroom."—*Li chi, Ko chih ching yüan, c.* 19, *Kung shih lei*, p. 31*b*.

"A man and a woman should not sit together."—*Tsa li, Yüan chien lei han, c.* 251, p. 1*b*.

"'Contrary to the rule that men and women shall not even touch each other's hands.' (As a safeguard of morality. According to the ancient moral code of China, men and women were prohibited from handing things to each other, for fear their hands might touch.)"—*Giles, Historic China*, p. 182.

"A woman of your servant's neighbour, though she did not marry, yet at 30 had 7 children."—*Chan kuo ts'ê*, in *Ku wên hsieh i hsiang chieh, c.* 5, p. 29*a*.

[*Giles* (*Hist. of Ch. Lit.*, p. 18) says the position of women generally seems to have been very much what it is at the present day. Ref. MARITAL.]

[Instances of the refusal of widows to re-marry, which was regarded as an act of chastity, are given under MARITAL, *q.v.* also for the dependence of women and the rules to be observed between husband and wife.]

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

"In the pursuit of some flux by which the dross of animalism was to be purged away, and the higher part of man's nature to be crystallized out and sublimed into some stable and eternal form, these Taoists practised fasting, discipline, worship, the use of charms, and the search for a sovereign remedy for all the ills of life."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 139.

About A.D. 80, Pan Hui-pan, also known as Pan Chao, "a sister of the historian Pan Ku . . . was made preceptress of the Empress, and wrote the first work in any language on female education: it was called *Nü Kiai* or *Female Precepts*, and has formed the basis of many succeeding books on female education. The aim of her writings was to elevate female character, and make it virtuous. . . . Instructions in morals and the various branches of domestic economy are more insisted upon in the writings of this and other authoresses, than a knowledge of the classics or histories of the country."—*Williams, Midd. King.*, i. 573–4.

[Chang Kang 張綱 was ordered by the Emperor Shun Ti to proceed on a commission to examine into the morals of the empire. His saying, 'While wolves are in office, why seek out foxes,' and his bold impeachment of the corrupt officials occupying high places, would seem to show that the prevailing condition of morality at the time was not very high.]—*Giles, Bio. Dic.*, pp. 30–1.

"If the black heads had been as virtuous . . . as the inscriptions [of Ch'in] declare, it would hardly have been necessary to tell them so at such length."—*Simcox*, ii. 101.

"The reign of the warlike Wu-ti was marked by the spread of luxury; many wives, many horses, many clothes, and a thousand costly ornaments seduce the prince to abandon the antique simplicity of his ancestors. A memorialist in a subsequent reign [48 B.C.] reiterates the same complaints."—*Ibid.* ii. 111.

"The last princes of the Han Dynasty were far from being as amenable [as Ho-ti] to the remonstrances of their advisers. We find, in the poetic annals of their epoch, a large number of petitions in verse, written in exile, by faithful servants mourning over their disgrace, and still more over the blindness of their sovereign. . . . One cannot help remarking the tone of dignity which always prevails in these complaints, and even in the supplications of the exiles trying to obtain a pardon, by calling attention to their unrecognized services. Not a word is to be found which lowers the character of man, not an expression which savours of abject flattery."—*D'Hervey-Saint-Denys, Poésies*, Introd. p. xxvii.

Chai Tsun (died A.D. 33) "wore common leather breeches and cotton socks, distributing all his prize-money among his soldiers, who were strictly forbidden to pillage, and whose leisure hours he sought to fill up with refined and intellectual amusements. Even in war time he would not suffer the usual religious ceremonies to be neglected."—*Giles, Bio. Dic.*, p. 7.

"Wenti was a strong advocate of peace."—*Boulger, Short Hist.*, p. 12.

[An instance of extreme fraternal affection combined with filial conduct is given in *P'ei wên yün fu, c.* 56, p. 1*a*, and one of a man not marrying again after the death of his wife in *c.* 66*b*, p. 170*a*.]

[The reason assigned in the *Po hu t'ung* (quot. *P'ei wên yün fu, c.* 66*b*, p. 169*b*) why the Emperor should marry a wife only once is "to guard against lewdness, since to marry more than once would look like giving up virtue for beauty."]

"The laws against *scandulum magnatum* [妖言] were made very severe by Shih Hwang Ti."—*Ch. Rev.*, xii. 444.

"The term 斬賊首級 originated with the Ts'in dynasty, for every enemy's head one step [級] in rank [爵] was the reward."—*Ibid.* xiii. 53.

"The cannibalism borne witness to by Colonel Mesny . . . is frequently alluded to in Chinese history. For instance, the tongue of 王莽 was cut out and eaten by a bystander when his head was exposed [切食其舌]. The phrase 'eat the flesh and sleep in the skin' of an enemy is colloquial."—*Ibid.* xiii. 59. The *Kang chien ch'üan pien, c.* 9, p. 64*b*, says that his whole body was eaten and that "in struggling for his flesh ten men were killed."

Period of Disruption (221 *to* 589).—*Table IV.*

[The collapse of public morality and the greed for mere wealth which characterised the period A.D. 291–300 are satirized by Lu Pao in his 錢神論, a discourse on the Genius of Money.]—*Giles, Bio. Dic.*, p. 548.

"[Men] were generally given to adultery, but the women even more so. Before the night of her marriage a woman bade farewell to her adulterers. When the husband heard it he esteemed her more if they had been numerous. But after marriage the husband guarded her from further illegal intercourse. Anyone who committed adultery should be punished according to the circumstances of the case."—*P'ei wên yün fu, c.* 95, p. 130*b*.

The tea plant was first cultivated for the infusion made from its leaves about A.D. 350, and "it is noticeable that references to drunkenness become much rarer in future than in the literature of the earlier times."—*Simcox*, ii. 130.

"An emperor who had stayed out beyond the customary hour, was rebuked by the officer on guard, who affected not to recognise him. The emperor had gone out early, and it was impossible that he should so far have neglected the duties of his office and the rules of propriety as to stay out hunting all day! It was also regarded as the extremity of license for the palace gates to stand open by night, or for the heir apparent to mix freely for pleasure with the common people or discard the orthodox robes of state. Anarchy could hardly obtain in the kingdom, when the court was in such rigid subjection to the Rites and their interpreters."—*Ibid.* ii. 128.

"Fu Tzŭ said: 'T'ai Tsu thought that it was wrong to be extravagant at marriages. When his daughters were married, he only used the black curtain and not more than 10 maids as attendants."—*Wei chih Wu Ti chi chu, Tzŭ shih ching hua, c.* 32, p. 15*a*.

"When Chang Hua-yüan was Department Magistrate of Yen Chou, on New Year's Day he gave prisoners 5 days' leave to visit their respective relatives. At the appointed time they all returned to prison."—*Pei Ch'i shu, Shih lei t'ung pien, c.* 5, *Sui shih pu*, p. 9*b*.

"Shao Su remonstrated with Yin, king of Ch'êng Tu, for punishing the prince of Ch'ang Sha, saying: 'Elder and younger brothers are just like the right and left hands of the body."—*Chin shu, ibid. c.* 16, p. 13*b*.

"The whole family of Yang Tan consisted of 100 men and women who all wore hempen garments and ate together, but there were no disagreeable words heard in the house."—*Ibid. c.* 74, p. 187*a*.

[Revenge was taken even on the dead, corpses of enemies being exhumed and burned.]—*De Groot, Rel. Syst.*, i. i. 343–4, and see MILITARY. Cannibalism continued as late as the 4th and 5th centuries.

"When Yung Ch'üan, a military officer, rose in rebellion, the prostitute Mao Hsi-hsi did not come to attend upon him and said: 'Though I am so base as to be a prostitute, yet I have never served a rebellious officer.' For this Ch'üan killed her. This incident being officially reported to the Throne, she immediately had bestowed upon her the title of 'Loyal and Heroic Lady.'"—*San ch'ao yeh shih, P'ei wên yün fu, c.* 24, p. 7*b*.

From the Restoration of Unity to the end of the Five Dynasties (589 *to* 960).—*Table V.*

"Religion, mainly in the form of Buddhism, prevailed then to a greater extent than at any other time before or since. Along with it came Poetry and the Fine Arts, but at the same time moral and intellectual decadence."—*Journ. N.-C.B.R.A.S.*, N.S. vii. 165.

"It was the time-honoured custom at this period for the high officers throughout the empire to bring to their sovereign's notice those men in their jurisdictions who were remarkable for the possession of high moral character and intellectual abilities that they might be employed in the administration of government."—*Ibid.* vii. 167.

"Ghosts and demons are . . . according to Han-wên-kung the reproaches of a troubled conscience which imagination bodies forth in spectral monsters visible only to the mind's eye, or at the most mere subjective creations having nothing corresponding to them in the actual world. It is not by any demon that pain and misery are brought on man, they are the inevitable consequences of his own misconduct."—*Journ. N.-C.B.R.A.S.*, N.S. vii. 179.

"The *Yuan-hui* (原毀) or examination of the essential of moral criticism is also a very charming essay. . . . Its burden is that we should be rigorous and thorough in criticising ourselves and lenient and slack in criticising others. The leading men of his time, Han Yü says, were not so; on the contrary they exacted saintship in others while content to be themselves like the multitude."—*Ibid.* vii. 179–80.

"That every son should love his parents is natural. Yang Kuang of Sui killed his father Wên Ti and usurped the Throne—his natural disposition had perished."—*Yu hsüeh hsü chih, c.* 1, p. 23*a*.

"Once when the Emperor was walking into the imperial garden, he saw bamboos growing densely together, but their shoots did not grow outwards. On seeing this he turned to the princes and said: 'Father and son, and elder and younger brothers, should be closely attached to each other like this.'"—*K'ai yüan i shih, Kuang shih lei fu, c.* 16, p. 14*a*.

"The Chinese annalists tell many stories of Taitsong's personal courage."—*Boulger, Short Hist.*, p. 30.

"Every theatrical play without morality is in the eyes of the Chinese but a ridiculous work in which they see no sense. According to Chinese authors, the object the author sets himself in a serious drama is to present the noblest lessons of history to the ignorant who do not know how to read (*Morrison, Dic.*, 'Drama'); and according to the penal code of China, the object of theatrical representations is 'to place on the scene true or fictitious pictures of just and good men, of chaste women and affectionate and obedient children so as to induce the spectators to practise virtue." "This moral theory to a certain degree raised the Chinese plays above all the plays of ancient times, with the exception of the Greek in the two first periods of their existence."—*Bazin, Théâtre Chinois*, Introd. p. xxix.

Abu Zeyd says: "There are in China some women who will not submit to the restraints of a regular life. . . . The custom is for them to seek an audience of the chief of police, and inform him of . . . their desire to be admitted to the number of the courtesans. . . . The woman's name and the name of her father are taken down, with her description, and place of residence; and she is registered at the office of the courtesans. They place round her neck a string with a copper badge, stamped with the royal seal; and finally, they hand her a document, stating that this woman is admitted among the number of the courtesans, that she will pay, annually, to the public treasury, such and such a sum, in copper coins, and that any man who may marry her, shall be put to death. From thenceforth, the woman pays the sum fixed, every year, and no one is allowed to molest her. These women go out in the evening, unveiled, and wearing dresses of coloured stuffs."—*Reinaud, Relation*, i. 70, 71.

In the reign of Hsüan Tsung "women ceased to veil themselves as of old."—*Giles, Bio. Dic.*, p. 451.

[Infanticide was checked in Chu Chi. See MARITAL.]

Sung Period (960 *to* 1280).—*Table VI.*

Under Jên Tsung (1022–63) "the presentation of auspicious articles was forbidden; general pardons were frequent, and capital punishment rare. The Emperor refused to chastise Korea when tribute was not sent, because of his hatred of bloodshed; and on the occasion of a pestilence in the capital in 1054, he insisted on distributing all the medicine of the Palace."—*Giles, Bio. Dic.*, pp. 55–6.

"The principles of Confucian morality are still expected to regulate the conduct of Chinese households."—*Simcox*, ii. 202.

[Instances showing forbearance, filial piety and fraternal submission, as the secret of family happiness, are related in *Chia li ta ch'êng, c.* 1, p. 19*a*.]

"Yao Ssŭ's father, Pao, was killed in battle at Ting Chou. On all his implements and pictures were written the words: 'Do not forget to seek revenge.'"—*Sung shih Yao ssŭ chuan, P'ei wên yün fu, c.* 26*a*, p. 166*b*.

"Chou Kung-shu at a dinner-party fixed his regards upon a prostitute. After that he secretly said to someone: 'Let it not be known by Yin Yen-ming.' When [Ch'ên] Yi Ch'üan returned home, Ho Ching inadvertently disclosed the story. Yi Ch'üan said: 'It is no better than a beast or bird that one's person begat from one's parents should be matched with so base a prostitute.'"—*Jên p'u lei chi, c.* 5, p. 33*b*.

Mongol Period (1280 *to* 1368).—*Table VII.*

They are "men of peaceful character . . . you hear of no feuds or noisy quarrels, or dissensions of any kind among them. Both in their commercial dealings and in their manufactures, they are thoroughly honest and truthful, and there is such a degree of good-will and neighbourly attachment among both men and women, that you would take the people who live in the same street to be all of one family." They treat their women with the greatest respect. "They also treat the foreigners who visit them for the sake of trade with great cordiality, and entertain them in the most winning manner, affording them every help and advice in their business."—*Yule, Marco Polo*, ii. 161.

"Gay water parties and picnics were the favourite amusement; and if sometimes, as foreshadowed in the ancient odes of Wei, these expeditions were not undertaken in company such as a classical moralist could approve, there was at least a varnish of literary polish thrown over even disreputable *liaisons*. The Aspasias of the period were well educated, and several plays of the Yuen dynasty were written by literary *comédiennes*, who by law and custom belonged to this class. The virtuous courtesan was a rather favourite heroine with the dramatists, and one plot turns upon her right, under an ancient law, to be allowed to marry lawfully a respectable citizen, as a reward for having dutifully cherished and maintained her mother till the latter's death."—*Simcox*, ii. 220.

"The theatrical plays show us that the moral relations between woman and man have varied since the XIIIth century. We could multiply examples and accumulate proofs to demonstrate that the feebler sex in China did not, under the rule of the grandson of Gengis-khan, share the sad condition to which it was reduced under the government of the Tartars."—*Bazin, Théâtre Chinois*, Introd. p. xxiv.

"The Tartars, before they were converted to the religion of the Idolaters, never practised Almsgiving. Indeed, when any poor man begged of them they would tell him 'Go with God's curse, for if He loved you as he loves me, he would have provided for you!' But the sages of the Idolaters, and especially the *Bacsis* mentioned before, told the Great Kaan that it was a good work to provide for the poor, and that his idols would be greatly pleased if he did so."—*Yule, Marco Polo*, i. 432 (2nd ed.).

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

"The principal intent that this king and his governors have, as is gathered by their laws, is to preserve the commonweal from vices; . . . and lest any should offend, they use great vigilancy, and do judge that the liberty and dishonesty of the women is most prejudicial. . . . So that a dishonest woman is known by name, although it be in a great city. . . . And the best way they have to prevent this is [the careful seclusion and unremitting labour of all adult women]. Albeit tendering the conservation of this honest crew, and to eschew greater evils in the commonwealth, they permit common women as a necessary thing; yet they do allow them in such sort that their evil example may not be hurtful unto the honest state of them which live chaste. . . . They do build for them houses . . . in the suburbs, giving them straight commandment there to remain . . . and not to straggle and go abroad at all. And whilst they live there, they are prohibited, upon pain of death, to enter into the gates of the city or any part thereof. Such women as do use this faculty are nothing esteemed among them, for they are for the most part of the basest sort, as strangers, slaves or such as have been bought of their mothers being young [see *Slavery*]. [They are taught music and other accomplishments; and the houses where they live are placed

under the inspection of an official, before whom every fresh inmate must appear.] "They have amongst them many blind women, that are free and not bond; these are trimmed, dressed and painted by others that have their sight."—*Mendoza*, i. 144–7.

[The respect shown to women, "as well strangers as town-born, or of what degree soever," is referred to in *ibid.* i. 144; and the "means to prevent vice" (by keeping the women in seclusion and making them avoid idleness) on pp. 145–7.]

"In 1599 the generals at the seat of war were expressly advised to send home only reports of successes, real or imaginary."—*Simcox*, ii. 249.

"Semedo describes with as much admiration as an 'Old Resident,' at Canton three hundred years later, the 'inviolable fidelity with which the Chinese merchants fulfil their business engagements,' and this in spite of the great facilities for fraud offered by the fact that the Portuguese were obliged to give in advance to the native agents the money with which the latter make purchases on account of the foreigners in different parts of the interior. Ricci complained that money forwarded for his use through Chinese agents did not always come to hand; but Semedo, on the contrary, met with kindness as well as honesty: for more than once, as strangers from a distant region, the Fathers had money lent to them without interest."—*Ibid.* ii. 270–1.

"In 1628 Hoai-tsong, the last of the Ming emperors, ascended the throne. At the outset of the next campaign the Mantchu Emperor ordered his troops to spare non-combatants, trees and buildings, not to maltreat their prisoners, and to give quarter to all who asked it."—*Ibid.* ii. 249.

The Emperor Mu Tsung's "morals can have been little improvement on those of his father, as he is accused in the history of pottery of a taste for china decorated with licentious subjects."—*Ibid.* ii. 248.

Manchu Period (1644 *to* —).—*Table IX.*

"In a work of some note on morals, called 'Merits and Demerits examined,' a man is directed to keep a debtor and creditor account with himself of the acts of each day, and at the end of the year to wind it up. If the balance is in his favour, it serves as the foundation of a stock of merits for the ensuing year; and if against him it must be liquidated by future good deeds. Various lists and comparative tables are given of both good and bad actions in the several relations of life; and benevolence is strongly inculcated in regard, first, to man, and, secondly, to the brute creation. To cause another's death is reckoned at one hundred on the side of demerit; while a single act of charitable relief counts as one on the other side. . . . To save a person's life ranks, in the above work, as an exact set-off to the opposite act of taking life away; and it is said that this deed of merit will prolong a person's life twelve years. A pretty correct idea of Chinese moral sentiment might be gathered from the scale of actions there given. To repair a road, make a bridge, or dig a well, ranks as ten; to cure a disease, as thirty; to give enough ground to make a grave, as the same; to set on foot some very useful scheme or invention, ranks still higher. On the other hand, to reprove one unjustly counts as three on the debtor's side; to level a tomb as fifty; to dig up a corpse, as one hundred; to cut off a man's male heirs, as two hundred; and so on. These notions are not peculiar to the Buddhist sect, but prevail universally among the Chinese, who are as little troubled with sectarian divisions and animosities as any people in the world."—*Davis, Chinese*, ii. 91–2.

The people "are quite used to hearing the highest moral platitudes from their rulers, to whom they would not lend a dollar on their word."—*Williams, Midd. King.*, i. 691.

"There can be little doubt that the belief of the constant presence of [the Kitchen] god has the tendency to restrain from evil, and to bring the words and actions of the family into closer accord with what they deem to be right and proper."—*Nevius, China*, p. 135.

"Their [Manchus] life is a haughty and exclusive one. . . . Their chief characteristic was a combination of laziness and pride; but wherever placed with foreigners in the relation of pupil to teacher, as for instance in schools, drill-grounds, laboratories, etc., their bearing is distinctly less priggish and more gentlemanly than that of Chinese. . . . The Manchus, like nearly all northerners, have a tendency to get drunk. . . . Even at official interviews a Manchu mandarin is occasionally flushed with liquor, in which case he often becomes a braggart."—*Parker, China*, pp. 261–2.

"Liberty in the now too popular acceptation of the word—as the unconditioned right to do as one pleases—is no part of Chinese mental experience. All freedom is associated with *loyalty*, either to the ruler, the traditional institutions and ceremonial grades, or, when these lose their hold, to the inherent sense of necessity for being governed, which characterizes the race. This necessity, in the highest minds as elsewhere, takes the form of reverence for the moral and spiritual ideal, as is manifest in the whole tone of the classical writings; while in ordinary experience it merges in typical rights of *the people as such*. The validity of an ultimate appeal to the sense of the people subsists in spite of the absence of those methods of effectuating the popular will with which Western races are familiar. Though China is the inventor of paper and printing, nothing has existed, until the present time [1880], more nearly approaching a popular press than the court bulletin of such events, petitions, edicts, honors, services, ordinances, as are thought fit for general perusal. Nevertheless, the popular sentiment gets expression in satires, stories, placards, remonstrances, discussions, and in the secret societies whose germs are in the older records of the nation. Legislative institutions in our sense are wanting, but official conduct is ventilated in the town councils, and an unpopular mandarin is frequently driven from his place. The responsibility for popular commotions being by law laid upon these government officers, their disposition is to avoid giving cause of offence to the community. But, after all, we must observe how entirely the interest of the individual is sacrificed to the ideal of *public* rights in the fact that those last self-destructive resorts for the overthrow of unjust officials, suicide and oath-bound conspiracy, are exceedingly prevalent."—*Johnson, Or. Rel.—Ch.*, pp. 305–6.

Mrs. Charles Hartwell says of the District of Chang-loh, S.E. of Foochow:—"The women have the appearance of great energy and force of character, but this is all expended in seeking worldly prosperity. If the family is prosperous, pride and self-satisfaction are very manifest. If calamity comes, corresponding dejection is seen. It is said that the people here never sell their daughters for slave girls. This is an indication of pride, but infanticide is very common. In addition to pride in building up their families and following all the ancient customs, we find a great tendency among the men, and often among the women, to quarrel. Quick temper is often acknowledged by them. . . . I have heard of several women who took their own lives, merely from anger. In going among them, I find a degree of sociability and politeness which is very pleasant."—*Woman's Work*, ii. 37, 38.

"The daily practice of crushing children's feet and the ceaseless contact with the resultant pain and agony have seared the heart and conscience of Chinese motherhood as with a hot iron."—*N.-C. Herald*, April 25, 1900, p. 746.

"The Chinese have a great affection for the place of their nativity, and consider a residence in any other province like being in a foreign settlement. They always wish to return thither in life, or have their remains carried and interred there after death."—*Williams, Midd. King.*, i. 462, note.

[Legge testifies to the patriotism of the Chinese.]—*London and China Tel.*, July 5th, 1875.

The husband "thinks there is something sacred in his love for wife, or home, not to be lightly spoken of, or witnessed by everybody. The wife loves her husband too, with a sort of 'looking-up-to' affection; she thinks him not only *her* superior, but the superior of any one else."—*Journ. N.-C.B.R.A.S.*, N.S. vii. 94.

"One might be led to conclude that the Chinese were generally a very happy people, could this only be inferred from the value which they set on long life. The thing may be partly explained, however, by the great reverence with which age is always treated, and by the fact, that old persons commonly enjoy an unusually great share of comparative ease and exemption from toil, by the services which both opinion and law impose on their juniors. The greatest favour and distinction that the Emperor can bestow on one of his ministers is the word *show* [*shou*], 'long life,' written in a peculiar manner with his own hand, and supposed, no doubt, to be one of the best promoters of longevity. Persons of the lowest class, who have attained to an unusual age, have not unfrequently been distinguished by the Emperor; and Kien-loong [Ch'ien Lung], when himself a very old man, gave a solemn feast to all his subjects, of *every rank*, who had passed the usual term of human life! No doubt this solid foundation of their social and political system, on the patriarchal basis, has contributed to its steady duration."—*Davis, Chinese*, ii. 142.

[The sentiments shown by the treatment of children by their parents are given under FILIAL.]

"Industry is the ruling virtue of the Chinese, from the top of the scale to the bottom, but with the not unreasonable qualification that a man must be working for himself. . . . The whole wits of nearly every living Chinaman (and woman) seem to be devoted to turning to pecuniary profit every incident in which he has had, has, or may have a hand, direct or indirect."—*Parker, China*, pp. 277–8.

"There are few eastern natives more charitable than the Chinese."—*Scarth, Twelve Years*, p. 158.

"Charity has no place among the virtues of the people."—*Giles, Sketches*, p. 119.

"The Chinese are said to be ungrateful. This I totally deny. . . . When they find that . . . they are positively receiving some tenderness or consideration, such as gratuitous medical aid, free assistance in righting a wrong, the present of a coffin to their mothers, and such-like things indicative of disinterestedness, they positively overflow with feelings of respectful gratitude."—*Parker, China*, pp. 267–8.

"More uneradicable than the sins of the flesh is the falsity of the Chinese, and its attendant sin of base ingratitude [? *v.* preceding extract]; their disregard of truth has perhaps done more to lower their character than any other fault. They feel no shame at being detected in a lie (though they have not gone quite so far as not to know when they do lie), nor do they fear any punishment from their gods for it. On the other hand, the necessity of the case compels them, in their daily intercourse with each other, to pay some regard to truth, and each man, from his own consciousness, knows just about how much to expect. . . . A Chinese requires but little motive to falsify, and he is constantly sharpening his wits to cozen his customer—wheedle him by promises and cheat him in goods or work. There is nothing which tries one so much when living among them as their disregard of truth, and renders him so indifferent as to what calamities may befall so mendacious a race; an abiding impression of suspicion towards everybody rests upon the mind, which chills the warmest wishes for their welfare and thwarts many a plan to benefit them. Their better traits diminish in the distance, and patience is exhausted in its daily proximity and friction with this ancestor of all sins."—*Williams, Midd. King.*, i. 834–5.

"A Chinaman generally lies in order to get some petty pecuniary advantage, to save trouble, to conceal neglect, or to spite an enemy."—*Parker, China*, p. 264.

"Some of the better traits of their character have been marvellously developed. They have attained, by the observance of peace and good order, to a high degree of security for life and property; the various classes of society are linked together in a remarkably homogeneous manner by the diffusion of education in the most moral books in their language and a general regard for the legal rights of property. Equality of competition for office removes the main incentive to violence in order to obtain posts of power and dignity, and industry receives its just reward of food, raiment, and shelter with a uniformity which encourages its constant exertion."—*Williams, Midd. King.*, i. 833.

[The honesty of the merchant and banker is praised by all writers. "It is noticeable that while novelists are never tired of satirizing the cupidity of the mandarins, the assumption of the literati, and the viciousness of the priesthood, they refrain from reflections on a class which at least honestly toils and only asks to be allowed to reap the reward of its own untiring industry" (*Douglas, Society in China*, pp. 140–1).]

"In business dealings, unlike the Japanese, the Chinese keep to their word, even when it is to their own disadvantage to do so."—*Little* (*Mrs. A.*), *Int. Ch.*, p. 205.

"As to mercantile honour, in spite of occasional lapses, such as occur in all countries, it is . . . universally admitted that Chinese credit stands deservedly high."—*Parker, China*, p. 271.

Nevius says of the women who spend their lives in performing various Buddhist ceremonies, such as "worshipping books," &c. (a kind of professional devotees who are not nuns), "they generally lead comparatively honest and blameless lives, and are much respected by their own people. The character of their employment is such as to keep them constantly on their guard, as others look to them as examples, and they thus become habitually careful to avoid open sins and improprieties."—*China*, p. 112.

"Honesty cannot have been a virtue very prevalent among the lower classes in the time of Yung Chêng, for we find that that monarch actually thought it necessary, in the 12th month of the 5th year of his reign, to express in a Decree his admiration of the conduct of a carter, who having been engaged in the conveyance of military treasure, found, on his return, an ingot of silver in the straw at the bottom of his cart. This he was honest enough to give up at once to the authorities, and he must have been delighted afterwards to learn that the Emperor, as is stated in the decree, had ordered the piece of silver itself to be given to him as a reward."—*N. and Q. on C. and J.*, iii. 37.

"Gambling is universal. Hucksters at the roadside are provided with a cup and saucer, and the clicking of their dice is heard at every corner. A boy with but two cash prefers to risk their loss on the throw of a die to simply buying a cake without trying the chance of getting it for nothing. Gaming-houses are opened by scores, their keepers paying a bribe to the local officers, who can hardly be expected to be very severe against what they were brought up in and daily practise; and women, in the privacy of their apartments, while away their time at cards and dominoes. Porters play by the wayside when waiting for employment, and hardly have the retinue of an officer seen their superiors enter the house, than they pull out their cards and dice and squat down to a game."—*Williams, Midd. King.*, i. 825.

[For their apathy in regard to the *Wei Hsing* Lotteries, a popular form of gambling amongst the Cantonese in connection with the public examinations, the Viceroy and several of the highest officials in Canton were (1874) disgraced and stripped of their official rank.]—*Boulger, Short Hist.*, pp. 337–8.

[Smith in his 24th chapter (headed "Squeezers") relates two stories to illustrate the corrupt and extortionate practices of Chinese officials. In one case, a Taotai invited a rich merchant to dinner, and then kept him prisoner till he paid the desired sum; in another, he granted to a trader a permit to land a cargo of powder and muskets (at that time contraband) and then forced him to give it up by threats of prosecution, in order to cover his own defalcations, or negligence.]—*Obs. on China and the Ch.*, pp. 131–5.

"Thieving is exceedingly common, and the illegal exactions of the rulers . . . are most burdensome. This vice, too, is somewhat restrained by the punishments inflicted on criminals, though the root of the evil is not touched. While the licentiousness of the Chinese may be in part ascribed to their ignorance of pure intellectual pleasures and the want of virtuous female society, so may their lying be attributed partly to their truckling fear of officers, and their thievery to the want of sufficient food or work. . . . Their avarice is not so distinguishing a feature as their love of money, but the industry which this desire induces or presupposes is the source of most of their superiority to their neighbors. The politeness which they exhibit seldom has its motive in goodwill, and consequently, when the varnish is off, the rudeness, brutality, and coarseness of the material is seen; still, among themselves this exterior polish is not without some good results in preventing quarrels, where both parties, fully understanding each other, are careful not to overpass the bounds of etiquette."—*Williams, Midd. King.*, i. 835–6.

[Giles says, with regard to *theft*, that, though: (1) many petty cases which swell the statistics in England, never come into court in China; (2) many robberies remain undetected for want of an organized police force; (3) many cases of theft are compromised; (4) stealing food, when people are starving, is not considered theft, yet, *on the whole*, statistics show that theft is not more general than in England. Wages are low, as it is a recognized thing that servants make money by perquisites and commissions: this is not looked on as dishonest. Foreigners prove, by the confidence they place in their servants (and usually without serious loss), that it is an unfair exaggeration to call the Chinese "a nation of thieves."]—*Ch. Sketches*, pp. 118–22.

"The Chinese are probably the most expert robbers, pirates and burglars in the world. Thieves are divided into two classes, pickpockets and housebreakers. The first are migratory, and visit every fair; when they arrive, they call on the chief officer, and request permission to trade (plunder) which is readily granted, with the caution not to make a noise. Should they be caught in the act they get a few blows. This fraternity have strict laws which are rigidly obeyed. Should two bands meet at one fair, they must fight for the day or surrender. They have regular places for depositing the plunder. These bands are . . . subject to . . . chiefs, some of whom have 600 men under them. The farmers all keep dogs to protect their property."]—*R. M. Martin, China*, i. 55.

[Simon alleges that crime is comparatively infrequent. At Han-kow, one murder was committed in 34 years. In Chih-li province, with a population of 25 millions, only 12 executions a year took place in 1866 and 1867; and this, though theft is punished with death on a third conviction.]—*Cité Chinoise*, p. 7.

"How great the national suffering had become [1821–51] was shown by the marked increase of crime, especially all forms of theft and the coining of false money, for which new and severe penalties were ordained without greatly mitigating the evil."—*Boulger, Short Hist.*, p. 197.

"Elepoo owed his high position in the Imperial Council to his honesty, which was, perhaps, the rarest quality at Pekin."—*Ibid.* pp. 197–8.

"The annals of China afford no counterpart to those dark pages of European history which record the deeds of Tofana and Brinvilliers. No one in all her history is suspected even of the crime of secretly poisoning men of rank in the State. (The only instance in the long line of rulers, in which an Emperor was secretly made away with, was by the Siseran operation of driving a nail into his brain while he was asleep,—*Wên-ti*, 617 A.D.). This infrequency of poisoning is not due to ignorance of substances which have the power of impairing or destroying the functions necessary to life."—*Journ. N.-C.B.R.A.S.*, N.S. ix. 173.

If "we consult the writings of popular novelists, we shall discover that plots often turn on the crime of poisoning. It is noteworthy that in every instance given, the poisoners are represented as discontented wives, and the victims of disagreeable husbands. Intelligent natives defend this representation of

the novelists on the Confucian apophthegm that, while men's hearts are benevolent, women's hearts are poisonous; and they aver in confirmation of this ancient view of the better sex, that at the present time, in the cases of domestic strife that come before the Yamens of Shanghai, hardly one per cent. of the complainants are husbands. Viewed from a philosophical standpoint, the state of things reflects most unfavourably on the masculine sex, indicating, as it certainly does, that the treatment to which the longsuffering and gentle sex is subjected, is absolutely insupportable."—*Ibid.* ix. 174.

Kiang tsai, when besieged in Taitong, encouraged his soldiers and said, "Is it not better to sell our lives like brave men than to fall ingloriously under the steel of the Tartars."—*Boulger, Short Hist.*, p. 128.

Hsi Wang, Chinese leader in Ssŭ Ch'uan, also said, "An effeminate heart is not well suited to great enterprises; the only passion heroes should cherish is that of glory."—*Ibid.* p. 129.

"The northern men are very much given to [crying]. When there has been a fight in the street, you generally find the combatants in tears; and if there is a coolie doing something particularly vexatious, and an angry foreigner gives him a good 'punch in the ribs,' the Chinaman will drop down and have his cry. The southern people are different and will even resist a blow."—*Scarth, Twelve Years*, p. 149.

"One notices, moreover, in it [Chinese army] much less discipline than in the modern European troops, and, without doubt, less courage. . . . The education which they [the Chinese] receive at the present day must have helped to soften their nature. Only treatises on morality are placed before the eyes of young Chinese; they are spoken to only on the subjects of laws and politics; they see everywhere little regard for the military calling; those who embrace it often do so only on account of inability to take up any other profession. They are wanting in the quality which leads to great advance in all walks of life, viz., emulation."—*Grosier, Descr. de la Chine*, v. 18.

"It may be true that some of the Tartar troops yet retain something of the warlike spirit which enabled so few of them to overrun this vast empire; though, even against this, come the constant complaints of the Emperors, from Keënlung downwards, as to the falling off of the military ardor, and the lessened dexterity in the use of their peculiar weapons, the bow and the sword. These complaints are often now to be found in the Peking gazettes."—*Ch. Repos.*, v. 170.

Justice and leniency in the administration of punishments was inculcated. "All current works of popular teaching are full of a similar spirit; and the same may be said of the odes, proverbs, toy-books, tales, most widely circulated in the empire. The Penal Code itself opens with a distinction between nominal and actual punishments, which leaves a wide margin for humane administration."—*Johnson, Or. Rel.—Ch.*, pp. 45–6.

"I think it must be conceded that the Chinese are cruel."—*Parker, China*, pp. 270–1. See instances given.

"The first Mantchu Emperor kept his vow, to immolate two hundred thousand Chinese to his murdered father's memory."—*Simcox*, ii. 249.

[The existence of the system of blood revenge is indicated in the Cantonese saying: "The three surnames of Liu, Wang, and Chêng are so powerful that they need not give life for life in homicidal cases."]—*Ch. Rev.*, xiii. 50.

"The approbation of suicide under depressing circumstances in China may be said to amount to enthusiasm. Pagodas are erected to the 'beautiful suicide of love.' Honorary tablets are frequent to widows who have betaken themselves to their lost husbands. So fashionable became such suicides, that in the early part of the last century an imperial edict forbade this public reward. The reader of the 'Peking Journal' will still find petitions for these tablets, especially in behalf of daughters who are described as models of filial piety, for putting an end to their lives in imitation of their mothers. Even the self-immolation of widows amidst crowds of spectators still occurs."—*Johnson, Or. Rel.—Ch.*, pp. 40–1. See also *Scarth, Twelve Years*, p. 106, who states that after the unsuccessful rebellion in Canton, rebels were invited to commit suicide, and pavilions, with every convenience for that purpose, were erected by the officials. The small regard for human life was shown by men sometimes killing themselves out of revenge, or to escape disgrace, or when unable to pay debts, and suicides by widows, girls whose fiancés had died, or who fear they may be forced to break vows of celibacy, or by sons or daughters unwilling to survive a parent, were considered honourable (*Giles, Sketches*, pp. 129–32). On suicide generally see *Matignon, Superstition, etc.*, pp. 67–142, and on infanticide, pp. 157–86.

"Temperance . . . is a Chinese virtue." ". . . Neither drunkenness nor 'drinking' exists in China: the exceptions are a minimum quantity. In eating there is no question of indulgence in the case of 95 per cent. of the population."—*Parker, China*, p. 276.

"At a Chinese market in the afternoon it is a very common thing to see people stupidly and even reeling drunk. I have even known murders committed at these markets by intoxicated persons."—*N.-C. Herald*, Aug. 27th, 1902.

[Women were on the whole well treated by their husbands. Giles says that wife-beating is unknown, though power of life and death is under certain circumstances vested in the husband (*Penal Code*, § 293), while, on the other hand, a wife may be punished with 100 blows for merely striking her husband, who is also entitled to a divorce (*ibid.* § 315).]—*Chinese Sketches*, pp. 11–14.

"The Chinese family life compares favourably with the somewhat too loose bonds of the occidental,—in fact, in family life China presents herself at her best."—*Möllendorff, Fam. Law.*, p. 4.

"Seduction and adultery are comparatively infrequent, the former may even be said to be rare; but brothels and their inmates occur everywhere on land and on water."—*Williams, Midd. King.*, i. 834.

[Unnatural vice was common.]—*Matignon, Superstition, etc.*, pp. 187–209.

Miss Lily Happer, A.P.M. Canton, says that "the seclusion of the women . . . is carried so far that sometimes they are unwilling to see a male physician of their own people; often only allowing the hand and wrist to be exposed so that the pulse can be felt, and keeping the face hidden."—*Woman's Work*, iii. 60.

Miss H. Noyes says: "The Cantonese ideas of propriety are such as to make it seem impossible to establish a school for girls under the instruction of a male teacher. I think even the native Christians would hardly be willing to send their daughters to such a school. In wealthy families, however, it is not uncommon for the daughters to be taught by a man; perhaps a relative, or an old friend of the family; and it is always esteemed a great advantage."—*Ibid.* ii. 135.

"It is not considered proper that men, if strangers, should remain long in the presence of women." [The author relates, how he and a companion, when resting in the shade, within sight of a garden in which two women were working, were requested to move on.]—*Simon, Cité chinoise*, pp. 11–12.

"They reckon it indecorous in women of birth and breeding to show even their hands, and in touching or moving anything these are generally covered by the long sleeve."—*Davis, Chinese*, i. 322–3.

The women's "dress is extremely modest and becoming. . . . What we often choose to call *dress* they would regard as absolute nudity, and all close fitting to the shape as only displaying what it affects to conceal."—*Ibid.* i. 358.

"Doubtless Chinese ladies speak of many subjects with the freedom of the days of Queen Elizabeth; but how women can be called mock modest who always remain fully clad in such damp heat as leads men to strip to the waist in all their shops, as also at their dinner parties, when summer is at its height, I cannot understand. The amount of suffering from heat that must be undergone by women in consequence of their observance of decorum seems not at all to have been sufficiently appreciated. I have never yet seen a Chinese woman insufficiently clad, nor committing any act that could possibly be considered indecent. The whole behaviour of Chinese ladies would lead me to suppose that they would shrink from anything of the kind. . . . The women leading a vicious life . . . have for the most part been sold into slavery in their childhood, their families not having enough rice to feed them. . . . Doubtless there are in China, as in other countries, women who prefer vice to virtue; but if I am any judge of expressions or manners, these last must be rarer in China than in any other country with which I am acquainted."—*Little (Mrs. A.), Int. China*, pp. 169–70.

"Chinese ladies appear very affectionate, and are very caressing. Whether they really do like me or not, they almost always succeed in making me think they do; and I think other European ladies would say the same. But as to whether the holding one's hand and occasionally stroking it means anything, I really do not know. They never have shown me anything, unless they wanted to sell it, except their children. . . . It must be recollected that to the Chinese a foreign woman's tight-fitting dress showing her figure is very indecent. It also seems to them very shocking for a lady to go about unattended by a woman; and for a woman to stand up firmly on her feet and walk on them like a man seems far more indelicate than it does in England to wear so-called rationals. . . . They are, indeed, greatly concerned about our indecency."—*Ibid.* p. 87.

"In a Chinese city one does not at night hear the cries of women as one too often does in London."—*Ibid.* p. 180.

"The Chinese are undoubtedly a libidinous people, with a decided inclination to be 'nasty' about it. . . . A check is placed upon this national characteristic by the almost universal practice of early marriage. Moreover, 90 per cent. of the population are too poor even to think of any further indulgence than the possession of a single wife affords. . . . Most rich mandarins . . . go beyond necessity, and they are the most profligate class. Next come the wealthy merchants; but these, when living at home, are naturally more bound to decency by family ties than are the mandarins who move about to temporary habitations with their servants and concubines. Still, amongst all classes and ranks the 'moral sense' is decidedly weak."—*Parker, China*, pp. 272–3.

The "Temple of Longevity" in Canton "was destroyed in November, 1881, by a mob who were incensed at the alleged misbehaviour of some of the priests towards the female devotees—an instance of the existence in China of a lively popular sentiment regarding certain matters."—*Williams, Midd. King.*, i. 164.

[Ch'ao Chou Fu in Kuang Tung was famous for the number of its catamites. See also *Parker, China*, p. 273.]

[For the scale of virtues and vices in the treatment of slaves see REG. OF LAB.; for the tone of the drama, ÆSTHETIC PRODUCTS; and for prostitution, MARITAL.]

RELIGIOUS IDEAS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

The soul.—[The soul, at first regarded as single and abiding with the body after death, came to be looked upon as of two parts, the *hun*, *ch'i*, or *shên* (after death *ming*), which returns to heaven, and the *p'o* (*kuei*) which returns to earth with the body. The *kuei*, in soul worship, was prior to the *shên*. The *kuei* abode with the buried body in the grave. The *shên*, or the *ming* of the *shên*, dwelt about the spot, and particularly in the inscribed grave-stone. Either part of the soul was separately sacrificially worshipped. The soul could leave the body (as in dreams) and enter other things besides human bodies: "All that exists is animated."]—*De Groot, Rel. Syst.*, iv. 1–69. As to the multiplicity and divisibility of human souls, the assistance given to the idea of the soul by shadows, and disease of the soul, insanity, convulsions, etc., see *ibid.* pp. 70–122.

Future Life.—"The emperor Pwan-kăng, irritated by the opposition of the wealthy and powerful Houses to his measures, and their stirring up the people also to murmur against them, threatens them all with calamities to be sent down by his High ancestor, T'ang the Successful. He tells his ministers, that their ancestors and fathers, who had loyally served his predecessors, were now urgently entreating T'ang, in his spirit-state in heaven, to execute great punishments on their descendants. Not only, therefore, did good sovereigns continue to have a happy existence in heaven; but their good ministers shared the happiness with them, and were somehow round about them, as they had been on earth, and took an interest in the progress of the concerns which had occupied them during their lifetime. Modern scholars, following in the wake of Confucius, to whom the future state of the departed was all wrapt in shadows, clouds, and darkness, say that the people of the Shang dynasty were very superstitious." "There is no hint in the Shoo nor elsewhere, so far as I am aware, of what became of bad emperors and bad ministers after death, nor, indeed, of the future fate of men generally. There is a heaven in the classical books of the Chinese; but there is no hell; and no purgatory. Their oracles are silent as to any doctrine of future rewards and punishments. Their exhortations to well-doing, and their warnings against evil, are all based on a reference to the will of God, and the certainty that in this life virtue will be rewarded and vice punished. 'Of the five happinesses, the first is long life; the second is riches; the third is soundness of body and serenity of mind; the fourth is the love of virtue; and the fifth is doing or receiving to the end the will of Heaven.' There is no promise of rest or comfort beyond the grave. The virtuous man may live and die in suffering and disgrace—let him be cheered. His posterity will reap the reward of his merits. Some one, sprung from his loins, will become wealthy, or attain to distinction. But if he should have no posterity:—it never occurred to any of the ancient sages to consider such a case."—*Legge, Ch. Class.*, III. i. Prol. pp. 195–6.

[As to the fondness for superstition which was characteristic of the Shang dynasty, see also *ibid.* III. ii. 338, note.]

"Later times charge the Shang dynasty with being superstitious. Officiousness—sacrificing unnecessarily to certain spirits, and at unnecessary times—and the attempt to please them by the multitude of observances, would seem . . . to be the things . . . condemned by Yuĕ [in *The Charge to Yuĕ, Shu ching*, Pt. IV. Bk. VIII. Pt. ii. 11]."—*Ibid.* III. i. 258, note.

Fairies.—"The Chinese have the most profound belief in the existence of fairies. In their imagination, the hills and the mountains that are supposed to be the favourite resorts of these mysterious beings are all peopled with them, and from these they descend into the plains, and mingling in the guise of men and women amongst the masses of this Empire carry out their benevolent purposes in aiding the distressed and the forlorn." "The conceptions that people generally have about them are necessarily of a vague and indefinite character. They are fully convinced, however, that they are highly intelligent and with large and loving sympathies for everything human, and they also believe just as strongly that they have played an active part in connexion with men during all the centuries of the past, and that in the great crises through which men have been called to pass, they make it a point to be present on such occasions to help men to come through their trials and to survive the calamities that might otherwise have destroyed them. During the changes of dynasties, and in times of revolution and anarchy when men's lives are accounted of little value, these benign beings are supposed specially to manifest themselves to aid as far as possible in alleviating human misery and in suggesting modes of escape from impending disasters." "The common theory about fairies is that originally they were all men and women, who were born of human parentage and passed through the common experiences that mankind have to encounter. They were not content, however, to submit to pain and sorrow and death, things that men usually deem inevitable, but their hearts were warmed with a nobler ambition, and they determined to work out a salvation from such and thus to emerge into a condition where life would be unending and where no sadness should ever cloud their spirits, and no tears ever dim their eyes." "The first step to this condition of immortality must be an absolutely pure life. There must be no yielding to evil, neither in thought nor in action. Every wrong passion must be sternly repressed and only thoughts of good must be dwelt upon. The one essential thing about this goodness is that there must be a profound love for man. Any ill will to man or any indifference to his well-being would at once arrest any progress that had been made towards a fairy life." "In addition to these requisite qualifications there is also a very rigorous discipline that must be endured, if a man would hope to be delivered from the human conditions that bind him down to earth. He must gradually give up all the ordinary food of men, and live on certain herbs that are to be found on the mountains. He must search out for the elixirs of immortality that are hidden from the gaze of ordinary men, but are discoverable to those whose purpose it is to become fairies. After a certain course of this diet, the body loses its coarseness and becomes more ethereal, so that it mounts in the air and can travel long distances without any fatigue whatsoever. In all his travels, however, or in his repression of the merely sensuous part of his nature, the man must never forget that he must continually keep before him some great benevolent purpose by which men are to be benefited. The love of money, too, must be absolutely banished from his mind and no selfish thought of enriching himself must ever be allowed to enter his heart."—*N. C. Daily News*, Jan. 29, 1909. For the incarnation of Lao Tzŭ during the Shang dynasty see following Period.

Animal-worship, etc.—[On zo-anthropy generally see *De Groot*, iv. 156–63, and on the different classes of animals (were-tigers, wolves, dogs, foxes, bears, stags, monkeys, rats, horses, donkeys, cows, bucks, swine, etc.), pp. 163–212. On were-reptiles ("tortoise-worship may be said to have a somewhat extensive literature of its own, and dates back as far as 2900 B.C."—*Balfour, Leaves*, pp. 151–2), birds, fishes, and insects, *De Groot*, iv. 212–43, on plant-spirits, pp. 272–324, on Demonology and Sorcery, vol. v, and on the war against spectres, vol. vi.]

Superstitions.—"Tradition . . . speaks of the existence of white foxes at the time of the Emperor Yü (2200 B.C.), and of that monarch having a lucky omen in the sight of one when

he was seeking a bride. Afterwards these rare and beautiful creatures came to be regarded as of ill omen."—*Journ. N.-C.B.R.A.S.*, N.S. viii. 47.

"Fire was looked upon since early times among the Chinese as a great purifier, and large state fires were kindled at the beginning of each season, to ward off the evil influences of the incoming period. Special wood fuel was selected with that object. The management of these fires was in the hands of a Director of Fire. The first appointment of this kind dates from the reign of Ti Kuh Kao Sin, the fourth ruler of the Bak Sings in China (2160–2085 B.C.)."—*Lacouperie*, *Western Origin*, p. 161.

"A pheasant suddenly makes its appearance and crows, while Kaou-tsung is engaged in the supplementary sacrifice to T'ang. This is understood to be indicative of something wrong in the service, and Tsoo Ke, a worthy minister, proceeds to lecture the emperor on the subject."—*Legge*, *Ch. Class.*, III. i. 265, note.

"More than eleven centuries ago Chen Tsang-khi wrote: 'The very best among such old coffin boards which become better as they grow older, are those of *San* wood. When these are a thousand years old, they are imbued with *shen* afflatus, and they should then be used for making the sounding boards of harps.'"—*De Groot*, *Rel. Syst.*, i. i. 329.

Religions.—"The Shu king [gives evidence that] the worship of Yao and Shun is a monotheism, with an inferior worship of spirits. . . . The original monotheism of the Chinese remains in the state worship of to-day."—*Legge*, *Religions of China*, pp. 16, 23, 51.

"The idea of a Supreme Being is brought out very fully in the Odes. . . . He is apparently in the form of man, for in one place we read of His footprint. . . . He comforts the afflicted. He is free from error. His 'Way' is hard to follow. He is offended by sin. He can be appeased by sacrifice."—*Giles*, *Hist. of Ch. Lit.*, p. 20.

"The name by which God was designated was *the Ruler*, and *the Supreme Ruler*. . . . We find it constantly interchanged with the term *Heaven*. . . . By God kings were supposed to reign, and princes were required to decree justice. All were under law to Him, and bound to obey His will. Even on the inferior people He has conferred a moral sense, compliance with which would show their nature invariably right. All powers that be are from Him. He raises one to the throne and puts down another. Obedience is sure to receive His blessing; disobedience, to be visited with His curse. The business of kings is to rule in righteousness and benevolence, so that the people may be happy and good. They are to be an example to all in authority, and to the multitudes under them. Their highest achievement is to cause the people tranquilly to pursue the course which their moral nature would indicate and approve. When they are doing wrong, God admonishes them by judgments,—storms, famine, and other calamities; if they persist in evil, sentence goes forth against them. The dominion is taken from them, and given to others more worthy of it."—*Legge*, *Ch. Class.*, III. i. Prol. p. 193.

"The chiefs and rulers of the ancient Chinese were not without some considerable knowledge of God; but they were accustomed, on their first appearance in the country, if the earliest portions of the Shoo can be relied on at all, to worship other spiritual Beings as well."—*Ibid.* III. i. Prol. p. 192.

'God or Shang-ti was adored in antiquity on the top of a mountain; the chief of the nation, the emperor, alone ascended this mountain, whilst the people remained standing at its foot. There the emperor *prayed* to the Supreme Ruler, to Him who had created everything. For this purpose five mountains were destined, called 'The Five Peaks.' Afterwards the loss of time occasioned by the voyages to these mountains suggested the idea to erect a building for the purpose of praying to Shang-ti. This building was called, under the first dynasty Hia, . . . the *Shi-shih*, 'The House of Generations and Ages,' or the temple erected by the dynasty of Hia in honour of Him who made the ages and generations. Under the Shang dynasty, . . . this temple was called the Shang-chung-uh, or 'The temple renewed by the Shang dynasty.'"—*Schlegel*, *Hung League*, p. xvi.

"The first objects of religious veneration among the ancient Chinese were undoubtedly Heaven and Earth; they are the two greatest of the three great Powers of Nature, and the progenitors of the third, which is Man."—*Giles*, *Historic China*, p. 386.

"Ancestral worship seems to be the national religion of China."—*Dudgeon*, *Diet*, &c., p. 283.

"There was also among the early Chinese the religious worship of their departed friends, which still continues to be observed by all classes from the emperor downward, and seems of all religious services to have the greatest hold upon the people. The title given in the Shoo to Shun's Minister of Religion is that of 'Arranger of the Ancestral Temple.'" "The spirits of the departed were supposed to have a knowledge of the circumstances of their descendants, and to be able to affect them. Events of importance in a family were communicated to them before their shrines; many affairs of government were transacted in the ancestral temple. When Yaou demitted to Shun the business of the government, the ceremony took place in the temple of 'the accomplished ancestor,' the individual to whom Yaou traced his possession of the supreme dignity; and while Yaou lived, Shun, on every return to the capital from his administrative progresses, offered a bullock before the shrine of the same personage."—*Legge*, *Ch. Class.*, III. i. Prol. p. 195. See the same in *Lacouperie*, *West. Orig.*, p. 377.

"Who the 'six Honoured ones,' whom Shun sacrificed to next to God, were, is not known. In going on to worship the hills and rivers, and the host of spirits, he must have supposed that there were certain tutelary beings, who presided over the more conspicuous objects of nature, and its various processes. They were under God, and could do nothing, excepting as they were permitted and empowered by Him; but the worship of them . . . must have always been the parent of many superstitions; and it paved the way for the pantheism which enters largely into the belief of the Chinese at the present day, and of which we find one of the earliest steps in the practice, which commenced with the Chow dynasty, of using not only the term *Heaven* as a synonym for God, but the combination *Heaven and Earth*."—*Legge*, III. i. Prol. p. 194.

"Now when I offer the great sacrifices to my predecessors, your forefathers are present to share in them. They observe the happiness I confer and the sufferings I inflict, and I cannot dare to reward virtue that does not exist."—*Shu ching*, Pt. IV. Bk. VII. Pt. i. 14; *Legge*, III. i. 230.

"The spirits do not always accept the sacrifices which are offered to them;—they accept only the sacrifices of the sincere."—*Ibid.* Pt. IV. Bk. V. Pt. iii. i.; *Legge*, III. i. 209–10.

"I think it likely that the breath or air, *khî*, became the name with the earliest Chinese for their first concept of *spirit*; then the breath inspired or inhaled was called *kwei*, and became the name for the grosser part of the spirit, returning to the earth; and *shăn*, the breath exhaled or expired, the name for the subtler and intellectual spirit, ascending to a state of activity and enjoyment. The explanations of the terms in the *R Yâ* and other dictionaries seem to justify this view. The combination *kwei shăn* is sometimes best translated by 'spiritual beings.' The school of the Sung philosophy understand by it—the contracting and expanding of the primary matter, or that matter conceived of in two forms or with two opposite qualities. . . . Whatever be thought of the Sung speculations and theories, I think that a translator ought to give an indication of the primary meaning of the name *kwei shăn*."—*Legge*, *Yi King*, p. 419, note.

"The religion of the Shu is in three things: faith in righteousness, in the people, in Heaven. A concrete virtue: no abstract creed, no class nor caste interferes from without with the movement of the political order: celestial wisdom is embodied in institutions, including official rites as their safeguard and filial bond; the true prince comes, by the divine appointment of character, to enthrone righteousness; the overthrow of an evil dynasty is the justice of a divine order, whose indications are ever at hand, shown indeed by divination to the wise though the interpretation must rest with human judgment, rightly weighing the facts (*Shu-king*, Pt. V. B. iv. Later critics call divination the superstition of the Shang; but scarcely any have repudiated it. *Legge*, note, p. 338)."—*Johnson*, *Or. Rel.—Ch.*, pp. 491–2.

Divination.—The practice of divination "had prevailed in China for more than a thousand years before the time of king Wên."—*Legge*, *Yi King*, Introd. p. 10.

"Divination was practised in China from a very early time. I will not say 5,200 years ago, in the days of Fû-hsî, for I cannot repress doubts of his historical personality; but as soon we tread the borders of something like credible history, we find it existing. In the Shû King [II, ii, 18], in a document that purports to be of the twenty-third century B.C., divination by means of the tortoise-shell is mentioned; and somewhat later we find that method continuing, and also divination by the lineal figures, manipulated by means of the stalks of a plant (*Shu*, V, iv, 20, 31), the *Ptarmica Sibirica*, which is still cultivated on and about the grave of Confucius, where I have myself seen it growing."—*Ibid.* p. 40.

"Our present Yih King is entirely a book of the Chow dynasty; but the text shows that the manipulation of Fuh-he's lines, and the derivation of meanings from the combination of them were practised, at least to some extent, in the earlier times."—*Legge*, *Ch. Class.*, III. ii. 336, note.

"Although the ancient Chinese can hardly be said to have had the knowledge of a future state, and were not curious to enquire about it, they were anxious to know about the wisdom and issues of their plans for the present life [*cf. infra*]. For this purpose they had recourse to divination." Shun practised it, "if we can put faith in 'The Counsels of Yu.' The instruments of divination were the shell of the tortoise and the stalks of a certain grass or reed. By various caustic operations on the former, and by manipulations with the latter, it was supposed possible to ascertain the will of Heaven. . . . One observation ascribed to Shun is worthy of remark. He tells Yu that 'divination, when fortunate, must not be repeated ("The Great Plan" Sec. 7).'"—*Ibid.* III. i. Prol. pp. 196–7. In *Shu ching*, II. ii. II. 18, divination is used to determine the successor to the throne.

"It would appear that the emperor [P'an Kêng] submitted the conclusion to which he came [to remove the capital to Yin] to the decision of the tortoise, and when the divination approved of the transference of the capital, the people ceased their opposition."—*Legge*, III. i. 246, note. See also *ibid.* III. i. Prol. p. 196.

[Divination was practised as a preliminary to building (*Shu ching*, Pref. 46).]

[A tortoise was employed at the imperial court for divination. It was supposed to measure, lengthways and across, a cubit and two inches.]—*Legge*, III. i. 271, note.

"One of the undoubtedly ancient elements in Chinese religion—the practice of divining by the tortoise-shell—may not have been peculiar to them. Choo-hi says of it, 'The way of divination by the tortoise was by the application of fire to scorch the tortoise-shell till the indications appeared on it.'"—*Simcox*, ii. 37, note 2.

"As soon as the curtain lifts from China, and we get a glimpse of its greatest men about four thousand years ago, we find them trying to build up a science of the will of Heaven and issues of events, from various indications given by the shell of a tortoise and the stalks of the milfoil! . . . We may be sure that if such was the practice of the sages, superstitious observances entered largely as a depraving and disturbing element into the life of the people."—Legge, *Ch. Class.*, III. ii. 334–5, note. See also p. 351, and *passim*. "On great emergencies all the officers, great and small, united in the ceremony of divination."—*Ibid.* p. 352, note.

"The two kinds of divination were—first, that by means of the tortoise, or tortoise-shell rather, called 卜; and that by means of the stalks of the 蓍 plant, called 筮. 'The tortoise,' says Choo He, 'after great length of years becomes intelligent; and the 蓍 plant will yield, when a hundred years old, a hundred stalks from one root, and is also a spiritual and intelligent thing. The two divinations were in reality a questioning of spiritual beings, the plant and the tortoise being employed, because of their mysterious intelligence, to indicate their intimations. The way of divination by the tortoise was by the application of fire to scorch the tortoise-shell till the indications appeared on it; and that by the stalks of the plant was to manipulate in the prescribed way forty-nine of them, eighteen different times, till the diagrams were formed.' See the Chapter on Divination in the 'Historical Records.'"—*Ibid.* p. 335, note. For the various indications and the way in which they were obtained, see *ibid.* p. 336, note.

With regard to the rules for the application of the results of divination and the varying conclusions of men, to the solution of doubts, "Choo He observes that the opinions of men were first taken into consideration, but as they are liable to be affected by ignorance and selfish considerations, the views of the spirits, above such disturbing influences, and intimated by the divinations, were to have the greater weight in the final determination."—*Ibid.* p. 337, note.

"The object of the divination, it should be acknowledged, was not to discover future events absolutely, as if they could be known beforehand, but to ascertain whether certain schemes and conditions of events contemplated by the consulter, would turn out luckily or unluckily."—*Ibid.* pp. 40, 41.

"Occasionally, in the field of Chinese literature, we meet with doubts as to the efficacy of divination, and the folly of expecting any revelation of the character of the future from on old tortoise-shell and a handful of withered twigs; but when this [third] Appendix [to the *I ching*] was made, the writer had not attained to so much common sense. The stalks were to him 'spirit-like,' possessed of a subtle and invisible virtue that fitted them for use in divining."—*Legge*, *Yi King*, Introd. pp. 41–2.

"Many Chinese of more recent times seem to have an uneasy feeling of dissatisfaction on the subject of the ancient divinations; but hardly one has the courage boldly and fairly to disown them. To do so would be inconsistent with the proper veneration for the sages."—*Legge*, *Ch. Class.*, III. ii. 338, note.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Death, the soul, etc.—"The Chinese are . . . far from regarding death as an absolute reality. Life remains after the soul has left the body; the survivors even entertain a lingering hope that the soul may re-enter the clay and thus cause resurrection to take place. Taking for granted that the accumulated experience of ages has done something to establish among the people a notion of the reality of death, it is not beyond the pale of logic to conclude that the belief that the soul does not forsake the body, either before or after interment, and that it may recall it to life, must have borne a more potent sway over the Chinese mind in times gone by than it does at the present day. For the correctness of this conclusion we have abundant and direct testimony in the written documents of the empire. Numerous customs and practices having an important influence in the domain of religious and social life have been called into existence by this belief."—*De Groot*, *Rel. Syst.*, i. i. 241–2.

"The idea of the soul ascending to heaven after death is old Chinese, applicable to the case of wise kings. Wen Wang is said to have ascended to heaven after death." This is quite distinct from the Tauist "notion of the body ascending, which appears to have been imported from abroad," and originated the later legends of the Hu people who had the power of ascending to heaven and descending thence, and of Hwang Ti, the Yellow Emperor, having gone up to heaven."—*Journ. R.A.S.*, xviii. 26.

[Dreams were believed in and acted upon. Wu Wang's queen dreamt that the Ruler of Heaven said to her: "I name your son Yü," etc. At his birth the character Yü was visible on his hand, and was consequently assigned to him as his name. See also *infra* for the dream presaging the birth of Confucius.]—*Ch. Rev.*, xiii. 413.

"Ku-yen-wu tells us that it was at the end of the Chow dynasty that the connection of the genii 故 仙 with T'ai shan began; and that it was at the end of the Han dynasty that the same mountain began to be made the local home of the souls of the dead. We cannot say that the genii were known in the Hia, Shang and Chow dynasties or before, because they are not alluded to in the Tso-chwen or in the Kwo yü. Continuing this reasoning, we may determine that before B.C. 48, there was no talk of the souls of the dead. This is what Ku-yen-wu says, but in fact 'the calling back of the departed soul' of the poet Sung-yu belongs to the 3rd century B.C. and the doctrine of Hades where souls exist is alluded to in a well-known passage in the Tso-chwen directly or by implication. Foreign elements in Taouism had already entered China by two routes, the north-western and the southern. Both before and after Tso's time, western ideas were rapidly arriving, and were changing the religious belief, philosophy, and science of the Chinese nation in a quiet but most effective manner." "Ku-yen-wu continues, T'ai shan is on the east and Kang-fu 亢 父 on the west; Kang-fu knows about life, and Liang-fu is the lord of death. He then quotes the poet Po-wu-chi as saying that 'T'ai shan is grandson of heaven . . . [and] in virtue of this relationship (that is, the spirit of the mountain) has the control of the souls of men and knows the length of men's lives. Passages like this which show how old these legends are are very rare, but there is another which may be added to the testimony of the Po-wu-chi. It is that statement in the Han-shu which mentions that Hü-ch'ün went to T'ai shan to pray that he might be healed of a sickness from which he had suffered for three years. Also in the account of foreign countries it is said that among the Chwan people the souls of the dead go to the red mountain several thousand *li* to the N.W. of Liau-tung, just as in China the souls of the dead go to T'ai shan." [Dr. Edkins derives this belief from the Persians, from whom also the Japanese got their doctrine of a Hades.] The indigenous theory of the origin of the Tauist religion greatly needs to be amended and improved by the introduction of Hindoo and Persian elements [and the more ancient ideas of 2000–3000 B.C. were probably also largely due to foreign influence.]—*Ch. Rev.*, xviii. 61.

"The doctrine of the endless succession of worlds (the duration of each one constituting a Kalpa, or the 'Great Year' of the Stoics) is frequently alluded to in the Chinese classics. It is taught distinctly in the *Yih-King*, *e.g.*, 'When the Sun comes to the meridian he declines; when the Moon is full, she wanes; Heaven and Earth (in like manner) are alternately full and empty (*i.e.* opened out and chaotic) and the seasons decrease and increase (again); how much more men and Demon-gods!' (Sec. II; p. 40). The formation of each world is attributed to the chief Demon-god 'Keën' or Heaven, who is the good principle or Light; and this is always called the 'opening out' of the world, and is compared to the opening of a door, in allusion to the Ark, the allegorical Great Mother, who generates all things; while the destruction of each world when all things return to Chaos or the Ovum Mundi, is attributed to *Kwăn*, or the Earth, who is the evil principle, or Darkness; and this return into Chaos is compared to the shutting of a door." . . . "The paraphrase [on *Yih-King*, iii. 10] compares each 'opening and shutting' to a *year* and designates each 'a revolution of nature.' It also represents these revolutions as going on endlessly. . . . In the *Po* diagram all things are represented as coming to an end in consequence of the *depravity of mankind*, the 'mean

man' gaining the ascendancy, and the 'Prince' or *Keën*, the 'Mind' who generates all things retiring . . . into quiescence. At the *Fuh* diagram, however, this 'Mind' returns and generates a new world from the materials of the old." [This is supported by quotations from Choo-tsze (Ch. 49, T.T. 5. 6), Sing-le-ta-tseuen (viii, 13), and the "Mirror of History."]—*Ch. Rec.*, iii. 235–6.

Powerful men.—"The references to Yaou and Shun in the succeeding parts [to the Canons of Yao and Shun] of the Shoo are so very scanty as to excite our surprise, and induce the idea that it was not till the time of the Chow dynasty that they obtained the prominent place in the early history of the Empire which is now assigned to them." "In the Books of Hea, Shun is not mentioned at all, and Yaou is mentioned only once." "In the Books of Shang, Yaou and Shun are mentioned once. . . . By this time Yaou and Shun had become mythical personages, embodying the ideal of a perfect sovereign."—*Legge, Ch. Class.*, III. i. Prol. pp. 55–1.

"In thus disposing of the existence of superior powers, the philosophers do not shut out all intelligent agencies, but have instituted a class of sages or pure-minded men of exalted intellects and simple hearts, who have been raised up from time to time by Heaven, Shanghti, or some other power, as instructors and examples to mankind, and who therefore deserve the reverence of their fellows. The office of these *shin jin* [*shêng jên*], 'perfect men' or saints, is to expound the will of heaven and earth; they did not so much speak their own thoughts as illustrate and settle the principles on which the world should be governed; they were men intuitively wise without instruction, while common people must learn to be wise. Of all the saints in the calendar of the *Ju kiao* Confucius is the chief; with him are reckoned the early kings, Yao and Shun, with King Wân and his two sons King Wu and Duke Chau; but China has produced no one since the 'most holy teacher of ancient times' whom his proud disciples are willing to regard his equal—Mencius being only a 'number two saint.' The deceased Emperors of the reigning dynasty are canonized as its efficient and divine patrons, but a new line of monarchs would serve them as they did their predecessors, by reducing them to mere spirits."—*Williams, Midd. King.*, ii. 201–2.

Fairies.—"Many names of benevolent fairies are mentioned who have . . . appeared and who have distinguished themselves by the active part they have taken in times of great peril to the men of the Middle Kingdom. Lau-tze is one of these. By ordinary historians he is looked upon simply as a great man who was born about the close of the sixth century B.C. and who became the founder of the Taoist system of philosophy. The romancists, however, and the students of fairy lore have a very different theory about him. They declare that he was originally a fairy, and that on several occasions he left the Western Heaven and became a man, in order that he might rescue men from the sorrows that the bad government of some vicious and unprincipled King was bringing on the country." "They appeal to his very name as an evidence that he did not enter into life as ordinary mortals do. Lau-tze translated into English means the aged son, for that most veracious thing, tradition, positively affirms that eighty-one years elapsed before his mother could give him birth, and that when finally he was born the hair with which his head was covered was as white as snow, whilst three wrinkles furrowed his forehead and gave him a prematurely old appearance." "That Lau-tze had various incarnations is very widely believed by the readers of fairy lore. It is positively asserted for example that he appeared during the latter days of the Shang dynasty (B.C. 1766–1121), when the unprincipled conduct of its last king was causing rebellion amongst his nobles, and alienation of heart amongst his people generally. In the interests of the nation as a whole, Lau-tze had no hesitation whatever in espousing the popular side, and it is believed that he not only gave valuable advice to Prince Wu the founder of the dynasty that succeeded the one just overthrown, *viz.* the Chow, B.C. 1122–255, but also that the countless spirits that he summoned from the unseen world fought on the side of the rebellious nobles and finally secured them the victory." "Prince Wu the founder of the great Chow dynasty is a famous man in the annals of China and his name is always linked with those of the distinguished Kings Yao and Shun, who in the estimation of the Chinese are the beau-ideal rulers, whose reign brought untold blessings upon the Flowery Land. That this Prince was so successful in the government of China was mainly due, it is believed, to the influence that this fairy counsellor exercised over him, and to the wise counsels that he was able to give him in all the emergencies in which he was placed."—*N.-C. Daily News*, Jan. 29th, 1910.

Ancestor-worship.—"If we were to search through every class of society in China for the one spiritual force that influences and dominates them all, we should find it to be ancestor worship. There is no other in the region of belief that would take its place for a moment. A man for example may worship the idols or not; he may profess a belief in them or he may express his utter scepticism about them, and no one cares a button what he thinks. Let a man, however, neglect the worship of the dead, and he is looked upon with the utmost scorn, both by his own kindred and also by his neighbours. The bitterest taunt that the heathen can hurl against the Christian, and the one that stings him most is the sneering statement that he has no ancestors."—*Macgowan, Lights and Shadows*, p. 71.

"This worship dates back to the very earliest times of Chinese history. Confucius in his 'Record of Rites,' lays down minute rules as to the etiquette that should be observed in its performance. It would seem, however, as though its character has materially changed since his time. Then the services in the ancestral temples were simply memorial ones, in order to keep alive the recollection of the loved ones that had passed away and to prevent their memory from fading out of the minds of the living."—*Ibid.* p. 71.

"During the centuries that have elapsed since then, a great many accretions have been added to the original idea. Men after a time began to believe that the founders of their clans, though dead, possessed great power in the land of spirits and that they could control the lives and fortunes of their kindred on earth. With the gradual growth of this belief, faith in ancestor worship struck its roots deeper and deeper into the hearts of the nation. Since the prosperity or adversity of the clan depended upon the dead father of the race, it became an article of prime importance that regular worship should be paid to them, and that the bond that bound the living and the dead should never be snapped even for a moment. The idea of kindly recollection of the dead has vanished and men keep up the worship of them now simply because they fear that if they neglect them, decay of fortunes and sorrows innumerable will fall upon the homes of their posterity."—*Ibid.* pp. 71–2.

"The Chinese theory is that a man has three souls. When he dies one of these goes into the 'dark world,' where it is believed that it finds a state of things very similar to that he left in this life. The popular ideas, however, on this subject are very vague, and will not bear pressing too closely, but there is a general conception that the other world is a counterpart of this, only its conditions are of a decidedly inferior, and less cheerful character. A second soul remains in the tomb, whilst the third enters the ancestral tablet, and it is with these two last that ancestor worship is entirely concerned."—*Ibid.* p. 72.

"If the man be a chief of his clan, his tablet is placed in the ancestral temple amongst those of the distinguished men of his kindred, but if he is an ordinary individual, it is put in some convenient place in his old home, where it is cared for by the friends that mourn his loss. The spirit in the grave is worshipped once a year in the spring at the festival called the 'Feast of Tombs.' In some respects this ceremony is one of the most interesting sights that one meets with in China. The hills and mountains that abound in the southern part of the Empire are the favourite places where the people like to bury their dead. This is not entirely from an aesthetic point of view, but simply because the 'Fêngshui' there is believed to be so powerful that it will combine with the efforts of the dead ancestors in sending down blessings upon the living descendants."—*Ibid.* p. 72.

"It is the custom at the 'Feast of Tombs,' for nearly the whole population to turn out and visit their family graves on the hillsides. The husband and the wife and the little ones troop out with happy faces for their joyous expedition to the hills. It is an annual picnic that, for the youngsters at least, has a fascination and a charm that have put sunshine into their lives for weeks before. The man carries a hoe and his wife sundry good things in a basket that are to serve both as offerings to the dead and as the feast that they will all by-and-by partake of when the service is over."—*Ibid.* pp. 72–3.

"The appearance of the mountains at this time is a highly picturesque one. They are bathed in floods of sunshine that steeps them with a glory that dazzles one to look upon. And see how beautifully they are fretted and veined with shadows. Here a monster cliff, projecting from the face of the mountain, paints a dark picture of itself on the glowing canvas, whilst there light and transparent shadows of the passing clouds travel over the sunlit face of the hill and add the grace and charm of variety to it. The grass, amber hued, dyed by the winds that sung and sighed amongst it during the winter months, seems to be looking piteously for the Spring rains to flash the green back again into it, whilst the hills that one can see in the distance appear dusky red when viewed through the hazy glory of the fiery rays of the sun." "The figures that move in and out the thousands of graves that dot the face of the hills give them a warm and living look. The men and women in their dull blue cotton clothes seem like delicate shading in the fierce light by which they are enveloped, whilst the girls in their white cotton dresses, trimmed with shades of pink and crimson, act as a silver lining to the shadows that now and again mingle with the sunlight. The picture produced by fiery sun, and fleecy clouds, and figures moving amongst the lights and shadows on the hillsides is one full of poetry and suggestive of thoughts that carry one away from dull earth to a land of romance." "When the family arrives at the grave, the father uses the hoe he has brought with him to repair the damages that the rains and the storms of the past year have done to it. Whilst he is trimming it and returfing the mound that has lost its shapely roundness, the wife and girls are placing the offerings of food on the stone slab in front of it, ready for the hungry spirit within to satisfy the long fast of the year. When all these preliminaries have been gone through, the father as the high priest of the family, stands erect in front of the grave, and with hands uplifted and pressed together he addresses the spirit. 'Your children have come to-day with offerings of food. We are poor, or we would have brought you a richer repast than what we have spread before you. Come, we pray you and disdain not the simple food, but partake of it, and so show that you love us as you did before you left us for the 'Dark World.'" *Ibid.* pp. 73–4.

"He then goes on to tell the dead how the family is. 'We have not prospered during the past year. We have had losses in the business. Sickness has visited our family, and we can only just manage to drag through life, though we all work hard and use the utmost economy in the home. We look to you to save us in the future. Remember our kinship and use your power to bless us with prosperity. Listen to us, our father, and cheer the hearts you still love by rescuing them from poverty and disgrace." "After this formal worship of the dead, the good things that have been left over by the now satisfied spirit, are eaten by the hungry family. The eyes of the girls glisten, as they look at the cakes, and the cold fowl and the luscious fruits that hunger, stimulated by the mountain air, invests with a charm they could not have had in the frowsy old town from which they have come at the foot of the hills. What a splendid day they are having! There is not a cloud upon the face of any one of them, but the dainties disappear amid laughter and jokes and pleasant conversation that make the time fly." "At length the afternoon begins to wane. The sun has gone down behind a distant mountain, and a twilight has crept into the air and dimmed its richness. The shadows too lengthen, marching as it were out of the night, and quenching the golden hues that have touched the landscape with their glory. The crowds upon the mountain side now begin to dissolve. The varied stories of the past year, with their tragedies and comedies, have been rehearsed in the hearing of the dead, and with last lingering looks at the mounds that contain the ashes of those they love, they wend their way to the plain beneath. For another year the solitude will be unbroken, excepting by the foot of the passer-by, and all that will be left to care for them, will be nature's kindly hand, which will strive to repair the damage done by storms, and rain and sunshine by covering them with grasses and wild flowers."—*Ibid.* pp. 74–5.

"The spirit in the tablet in the home is worshipped twice a year, with very much the same ceremonies as that in the grave. The greatest honours are reserved for the spirits of the founders and chiefs of the clan, whose tablets are placed in a large building called 'The Hall of Ancestors.' These are worshipped in the Spring and Autumn by all members of the tribe that can possibly attend."—*Ibid.* p. 75. For a description of an actual service, performed in a large hall by ten elders of the clan in the presence of its male members, all gaily arrayed, an consisting in sacrificial offerings of wine and food, the reading and burning of a list of the male members, and the final kowtowing before the tablets followed by the feasting of all present, see pp. 75–81.

"The cult has been perpetuated and intensified by these feasts. The founders and chiefs of the clan were evidently conscious that it would require something more than mere sentiment to make their descendants remember them after they were dead. They consequently left endowments in the shape of public lands, that were to be used for paying all expenses connected with the worship of them. In order to prevent the absorption of these properties by some powerful members of the clan, it was decreed that they should be held in rotation by the different branches, who were allowed to appropriate to their own private use whatever sums remained after all the expenses connected with this worship were met. The founders thus appealed not only to the religious instincts of the tribe, but also to their passions." "Every member of the clan has a personal interest in the matter. The feasts come to him free, and when his turn comes round, he has the handling of the proceeds of this ecclesiastical endowment. The system has thus become rooted in the hearts of the Chinese through the selfish interest they have in it. Take away the lands and abolish the feasts, and in time the belief in the dead would be greatly modified and the regular worship of the clan, at least, gradually die out. China is not the only country in the world where endowments have been the means of perpetuating systems and of fostering customs that have not always been for the highest good of the nation."—*Ibid.* pp. 80–1.

"In the semi-annual service there are no elements of poetry or romance. It is entirely a severe matter of business. No spirit of love or affection has caused the gathering that has met here to-day to perform the ceremony just described. Most of the spirits left the earth at least a hundred years ago or so. The men of to-day have lost touch with them. What kind of men they were no one knows or for that matter cares. There is one profound impression, however, that binds the living to them, and that is that in that unseen world those shadowy, misty forms that once lived here and tilled the fields and lived the common life of to-day, have in some mysterious way been transformed so that they hold the fate of their descendants in their hands. Whatever tenderness they may have had in actual life, it has evidently been crushed out of them by their sad and bitter experiences in the Dark World in which they now live. This latter is supposed to be a facsimile of the present, only with all the joyous elements eliminated, and with the main features of this following them like a Nemesis into that. The poor man never finds himself suddenly transformed into a wealthy man, but the same struggle that he had here goes on, though more intensely in his new life, where no sun ever shines, and a perpetual gloom crushes all joy out of his heart. The man who has been beheaded walks about for ever a headless ghost. His lot is one of the most pitiable of all, for he can have no human companionship, and he can never express the thoughts that wander through his heart, whilst the voice of sympathy can never ease the unending pain of his existence."—*Ibid.* pp. 81–2.

"Now it is a remarkable fact that the Chinese believe that the innumerable hosts that dwell in that clouded land are absolutely dependent upon their friends in this for any comforts they possess there. The food they eat and the money they have to spend all come from them and are transmitted through the annual offerings that are made to them. Any stay of these means suffering to the spirits, and these, sullen and enraged at the neglect, send misery and calamity upon the home of their friends." "This thought is so deeply ingrained in the nation that the Chinese have actually arranged a separate festival for the spirits in Hades that have no living friends on earth, and who, therefore, are left hungry and uncared for in that dark land. During the month of August the whole Empire by an almost unanimous consent, lay out tables in the open air with all the various kinds of food that the Chinese delight in for the special benefit of the hungry spirits that the presiding god of Hades lets out for this month. They are thus supposed to be propitiated by the kindness of mortals and to be induced to refrain from using their supernatural powers to distress mankind."—*Ibid.* p. 82.

"The worship of the dead at the grave, whilst it still has the commercial character in it, is of a much more kindly nature than that performed in the great ancestral hall. The reason for this is obvious. The friends that lie buried there are of a nearer kinship and the loss of them is generally more recent. Some loved one has been taken from the home, and the sorrowing hearts, full of agony at their loss, come with tears that flow naturally and with loud and passionate outcries to bewail their loss. And it is not simply at stated times that the mourners come to these graves to unburden their hearts of the sorrows that fill them. A husband for example has died. He was only just in the prime of life. He and his wife were devotedly attached to each other, though none would have dreamt of it had they simply seen them in every-day life. Etiquette in China demands that neither husband nor wife shall show before others any sign whatever that they love one another. Well, the husband one day is attacked by one of those maladies that in these eastern lands run their course so rapidly, and before the wife has time to realize that danger threatens, her husband is dead." "And now what a change takes place. It would seem as though the great fountains of the woman's heart has burst all bounds and was pouring forth its treasures that it has been hiding for years. The restraints that society had put upon her when her husband was alive have now vanished with his death, and she indulges in the most passionate expressions of devotion that any woman East or West under the wildest or the deepest love could ever imagine. Her cries are uttered in the presence of her neighbours who, Oriental-like, gather round to witness what is going on."—*Ibid.* pp. 82–3.

"The religion of the Chinese was at this date a modification of the older and simpler form of nature-worship practised by their ruder forefathers. The principal objects of veneration were still Heaven and Earth, and the more prominent among the destructive and beneficent powers of nature; but a tide of personification and deification had begun to set in, and to the spirits of natural objects and influences, now rapidly assuming material shapes, had been added the spirits of departed heroes, whose protection was invoked after death by those to whom it had been afforded during life."—*Giles, Historic China*, p. 6.

"In the remarkable narrative, which we have in the 6th of the Books of Chow, of the duke of Chow's praying for the

recovery of his brother, King Woo, from a dangerous illness, and offering to die in his stead, he raises three altars :—to their father, grandfather, and great-grandfather ; and prays to them, as having in heaven the charge of watching over their great descendant. When he has ascertained by divination that the king would recover, he declares that he had got Woo's tenure of the throne renewed by the three kings, who had thus consulted for a long futurity of their House." "This case shows us that the spirits of good kings were believed to be in heaven."—*Legge, Ch. Class.*, III. I. Prol. p. 195.

"Along with the worship of God [*v. infra*] there existed in China, from the earliest historical times, the worship of other spiritual beings—especially, and to every individual, the worship of departed ancestors. Confucius recognized this as an institution to be devoutly observed. 'He sacrificed to the dead as if they were present; he sacrificed to the spirits as if the spirits were present. He said, "I consider my not being present at the sacrifice as if I did not sacrifice."' The custom must have originated from a belief of the continued existence of the dead. We cannot suppose that those who instituted it thought that with the cessation of this life on earth there was a cessation also of all conscious being. But Confucius never spoke explicitly on this subject. He tried to evade it. 'Ke Loo asked about serving the spirits of the dead, and the master said, "While you are not able to serve men, how can you serve their spirits?" The disciple added, "I venture to ask about death," and he was answered, "While you do not know life, how can you know about death."' Still more striking is a conversation with another disciple, recorded in the 'Family Sayings.' Tsze-kung asked him, saying, 'Do the dead have knowledge (of our services, that is), or are they without knowledge?' The master replied, 'If I were to say that the dead have such knowledge, I am afraid that filial sons and dutiful grandsons would injure their substance in paying the last offices to the departed ; and if I were to say that the dead have not such knowledge, I am afraid lest unfilial sons should leave their parents unburied. You need not wish, Ts'ze, to know whether the dead have knowledge or not. There is no present urgency about the point. Hereafter you will know it for yourself.'"—*Ibid.* i. Prol. p. 100.

"The real religion of the Chinese, that in which more than anything else they trust, and to which they look for consolation and reward . . . [is] the worship of deceased ancestors. The doctrines of Confucius and the ceremonial of the State religion, exhibit the speculative, intellectual dogmas of the educated literati and thinkers, who have early been taught the high ideal of the Princely Man set forth by their sages. The tenets of Lau-tsz' and the sorcery and incantations of his followers show the mystic and marvellous part of the popular belief. . . . But the heart of the nation reposes more upon the rites offered at the family shrine to the two 'living divinities' who preside in the hall of ancestors than in all the rest. This sort of family worship has been popular in other countries, but in no part of the world has it reached the consequence it has received in Eastern Asia, every natural feeling serves, indeed, to strengthen its simple cultus."—*Williams, Midd. King.*, ii. 235–6.

"It is probable that [ancestral worship] was practised . . . two thousand years before the Christian era ; and in the rites of Chow, a thousand years later, we find it reduced to a precise and complicated code ; but it was not so stereotyped as to be incapable of further alteration. It was then disfigured by grotesque ceremonies [no longer in use] . . . particularly [that of] young children being made to personate their ancestors, and, habited in ghostly costume, receiving the homage of their own parents. Nor was it then clothed with the imperious authority which it now exercises. [Confucius is said not to have known where his father was buried.] This indicates a degree of laxity impossible at the present day. . . . It is to Confucius more than to any other man that the strictness with which the rites of this worship are now universally observed, [is due. He made] filial piety the corner-stone of his ethical system."—*Martin, Chinese*, pp. 262–3.

"In the *Shi King* [*Shih ching*], whose existence . . . is coeval with Samuel or earlier, are many references to this worship, and to certain rites connected with its royal observance. At some festivals the dead were personated by a younger relative, who was supposed to be taken possession of by their spirits, and thereby became their visible image. He was placed on high, and the sacrificer, on appearing in the temple, asked him to be seated at his ease, and urged him to eat, thereby to prepare himself to receive the homage given to the dead. When he had done so he gave the response in their name ; the deified spirits returned to heaven, and their personator came down from his seat."—*Williams, Midd. King.*, ii. 236.

"The teachings of this ancient book intimate that the protecting favor of the departed could be lost by the vile, cruel or unjust conduct of their descendants—thus connecting ancestral worship and reward with personal character. . . . Many stories occur in the native literature exemplifying this idea by actual experiences of blessing and cursing, all flowing from the observance or neglect of the required duties."—*Ibid.* ii. 237.

"The great sages, Confucius and Mencius, with the earlier rulers, King Wăn and Duke Chau, and their millions of followers, have all upheld these sentiments, and those teachings and examples are still as powerful as ever. In every household, a shrine, a tablet, an oratory, or a domestic temple, according to the position of the family, contains the simple legend of the two ancestral names written on a slip of paper or carved on a board. Incense is burned before it, daily or on the new and full moons ; and in April the people everywhere gather at the family graves to sweep them, and worship the departed around a festive sacrifice [*v. supra*]. To the children it has all the pleasant associations of our Christmas or Thanksgiving ; and all the elder members of the family who can do so come together around the tomb or in the ancestral hall at the annual rite. Parents and children meet and bow before the tablet, and in their simple cheer contract no associations with temples or idols, monasteries or priests, processions, or flags and music. It is the family, and a stranger intermeddleth not with it ; he has his own tablet to look to, and can get no good by worshipping before that bearing the names of another family."—*Ibid.* ii. 237.

"As the children grow up the worship of the ancestors, whom they never saw, is exchanged for that of nearer ones who bore and nurtured, clothed, taught, and cheered them in helpless childhood and hopeful youth, and the whole is thus rendered more personal, vivid, and endearing. There is nothing revolting or cruel connected with it, but everything is orderly, kind and simple, calculated to strengthen the family relationship, cement the affection between brothers and sisters, and uphold habits of filial reverence and obedience. Though the strongest motive for this worship arises out of the belief that success in worldly affairs depends on the support given to parental spirits in Hades, who will resent continued neglect by withholding their blessing, yet, in the course of ages, it has influenced Chinese character, in promoting industry and cultivating habits of domestic care and thrift beyond all estimation." "It has, moreover, done much to preserve that feature of the government which grows out of the oversight of Heaven as manifested to the people through their Emperor, the Son of Heaven, whom they regard as its vicegerent. The parental authority is also itself honoured by that peculiar position of the monarch, and the child grows up with the habit of yielding to its injunctions, for to him the family tablet is a reality, the abode of a personal Being, who exerts an influence over him that cannot be evaded, and is far more to him as an individual than any of the popular gods. Those gods are to be feared and their wrath deprecated, but the 'illustrious ones who have completed their probation' represent love, care, and interest to the worshippers if they do not fail in their duties." "Another indirect result has been to define and elevate the position of the wife and mother. All the laws which could be framed for the protection of women would lack their force if she was not honoured in the household. As there can be only one 'illustrious consort' (*hien pi*) named on the tablet, there is of course only one wife (*tsi*) acknowledged in the family. There are concubines (*tsieh*), whose legal rights are defined and secured, and who form an integral part of the family ; but they are not admitted into the ancestral hall, and their children are reckoned with the others as Dan and Asher were in Jacob's household. Polygamous families in China form a small proportion of the whole ; and this acknowledged parity of the mother with the father, in the most sacred position she can be placed [in], has done much to maintain the purity and right influence of woman amid all the degradations, pollutions, and moral weakness of heathenism. It is one of the most powerful supports of good order. . . . Another benefit to the people, that of early marriages, derives much of its prevalence and obligation from the fear that, if neglected, there may be no heirs left to carry on the worship at the family tomb."—*Ibid.* ii. 237–9.

"The duke of Chow offered himself to die in the room of his brother, king Woo ; and . . . thought his offer might somehow be accepted through the intervention of the great kings, their progenitors, to whom he addressed himself."—*Legge, Ch. Class.*, III. ii. 354, note.

"The prayer of the duke of Chow [*Shu ching*, Pt. V. Bk. VI.] is addressed to the three kings, and . . . it is addressed to them in the character of mediators or intercessors with Heaven or God. The analogy of the circle of religious notions among the Chinese obliges us to adopt this conclusion, and in par. 7, we have an express reference to the supreme disposing of God in human affairs. Still it must be allowed that the doctrine of the former kings being only intercessors is not indicated in the text so clearly as it might have been. In illustration of this I shall quote the words of Ts'aou Heŏ-tseuen (Ming dyn.). He says :—'The earlier scholars were led by the words—"I have received a new appointment for him from the three kings," to doubt whether the duke's language (in p. 6)—"I have many abilities and arts which fit me to serve spiritual beings," really referred to Heaven. They rather thought it did not ; but we must not thus pertinaciously insist upon particular expressions. Anciently, when sovereigns sacrificed to Heaven and Earth, they depended on the efficacious spirituality of their ancestors to present and second their request. Heaven was the most honourable, and they did not dare to approach it abruptly ; their ancestors were the nearest to them, and they could, through the kindness between them, make their thoughts known to them. There is no reason why we should not say that the words, "I have received a new appointment from the three kings," are equivalent to "I have received a new appointment for him from Heaven."'"—*Ibid.* III. ii. 356–7, note.

"The appointments [investing the representatives of the ancient kings with territories—on the overthrow of the Shang dynasty by the defeat of the tyrant Chon Hsin] were given, not because of services rendered to the new dynasty, as many others were, but from respect to the memories of the great men represented, that the sacrifices to their spirits might not fall into disuse."—*Ibid.* III. ii. 317, note.

[Every family had its ancestors for its tutelary Spirits (神). They inhabited the air, and surveyed the actions of men (*Shih ching*, II. vi. V. ; III. iii. IV.). Besides the tutelary Spirits special to each family, every mountain had its Spirit, and every great river (III. iii. V. i.). Each district even had its protecting Spirit, and the Spirit of the ground was invoked at the solemnities which opened and terminated the agricultural labours of the year. At epochs of great prosperity, when a sage monarch was on the throne, the Spirits appeared under the form of a fabulous quadruped, the *ch'i lin*, or of a bird equally fabulous, the *fĕng huang*.]

[For Confucius' attitude towards ancestor-worship see *Confucianism*.]

Animal-worship.—"The character of the archaic religion can be judged from a passage" in Ssŭ-ma Ch'ien's treatise on the *Fĕng* and *Shan* (p. 51 of M. Chavannes' version). "'Formerly the son of Heaven offered a sacrifice in the spring to ward off calamities. To Hwang ti he sacrificed an owl and a tiger ; to the "hidden sheep," a sheep ; to the activity of the horse, a dark-coloured stallion ; to T'ai i, the prince of Mount Tso and the greatness of earth, an ox ; to the sages of the Mount Ou i they offered dried fish, and an ox to the ambassador of the Yin and the Yang.' Ssema-tsien quotes an earlier author for the statement that 'the spirits frequent' a given spot because it is a 'high place,' and the above passage, in which 'the activity of the horse' is mentioned along with the local worship of mountains (elsewhere associated with that of rivers) may be taken in conjunction with" [the following extracts] . . . "to show that the worship of animals was not unknown in ancient China."—*Simcox*, ii. 37, note 2.

"In historic China there has never been much room to spare for the lower animals, and we find nothing answering to the Egyptian sentiment about them. All the more importance therefore attaches to a single passage in the Li-ki, bearing on the worship of animals, which must be of really ancient origin, preserved in spite or perhaps because of its having become entirely unintelligible ; as it must have become, not merely before the compilation of the classic in its present form, but before the time of any comments on it by authorities of the Chow dynasty, such as survived traditionally in some cases till the Han period, with which the virtually continuous stream of commentation begins. In the description of a great sacrifice made by the son of Heaven, apparently as a sort of harvest festival, offerings were made to the legendary inventors of the different grains and arts of husbandry, and to the representatives 'of the birds and the beasts.' The text proceeds : 'The ancient wise men had appointed all the agencies, and it was felt necessary to make this return to them. They met the (representatives of the) cats, because they devoured the rats and mice (which injured the fruits of the fields), and (those of) the tigers, because they devoured the (wild) boars (which destroyed them). They met them and made offerings to them. They offered also to (the ancient inventors of) the dykes and water channels ; (all these were) provisions for the husbandry.'"—*Ibid.* i. 148.

"Taking the text in its utmost brevity, it shows that the most utilitarian and rationalistic of races, according to a tradition, of which its conservatism guarantees the extreme antiquity, rendered quasi divine honours to cats and tigers, because they devoured the rats, mice, and boars of the fields. The worship of human benefactors and remote ancestors, legendary or historical, exists, together with the worship of birds and beasts, as something quite distinct, and resting on a totally different class of motives. 'All things originate from heaven ; man originates from his (great) ancestor.' Therefore a legendary Minister of Agriculture was associated with heaven in another sacrifice, the purpose of which is described as 'an expression of gratitude to the source (of their prosperity) and a going back in their thoughts to the beginning (of all being).'"—*Ibid.* i. 148–9. For animal worship, etc., see further works quoted under previous Period.

Deities.—[The following extracts referring more especially to this Period, confirm those given under the previous Period.]

"The Book of Poetry abundantly confirms the conclusion drawn from the Shoo-king that the ancient Chinese had some considerable knowledge of God. The names given to Him are *Te* (帝), which we commonly translate *emperor* or *ruler*, and *Shang Te* (上帝), *the Supreme Ruler*. My own opinion . . . is that *Te* . . . should be rendered in English by *God*. He is also called in the She 'the great and sovereign God,' and 'the bright and glorious God' ; but, as in the Shoo, the personal appellation is interchanged with *T'ëen* (天), *Heaven* ; *Shang T'ëen* (上天), *Supreme Heaven* ; *Haou T'ëen* (昊天), *Great Heaven* ; *Hwang T'ëen* (皇天), *Great* or *August Heaven* ; and *Min T'ëen* (旻天), *Compassionate Heaven*. The two styles are sometimes combined, as in III. iii. IV., where we have the forms of *Shang Te*, *Haou T'ëen*, and *Haou T'ëer Shang Te*, which last seems to me to mean—*God dwelling in the Great Heaven*."—*Legge, Ch. Class.*, IV. I. Prol. pp. 131–2.

"The term *Shang Ti* . . . is not quite so vague as *T'ien*, which seems to be more of an abstraction, while *Shang Ti* is a genuinely personal God. Reference to *T'ien* is usually associated with fate or destiny, calamities, blessings, prayers for help, etc. The commandments of *T'ien* are hard to obey ; He is compassionate, to be feared, unjust, and cruel. *Shang Ti* lives in heaven, walks, leaves tracks on the ground, enjoys the sweet savour of sacrifices, approves or disapproves of conduct, deals with rewards and punishments in a more particular way, and comes more actually into touch with the human race." "The two terms refer in Chinese thought to one and the same Being, though possibly with differing attributes."—*Giles, Rel.*, pp. 16, 17.

"The character *T'ien* is just such a representation of a human being as would be expected from the hand of a prehistoric artist ; and under this unmistakable shape the character appears on bells and tripods, as seen in collections of inscriptions, so late as the sixth and seventh centuries B.C., after which the head is flattened to a line, and the arms are raised until they form another line parallel to that of the head."—*Ibid.* p. 14.

[Several odes of the *Shih ching* indicate, in an undeniable manner, the belief in one Supreme Being, Shang-ti, the Sovereign Lord. III. i. II. 3 says that king Wên honoured Shang-ti by a reverent worship, and that thence came the prosperity of this prince and of his race. In the same ode (st. 7) Shang Fu says to king Wu, before the famous battle of Mu : "Shang-ti is with you, have no doubts in your heart." The favour of Shang-ti shown to the arms of king Wu is celebrated in the same terms, in IV. ii. IV. 2. III. i. VII shows Shang-ti wearied with the faults of the families of Hsia and Shang, and calling the family of Chou to replace them. It is Shang-ti who directs T'an-fu or king T'ai, the ancient chief of this family, in the countries of the west. He seconds his labours to clear the land, and raises him to the dignity of chief. He chooses among his three sons him who shall be the leader. He encourages his grandson, the sage *par excellence*,—king Wên (*Journ. Asiat.*, 1843).]

[In the same way, in Part IV. iii., which contains the songs of the Shang dynasty, the 3rd ode says that Shang-ti chose the illustrious and courageous Ch'ing T'ang, to reign over the four quarters of the land. The 4th ode celebrates the reverence of Ch'ing T'ang for Shang-ti, who was touched by it, and called the virtuous prince to the head of the nine regions (*ibid.*).]

[In the odes of the 3rd Book of Part III. which deplore the decadence of Chou, and the public misery, the complaints are addressed to *T'ien* or Heaven, and to *Shang T'ien*, or High Heaven. The prayers of king Hsüan on account of the drought (III. iii. IV.) are addressed to the Supreme Being, designated by the name of *Shang T'ien*, of *T'ien*, and also of *Shang-ti*. King Hsüan says that Shang-ti has withdrawn His regards from the earth, and abandons it. Shang-ti is represented by the *Shih ching* as a Being perfectly just, who hates no one (II. iv. III. 4) (*ibid.*).]

The *Shu ching*, Pt. V. Bk. XIX. 2, 4, and 6 "supply a very striking testimony of the recognition in those times of God as ruling over the nations of the earth. Yu, T'ang, and kings Wăn and Woo, the founders of the three great dynasties which are still celebrated, all considered it their great business to honour and serve God. They were simply His ministers. . . . They held fast this important principle—that they were called to their high stations by the one Supreme Ruler, and were bound to occupy in them so as to please Him."—*Legge, Ch. Class.*, III. ii. 511, note.

"God appears especially as the ruler of men and this lower world. He appointed grain for the nourishment of all. He watches especially over the conduct of kings, whose most honourable designation is that of 'Son of Heaven.' While they reverence Him, and administer their high duties in His fear, and with reference to His will, taking His ways as their

pattern, He maintains them, smells the sweet savour of their offerings, and blesses them and their people with abundance and general prosperity. When they become impious and negligent of their duties, He punishes them, takes from them the throne, and appoints others in their place. His appointments come from his fore-knowledge and fore-ordination."—*Ibid.* IV. i. Prol. p. 132.

"Sometimes He appears to array Himself in terrors, and the course of His providence is altered. The evil in the State is ascribed to Him. Heaven is called unpitying. But this is His strange work; in judgment; and to call men to repentance. He hates no one; and it is not He who really causes the evil time:—that is a consequence of forsaking the old and right ways of government. In giving birth to the multitudes of the people, He gives to them a good nature, but few are able to keep it, and hold out good to the end. In one ode, . . . a fickle and oppressive king is called *Shang Te* in bitter irony."—*Ibid.* p. 132.

"Under the Chau dynasty . . . it [the building in which prayers were offered to Shang-ti] was named the *Ming thang*, temple erected in honour of him who is the source of all light, or, simply, 'The Temple of Light.' The character of *Ming* 明, light, is composed of two parts—sun 日, and moon 月. Nothing being more resplendent in the eyes of man than the sun and moon, he naturally took these symbols to name the place especially designed for the worship of him who is the Father of Light."—*Schlegel, Hung League*, p. xvi.

"It is remarkable how, in the course of the prayer [offered by king Wu on his conquest of Shang], reference is expressly made both to 'God' and to 'Heaven' as supreme. Why was it not addressed directly to God? There are both imperfect monotheism and polytheism in it. God is recognized as supreme, and at the same time other spirits are recognized, who would give effect to His will, and might be prayed to for that purpose. As Woo addressed his army in the grey dawn of the day at Muh, we may say that he had but the grey dawn of religious knowledge in his mind."—*Legge, Ch. Class.*, III. ii. 314, note.

"While the ancient Chinese thus believed in God, and thus conceived of Him, they believed in other Spirits under Him, some presiding over hills and rivers, and others dwelling in the heavenly bodies. In fact there was no object to which a tutelary Spirit might not at times be ascribed, and no place where the approaches of spiritual Beings might not be expected, and ought not to be provided for by the careful keeping of the heart and ordering of the conduct. In the legend of Howtseih . . . we have a strange story of his mother's pregnancy being caused by her treading on a toe-print made by God. . . . A Spirit is said to have been sent down from the great mountains, and to have given birth to the princes of Foo and Shin. . . . King Woo is celebrated as having attracted and given repose to all spiritual Beings, even to the Spirits of the Ho and the highest mountains." Complaints are made against the host of heaven,—the Milky Way, etc.,—as responsible for the sufferings caused by misgovernment and oppression. "Mention is made . . . of the demon of drought; and we find sacrifices offered to the Spirits of the ground and of the four quarters of the sky, to the Father of husbandry, the Father of war, and the Spirit of the path."—*Ibid.* IV. i. Prol. pp. 132–3.

"These last three, however, were probably the Spirits of departed men. A belief in the continued existence of the dead in a spirit-state, and in the duty of their descendants to maintain by religious worship a connection with them, have been characteristics of the Chinese people from their first appearance in history. The first and third Books of the last Part of the She profess to consist of sacrificial odes used in the temple services of the kings of Chow and Shang. Some of them are songs of praise and thanksgiving; some are songs of supplication; and others relate to the circumstances of the service, describing the occasion of it, or the parties present and engaging in it. The ancestors worshipped are invited to come and accept the homage and offerings presented; and in one . . . it is said that 'king Wăn, the Blesser,' has descended, and accepted the offerings."—*Ibid.* p. 133.

"The first stanza of III. i. I. describes king Wăn after his death as being 'on high, bright in heaven, ascending and descending on the left and the right of God,' and the ninth ode of the same Book affirms that Wăn, his father, and grandfather, were associated in heaven. The early Chinese . . . did not suppose that man ceased all to be, when his mortal life terminated. We know, indeed, from the Tso-chuen, that scepticism on this point had begun to spread among the higher classes before the time of Confucius; and we know that the sage himself would neither affirm nor deny it; but that their dead lived on in another State was certainly the belief of the early ages . . . as it is still the belief of the great majority of the Chinese people. But the She is as silent as the Shoo-king as to any punitive retribution hereafter. There are rewards and dignity for the good after death, but nothing is said of any punishment for the bad. In one ode, indeed (II. v. VIII. 6), a vague feeling betrays itself in the writer, that after every other method to deal with proud slanderers had failed, Heaven might execute justice upon them; but it may be that he had only their temporal punishment in view. The system of ancestral worship prevented the development of a different view on this subject. The tyrant-oppressor took his place in the temple, there to be feasted, and worshipped, and prayed to, in his proper order, as much as the greatest benefactor of his people. I have pointed out . . . how king Seuen, in his distress in consequence of the long-continued drought, prays to his parents, though his father king Le had been notoriously wicked and worthless; and how endeavours have been made to explain away the simple text, from a wish, probably, to escape the honour which it would seem to give to one so undeserving of it."—*Ibid.* pp. 133–4. *Cf. supra.*

"It is not till . . . the Chow dynasty that anything can be discovered to lead us to think of Shang Te as other than one and supreme. During the Chow there grew up the doctrine of five Tes, sometimes represented as distinct from Shang Te, and sometimes as different manifestations of Him. It has not, however, maintained itself."—*Ibid.* III. i. 34, note.

"The distribution of the stars among the States of China commenced 805 B.C., for the first two signs of the zodiac of twenty-eight were assigned to Cheng, which did not exist as a State till that year. This requires us to regard the ninth century as the time when astrology was introduced. The worship of stars and other causes led to the production of local legends. Four centuries was the space occupied by the growth of these legends till the time of Tso Chien ming and Lie tsï. In their writings we can discover the exact form the legends took." "Tso was a historian, and gave such legends as he adopted in the form of history. Lie tsï was not a historian. He gave legends as he heard them, or he invented incidents and characters to suit his moral and religious objects."—*Ch. Rev.*, xiii. 418.

"If we . . . look upon the philosophy of the five elements and the worship of the five emperors as of foreign origin, it is important to notice that it is limited by . . . Sï Ma c'hien's history to the eighth century before Christ. It was then that this worship began, and it was not completed till the Han dynasty, in the second century before Christ."—*Ibid.* xiii. 417.

"The worship of the gods of the five elements . . . appears first in the seventh century before Christ and in north-western China, in a region at that time only recently admitted to China proper. This worship spread afterwards to other parts of the country, and was adopted by such emperors and dynasties as were fond of Tauism."—*Ibid.* xiii. 417.

"In the 6th century before Christ there can be no doubt . . . that in the countries of Sung and Tsin the brighter stars of these groups [Scorpio and Orion] were worshipped."—*Ibid.* xiii. 414.

"It is then [6th century B.C.] that we find stars worshipped in particular cities and that the twelve signs of the zodiac were believed to control the destinies of States. Particular stars and groups of stars were worshipped as the supposed causes of fires and such like calamities. . . . In 540 B.C. there is a more detailed account of the same worship, in the Tso chwen, and at about the same time, in the Kwo yü, we find abundant proof that the Chinese then believed that the various baronies of China were all controlled by particular stars. If we had the records, we should most likely find that in each of the numerous States into which the country was then divided, there was star worship based on the astrological belief of the times. We also learn from . . . the Tso chwen, that fresh legends unknown to Confucius were growing up in his time on the Shantung coast which aimed greatly to extend classical records of Chinese primitive history." "If the question be asked, is there any special indication that foreign influences led to the worship of stars and to the legends respecting the primitive emperors which became current in the Cheu dynasty, it may be replied in the affirmative."—*Ibid.* xiii. 416. See also *Journ. R.A.S.*, xviii. 10, and *infra, Myths.*

The river-god Ho-peh "was represented as a man with four faces driving in a fairy chariot drawn by two dragons. (*Cf. Shan-hai-king*, Riv. 12, f. 3.) His name has been assimilated to that of a certain *Ho-pak*, spoken of as an ally of the Chinese in that region, under the reigns of *Hia Ti Mang*," 1st year, and his successor Ti Sieh, 16th year, in the *Tchuh shu ki nien; i.e.* about 1813 and 1781 according to the rectified scheme of chronology. Ho-peh, *i.e.* Ho-pak, was perhaps a local substitute of *Oh-pak*, a god of fire, of whose worship we hear in 540 B.C. in the Tso-tchuen, in connection with fire worship, introduced in the state of Sung, apparently not long before, from the foreign source we are studying."—*Lacouperie, Western Origin*, p. 94.

"Fire-worship, connected with Astrology, was established in the State of Sung, some time before 564 B.C. See the *Tso-tchuen*, under the years 564 and 541 B.C."—*Ibid.* p. 90.

[Various new notions about fire appeared in the 6th century B.C. in those Chinese states which were nearest to the foreign settlements in S. Shantung. Among other innovations were:] "A state sacrifice every year at the vernal equinox for the renewal of fire; all fire had to be extinguished three days previously, and food taken cold. The rule was established for the first time in *Tsin* (Shansi) by the Marquess Wen (636–627 B.C.) who had taken as a wife *Ki-Wei*, one of the chief's daughters of the non-Chinese barbarians Tsiang-ku-lu. We hear of a new worship of a deity of Fire named *Hwei-luh*, and of a deity of water named *Hiuen Ming* . . . in 524 in *Tch'eng* (S. Honan) once only, as if it were a local affair, but it seems connected with the pyrolatric views mentioned earlier, notably in 564, 541, and 533, in the state of *Sung* (E Honan) which, as we know, was in close relation with the foreigners of Lang-ya and Tsi-moh." "A female and male character attributed respectively to fire and water, which are distinctly stated, fire to be the *fei* or wife of water, the water to be the *mou* or husband of fire, in 533 and 525 B.C." "The worship of the fire-goddess *Hwei-luh* . . . has become the worship of the Spirit of the Hearth, the household fire god, commonly called the Kitchen-god. It was sacrificed [to] for the first time by Hia Fu-tchi, Keeper of the Ancestral temple of the State of Lu, about 600 B.C., who burnt in his honour, and right in the teeth of sacrificial orders, a pile of fire-wood. Confucius, whose opinion was asked in after times on the matter, disapproved that mode of sacrificing on that occasion. 'At present,' said he, 'that sacrifice is paid to a wife of old time; the materials for it might be contained in a tub, and the (ritual) vase is the common wine-jar.' A popular saying quoted in the Lun-yü: 'It is better to pay court to the kitchen fire than to the south-west corner,' shows that this worship was not yet an ancient institution at the time of Confucius. As a fact it was then worshipped only in some parts of the land; in 533 it existed in Honan E., and in the 3rd century B.C. it was also flourishing in Kiang-su and in Shansi. . . . It was adopted by the Emperor himself under the Han dynasty (133 B.C.); at present it has become the most extensively worshipped divinity of China, the various names given to it show the successive and different aspects under which it was considered. That of *Hwei-luh*, its historical antecedent which has been already described, was shortened into the name of *Wei*, from that of Ki Wei, the Chinese lady of barbarian birth, wife of the Duke Wen of Tsin in 636–627 B.C., doubtless because her husband had made some innovations in the annual ceremony of the renewal of fire. . . . Another denomination used in the 4th century B.C., for *Ki Wei* was *Ki*, which is the tuft or coiffure of a Chinese lady; the deity was then represented as a beautiful woman dressed in red. Her worship, as that of the First Cook, *Sien tch'uei*, was recognised as a regional arc in *Tsin*, *i.e.*, North half of Shansi, by Kao-tsu, the first emperor of the Han dynasty, in 204 B.C. The names of *Tsuan shin*, 'Spirit of the furnace,' and of *Tsao-shin*, 'Spirit of the hearth' were and have remained the most common names of the divinity. Its female character was generally acknowledged, and remained undisputed until the 2nd century of our era, when it passed to the stronger sex."—*Ibid.* pp. 160–1.

"*Lun yü*, III. xiii. 1; Ch. Cl. I, 23. The famous philosopher Tchu-hi has remarked on this subject. 'The kitchen-fire was comparatively a mean place, but when the spirit of it was sacrificed to, then the rank of the two places was changed for the time, and the proverb was in vogue.' Signor Carlo Puini, *Le culte des génies tutelaires*, thinks that it refers to a performer of sacrifices 'à l'Esprit du Foyer plûtot qu'aux Lares domestiques.' But this is stretching too far the meaning of the Chinese text."—*Ibid.* p. 162.

There was "a remarkable dualist-worship established in Tcheng, in 524 B.C., to *Hwei-luh*, god of light and fire, and *Hiuen-ming*, god of darkness and water, then known in Chinese mythology for the first time." . . . [Hwei Luh has no meaning in Chinese, but might be connected with Ahura Mazda, and Hiuen Ming, anciently Hun-meng, with Anromainyus. The Persians ruled in Babylonia after 538 B.C.] —*Ibid.* pp. 90, 95.

"According to Khung Ying-tâ, a little was taken from all the dishes, and placed on the ground about them as an offering to 'the father of cookery.'"—*Legge, Lî Ki*, i. 80, note.

[It was the custom at *Yeh* in the state of *Wei* (Chang-teh-fu) in Honan, to "give a wife to the river-god Ho-peh," annually, by throwing a girl into the river. It was suppressed by Si-men-pao, chief officer of *Yeh*, during the reign of Marquis Wen of Wei, 424–387 B.C.]—*Lacouperie, Western Origin*, pp. 90, 94. See also *Yüan chien lei han*, *c.* 126, p. 7*b*.

[It was the custom in the State of Lu, at the above date, in time of drought, to leave a person exposed to the sun, to die of thirst and hunger. See Tso-chuen, Ann. 639. This practice, which Lacouperie attributes to the influence of foreign ideas brought by Indian and other traders to Shan-tung, does not seem to have existed elsewhere.]—*Ibid.* pp. 90, 94.

[For the names of the gods of various weapons see *T'ai kung ping fa*, *Ko chih ching yüan*, *c.* 41, *Wu pei lei*, p. 13*b*; *c.* 32, pp. 22*a*, 23*b*.]

Taoism.—Lao-chün "was the name, or rather title, of the founder [of Taoism]. This person appeared nearly simultaneously with Confucius, by whom he is mentioned [?] about 560 years before the Christian era. As far as can be gathered of the real drift of his doctrines, he seems to have inculcated a contempt of riches and honours, and all worldly distinctions, and to have aimed, like Epicurus, at subduing every passion that could interfere with personal tranquillity and self-enjoyment. As death, however, was something that they could not pretend to despise, his disciples and successors set themselves to work to invent an elixir of long life, or of immortality, and thus became in time a species of *alchymists*. They have been alternately favoured and persecuted at different periods of Chinese history, but seem to have flourished most under the Soong [Sung] dynasty, subsequent to the tenth century of our era, a period when all speculative opinions, and every species of spurious learning, were most in vogue."—*Davis, Chinese*, ii. 114. See also following Period.

"The popular belief respecting the origin of Tauism is . . . given in the *Sau shinki* [*Sou shên chî*]. Lao-tzŭ is represented as having existed as a living principle, pervading empty space, before the creation, when the heavens were as yet without light, and the earth without form. After the evolutions and transformations of thousands of years, this principle was personified in a deity called *Miau wu shing kiun*, the 'Holy Ruler of Wonderful Nonentity.' This deity, after innumerable ages and catastrophies again appeared as the *Miau yu shing kiun*, or 'Holy Ruler of Wonderful Entity.' The next form . . . assumed was that of *Hwan tun shing kiun*, or 'Holy Ruler of Chaotic Confusion.' . . . After the creation of man, Lao-tzŭ is supposed to have appeared on the earth at different times in the form of king of different dynasties, and as teacher or adviser of kings, though the world was not aware of his presence. When he descended as the philosopher Lao-tzŭ he is represented as having descended from heaven as a sunbeam, in the form of a round ball of variegated colours, which fell into the mouth of a sleeping virgin."—*Nevius, China and the Ch.*, pp. 114–29.

"The sectarians supposed their founder was merely an impersonation of this power [*Tao*] and that he whom they call 'the venerable prince, the origin of primary matter, the root of heaven and earth, the occupier of infinite space, the commencement of all things, farther back than the utmost stretch of numbers can reach,' created the universe. They notice three incarnations of him during the present epoch, one during the Shang dynasty, 1407 B.C., one at the time of Confucius, and a third about A.D. 623, when a man of Shansi reported having seen an old man who called himself Lau-kiun."—*Williams, Midd. King.*, ii. 214.

Lao Tzŭ "taught and practised a weak inactivity and neglect of the world and its concerns, loving neither fame, nor pleasure, nor business."—*Davis, Chinese*, ii. 115.

"The teachings of Lau-tsz' [Lao Tzŭ] are not unlike those of Zeno; both recommend retirement and contemplation as the most effectual means of purifying the spiritual part of our nature, annihilating the passions, and finally returning to the bosom of *Tao*. His teachings on the highest subjects of human thought have furnished his countrymen ample materials for the most diverse views on these same themes according to their various fancies. In his striving after the infinite he can only describe *Tao* by what it is not and delineate *Teh* as an ideal virtue which no man can attain to." His "teachings are susceptible of almost any explanation, and Julien's extracts from the commentaries give one some idea of their diversity. . . . The names of sixty-four commentators are known, of whom three were reigning emperors; and their explanations have given their countrymen very doubtful guidance through this mystic book. . . . His countrymen . . . have looked upon this system of philosophy rather as the reveries of a wise man than the instructions of a practical thinker." "The main object kept in view throughout this work [*Tao tê ching*] is the inculcation of personal virtue, and Lau-tsz' found his argument for its practice in the fitness of things, as he tries to prove by referring all the manifestations and laws of mind and matter to the unknown factor *tao*."—*Williams, Midd. King.*, ii. 207–9.

"Taoism was originally a compendium of customs and practices framed upon the prevailing ideas concerning the human soul. Adopting these as its own, it cast them into a system of Philosophy, Alchemy and Religion."—*De Groot, Rel. Syst.*, i. i. xiii.

"The foreign elements introduced into early Tauism were subjected to a process of assimilation, by which they were naturalised. The emperor Hwang ti took the place of a Tauist sage. Incidents and conversation were invented as they were needed. The doctrine was called that of Hwang Lau, and this

expression implies that the emperor Hwang ti had as much to do with the authorship of this religion as Lau tsi himself. It need not on this account be supposed that Tauism was an old religion or that the Yellow emperor had anything to do with its formation. Western ideas and myths were communicated to them by the many foreigners who then resided in China either as merchants or as members of the many Tartar tribes who then occupied districts in North China; or by travellers arriving by the Kansu route. The Chinese, in taking what was offered them, worked it up into new forms by which it became fitted to dovetail with the history, religion, mythology and philosophy of their own country. It is in this form, half-foreign, half-native, that these contributions of foreign knowledge, received long ago by the Chinese, have come down to us."—*Ch. Rev.*, xiii. 411.

"Much Hindoo and Persian philosophy and legend came to China after the age of Dyrus, when Bactria was included in the new Empire then founded, in sufficient abundance for it to be possible for the three great Tauist philosophers of antiquity to borrow various doctrines and legends which they needed for the new religion they were forming."—*Ibid.* xiii. 410.

After describing the origin in the Sung dynasty of the *Yü li chao chüan* and the positions round the horizon of the Ten Halls of Judgment and the Ten Kings who occupy them, Edkins continues: "The cosmological form of the Zoroastrian universe shows that Persian thought is the parent of the Buddhist cosmology of India, and the two together helped to suggest the Taoist universe in the form which it took in the age after Laotse and Chuangtse. This opinion is confirmed by the fact that the stars are grouped in Sz Ma-tsien's chapters on astronomy, written a century before Christ, in the same way as by Zoroaster. The fixed stars are grouped as north, south, east, west, and central, and they are guided and controlled by the five emperors or the sovereign essences of the planets. This gives us an approximate date for Zoroaster, for there can be little error in stating that this stellar mythology may from a Chinese point of view be referred to a period between the 12th and 9th centuries before Christ, for it was after that time that the Chinese began to regard the stars and planets as ruled by divinities, each different from the other. In this they appear to have learned from the Persians and the age of Zoroaster will be within the limits here given." "Another important point to note here is that the doctrine of astrological and physical fate belongs alike to China, Persia, India and Western Asia. This fate is impersonal, immutable, inevitable and is always morally right. Every person according to Asiatic belief receives what he deserves of happiness and misery, and thus invariably just retribution befalls men earlier or later according to moral decree." "The first four or five pictures represent the Jade Emperor, the God of Taishan, the Emperor of the Chou dynasty, and the God of Fire. Beside these there is the Ti Ts'ang Wang P'usa. They represent the doctrine of future retribution as believed in China before the introduction of Buddhism. The Chou Emperors obtained the throne by the will of Heaven. They also gained the control of the invisible world as indicated by the fact that China came to know particularly regarding the future state during the Chou dynasty. The doctrine of immortal life attainable by ascetic methods came to be then known. Hades was then for the first time called the place of the Yellow Fountain. Genii ascended to Heaven, and the dead met at the Yellow Fountain. Paradise is also to be found in certain happy islands beyond the eastern seas. The mother of the Western King resides on the Kwunlun mountain in the west. The plant which confers immunity from death was brought to China in the same period of time. All these things became subjects of the people's faith in the Chou dynasty. In consequence of this the Chou Emperor is appointed the first judge of the dead of terrestrial origin. The celestial judges are Yüti and Tsz-huang or Tungyo tati, representing the beings who in the ancient classics are known as Shangti, and as the spirit of the Taishan mountain. But the God of fire became also known from Persia in the Chou dynasty. His office entitles him to be the god of the family, and of marriage, of the kitchen, and of protection from fire; he carries to heaven a faithful report of the moral conduct of all the family at the end of each year." "The insertion of these four divinities before the pictures of the ten judgment halls is all accounted for on the ground that it was in the Chou dynasty that the judgments of the future state entered China through the Zoroastrian teaching. Of this we find distinct traces in the history by Tao T'sien-ming and in the notices we have in the Classics of the ancient dual philosophy, the mountain worship and the worship of the god of fire and of the sun." "In books on China describing its early condition by western authors perhaps the most important omission is the influence of Persian thought." "That Ti Ts'ang Wang P'usa should appear among the picture shows that it was Buddhism which first clearly taught in China the future state with the metempsychosis. Buddhism, true to itself, comes not to reign but to save. Ti Ts'ang appears to redeem men, seated on a lion to indicate victorious progress. The *Yüli* calls him the Instruction Ruler of the Dark World. The term Instruction Ruler, *Kiau Wang*, was in the Ming dynasty adopted to designate the Pope and has been ever since employed."—*N.-C. Herald*, Nov. 30th, 1894.

About 680 B.C. traders from the Indian Ocean founded settlements (*Lang-ga* and *Tsch-mieh*, or *Tsih-moh*) on the gulf of Kiau-chau in Shantung, and imported ideas which gave birth to that system of astrology and magic afterwards incorporated with Taoism, and sometimes called by way of distinction, *Tao-sze-ism*. Four men are especially conspicuous in connection with the prorogation of these doctrines:—Sze Yoh, who gave astrological explanations to the Duke of Tsin in 564 B.C. Tze Tch'ang, of Tcheng (Honan, C.) died 521 B.C. *Tze Shen*, of Sung (Honan, E.) fl. 545–522 B.C. [See *Tso-chuen*, *Ann.* 545, 522.] Tch'ang Hwang in Tchou (Honan W. Shensi S.E.) fl. 550–492 B.C.; Sze-ma-Tsien says of him "that he was acquainted with all matters concerning the gods and spirits, and the sayings about the wonderful among the people of Tchou date from his teachings." (See *She-ki*, Riv. 28, f. 7 v.) "These four men may be looked upon as the real founders of Tao-sze-ism, and were the immediate predecessors of Lieh-tze and Tchwang-tze. . . . Meanwhile another kind of influence derived from Hindu thought had entered the country from the S.W., and shows itself in the *Tao-teh-king*."—*Lacouperie, Western Origin*, pp. 88–91. See further pp. 120–5 as to the alleged Western origin of Taoism proper.

Confucianism.—"The next stage was the Confucian. Confucius had the good sense to say that he understood nothing about souls and natural mysteries; he therefore declined to discuss them. But meanwhile forms and ceremonies had insensibly grown up with advancing wealth and experience; besides which Taoism and other philosophical doctrines were beginning to make men speculative and polemical. Confucius, therefore, did his best to reconcile popular customs or prejudices with the practical business of state; he does not seem to have much sympathised with mere 'thinkers.' He evidently thought Laocius a humbug, and he would have thought Kant a humbug too. He was a sort of popular democratic Lord Chesterfield, and tried to teach his children of China how to be decent, orderly, and gentle; how to give and take without violence; how to observe distinctions of rank; how to keep women in check; and so on. He did this with such success (despite a suspicion of priggishness) that his influence still remains. He was no religious teacher; but as a moral instructor he must be given rank after Jesus of Nazareth,—even after Shakyamuni; with, but before Mahomet."—*Parker*, *China*, pp. 282–3.

"Confucius, as his name has been latinized by the Jesuits (being really Koong-foo-tse [K'ung Fu Tzŭ]), was born about 550 B.C. in the state Loo, within the district now called Keo-fow Hien [Chiu-fu Hsien], just to the eastward of the great canal in Shantung province." His doctrines "constitute rather a system of philosophy in the department of morals and politics, than any particular religious persuasion."—*Davis*, *Chinese*, ii. 41–2.

"The position and influence of Confucius are to be ascribed, I conceive, chiefly to two causes:—his being the preserver, namely, of the monuments of antiquity, and the exemplifier and expounder of the maxims of the golden age of China; and the devotion to him of his immediate disciples and their followers. The national and personal are thus blended in him, each in its highest degree of excellence. He was a Chinese of the Chinese; he is also represented, and all now believe him to have been, the *beau ideal* of humanity in its best and noblest estate."—*Legge*, *Ch. Class.*, i. Prol. p. 94.

Confucius "did not speculate on the creation of things or the end of them. He was not troubled to account for the origin of man, nor did he seek to know about his hereafter. He meddled neither with physics nor metaphysics. The testimony of the Analects about the subjects of his teaching is the following:—'His frequent themes of discourse were the Book of Poetry, the Book of History, and the maintenance of the rules of Propriety.' 'He taught letters, ethics, devotion of soul, and truthfulness.' 'Extraordinary things; feats of strength; states of disorder; and spiritual beings; he did not like to talk about.'"—*Ibid.* pp. 98–9.

"The question has, indeed, been raised, whether he (Confucius) did not make changes in the ancient creed of China (*Hardwick*, *Christ and other Masters*, pt. III, pp. 18–9), but I cannot believe that he did so consciously and designedly. Had his idiosyncrasy been different, we might have had expositions of the ancient views on some points, the effect of which would have been more beneficial than the indefiniteness in which they are now left, and it may be doubted, so far, whether Confucius was not unfaithful to his guides. But that he suppressed or added, in order to bring in articles of belief originating with himself, is a thing not to be charged against him."—*Ibid.* Prol. p. 99.

"Confucius preferred to speak of Heaven," rather than of God. . . . "Not once throughout the Analects does he use the personal name. I would say that he was unreligious rather irreligious; . . . and he prepared the way for the speculations of the literati of mediæval and modern times, which have exposed them to the charge of atheism."—*Ibid.* pp. 99–100.

"Confucius recognised this [worship of ancestors: *v. supra*, *Religions*] as an institution to be devoutly observed. . . . As by his frequent references to Heaven, instead of following the phraseology of the older sages, he gave occasion to many of his professed followers to identify God with a principle of reason and the course of nature; so, . . . he has led them to deny, like the Sadducees of old, the existence of any spirit at all, and to tell us that their sacrifices to the dead are but an outward form, the mode of expression which the principle of filial piety requires them to adopt, when its objects have departed this life."—*Ibid.* pp. 100–1.

"Among the four things which it is said he taught, 'truthfulness' is specified (*Ana.* VII. xxiv), and many sayings might be quoted from him, in which 'sincerity' is celebrated as highly and demanded as stringently as ever it has been by any Christian moralist; yet he was not altogether the truthful and true man to whom we accord our highest approbation. There was the case of Măng Che-fan, who boldly brought up the rear of the defeated troops of Loo, and attributed his occupying the place of honour to the backwardness of his horse. The action was gallant, but the apology for it was weak and wrong. And yet Confucius saw nothing in the whole but matter for praise (*Ana.* VI. xiii). He could excuse himself from seeing an unwelcome visitor on the ground that he was sick, when there was nothing the matter with him (*Ana.* XVII. xx). These perhaps were small matters, but what shall we say to . . . his deliberately breaking the oath which he had sworn, simply on the ground that it had been forced from him? . . . It must have had, and it must still have, a very injurious influence upon" the people and scholars of China.—*Ibid.* pp. 101–2.

"With the Confucians of China, the gods appeared to hold by no means an undivided supremacy, the saints or sages (*shing-jin*) seeming to be of at least equal importance." "Confucius admitted that he did not understand much respecting the gods, and therefore he preferred being silent on the subject; Choo-foo-tsze (or Choo-tsze) affirmed that sufficient knowledge was not possessed to say positively that they existed; but he saw no difficulty in omitting the subject altogether. Though the sages of China did not claim for themselves an equality with heaven, yet they talk of each other in a way that sounds like blasphemy. Heaven and earth (they say) produced man, but the work was incomplete; men were to be taught the principles of reason, which heaven and earth could not do; the work of the sages was equally great, and therefore heaven, earth, and the sages form a triad of powers, equal among themselves." "The Chinese division of human knowledge . . . is into *Heaven*, *Earth*, and *Man*." "The *Joo-keaou* [*Ju Chiao*], or sect of the learned . . . which is so miserably deficient respecting the Deity, is also entirely silent respecting the immortality of the soul, as well as future rewards and punishments. Virtue is rewarded, and vice punished in the individuals, or in their posterity on earth; but of a separate state of existence they do not speak." "Their philosophy makes man consist of a *king* [*hsing*] figure, or visible body, and *ky* [*ch'i*], spirit, or emanating principle. While the union continues, the body remains sensible, and the separation is death."—*Davis*, *Chinese*, i. 68–9. See also *Morrison*, *Dic.*, i. 613–4.

"The prime idea in this worship is that the Emperor is *Tien-tsz'* [*T'ien-tzŭ*], or 'Son of Heaven,' the coordinate with Heaven and Earth, from whom he directly derives his right and power to rule on earth among mankind, the One Man who is their vicegerent and the third of the trinity (*san tsai*) of Heaven, Earth, and Man. With these ideas of his exalted position, he claims the homage of all his fellow-men. He cannot properly devolve on any other mortal his functions of their high priest to offer the oblations on the altars of Heaven and Earth at Peking at the two solstices. He is not, therefore, a despot by mere power, as other rulers are, but is so in the ordinance of nature, and the basis of his authority is divine. He is accountable personally to his two superordinate powers for its record and result. If the people suffer from pestilence or famine he is at fault, and must atone by prayer, sacrifice, and reformation as a disobedient son. One defect in all human governments—a sense of responsibility on the part of rulers to the God who ordains the powers that be—has thus been partly met and supplied in China. It has really been a check, too, on their tyranny and extortion; for the very books which contain this State ritual intimate the amenability of the sovereign to the Powers who appointed him to rule, and hint that the people will rise to vindicate themselves. The officials, too, all springing from the people, and knowing their feelings, hesitate to provoke a wrath which has swept away thousands of their number."—*Williams*, *Midd. King.* ii, 194–5.

"The State religion of China has had a remarkable history and antiquity, and, though modified somewhat during successive dynasties, has retained its main features during the past three thousand years. The simplicity and purity of this worship have attracted the notice of many foreigners, who have disagreed on various points as to its nature and origin. . . . What was the precise idea connected with the word *tien*, 'heaven,' and *hwang tien* [*huang t'ien*], 'imperial heaven,' as they were used in ancient times, is a very difficult point to determine; the worship rendered to them was probably of a mixed sort, the material heavens being taken as the most sublime manifestation of the power of their maker, whose character was then less obscured and unknown than in after times, when it degenerated to Sabianism."—*Ibid.* ii. 194.

"The objects of State worship are chiefly things, although persons are also included. There are three grades of sacrifices, *great*, *medium*, and *inferior*, the last collectively called *kiun sz'*, or 'the crowd of sacrifices.' The objects to which the great sacrifices are offered are only four, viz., *tien* [*t'ien*], the heavens or sky, called the imperial concave expanse; *ti*, the earth, likewise dignified with the appellation imperial; *tai miao*, or the great temple of ancestors, wherein the tablets of deceased monarchs of this dynasty are placed; and, lastly, the *shĕ tsih*, or gods of the land and grain, the special patrons of each dynasty. The tablets representing these four great objects are placed on an equality by the present monarchs, which is strong presumptive proof that by *tien* is now meant the material heavens." "The medium sacrifices are offered to nine objects: The sun, or 'great light,' the moon, or 'night light,' the manes of the emperors and kings of former dynasties, Confucius, the ancient patrons of agriculture and silk, the gods of heaven, earth, and the cyclic year. The first six have separate temples erected for their worship in Peking. The inferior herd of sacrifices are offered to the ancient patron of the healing art and the innumerable spirits of deceased philanthropists, eminent statesmen, martyrs to virtue, etc.; clouds, rain, wind, and thunder; the five celebrated mountains, four seas, and four rivers; famous hills, great watercourses, flags, triviæ, gods of cannon, gates, queen goddess of earth, the north pole, and many other things."—*Ibid.* ii. 195–6.

"The remarks of Confucius upon religious subjects were very few; he never taught the duty of man to any higher power than the head of the State or family, though he supposed himself commissioned by heaven to restore the doctrines and usages of the ancient kings. He admitted that he did not understand much about the gods: that they were beyond and above the comprehension of man; and that the obligations of man lay rather in doing his duty to his relatives and society than in worshipping spirits unknown. 'Not knowing even life,' said he, 'how can we know death?' and when his disciples asked him in his last illness whom he would sacrifice to, he said he had already worshipped. Chu Hi resolved the few and obscure references to Shangti in the *Shu King* into pure materialism; making nature to begin with the *tai kih*, called *premier principe matériel* by the French, which operating upon itself resolved itself into the dual powers, the *yin* and *yang*."—*Ibid.* ii. 199–200.

"The principal objection to [the term State Religion as a translation of *Ju Kiao*] is that it would be calculated to give a wrong impression . . . there being no religion in China which is specially sanctioned and upheld by the State. There are peculiar rites and forms of worship practised exclusively by officers, because they are regarded as specially appropriate to them as officers. In addition to these official rites, they, with their families, adopt very much the same forms of belief and worship that the common people do."—*Nevius*, *China and the Ch.*, p. 79.

"The other, and still more remarkable trait of Chinese idolatry, is that there is no deification of sensuality, which, in the name of religion, could shield and countenance those licentious rites and orgies that enervated the minds of worshippers and polluted their hearts in so many other pagan countries. No Aphrodite or Lakshmi occurs in the list of Chinese goddesses; no weeping for Thammuz, no exposure in the temple of Mylitta or obscene rites of the Durga-puja, have ever been required or sanctioned by Chinese priests; no nautch girls as in Indian temples, or courtesans as at Corinth, are kept in their sacred buildings. Their speculations upon the dual powers of the *yin* and the *yang* have never degenerated into the vile worship of the *linga* and *yoni* of the Hindus, or of Amun-kem, as pictured on the ruins of Thebes. Although they are a licentious people in word and deed, the Chinese have not endeavoured to lead the votaries of pleasure, falsely so called, further down the road of ruin, by making its path lie through a temple and trying to sanctify its acts by putting them under the protection of a goddess. Nor does their mythology teem with disgusting relations of the amours of their deities; on the contrary, like the Romanists, they exalt and deify chastity and seclusion as a means of bringing the soul and body nearer to the highest excellence. Vice is, in a great degree, kept out of sight, as well as out of religion, and it may be safely said that no such significant sign as has been uncovered at Pompeii, with the inscription *Hic habitat felicitas*, was ever exhibited in a Chinese city."—*Ibid.* ii. 192–3.

"'The family that accumulates goodness is sure to have superabundant happiness, and the family that accumulates evil is sure to have superabundant misery' (*I ching*, App. 4, Sect. ii. 5). The language makes us think of the retribution of good and evil as taking place in the family, and not in the individual; the judgment is long deferred, but it is inflicted at last, lighting, however, not on the head or heads that most deserved it. Confucianism never falters in its affirmation of the difference between good and evil, and that each shall have its appropriate recompense; but it has little to say of the where and when and how that recompense will be given. The old classics are silent on the subject of any other retribution besides what takes place in time. About the era of Confucius the view took definite shape that, if the issues of good and evil, virtue and vice, did not take effect in the experience of the individual, they would certainly do so in that of his posterity. This is the prevailing doctrine among the Chinese at the present day; and one of the earliest expressions, perhaps the earliest expression, of it was in the sentence under our notice that has been copied from this Appendix into almost every moral treatise that circulates in China. A wholesome and an important truth it is, that 'the sins of parents are visited on their children;' but do the parents themselves escape the curse? It is to be regretted that this short treatise, the only 'wing' of the Yî professing to set forth its teachings concerning man as man, does not attempt any definite reply to this question."—*Legge, Yi, King*, Introd. pp. 47–8.

[For the supposition that Confucius was the Ju T'ung Buddha see *Tzŭ shih ching hua*, *c.* 180, p. 11*b*.]

Traces of Buddhism.—"Whether we accept or reject the statements of Lie-tzû, we must, I think, agree with the author of the Chêng-tzû-t'ung, that long before the time of Han Ming Ti the existence of the Buddha had been known in China. [It may have reached China either through Tibet or Burmah.] Nor can the apparent ease and readiness with which this Emperor's dream [*v.* following Period] was interpreted be explained otherwise. . . . We may, therefore, coincide with Edkins and others in their opinion that it was during the third century B.C. that Buddhism began to be propagated in China."—*Ch. Rec.*, ii. 2.

"As early as 250 B.C. Buddhist missionaries peregrinated through China. They found there a popular religion, the chief characteristics of which were serpent and tree-worship, the grand moral system of Confucianism with its worship of ancestors, and the system of Taoism, which had already descended from its sublime height of philosophic mysticism to an alliance with popular forms of superstition, sorcery and witchcraft. The Buddhists at once arrayed themselves on the side of popular superstition and Taoism, in opposition to Confucianism. But for fully three hundred years, from 250 B.C. to A.D. 62, the labours of Buddhists in China met with little success; in fact, statistic enquirers into the missionary problem of that time would have called Buddhist propaganda in China a decided failure."—*Eitel, Buddhism*, pp. 23–5.

Cosmogony.—"The date of the beginning of all things has been nicely calculated by Chinese chronologers. There was first of all a period when Nothing existed, though some enthusiasts have attempted to deal with a period antecedent even to that. Gradually Nothing took upon itself the form and limitations of Unity, represented by a point at the centre of a circle. Thus there was a Great Monad, a First Cause, an Aura, a Zeitgeist, or whatever one may please to call it." "After countless ages, spent apparently in doing nothing, this Monad split into Two Principles, one active, the other passive; one positive, the other negative; light and darkness; male and female. The interaction of these Two Principles resulted in the production of all things, as we see them in the universe around us, 2,269,381 years ago. Such is the cosmogony of the Chinese in a nutshell."—*Giles, Hist. of Ch. Lit.*, p. 3. The number of years since the beginning of the universe was extended in a later age to 3,276,481.

"Chinese philosophers speak of the origin of all created things, or the *premier principe materiel* (as it has been called in French translations), under the name of *Tae-keih* [T'ai-chi]. This is represented in their books by a figure, which is thus formed. On the semidiameter of a given circle describe a semicircle, and on the remaining semidiameter, but on the other side, describe another semicircle. The whole figure represents the *Tae-keih*, and the two divided portions, formed by the curved line, typify what are called the *Yâng* and *Yin;* in respect to which, this Chinese mystery bears a singular parallel to that extraordinary fiction of Egyptian mythology—the supposed intervention of a masculo-feminine principle in the development of the *mundane egg*. The *Tae-keih* is said to have produced the *Yâng* and *Yin*, the active and passive, or male and female principle, and these last to have produced all things. The Heaven they call *Yâng*, the Earth *Yin*, the Sun is *Yâng*, the Moon *Yin*, and in the same manner the supposed analogy is carried throughout all nature. One might sometimes be led by their definitions of the *Tae-keih*, to suppose it an intelligent being; but the general drift of the system is plainly material, as it does not discriminate between the creature and the Creator."—*Davis, Chinese*, ii. 65–6.

"Heaven was formless, an utter chaos; the whole mass was nothing but confusion. Order was first produced in the pure ether, and out of it the universe came forth; the universe produced air, and air the milky-way. When the pure male principle *yang* had been diluted, it formed the heavens; the heavy and thick parts coagulated, and formed the earth. The refined particles united very soon, but the union of the thick and heavy went on slowly; therefore the heavens came into existence first, and the earth afterwards. From the subtle essence of heaven and earth, the dual principles *yin* and *yang* were formed; from their joint operation came the four seasons, and these putting forth their energies gave birth to all the products of the earth. The warm effluence of the *yang* being condensed, produced fire; and the finest parts of fire formed the sun. The cold exhalations of the *yin* being likewise condensed, produced water; and the finest parts of the watery substance formed the moon. By the seminal influence of the sun and moon, came the stars. Thus heaven was adorned with the sun, moon, and stars; the earth also received rain, rivers, and dust."—*Ch. Repos.*, iii. 55.

"The above might, with no great impropriety, be styled, 'a sexual system of the universe.' They maintain that when from the union of the *Yâng* and *Yin* all existences, both animate and inanimate, had been produced, the sexual principle was conveyed to, and became inherent in all of them. Thus heaven, the sun, day, etc., are considered of the male gender; earth, the moon, night, etc., of the female. This notion pervades every department of knowledge in China. It exists in their theories of anatomy and medicine, and is constantly referred to on every subject. The chief divinities worshipped by the Emperor, as high-priest of the state religion, are Heaven and Earth, which in this sense appear to answer in some degree to *ουρανος* and *γη*, in the cosmogony of the Greeks." "Of *Tien*, or heaven, they sometimes speak as of the Supreme Being, pervading the universe, and awarding moral retribution: and it is in the same sense that the Emperor is styled 'the Son of Heaven.' At other times they apply the term to the visible sky only. Heaven stands at the head of their *moral*, as well as *physical* system, and most of the attributes of the Deity are referred to it. The common people colloquially apply to it a term of respect, equivalent to *venerable father*, or *lord*; and *Choo-tsze* himself says on one occasion, that 'Heaven means God.' *Ty* [*Ti*], the earth, is called by the Chinese *mother*, in the same way that *Tien*, heaven, is styled *father*, and between these two, all sublunary things are said to have been produced."—*Davis, Chinese*, ii. 67–8.

"No creator is known or imagined who, like Brahma, lives in space, ineffable, formless; but the first being, Pwanku [P'an Ku], had the herculean task to mould the chaos which produced him, and chisel out the earth that was to contain him. One legend is that 'the dual powers were fixed when the primeval chaos separated. Chaos is bubbling turbid water, which enclosed and mingled with the dual powers, like a chick *in ovo*, but when their offspring Pwanku appeared their distinctiveness and operations were apparent. *Pwan* means a "basin," referring to the shell of the egg; *ku* means "solid," "to secure," intending to show how the first man Pwanku was hatched from the chaos by the dual powers, and then settled and exhibited the arrangement of the causes which produced him.'"—*Williams, Midd. King.*, ii. 138.

"The Chinese have also the notion of an egg, and that the *tai kieh* was evolved from it, or acted like the process of hatching going on in it, though it may be that with them the introduction of the egg is more for the sake of illustration than as the form of the cause."—*Ibid.* ii. 200.

"The Rationalists have penetrated furthest into the Dædalian mystery of this cosmogony, and they go on to show what Pwanku did and how he did it. They picture him holding a chisel and mallet in his hands, splitting and fashioning vast masses of granite floating confusedly in space. Behind the openings his powerful hand has made are seen the sun, moon, and stars, monuments of his stupendous labors; at his right hand, inseparable companions of his toils, but whose generation is left in obscurity, stand the dragon, the phœnix, and the tortoise, and sometimes the unicorn, divine types and progenitors with himself of the animal creation. His efforts were continued eighteen thousand years, and by small degrees he and his work increased; the heavens rose, the earth spread out and thickened, and Pwanku grew in stature, six feet every day, till, his labours done, he died for the benefit of his handiwork. His head became mountains, his breath wind and clouds, and his voice thunder; his limbs were changed into the four poles, his veins into rivers, his sinews into the undulations of the earth's surface, and his flesh into fields; his beard, like Berenice's hair, was turned into stars, his skin and hair into herbs and trees, and his teeth, bones, and marrow into metals, rocks, and precious stones; his dropping sweat increased to rain, and lastly (*nascitur ridiculus mus*) the insects which stuck to his body were transformed into people!" "Pwanku was succeeded by three rulers of monstrous forms called the Celestial, Terrestrial, and Human sovereigns, impersonations of a trinity of powers, whose traces and influences run through Chinese philosophy, religion, and politics; their acts and characters are detailed with the utmost gravity, and more than Methusalean longevity allowed them to complete their plans. Their reigns continued eighteen thousand years (more or less according to the author quoted), during which time good government commenced, men learned to eat and drink, the sexes united, sleep was invented, and other improvements adopted. One would think, if the subjects of these wonderful beings were as long-lived, great perfection might have been attained in these and other useful arts; but the mysterious tortoise, companion of Pwanku, on whose carapace was written, in tadpole-headed characters, the history of the anterior world, did not survive, and their record has not come down. After them flourished two other monarchs, one of them called Yu-chau, which means 'having a nest,' and the other Sui-jin, or 'match-man.' Whether the former invented nests for the abodes of his subjects, such as the Indians on the Orinoco have, is not stated; but the latter brought down fire from heaven for them to cook with, and became a second, or rather the first, Prometheus."—*Ibid.* ii. 138–41.

Myths.—"A remarkable development of myth and poetical imagination followed the almost prophetic warnings uttered by Confucius."—*Journ. P.O.S.*, ii. 144–5.

"If we reflect a little on the reason why myths are foreign to the Chinese classics, it is because the people were then, what they are still, *not naturally inclined to mythological invention*. The idea would never have occurred to them to invent legends at all, but for the arrival in their country of sailors' stories, pictures and images of gods, and Hindoo legends, brought by Buddhists and others. Afterwards when the Chinese became familiar with such pictures and stories, it was easy to continue inventing new myths."—*Ch. Rev.*, xiii. 408.

"Lie tsï is one of the authors who deals in myths and he does it on a large scale. He alludes to Lau tsï's book under the name 'Hwang ti shu' the book of Hwang ti, the Yellow Emperor. This is the first trace of the mythological connection of the Yellow Emperor with the Tauist religion. The reference of a passage of Lau tsï to Hwang ti who lived 2800 B.C. is a definite mythical creation and for this Lie tsï is solely responsible. He elaborates a scheme of creation which is more expanded than that of the Tau te ching. In this creation no persons are mentioned. But the author does not proceed far before he begins to invent incidents and conversations in which various celebrated persons take part. He cites the fable of the birth of Heu tsi, and a marvellous story of the birth of the sage Yi Yin, chief minister of the emperor Tang, 1766 B.C. His mother became by metamorphosis a hollow mulberry tree. A girl came to gather mulberries from the branches when she noticed an infant in the hollow part of the tree; she took it out, conveyed it home, reared it, and this was the sage." "This author is the first to invent dialogues between remarkable persons, such as Confucius, Lau tan, Yo tsï, the counsellor of Wen wang, the Yellow Emperor and others. He lived only a few decades of years after Confucius and did not therefore intend to present these dialogues as real. They were a vehicle for the application of Tauist truth to the popular apprehension. The imperial critics of last century say of him that he really existed and that his book is certainly older than 220 B.C. With the aid afforded us by these critics, we are able to arrive at the definite conclusion that religious romance had really commenced at the time of this author, who was living about 400 B.C. His object was to beautify and popularize the abstruse, unadorned philosophy of the founder of Tauism. Our author not only invented dialogues or adopted them from traditions. He invented or borrowed from traditions various journies and incidents. He had intellectual visions and he taught his disciples to regard them as of the same importance as if they consisted of real events."—*Ibid.* xiii. 408–9.

Lieh Tzŭ is "the first author in whom we find the legends of the Taouist Kings, Hwang ti and Mu wang. He first mentions the supernatural powers of magicians and the story of the western queen Si wang mu. He was the first to mention the islands of the immortals in the ocean, and kingdoms where dwarfs and giants reside, and where the people have for food the fruits of trees which enable them to continue for ever young. He tells stories of swords that can cut jade-stone in two. He is the first to mention that the world is deficient in one quarter and that Nü Kwa made use of stones of five colours to repair the defect. He has the honour of first representing the universe as resting on a great tortoise. One of these animals supports an immense island on its head, so he informs us, and swims away with it when so inclined. The God of the north he calls 禹彊 Yü ch'iang. . . . He introduces the names of Fu hi and Shen nung into his stories and states that, from the time of Fu hi till his day, 300,000 years had passed, and that there had elapsed before Fu hi an immeasurable period. He was the first to bring out clearly the distinction between soul and body. This separation of human nature into two parts does not appear so plainly before his time as after. Yet it is in Lau tsï, and it was in fact impossible for the idealistic philosophy of India to enter at all into China without this distinction being clearly expressed. There is a remarkable difference between Lau tsï and Lie tsï in this that Lie tsï accepted whatever foreign knowledge arrived, while Lau tsï could use only philosophy and of that only a select portion. Lie tsï is aware that a vast ocean surrounds the world and that it is ruled by various divinities. Lau tsï will have nothing to say about these things."—*Ibid.* xiii. 411.

[For Hsi Wang Mu, the "Goddess of the West," whom Giles identifies with Hera, see his *Adv. Sin.*, No. 1, the authors quoted by him, and *N. and Q. on C. and J.*, i. 12–14.]

[As to how the Tsin country (Shansi) came to have *Shi shên* and *Shên* (Orion) as its stars see *Ch. Rev.*, xiii. 413.]

[See also *supra*, *Deities*.]

Superstitions, etc.—"As might be expected, the birth of the sage [Confucius] is surrounded with many prodigious occurrences. One account is, that the husband and wife prayed together for a son in a dell of mount Ne. As Ching-tsae went up the hill, the leaves of the trees and plants all erected themselves, and bent downwards on her return. That night she dreamt the Black *Te* appeared, and said to her, 'You shall have a son, a sage, and you must bring him forth in a hollow mulberry tree.' One day during her pregnancy, she fell into a dreamy state, and saw five old men in the hall, who called themselves the essences of the five planets, and led an animal which looked like a small cow with one horn, and was covered with scales like a dragon. This creature knelt before Ching-tsae, and cast forth from its mouth a slip of gem, on which was the inscription,—'The son of the essence of water shall succeed to the withering Chow, and be a throneless king.' Ching-tsae tied a piece of embroidered ribbon about its horn, and the vision disappeared. When Heih was told of it, he said, 'The creature must be the K'e-lin.' As her time drew near, Ching-tsae asked her husband if there was any place in the neighbourhood called 'The hollow mulberry tree.' He told her there was a dry cave in the south hill, which went by that name. Then she said, 'I will go and be confined there.' Her husband was surprised, but when made acquainted with her former dream, he made the necessary arrangements. On the night when the child was born, two dragons came and kept watch on the left and right of the hill, and two spirit-ladies appeared in the air, pouring out fragrant odours, as if to bathe Ching-tsae; and as soon as the birth took place, a spring of clear warm water bubbled up from the floor of the cave, which dried up again when the child had been washed in it. The child was of an extraordinary appearance; with a mouth like the sea, ox lips, a dragon's back, etc., etc. On the top of his head was a remarkable formation, in consequence of which he was named K'ew, etc."—*Legge, Ch. Class.*, i. Prol. p. 59, note. See also p. 86.

Confucius said, "I am a man of Yin, and last night I dreamt that I was sitting with offerings before me between the two pillars [*i.e.*, where the dressing and coffining of the dead was performed]. No intelligent monarch arises; there is not one in the empire that will make me his master. My time has come to die."—*Ibid.* i. Prol. p. 88.

[At the time of an eclipse of the moon a virtuous king revised the laws (or punishments) to see wherein he had displeased heaven. See *Kuan Tzŭ, P'ei wên yün fu*, *c.* 24*a*, p. 62*b*.]

"By the people of that period [Chou] the fox was considered a very unlucky creature to meet."—*Journ. N.-C.B.R.A.S.*, N.S. viii. 47.

"Nan Chi Tzŭ (a hermit's designation), whose name was Liu Jung, once took out a cup and repeated incantations, whereupon the cup was immediately transformed into a tortoise. If cooked it could be eaten. It was complete in all its organs. Also the cup, after having been transformed into a tortoise, if the flesh were boiled off the carapace, the latter could be retransformed into a cup."—*Yün chi ch'i ch'ien, Shih lei t'ung pien*, *c.* 73, *Ch'i yung pu*, p. 21*b*.

"The changes of names of places in earlier dynasties have been frequent. Taoism and geomantic superstitions were then prevalent, and the principle guiding the changes of names will generally be found to be this—that an Emperor thus acts in order to benefit with an auspicious, or to injure with an inauspicious name, a city which he likes and honours, or dislikes and fears."—*Oxenham, Atlas*, Pref. p. iv.

"In the Chow dynasty, the practice of 'concealing the name,' as it is called (諱名), came into vogue."—*Legge, Ch. Class.*, III. ii. 353, note.

"The Li-ki contains many rules about the names to be used

or 'avoided'; *cf. S.B.*, xxvii. pp. 93 (where historical and literary compositions are exempted from the duty of avoiding names), 101, 107, 110, 111, 190; and xxviii. 18, 27, etc. Tso's Commentary (C.C., v. pt. ii. p. 50) gives curious details respecting name superstitions. In naming a child, 'the name must not be taken from the name of the State, or of an office, or of a mountain or river, or of any malady, or of an animal, or of a utensil, or of a ceremonial offering. [*Cf.* HABITS AND CUSTOMS.] The effect of such a course would be 'to do away with the state or the office, with the sacrifice to the hill or river, with the use of the animal as a victim, and the use of the utensil or of the offering in ceremonies.'"—*Simcox*, ii. 25–6, note.

"The prejudice against hare-flesh seems to have existed also with the primeval Chinese race. We read in the supplement to the ancient dictionary *Rh-ya*, that the population of Yo-yang [mod. Yo-chou Fu] considered the hare as the telluric genius, so that nobody dared to hunt it."—*N. and Q. on C. and J.*, ii. 68–9.

"Not a few references to" the practice of making an effigy and maltreating it "occur in Chinese tale books. In the twelfth century B.C., a certain philosopher (Chiang T'ai-kung) descended from the K'unlun mountains to assist the Martial Monarch (Wu Wang) of the Chou dynasty, by means of various magical artifices learned upon that Olympus of Taoism." "But the enemy had learned the use of potent, if unorthodox, magic arts too. One of these foes had graduated in wizardry upon Mount Omei in modern Szechuan. His name was Tsao Kung-ming. He rode on a tiger, and was armed with an iron whip, on lifting which with both hands, a magical light, as of a lightning flash, bewildered the beholders. The philosopher from K'unlun being attacked by this weapon, was thrown wounded off his steed, and his comrades in arms were routed. Whereupon another *orthodox* philosopher suggested *Ciurp Creadh*. A straw effigy was made of the heterodox magician, Tsao Kung-ming, with his name written thereon, and potent invocations besides. The effigy was then pierced with arrows, and three bows were placed so as to keep it always 'under fire.' At this the original fell ill, nor was he restored until the plot was discovered and the effigy secured by the enemy."—*N.-C. Daily News*, April 13th, 1899.

[Certain officers had the charge of interpreting the dreams of the king (*Shih ching*, II. iv. VIII. 5). Soothsayers also interpreted the dreams of men in power (II. iv. VI. 4). It was unlucky to see a black crow or a red fox (I. iii. XVI. 3). They dared not point to the rainbow with the finger if it was in the East (I. iv. VII.).]

[There was supposed to be a correspondence between the weather and the characters of men.—See *Shu ching*, Pt. v. Bk. iv. 37.]

[Superstitions were not so numerous as they were after Buddhism and Taoism had taken firm root.]—*Matignon*, p. 5.

Divination, etc.—"The Duke of Chow certainly practised it [divination]; and we have a regular staff of diviners among the officers of the Chow dynasty."—*Legge, Ch. Class.*, III. i. Prol. p. 196.

In the first month of winter "orders are given to the Grand recorder to smear with blood the tortoise-shells and dividing stalks, and by interpreting the indications of the former and examining the figures formed by the latter, to determine the good and evil of their intimations."—*Li chi*, iv. iv. i. ii.; *Legge*, i. 298. See also in *Mencius*, I. 7, 4, on the consecration of a bell by smearing parts of it with blood.

"The forms of the regular prognostications were in all 120, the explanations of which amounted to 1,200" (*Chou li*, Bk. XXIV.). "These explanations, no doubt consisting of a few oracular lines . . . were kept by themselves, and consulted on occasion, according to certain rules which have not come down. The duke of Chow . . . had recourse to them."—*Legge, Ch. Class.*, III. ii. 356, note.

"In the Supplement of Zo Khiû-ming to 'the Spring and Autumn,' there is abundant evidence that divination by the Yî was frequent, throughout the states of China, before the time of Confucius. There are at least eight narratives of such a practice, between the years 672 and 564 B.C., before he was born; and five times during his life-time the divining stalks and the book were had recourse to on occasions with which he had nothing to do. In all these cases the text of the Yî, as we have it now, is freely quoted. The 'Spring and Autumn' commences in 722 B.C. If it extended back to the rise of the Kâu dynasty we should, no doubt, find accounts of divination by the Yî interspersed over the long intervening period. For centuries before Confucius appeared on the stage of his country, the Yî was well known among the various feudal states, which then constituted the Middle Kingdom."—*Legge, Yî king*, Introd. pp. 4–5.

King Wên and the duke of Chou "were not divining themselves, but their words became oracles to subsequent ages, when men divined by the hexagrams, and sought by means of what was said under them to ascertain how it would be with them in the future, and learn whether they should persevere in or withdraw from the courses they were intending to pursue."—*Ibid.* pp. 10–11.

"During the latter part of the *Chau* dynasty, which continued to 249 B.C., *Kwei kuh sien sz* applied the *Yih-king* to the use of soothsaying, and is regarded as the father of augurs, though no book has come down to the present from him."—*Nevius, China*, p. 180.

"In the building of the Imperial capital all favourable circumstances must be combined. There was in ancient times no *feng shui*. This is a recent superstition. But it was required to have lucky portents and begin laying out a city upon a lucky day."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 256–7.

"On account of the universal belief in omens it was usual to divine by the tortoise to know if the locality selected was a good one. . . . In the *Book of Odes*, building was not commenced without an omen of a favourable character. This was done when Tai-wang moved south-west from the valley of the King river, in which lay his old residential city Pin, to the south of Chi-shan, in the valley of the Wei river. He then inscribed on the shell of a tortoise certain lines, and upon scorching it received such an answer that he knew that the site he had arrived at would be suitable. The cardinal points were determined and the simple laws of ancient architecture were followed." "Orientation was made an important point; and there was provision for religious ceremonies. A burnt sacrifice, for instance, was offered even in front of private houses in summer, and on that occasion the altar was on the south-east, the worship being that of the god of fire. This seems to show that the worship of the five elements was intimately connected with the ancient rules of house-building."—*Ibid.* xxiv. 260–1.

[At the foundation of a city, and in general for any affair difficult to decide upon, they consulted the lots (*Shih ching*, I. iv. VI. 2.). This was done in two ways:—by a certain plant called *shih* (筮); or by the shell of the tortoise (卜) (I. v. IV. 2; II. i. IX. 4; v. I. 3). We do not know well how the divination was performed formerly by the plant *shih*. At the present day, they place on the right and on the left a packet of stalks from this plant; then they recite some mysterious words, and by taking a handful of stalks from each packet, they prognosticate according to their number. The divination by the tortoise was made by smearing ink or some similar substance on the shell, placing fire on it, and auguring by the direction of the cracks made upon it by the heat.]

"External undertakings should be commenced on the odd days, and internal on the even. [The odd days are called 'strong,' as belonging to the category of *yang*; the even days 'weak,' as of the category of *yin*.] In all cases of divining about a day, whether by the tortoise-shell or the stalks, if it be beyond the decade, it is said, 'on such and such a distant day,' and if within the decade, 'on such and such a near day.' For matters of mourning a distant day is preferred; for festive matters a near day. It is said, 'For the day we depend on thee, O great Tortoise-shell, which dost give the regular indications; we depend on you, O great Divining Stalks, which give the regular indications.' Divination by the shell or the stalks should not go beyond three times. The shell and the stalks should not be both used on the same subject [to reverse by the one the indication of the other]. Divination by the shell is called *pû*; by the stalks, *shih*. The two were the methods by which the ancient sage kings made the people believe in seasons and days, revere spiritual beings, stand in awe of their laws and orders; the methods (also) by which they made them determine their perplexities and settle their misgivings. Hence it is said, 'If you doubted and have consulted the stalks, you need not (any longer) think that you will do wrong. If the day (be clearly indicated), boldly do on it (what you desire to do).'"—*Li chi*, i. i. v. 6, 22–7; *Legge*, i. 94.

"Lieh Tzŭ, a philosopher who lived near the end of the Chow dynasty, says that in the time of King Mu (1001 to 946 B.C.) there came to China from the extreme West, a magician who was able to go into water and fire, pass through metal and stone, and do many other marvellous things. This man has by some been identified with the historical Buddha, but wrongly."—*Ch. Rec.*, ii. 1.

Among the innovations introduced, about 665 B.C. by the traders from India and the Persian Gulf who settled in Shan-tung, were "Astrology and sorcery from Chaldean sources, tinged with Indian views, Elamo-Persian notions, mythological imagery of Egypt, India and Babylon, ideas of transmutation and alchemy." "This sorcery appeared, I think for the first time in 662 B.C. (*cf. Tso-tchuen*, 3. xxxii. 2). Astrology was not known in China, in 710, 669, nor even in 661 B.C.—all dates when it should have been resorted to, if known then. (*Cf. Tso-tchuen*, under these years). Besides divining by the tortoise-shell or the millfoil, the chief means of forecasting events were onomancy and palmistry. Astrology appears rather abruptly in 655 B.C. when Yen, the state diviner of *Tsin*, quotes as childish ditties (*t'ung yao*) an astrological answer concerning a project of his Prince, given by some adept of the new doctrines. . . . Astrology gradually took its place as a mode of forecasting events. An instance occurs in 564 B.C. in the same state of Tsin (Shansi); it was followed by subsequent statements in 545, 540, etc., which show that the belief had become well established in the above state, and in those of Tcheng (Honan C.), Sung, (Honan E.) and others. The twelve principal states of the Chinese dominions were, each, placed under the superintendence of one of twelve zodiacal signs whose names appear then for the first time. . . . *Amongst the states*, the astrological arrangement must have been made between 584 and 564 B.C."—*Lacouperie, Western Origin*, p. 92.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

Soul.—"In perusing such of the interesting pages of the Historical books of the Han dynasty as describe the ceremonial institutions of the State at that time, we find that the inveterate belief in the presence of the disembodied soul about the corpse had already then prompted the Government to celebrate another solemnity of the first order, *viz.*, the succession to the Throne, in the immediate presence of the deceased monarch."—*De Groot, Rel. Syst.*, i. i. 351–2.

Deities.—The *Shan hai ching* says the southern regions "are ruled by the Tai sui, the 'great year god.' By this is meant the god of each year in the cycle of sixty. The god that rules each year varies in turn till *each of the sixty* has presided in his place. . . . At the end of the account of Ocean Kingdoms in the south, it is said that the god of fire ruling the South is named Tokyon. He has the body of a quadruped, with the face of a man, and he rides two dragons. . . . The god of the west, Nokshu, has in his left ear a snake. He rides two dragons. The commentator of A.D. 300 adds that this was the god of metal, and that he had a human face, a tiger's claws, white hair, and a javelin in his hand. In describing the North Sea divinities, this book speaks of an animal like a horse and named Dodu. Another is like a white horse, with teeth like a saw. This beast feeds on tigers and panthers. The god of the north properly so called is named Gugom, and has a man's face, a bird's head, a black snake in each ear, and a black snake also under each foot.'" [He] is the god of water. In the east is Kumom, . . . who rules the element of wood, having a bird's body and a human face, . . . riding on two dragons."—*Journ. R.A.S.*, xviii. 24, 25.

"The worship of the Fire-goddess *Hwei-luh*, was adopted by the Emperor in 133 B.C., and afterwards became that of the Kitchen-god."—*Lacouperie, Western Origin*, pp. 141–2.

"*Tcheng huien* (A.D. 127–200) was I think the first . . . who put forward the view that the kitchen-god was no other than the Director of Fires of Antiquity, the Tchuh hiung of the reign of Ti kuh Kao sin, the fourth of the first rulers. He was followed in his views by several scholars who attempted to establish a connection between the Fire-god of the hearth and one or other of the early fire-makers, Sui-jen, Shen-nung, or Hwang-ti. And the deity in question became a god whose worship absorbed that of a god of fate, Se-ming. How this has come to pass is still an open question. . . . In some parts of China the Kitchen-god is male and female, *e.g.* at Fuh-tchou, *the Chau Kung*, 'prince of the hearth,' and *Chau Mu*, 'Mother of the hearth,' are worshipped together."—*Lacouperie, West. Orig.*, p. 165. See also *De Groot, Les Fêtes à Emouy*, pp. 449 *seq.*, 579 *seq.*

"The inhabitants of Lice Hill often saw the God of Lice flying in and out. In times of drought, if people prayed to him for rain, it would immediately fall. The people of later ages dug a pond under the hill and called it 'Lice Pond.'"—*Hsü Sou shên chi, Yün fu shih i*, *c.* 22, p. 14*a*.

"The worship of the five emperors was still more developed in the Ts'in and Han dynasties, when it became imperial."—*Ch. Rev.*, xiii. 417.

"On the 7th day of the 7th moon the Goddess of the West came down from heaven to the palace of the emperor [Wu] and ordered her attendant handmaid to get peaches. The maid soon returned with seven peaches served on a jade plate. They were as large as duck's eggs, of round shape, and dark-green colour. The Goddess of the West presented four of them to the emperor and eat three herself."—*Han Wu nei chuan, Shih lei t'ung pien*, *c.* 74, *Ch'i yung pu*, p. 5*b*.

"*Wên Ti*, 文帝 the God of Literature, otherwise denominated *Wên Ch'ang Ti Kiün*, 文昌帝君 is one of the canonical divinities to whom worship is officially addressed throughout the Empire of China, in conformity with imperial ordinances. Twice in each year, *viz.*, on the 3rd day of the 2nd month and again on some auspicious day specially chosen during the 8th month, sacrifice and invocations are offered before his altar in every city of the Empire; and the temples erected in his honour vie with those of Kwan-Ti, the God of War, in popular respect. Like the God of War, moreover—the deified warrior Kwan-Yü, whose fidelity and martial prowess belonged to actual history before they became converted to mythological uses—the God of Literature represents, at least in some degree, a purely human original, and owes his divine personality to the system under which the pontiff-sovereign of China wields authority to invest spirits of departed mortals with divine attributes and powers. The God called into being by an Imperial mandate has at the same time become wholly interfused with traditional ideas of a date anterior to the patent of his creation; and the result of this mixture of immemorial legends with modern official apotheosis may be seen at any of his temples, in the double personification to which the God of Literature is subjected. The deity is represented under the form respectively of a dignified and venerable sage, and of a wild unearthly figure, suggesting the idea of an excited demon rather than of a beneficent dweller among the celestial spheres." "A succinct account of the process by which the superstition in question has grown into shape is given in the work entitled *Wu Hio Lu* (吾學錄), by Wu Yung-kwang, which was published in 1832. The statement there presented is as follows:—'With regard to the worship of Wên-ch'ang, two versions of its derivation exist. According to one account, this deity is one of the Heavenly Gods. In the *T'ien Kwan Shu* (the Book of Uranography in the *Sze Hi*) the following passage occurs. The *Tow Kw'ei* ("Dipper") upholds and embraces six stars. . . . These constitute the palace of Wên-ch'ang.' From the foregoing passage first arose the designation Wên-ch'ang." "According to the other account, he is the disembodied spirit (*Kwei*) of a mortal" existing as various persons under different dynasties.—*Journ. N.-C.B.R.A.S.*, N.S. vi. 31–3.

"So early as the century preceding the commencement of the Christian era a belief in the influence over study and its results exercised by a part of the constellation known to ourselves as Ursa Major was entertained in China. From such a belief to the introduction of a concrete form of worship but one step was necessary; and this step was facilitated, there can be little doubt, by the torrent of Indian customs and mythological ideas which invaded China shortly before the birth of Christ. Under the influence of these exotic revelations the dreams of Chinese philosophers respecting mind and matter appear to have become enlarged, to have drawn into harmony with the objective tendency of Indian thought, and to have passed eventually, by a natural process of degradation, into the mixture of idolatry, soothsaying, and Rosicrucianism which has become popularly know as the Taoist religion. The doctors of this belief, which in the first centuries of our era had triumphant possession of the Chinese mind, were not slow to profit by the lessons of Buddhism, so soon as the legends bequeathed by Shakyamuni and his disciples made their way into China; and among the tenets thus transplanted there was none that agreed more closely with indigenous notions than the Buddhist legend which represents the stars as forming the abodes of various orders of celestial beings. The astrological speculations of early mystics required nothing but this hint to become transformed into a system of material worship. . . . No evidence exists . . . to prove the period when a bodily likeness was first designed for the patron of literature throned among the stars; but whatever may have been the time when this addition was made to the category of popular divinities, the device of combining his personality with that of the deified mortal canonized as the God of Tszet'ung was essentially a Taoist trick."—*Ibid.* vi. 40–1.

Buddhism.—"The *Chêng-tzŭ-t'ung* says that under the Ch'in Dynasty (246–202 B.C.) Shï-li-fang and other foreign ascetics came to China and that *Shï-Hwang-ti* . . . regarding them as strange and outlandish objects, put them in prison. During the night a golden man broke open the doors and allowed them to escape."—*Ch. Rec.*, ii. 1. This tradition is rejected by Koeppen and other well informed writers on Buddhism (see *N. and Q. on C. and J.*, ii. 51–2, and *Shih wu yüan hui*, *c.* 34, p. 4*a*).

[Terrien de Lacouperie dates the first introduction of Buddhism to China before the accession of the Hans, in the year 219 B.C. See *Bab. and Or. Rec.*, July, 1891.]

"A great revolution in thought took place about two centuries before our era; the time coincides with the conquests of the Parthians, and it is possible that Græco-Roman civilisation was affected by the same wave that influenced China—whatever it was. At all events there was a general movement and a simultaneous expansion in the world, all the way from Rome to Corea. The result was that China now first heard of India, Buddhism, and the Parthians; and before long Buddhist philosophy took a firm hold on the Chinese mind, just as Christianity at the same time got a grip of the Roman or Greek mind. The history of its spread over the Far East is a long one. Like Christianity, later on it soon became surcharged with useless 'doctrine,' and priestly corruption; in other words, the men who handled it were but poor representatives of the

founder. Hence it lost caste, and had its ups and downs from dynasty to dynasty, just as our European religions had during Tudor times. But it left behind a lasting effect in this way. Buddhism was democratic; it was the enemy of class feeling, luxury, cruelty, and greed. It was merciful, favoured simplicity and economy, and gave women an equal status with men. Hence it has had a decidedly good influence upon men's minds, and especially upon women's; in fact, Chinese women, having always been uneducated, and therefore unable to read or understand contentious philosophy; being assigned moreover by Confucius a back seat in life, could have no religion or moral teaching except Buddhism and 'nature.'"—*Parker*, *China*, p. 283.

"Chinese armies had been fighting a series of campaigns in Central Asia and had repeatedly come into contact with Buddhism established there. Repeatedly it happened that Chinese generals, engaged in that war, had occasion to refer in their reports to the throne, to the influence of Buddhism."—*Eitel*, *Buddhism*, pp. 23–5.

"In the reign of King Wu (140–86 B.C.) of the West Han Dynasty, a [gigantic] gold image of Buddha was brought [in 121 B.C.] to China [forming part of the spoils of these campaigns], and set up in the Sweet Spring Temple. This served as the model according to which the images of Buddha were afterwards made. King Ai of the same dynasty (6 B.C. to A.D. 1) sent learned men to search for images and books of the Buddhist religion, but they returned without having reached their destination."—*Ch. Rec.*, ii. 1; *K'ang Hsi's Dic.*, *s.v. Fo.*

"In the second year before Christ an ambassador of the Tochari Tartars (probably sent by Kanishka) presented the emperor of China with a number of the sacred books of Buddhism."—*Eitel*, *Buddhism*, pp. 23–5.

"If we keep these facts in mind, there is no apparent reason why we should discredit the story of the famous dream of the Emperor Ming-ti. It is reported in Chinese history, that in the year A.D. 61 the Emperor Ming-ti saw in a vision of the night an image of gigantic dimensions, resplendent as gold, its head surrounded by a halo as bright as the sun, approach his palace and enter it. At a loss how to explain this dream, the Emperor appealed to his younger brother, the prince of Thsu, who had been known for years as the most zealous protector of the Taoists and who probably favoured Buddhism too. At any rate, this prince at once suggested, that the golden image which the Emperor saw referred to the statue of Buddha, and that it seemed to be Heaven's command, that Buddhism should be introduced at court and adopted by the Imperial Government." "Thereupon the Emperor despatched an embassy, which passed through Central Asia, to Cashmere and India, and returned in the year A.D. 75 accompanied by an Indian priest, with a statue of Buddha carved in sandalwood, and one sacred book. The latter was forthwith translated and published by Imperial authority, and therewith Buddhism was [officially recognized and] firmly established in China."—*Ibid.* pp. 23-5. See also following extract. *Richthofen* (i. 501) remarks that the establishment of Buddhism in China may have had some connection with Ming Ti's conquest of the Tarym-basin, A.D. 60–70.

Buddhism "does not seem to have made much progress until the time of Ming Ti (A.D. 58 to 76), who, on learning that there was in a country to the west a god named Buddha, sent Ts'ai-yin and Ch'in-ching to India to learn the doctrines and obtain the books and images of this religion. These men returned [in 67] with 42 chapters of Buddhist Sutras and images, and with Shipmadanga and some other foreign monks. The monks were located at the capital in the *Hung-lu-ssŭ*, an office corresponding somewhat to the present Board of Ceremonies. One of them, Chu-fa-lan, translated the *Shi-chu-ching*, or Sutra of the Ten Restings. In the reign of Chang ti (76 to 89), the Chief of the Ch'u kingdom became a devoted follower of Buddhism, and many more books were imported. Eighty years afterwards, a Parthian monk arrived at Lo-Yang with a collection of Sutras, some of which he translated with great intelligence and perspicuity. More monks arrived in the reign of Ling Ti (168 to 190) from the country of the Getae and from India, and translated the Nirvana and other Sutras with great spirit and fidelity."—*Ch. Rec.*, ii. 2. See also *Eitel*, *Buddhism*, p. 25.

The writings brought back "recommended chiefly passionless inactivity, compassion and care of living things: they held that the spirit of man was not destroyed after death, but at once received another form; that according to one's works when living, so was one rewarded or punished. The commentators consider that this 'herding with barbarians,' 'tolerating a subject who did not kneel,' and 'believing a teaching not based on filial love' is the greatest curse that ever befel China."—*Ch. Rev.*, xii. 44.

"The Buddhist Church of Ceylon, with its dependencies in Burmah and Siam, maintained with great tenacity the original teaching of early Buddhism in comparative purity, whilst the Northern Buddhists, that is to say those of Northern India, Cashmere, Nepaul and afterwards those of China, Tibet and Mongolia, went on constantly adding to and expanding the common stock of doctrines and traditions, and entering into compromises with any form of popular superstition they found too deep-rooted and too popular to overcome."—*Eitel*, *Buddhism*, p. 23.

"Buddhism accepted on philosophical grounds a belief in extinction, but gave way to popular sympathy, and taught a happy future state in preference to it."—*N.-C. Daily News*, April 12th, 1899.

"The power of Buddhism in China has been owing chiefly to it ability and offer to supply the lack of certainty in the popular notions respecting a future state, and the nature of the gods who govern man and creation. Confucius uttered no speculations about those unseen things, and ancestral worship confined itself to a belief in the presence of loved ones, who were ready to accept the homage of their children. That longing of the soul to know something of the life beyond the grave was measurably supplied by the teachings of Sakyamuni and his disciples, and, as was the case with Confucius, was illustrated and enforced by the earnest, virtuous life of their founder. Though the sect did not receive the imperial sanction till about A.D. 65, these teachings must have gradually grown familiar during the previous age. The conflict of opinions which ere long arose between the definite practical maxims of the Confucian moralists, and the vague speculations, well defined good works and hopeful though unproved promises of future well-being, set forth by the Hindu missionaries, has continued ever since. . . . The early sages opened no outlook into the blank future, offered no hopes of life, love, happiness, or re-union of the friends gone before, and their disciples necessarily fell back into helpless fatalism. Buddhism said, Keep my ten commandments, live a life of celibacy and contemplation, pray, fast and give alms, and according to your works you will become pure, and be rewarded in the serene nirvana to which all life tends. But the Buddhist priesthood had no system of schools to teach their peculiar tenets, and, as there is only one set of books taught in the common schools, the elevating precepts of the sages brought forth their proper fruit in the tender mind. Poverty, idleness, and vows made by parents in the day of adversity to dedicate a son or a daughter to the life-long service of Buddha, still supply that priesthood with most of its members."—*Williams*, *Midd. King.*, ii. 221–2.

"But while it is true that Buddhism gave them a system of precepts and observances that set before them just laws and high motives for right actions, and proportionate rewards for the good works it enjoined, it could not furnish the highest standards, sanctions, and inducements for holy living. On becoming a part of the people, the Buddhists soon entered into their religious life as acknowledged teachers. They adapted their own tenets to the national mythology, took its gods and gave it theirs, acted as mediators and interpreters between men and gods, the living and the dead, and shaped popular belief on all these mysteries. The well-organized hierarchy numbered its members by myriads, and yet history records no successful attempts on its part to usurp political power, or place the priest above the laws. This tendency was always checked by the literati, who really had in the classics a higher standard of ethical philosophy than the Buddhists, and would not be driven from their position by imperial orders, nor coaxed by specious arguments to yield their ground. Constant discussions on these points have served to keep alive a spirit of inquiry and rivalry, and preserve both from stagnation. Though Buddhism, in its vagaries and will-worship, gave them nothing better than husks, put hypocrisy in place of devotion, taught its own dogmas instead of truth, and left its devotees with no sense of sin against any law, yet its salutary influence on the national life of China cannot be denied."—*Ibid.* ii. 223.

"The worship of ancestors and of good and bad spirits supposed to pervade and rule this world was perfectly compatible with the reception of Buddhism; thus its priests gradually became the high priests of the popular superstition, and have since remained so. They first ingratiated themselves by making their services useful in the indigenous ritual, and were afterwards looked upon as necessary for its execution. They propagated their doctrines principally by books and tracts, rather than by collecting schools or disciples in their temples; the quiet, indolent life they led, apparently absorbed in books and worship, and yet not altogether estranged from the world, likewise held out charms to some people."—*Ibid.* ii. 223–4.

"He [Buddha] claimed to be of royal descent, but, dissatisfied with Brahmanism, he left house and home, and tried at first to find peace in the most austere asceticism. Finally, however, he emerged, disentangling himself from the social trammels of caste and all sectarian doctrines, and teaching voluntary poverty and celibacy. On the basis of all existing religions he gradually built up a grand system, the chief characteristics of which were *socially* the complete insignificance of caste and property, *dogmatically* thorough atheism and deification of humanity, *morally* the dogma of the vanity and unreality of all earthly good, transmigration of the soul in accordance with the laws of moral retribution, and final absorption in Nirvâna." "One other characteristic, imprinted upon Buddhism by his master hand, is the spirit of thorough liberality and absolute tolerance, which has marked the early rise and progress of Buddhism and which enabled it to adopt the most valuable ideas of all religions it came in contact with, to enter into a compromise with almost every form of popular superstition and to found and maintain a Church for thousands of years, without ever persecuting a single dissenter. That Buddhism is to the present day a system of unlimited eclecticism, is no doubt the work of the clever reformer Skâkyamuni Gâutama Buddha himself."—*Eitel*, *Buddhism*, pp. 6–7.

"The five principal precepts, or rather interdicts, of Budhism, must be understood as being addressed to the priests alone, or to those who devote themselves to the god. They are the following:—1. Do not kill living creatures. 2. Do not steal. 3. Do not marry. 4. Speak not falsely. 5. Drink no wine."—*Davis*, *Chinese*, ii. 81.

"Their notion of total abstraction, or quietism, seems to aim at getting rid of all passions, even of thought itself, and ceasing to be urged by any human desires; a species of mental annihilation. Certainly, to judge by its effects on the priests, the practice of Budhism appears to have a most debasing influence. They have, nearly all of them, an expression approaching to idiotcy, which is probably acquired in that dreamy state in which one of their most famous professors is said to have passed nine years, with his eyes fixed upon a wall! They say, with reference to their system of moral retribution, that what a man receives now is an indication of his conduct in a former state; and that he may augur his future condition by his behaviour in this life. The merit, however, would seem to consist as much in inaction as action; in the abstinence from evil, or the mere self-infliction of pain, as the practice of good. They make up an account with heaven, and demand the balance in bliss, or pay it by sufferings and penances of their own, just like the Papists of Europe."—*Ibid.* ii. 90.

"Accommodating their system to all the existing superstitions, they opened the door to every sort of converts, who might retain as many of their old prejudices as they chose. They were by no means rigorous in enforcing the obligations of men to morality. To expiate sins, offerings to the idols and to the priests were sufficient. A temple built in honour of Fŏ, and richly endowed, would suffice to blot out every stain of guilt, and serve as a portal to the blessed mansions of Budha. When death approached, they promised to every one of their votaries speedy promotion in the scale of the metempsychosis, till he should be absorbed in Nirupan or Nirvana-nonentity. With these prospects the poor deluded victim left the world. To facilitate his release from purgatory, they said mass, and supplied the wants of the hungry departed spirit by rich offerings of food, which the priests in reality devoured. As Confucius had raised veneration towards ancestors into idolatrous worship ['not exactly idolatrous. They sacrifice to the invisible spirit, and not to any representation of it in the figure of an idol' (*ibid.* ii. 93)], they were ready to perform the office of priests before the tablets of the dead." "But notwithstanding their accommodating creed, the Chinese government has at times disapproved of it. As the importance of marriage has been acknowledged in China from time immemorial, and almost every person at years of maturity been obliged to enter that state, the celibacy of the priesthood of Fŏ was considered a very dangerous custom. Budha regarded contemplation and exemption from worldly cares as the nearest approach to bliss and perfection; therefore his followers passed lives of indolence, and practised begging as the proper means of maintaining themselves. This was diametrically opposed to the political institutions of China, where the Emperor himself sets the example of holding the plough. If such a system prevailed extensively, the immense population of the empire must be reduced to starvation, for it is only by the utmost exertion that it can subsist. These serious faults in the foreign creed gave occasion to its enemies to devise its extirpation [*see* ECCLESIASTICAL]. . . . Yet the natural consequence of its tenets was, that it could never become a religion of the state, and that the priests were never able to exercise any permanent influence over the populace. Besides, the Chinese are too rational to believe implicitly all the absurd Budhistic fables, nor can they generally persuade themselves that those numerous images are gods. When we add to this their national apathy towards anything concerning religion, from their being entirely engrossed by the affairs of this life, we can easily account for the disesteem in which they hold Budhism."—*Ch. Repos.*, ii.

"The paradise of Fŏ includes those circumstances of sensual indulgence which the founders of most false religions have promised to their votaries; but, unlike the elysium of Mahomed, no *houris* are to be supplied to the saints of Budhism, for even the women that are admitted there must first change their sex" (*Davis*, *Chinese*, ii. 104). "The bodies of the saints reproduced from the lotus [the lotus is a favourite type of creative power, and representations of it perpetually occur in connection with Budhism (*ibid.* ii. 104)] are pure and fragrant, their countenances fair and well-formed, their hearts full of wisdom, and without vexation. They dress not, and yet are not cold; they dress, and yet are not made hot. They eat not, and yet are not hungry; they eat, and yet are not satiated. They are without pain, irritation, and sickness, and they become not old. . . . They behold the lotus flowers and trees of gems delightfully waving, like the motion of a vast sheet of embroidered silk. On looking upwards, they see the firmament full of the To-lo flowers, falling in beautiful confusion like rain. The felicity of that kingdom may justly be called superlative, and the age of its inhabitants is without measure. This is the place called the paradise of the west."—*Ch. Gleaner*, iii. 280.

"Prior to their final condemnation, the souls are exposed to judgment in the courts of the *Shê ming Wâng*, 'the ten kings of darkness': the proceedings in these courts are represented exactly after the manner of the Chinese judicial trials, with the difference in the *punishments*, which, in these pictures of the infernal regions, are of course sufficiently appalling. In one view are seen the judge with his attendants and officers of the court, to whom the merciful goddess *Kuân-yin* appears, in order to save from punishment a soul that is condemned to be pounded in a mortar. Other punishments consist of sawing asunder, tying to a burning pillar of brass, etc. Liars have their tongues cut out; thieves and robbers are cast upon a hill of knives; and so on. After the trials are over, the more eminently good ascend to paradise; the middling class return to earth in other bodies, to enjoy riches and honours; while the wicked are tormented in hell, or transformed into various animals, whose dispositions and habits they imitated during their past lives."—*Ibid.* ii. 288.

"Every single Buddhist dogma is believed to have been evolved from the intuitive consciousness or inward experience of this one man. To the present day, any dogma, even of the latest growth, will be received by the most orthodox Buddhist, if it can be made to fit into the history of Buddha's inner life, as reported by ancient tradition."—*Eitel*, *Buddhism*, pp. 16–17.

"It is specifically urged against the doctrines of Fŏ, by the Confucians, that they unfit men for the business and duties of life, by fixing their speculations so entirely on another state of existence as to lead some fanatics to hang or drown themselves in order to anticipate futurity: nay, two persons have been known to commit suicide together, with a view to becoming man and wife in the next world. The priests are sometimes accused of employing their superstitious arts in seducing women: societies of women, at least, called *Ni-Koo* [*Ni-ku*], a species of nuns or female devotees, are encouraged by them. The tricks occasionally made use of by the priests resemble the practices of the fakirs in India. Le Comte tells a story of a bonze, who went about in a vessel stuck full of nails (something like that in which the Carthaginians are said to have shut up Regulus), and pretending that it was a merit to relieve him from his pain, he sold these nails to the devout at so much per head."—*Davis*, *Chinese*, ii. 89–90.

[For the resemblance of the Buddhist Bodisattva (P'usa) Mandjuari to Lao Tzŭ, and the alleged Western origin of Lao Tzŭ's doctrines, see *Watters*, *Lao Tzŭ*, p. 110.]

[For Koeppen's remarks on the civilising influence of Buddhism in China, see *Die Rel. des Buddha*, i. 481–2.]

Taoism.—"It is reasonable to suppose that the principal fabric of that doctrine which now distinguishes the professors of the Taou sect, was the work of those who succeeded Laou-keun, and made use of his name as the foundation of their system. They call him 'the original ancestor, or founder, honoured of heaven'; and the account given of him in popular books is, that he was an incarnation of some superior being, and that there is no age in which he does not come forth among men in human shape. They tell the various names under which he appeared from the highest period of fabulous antiquity down as late as the sixth century, making in all seven periods. In imitation, perhaps, of the Budhist Triad, the followers of Taou have also their own triad, which they denominate 'the Three pure ones.' This threefold source and supreme ruler is represented as presiding in heaven among the assembled gods, the sun, moon, stars, and constellations, and delivering his name, accompanied by many epithets of benevolence and mercy, to the 'great barefooted angel,' to be promulgated in the lower world, that amongst men all who see and recite that name may attain infinite happiness and complete deliverance from all evil. Their principal scripture is the *Taou-tĕ-king* [*Tao tê ching*]."—*Davis*, *Chinese*, ii. 115–6.

"The quiet philosophy of Lao-tzŭ was meanwhile undergoing

a fundamental change. It had begun to degenerate into a hocus-pocus system, the ultimate objects of which were avowedly the transmutation of metals and the preparation of an elixir of immortal life. A grandson of the founder of the dynasty, occupying a high position in the public service, and commonly known as Huai Nan Tzŭ, identified himself closely with these researches, and bequeathed to posterity a mystic work which now forms part of the Taoist canon, under the title of the *History of Great Light.*"—*Giles, Historic China*, pp. 36–7.

"Ma-twan-lin, in his great work, *Wen hian t'ong k'au* . . . says . . . that Lau-tsi and his immediate successors taught only the religion of purity and rest, with the avoidance of any speciality in action. [The Taoists say the Buddhists borrowed the *Wu wei* from Lao-tsu.] Their instructions contained, indeed, the germ of the mode of self-training called *liau-yang*, but they said nothing of the elixir, or of alchemy, or of charms. The disciples of Ch'ih-song-tsï and Wei-peh-yang studied carefully the self-training method, and that alone. Those of Li-shan-kïun, Lu-seng and Lwan-ta are known for their devotion to the discovery of the elixir of life. Chan-tan-ling and Kwan-k'iau-chï occupied themselves with attempting to persuade the people to make use of amulets. From the time of Tu-kwang-t'ing till that of Hwang-kwan, and subsequently, the chief attention of this sect has been bestowed on the composition of sacred books, daily chanting, and offerings to idols." [Lao-tsze had no wish, either, to commit his doctrines to writing. The Tao-teh-king] "was composed only, it is related, at the instance of the official in charge of the custom-house in Shansi, by which he wished to pass to the countries west of China" [or to found a sect; and we hear little of any immediate disciples of his. He] "taught that no specific mode for cultivating the character religiously should be adopted; man will, by maintaining a pure and tranquil temper, attain the desired end. . . ." "The second phase was . . . that of *self-training—liau-yang*. . . . This method consisted of a hermit life, and sitting cross-legged in a mountain cave [and trying to hold the breath]. . . . By continuing this process sufficiently long, the soul will at length become superior to the body, rise up out of it by its own power, ascend to heaven, and become one of the celestial genii." "There is another more modern phrase—*yang sing*, the 'Cultivation of the moral nature,' which is considered inferior in its character and results to that just described. He who wishes to train himself to perfect virtue should rise early, cleanse his body, and reverently reflect on his duties to heaven, earth, prince, parents and teacher. He should examine himself three times a day, as to his words, actions, self-control," etc. . . . "Why Ma-twan-lin should have singled out the names of Ch'ih-song-tsï and Wei-peh-yang as the founders of the *liau yang* method is not clear. The one is a fabulous character,—a genius of storms in the age of Shin-nong. . . . The other lived in the time of the Three Kingdoms, compounded an elixir, [and] obtained immortality by it." . . . [Chin-Shih-Hwang-ti sent a party to look for the Elixir of Life in 219 B.C. Among mineral substances, cinnabar (*tan shan*) was considered likely to yield it (see *infra*).] "The Tauists call the process of manipulating substances to obtain the elixir *Liau-wai-tan*, 'the obtaining by purification of the external elixir.' The corresponding process for rectifying the mind is denominated *Liau-nui-tan*. . . . By the former, the rank of earthly genii is attained (*ti sian*). But those who succeed in the latter become *tian sian*, or celestial genii." . . . [Alchemy was studied in China for two centuries B.C.—and therefore earlier than in the West.] "The transition from moral discipline like that of Lau-tsï to these less elevated pursuits may be partly explained by the limitations of the Tauist mythology before they began to borrow from the Buddhists, and the fact that they do not believe in future retribution for the human race at large. . . . The path to immortality was in their view quite beyond the reach of the mass of mankind, nor had they yet formed a popular worship with its idols, liturgies and offerings. They therefore sought some physical mode of attaining to that state of immortal blessedness, which so few could reach by moral means alone." [Western alchemy probably comes from China through the Arabs. The two powers ascribed to the mediæval "philosopher's stone"—that of turning other substances into gold, and of bestowing immunity from death, if taken as a medicine, were by the Chinese attributed to the sulphurit of mercury or cinnabar.] [Ko hung (4th century) wrote a book called *Pau p'uh tsi p'ian*, defending the Tauist superstitions, in which he devotes a section to the "golden elixir," asserts its wonderful properties, and gives directions for preparing it,—and another to *Sian yo*, on the medicine of immortality.] [Tauism principally directed its attention to *external nature*, while Confucius' philosophy is pre-eminently a *moral* one.] "The connection of Tauism with external nature may be further illustrated by a reference to the practice of carrying charms. Matwan-lin mentions the introduction of *fu luh* or *fu—amulets* or *charms*, as a separate feature in the history of religion, and later in time than those already considered. . . . The author already quoted describes their use as being to protect the wearer" against spirits and wild beasts, when travelling in the mountains. He goes on to give full directions. "Sometimes, he continues, a mirror is needed. Living things, when they grow old, can all, by means of their pure past, assume the human form. Their true shape can be infallibly detected by a mirror. . . . If it is one of the genii, or some good spirit residing on the mountain, this also may be learnt by means of the mirror. Several delineations are given in the same work, of charms, which consist of lines drawn . . . without any approach to the shape of the Chinese characters or any other intelligible form. They are all boldly ascribed to Lao-kiün. The unblushing confidence with which Ko-hung . . . speaks on these subjects, asserting the most indescribable things, and yet writing in the smooth and ready style of the man of the world, bespeaks him an impostor rather than an enthusiast. The whole system of charms and spells of Tauist origin, still so popular . . . could hardly have grown up without the aid of unscrupulous inventors. . . . What Confucius and his school discouraged, they have promoted, and the paper charms still posted on the doors and boats throughout China prove their success." [A legend is related in the *Pau p'uh tsï*, about a haunted arbour on Lin-lu mountain, where travellers, if they rested there, fell sick, and died. Peh-i, by using the magic mirror, compelled a number of seeming human beings assembled there, to resume their proper shape of dogs.] "The modern use of the *fu* is somewhat different from that which we meet with in the pages of *Pau p'u tsï*. They are posted on doors and boats to frighten away evil spirits." "The last development of Tauism mentioned by Ma-twan-lin includes its liturgical books and ceremonies. These grew up principally in the Tang and Sung dynasties" [*q.v.*]. [They were due to the influence of Buddhism; the earlier Tauist works being philosophical meditations in the style of Tau-teh-king, and external worship was little practised.] The *Ch'ang-ts'ing-tsing-king* "first given to the world by Koh-hiuen, who lived not long before Pau-p'uh-tsi, and attributed by him to Lau-tsi," belongs to the primitive Tauist stock, though it has several indications of Buddhist influence, which show that it is not so old as commonly supposed. But the later book *Siau tsai hu ming miau king* is entirely in the Buddhist manner." "The invocation to the three persons in the Tauist Trinity, commonly used in the Tauist daily service, contains several Buddhist expressions," e.g. *kalpa* and *fan* (= Brahma). "The notion that Lau-kiün assumes various names and appeared in the world at certain times from the earliest mythological period and downwards to the time when he really lived, must have originated after the doctrine of metempsychosis was brought to China." "The well-known Buddhist personage, Kwan-yin is invoked in the Tauist daily ritual."—*Trans. C.B.R.A.S.*, Pt. v. pp. 83–98.

"The first of the Taoist patriarchs in China was Chang Tao-ling who lived in the time of the Han dynasty. Lao Tzŭ appeared to him in the Stork-cry Hill and told him that in order to attain the state of immortality which he was seeking he must subdue a number of demons. Tao-ling in his eagerness slew too many, and Lao Tzŭ told him that Shang Ti required him to do penance for a time. Finally, however, he was allowed to become an immortal and the spiritual chiefdom of the Taoists was given to his family for ever. The descendants of Tao-ling reside at the Dragon Tiger Hill near Kuei-hsi in the province of Kiangsi. It is apparently about this Chang Tao-ling that Edkins says:—'Chang, one of the genii of Taoist romance, is believed to be identical with the star cluster of the same name, and he is represented by painters and idol makers with a bow in his hands shooting the heavenly dog.' One title of this spiritual chief in China is T'ien-shi or Heavenly Teacher, and the original patriarch seems to be worshipped in Japan under this name."—*Watters, Lao Tzŭ*, p. 110.

Judaism.—"We learn from Chinese sources that towards the close of the earlier Chow dynasty, about 255 to 200 B.C., an immigration took place of strangers from the West . . . a peaceful, commercial and religious folk, strongly attached to their peculiar faith . . . and were known among their pagan neighbours as the Tiao-kin Këaou, a sect which removed the sinew."—*Balfour, Waifs and Strays*, pp. 202–3.

"They [Jews] probably entered China through the north-western route, and there is no good reason for rejecting their own date, during the Han dynasty."—*Williams, Midd. King.*, ii. 271.

"It was also during this period that the Jews appear to have founded a colony in Honan, but we cannot say what kind of reception was accorded to the new faith. In the glow of early Buddhism, and in the exciting times of its subsequent persecution, it is probable that Judaism failed to attract much serious attention from the Chinese."—*Giles, Historic China*, p. 37.

"Some have said that the Pentateuch was carried to China in the sixth century B.C.; but no definite traces of Judaism are discoverable until several centuries later, under the dynasty of the Hans."—*Ibid.* p. 7.

Christianity.—Govea records a tradition that St. Thomas the Apostle "went to China and preached the gospel in the city of Cambala, and there built a church." [This tradition is perhaps confirmed by the Chaldean liturgy used by the Syrian Christians in India, in which St. Thomas is repeatedly referred to as having converted the Chinese.] "It ought to be noticed that the Indian bishops and metropolitans of the Christians of St. Thomas, have ever retained the name of China in their titles and subscriptions. When the Portuguese first came to Cochin, Mar Jacob, the bishop of the churches of Malabar, at that time, subscribed himself, 'Metropolitan of Hindoo and China.' [According to Antonius Govea] the ancient records of the episcopal church of Angamala, on the coast of Malabar, shew that it formerly used to send to Goa a superior, under whom were two suffragans; one in . . . Socotora . . . and one in southern China."—*Ch. Repos.*, xvi. 154–8.

Myths and legends.—"M. Bazin has endeavoured to show that in China there has been, from early times, a progression from magic to mythology, from mythology to philosophy; and when philosophy began to crystallize into parties and take on an organized discipline of sects, during and after the Han dynasty down to the Tang, they took up the old native mythology against the newly arrived Buddhists, and imitated them by adopting Lau-tsz' as their god and his book as the foundation of their tenets. Previous to this period he was one among the philosophers of the flowery Land; in time he has been taken as the founder of a system of religion."—*Williams, Midd. King.*, ii. 213.

"The Babylonian mythology and cosmogony influenced the Hindoo mind and powerfully modified the mythology and cosmogony of the Brahmanical and Buddhist religions. The transmission of thought was carried further east and the Chinese horizon was decorated with entirely new mythological conceptions and, in addition, the people of China acquired the belief in the medicine of immortality and the transmutation of metals."—*Journ. P.O.S.*, ii. 145–6.

From *Chavannes, La Sculpture sur Pierre en Chine*, Douglas describes a set of engravings representing a series of sculptures in the sacrificial temple of the Wu family in Shantung, which were executed in A.D. 147. These depict mythological scenes, showing unmistakable traces of Babylonian and Egyptian influence. "The series begins with a sculpture of three figures, two of which represent a man and a woman, with human bodies and heads and with serpents' tails which are intertwined. The male figure holds in his hand a carpenter's square which he appears to be handing to the female figure, while between these two, hanging in the air by their sleeves, is a boy with two shapeless legs. The Editor's note at the side has reference to the male figure only, and reads, 'Fu-hi Ts'ang-tsing was the first to practise royal duties. He drew the (eight) diagrams, and knotted cords in order to govern people within the seas! The female figure is recognised as that of Nu-kwa, who by some historians is said to have been Fu-hi's sister, and is here represented as his wife, and by others to have been separated from him by many generations. Of the boy, the Editor can make nothing. Now we know that according to Chinese legends, both Fu-hi and Nu-kwa had human bodies, and dragons' or serpents' tails; that they instructed men in the rudiments of civilization, the use of letters, and the arts of common life; that they taught the people to clothe themselves, to cook food, and established marriage. The benefits they thus conferred upon mankind forcibly remind us of those attributed to the Fish God of Babylonia, who rose from the sea every morning, and who instructed the people bordering on the Persian Gulf in the arts and sciences. But we are further told in the Chinese legendary history that Nu-kwa had the head of a cow, and this peculiarity leads us . . . [to Egypt], where we read of the Goddess Isis, who wore an ox-headed helmet, and who . . . in combination with the God Osiris, and their son Horus, forms a triad, many of the features of which could not be more accurately represented than by this sculpture in Shantung. . . . [The] detail [of the boy's shapeless legs] acquires interest when we find [from Plutarch] that Horus, also, suffered the consequences of an irregular birth in a weakness in his lower limbs." "Plate No. II represents an artificially-trained tree, banked up at the base of the stem. On the branches are a number of birds, at which an archer is shooting. Two boys or monkeys are in the act of climbing the tree, while a wicker basket hangs from the lowest branch. In this connection, it is curious to find that in the Egyptian orchards the trees were trained into particular shapes." "In Plate IV is shown an object which strikingly resembles an Egyptian obelisk. It will be remembered that obelisks were built to keep off the evil influences of the air, and were, it is believed, dedicated to the sun. In the Chinese sculpture, we have . . . a being with shapeless legs, similar to that shown in Plate I, in opposition to a figure which may possibly be intended to represent a spirit of evil." "The 5th plate . . . shows the arch of heaven formed by a double-headed dragon." The same idea we find frequently represented in Egyptian mythology [see *Wilkinson*, iii. 206]. "Plate VII represents a triad consisting of a female figure with the head of an animal producing a boy from her mouth, while opposite to her is a figure with a somewhat similar head which, in this case, is surmounted by a serpent. In its right hand this figure holds a weapon, and in its left a serpent. On the ground by the first figure is a large bird. It is impossible not to be reminded by these figures of the goddesses Mut and Bast of Egypt. Mut, as we know, was the mother of all things, and had the peculiarity . . . of producing men from her mouth, and things from her eyes." [For figures of Mut, see *Wilkinson*, iii. 31, 34.] "In *Wilkinson*, iii. 62, is shown the goddess Mut pouring water from a tree into a bowl held by a bird with a human head. A somewhat analogous scene is depicted in the Chinese sculptures, in which a man is receiving in a bowl the 'sweet-dew' pouring from the branches of a tree." "[One] sculpture represents a deity being drawn through clouds in a chariot by three doves, five horses, and three dragons, formed after the pattern of dragons found in the Assyrian sculptures. The chariot is covered by a canopy which is surmounted by a dove's head, and the cortege, which is accompanied by winged figures and doves, is met and welcomed by a male figure. In [the companion picture: Plate IX in *Journ. R.A.S.*] another chariot, drawn by seven dragons, bears a man in an opposite direction through the clouds into the presence of a winged standard-bearer, standing on a dove-headed cloud. It was suggested by Prof. Terrien de Lacouperie that these sculptures might possibly bear some relation to the legendary visit of Muh Wang (1001-946 B.C.) to Si Wang Mu . . . and hers to him. On further investigation, I am convinced that this is so, and that, while the sculpture referred to represents Si Wang Mu's cortege, that shown in Plate IX depicts that of Muh Wang. Si Wang Mu [for whom see *Mayers, C.R.M.*, p. 178] . . . is sometimes described as having a human head and a bird's body [and her description resembles that of Athor, Het or Mut, who] was thought to live behind the Western Mountain of Thebes, and it was into her arms that the setting sun . . . was said to be received [*Wilkinson*, iii. 115]. The persea tree which, as Sir G. Wilkinson says, 'was often confounded by ancient authors with the peach,' was sacred to her. Like Si Wang Mu, also, she is said to have been 'occasionally represented as a bird with a human head.'" "To complete the analogy between the myths of Athor and Si Wang Mu, we should find some reference to the sun sinking into the arms of the Chinese Goddess. And this we do in legendary records which have collected round the career of Muh Wang." "In the history of this prince, which is said to have been found in a tomb of one of the Wei Princes in 281 B.C., we have an account of a journey made by him to Si Wang Mu, in which so many characteristics of the Sun God are introduced that it is impossible not to recognize in him a counterpart of the Greek Phoebus." "Muh Wang, we are further told, was, like Apollo, armed with a bow which shot forth darts at men, and followed by dogs, which . . . were the enemies of beasts of prey. On the last day of the Sexagenary cycle, Muh Wang reached the abode of Si Wang Mu, who entertained him on the shore of the lake of gems with such delights that he forgot to return homewards until reminded of his duties by the goddess."—*Journ. R.A.S.*, xviii. 469–76.

"In Pan-ku's poem 東都賦 he describes the whale *king yü* as being the shape used for the wooden beater of a bell. This usage is based on a legend. The whale beats a monster, named 蒲牢獸. This monster, when beaten, utters a loud cry. In making bells 鐘 the workmen formed upon it a representation of this monster. The account in this form belongs to the Han dynasty. Hence we judge that the wooden fish as a beater to produce sounds in the Buddhist service, is entirely of Chinese origin. In ancient times, when the emperor was proceeding anywhere, five bells on his left were beaten, or one of them only, which was called the yellow bell. The five bells on the right then answered the sound. Buddhism has borrowed from an ancient imperial usage."—*Ch. Rev.*, xvi. 175.

[For the legend of Wên Chang, the God of Literature, see *supra, Deities.*]

Superstitions.—"Tei Ch'ang-fang could shorten the veins of the earth. When his guest was coming into his house, he then only went to market to buy pickled fish. But he was perceived by many people who lived beyond the distance of 1,000 li in this very day."—*Lieh i chuan, Yüan chien lei han, Shih wu pu, c.* 389, p. 39*a*.

"In Hwai-nan Tsz there is a passage which says that Lou Yang on one occasion waved his battle-axe (*ko*). When the sun grew near to its setting, in order to give more time for the combat then proceeding, the sun went back three signs. . . . This incident, recorded of a military captain of the 4th century before Christ, shows at least that in the time of Hwai-nan tsz it was customary to attribute supernatural power to the brandishing of a weapon by a commander in battle."—*Ch. Rev.*, xv. 308.

[The Ju yi is described in the 379th chapter of the

Cyclopædia *Yüan chien lei han*. It is first mentioned in the 3rd cent. A.D.—and next about 291—it was made of rock crystal, iron, amber, bamboo root, wood, or jade. Its name is a translation of the Sanskrit Riddhi, and it is supposed to have the power of granting the possessor's wishes. The stories about it (similar to those about the magical effect of Buddhist relics) spread with the introduction of Buddhism.]—*Ibid.* xv. 308.

[The son of an aged man was supposed to have no shadow and to be afraid of cold. This idea was used to test a case of legitimacy.]—*Fêng su t'ung*, *Yüan chien lei han*, *c.* 244, p. 4*a*.

"Like many other Chinese princes, Vouti [Wu Ti] was prone to believe in the possibility of prolonging human life, or, as the Chinese put it, in the draught of immortality."—*Boulger*, *Short Hist.*, p. 14.

"The prevalence of similar conceptions [respecting the power of jade] in the second century before our era is manifest from the following passage in the Books of the Earlier Han Dynasty: 'In the 16th year of his reign (164 B.C.) the emperor Wen acquired a drinking-cup of jade, on which was carved this inscription: "Master of mankind, may Thy life be prolonged to the great delight of this world."' We may further quote here the testimony of the 'Description of the Ten Islands' *Shih chen ki*, an account of fabulous countries which were believed to exist in several regions beyond the oceans. . . . It says: 'In Yung-chen, which is situated in the Eastern Ocean, rocks of jade exist, over one thousand fathoms high. From these rocks there issues a brook like sweet wine; it is called the Brook of Jade Must. If, after drinking some pints out of it, one suddenly feels intoxicated, it will prolong life.'"—*De Groot*, *Rel. Syst.*, i. i. 272.

Divination, magic, witchcraft, etc.—An instance of doubt as to the efficacy of divination "is given by Luî Kî (of the Ming dynasty, in the fifteenth century) in a story about Shâo Phing, who had been marquis of Tung-ling in the time of Zhin, but was degraded under Han. Having gone once to Sze-mâ Ki-kû, one of the most skilful diviners of the country, and wishing to know whether there would be a brighter future for him, Sze-mâ said, 'Ah! is it the way of Heaven to love any (partially)? Heaven loves only the virtuous. What intelligence is possessed by spirits? They are intelligent (only) by their connection with men. The divining stalks are so much withered grass; the tortoise-shell is a withered bone. They are but things, and man is more intelligent than things. Why not listen to yourself instead of seeking (to learn) from things?'"—*Legge*, *Yî King*, Introd. p. 41, note.

"Tso Tz'ŭ was possessed of magic art. He could fish a *tzŭ* (鯔) fish [a kind of carp (?) with a round body and greenish back, found in Kiangsu] out of a copper plate."—*Hou Han shu*, *Shih lei t'ung pien*, *c.* 74, *Ch'i yung pu*, p. 5*b*.

Ping Chi (died 55 B.C.) "exerted himself especially in putting down the witchcraft and sorcery which caused so much mischief."—*Giles*, *Bio. Dic.*, p. 628.

[Koeppen (*Rel. des Buddha*, i. 523) says that "the shadow of Buddha," seen by Hiuen Tsang and other Chinese pilgrims, at Buddha Gayâ, Nâgara, and elsewhere, is to this day produced by some jugglery at the monastery of the "Five Towers" in Shansi. See also *Huc* and *Gobet*, *Souvenirs*, i. 114. Pilgrims see the "shadow" after looking for some time through a small hole in the rock. The "glory of Buddha" described by several writers seems to be a natural phenomenon.]

Charms.—"The Taoists were accustomed to cut seals of the wood of the jujube tree four inches square, or three and a half of our inches, and circulated them among the people to check evil influences. They taught the people to believe that there were evil influences in the air always ready to affect them mischievously, and then they provided them with guardian charms to secure them from the harm which they themselves had taught them to fear."—*Edkins*, *Ch. Currency*, p. 7.

"This [the introduction of paper] led the Taoists for example to multiply charms rapidly by stamping them on paper to sell to the superstitious, either to hang on their doors or to carry with them when travelling."—*Ibid.* p. 1.

"The Chinese saw seals from Western Asia, and they made them themselves with their own writing cut upon them to be used in giving validity to official documents, as also to employ them as amulets to protect them from imaginary evils. The seal was not only used to stamp charms, but the handle was a tortoise, a tiger, or some other emblem of longevity or power, in order that it might have a defensive effect against evil. These ideas imported from Western Asia with the seals were as willingly adopted by the Chinese for imitation as the more reasonable idea of employing the seal as a manifest proof of the genuineness of documents."—*Ibid.* p. 6.

[In the *History of the Three States* by means of magic arts men and horses are brought from black thunder-clouds to disperse the enemy, but are rendered harmless by a preparation of the blood of swine, sheep, and dogs, which filled the air with men and horses of paper or straw, causing the rebels to be defeated with great slaughter. See *Davis*, *Chinese*, ii. 116–8.]

"Someone having asked Pao P'u-tzŭ the way to avert the 5 weapons, he replied: 'All that is necessary is, on the 5th day of the 5th moon, to make a "red efficacious charm" and wear it on the chest.' This was the 'hair pin' charm of the present time."—*Ching ch'u sui shih chi*, *Ko chih ching yüan*, *c.* 17, *Kuan fu lei*, p. 14*a*.

[See also *supra*, *Taoism*.]

Period of Disruption (221 *to* 589).—*Table IV.*

Soul.—"Chinese literature affords numerous proofs that the cohabitation of soul and body after death has never been doubted in succeeding ages. To quote one single instance out of the many before us:—The History of the South relates of Wang King-tsih, a statesman living in the last half of the fifth century: "On reaching the district city of Ki-Yang (where he was to enter upon his functions as Governor), at the foot of the Luh-chu mountains, the ten and odd ships of his clans-people who accompanied him started, but his own boat was the only one which did not move. He ordered his junior relations to jump into the water and push it forward, when his eye fell upon some black-varnished coffins. Invoking these he said, "If you are objects of good omen, then cause my boat to move forward quickly; and as I am a wealthy man, occupying a high position, I will take care that you are properly buried.' Instantly the boat moved on unto the city. Afterwards he had the coffins collected and buried."—*De Groot*, *Rel. Syst.*, ii. 354.

"During the discussion on the truth of religion which took place during the fifth century, 范 縝 wrote a book on the annihilation of the soul. He said the human form or 形 is the embodiment or 質 of the soul or 神, as the soul is the motor or 用 of the human form; and that the relation of the soul to the form is as that of the power of cutting or 利 to the knife; but, he went on, 'I have never heard it argued that when the knife is annihilated (沒) the power of cutting continues; how then can the form perish and the soul remain?'".—*Ch. Rev.*, xiii. 431–2.

"In the *Loh-yang kia-lan ki* (浩陽伽藍記) or Description of the Buddhist Monasteries in the city of Loh-yang, a work written in the sixth century, it is related: 'In the *Hiao ch'ang* period (525–8) the empress confiscated Liu Thing's immovable property. The same day on which Yuen-i was killed, Liu Thing had already expired; but the empress remembering his crimes, she had his grave opened and his body destroyed, that his manes might be deprived of everything in which to take refuge.'"—*De Groot*, *Rel. Syst.*, i. i. 344.

"In the Books of the Tsin Dynasty we read that Yin Hao (殷 洛), a learned official living in the fourth century, who was famous for the smart replies he had in store for every occasion,—'on being asked how it came to pass that a man dreamt of coffins when he was to be raised to an official dignity, and of filth when he should acquire wealth, gave the following answer: "The mandarinate is essentially rotten and a prey to corruption; hence a man dreams of a corpse when he shall become a mandarin. And money is in truth merely filth and mud; consequently, when wealth shall fall to the lot of a man, he dreams of dirt."'"—*Ibid.* i. i. 326.

Deities.—Wang Pi, who died A.D. 249, held "that 'Ti is the lord who produces (all) things, the author of prosperity and increase.'"—*Legge*, *Yî King*, Introd., pp. 31–2.

[For the gods of swords, axes, etc., see *Lung yü ho t'u*, *Ko chih ching yüan*, *c.* 42, *Wu pei lei*, p. 8*b*; p. 20*b*; *Yang ch'üan wu li lun*, *ibid.* p. 2*a*; *T'ai Kung ping fa*, *ibid.* p. 2*a*; etc.]

Elfs, etc.—[For elfs, sprites, etc., see *Chên chu ch'uan*, *Ko chih ching yüan*, *c.* 42, *Wu pei lei*, p. 2*a*; *Shên i ching*, *ibid. c.* 50, *Jih yung ch'i wu lei*, p. 30*a*; *Shên hsien chuan*, *Kuang shih lei fu*, *c.* 28, p. 6*a*; etc.]

Superstitions.—[For swords having superhuman powers see *Chin shu*, *Ko chi ching yüan*, *c.* 42, *Wu pei lei*, p. 15*b*.]

"Li Tzŭ-ch'ang, in the exercise of his jurisdiction, wishing to know the truth about a prisoner, carved an image of the prisoner out of oil-tree wood, and having dug a hole in the ground put it into it. If the crime was justly charged against the prisoner the wooden image would remain quiet: but if unjustly, it would come out of the hole. This was due to the spirit of the man being in the image."—*Ch'ên Chu-t'ung p'u*, *Tzŭ shih ching hua*, *c.* 55, p. 41*a*.

Buddhism.—[Confucianists refer the complete establishment of Buddhism in China to the Chin (265–420) and Southern Sung (420–472) dynasties, when its fame spread to foreign countries, and envoys were sent with laudatory messages and offerings from Annam, Ceylon, and several states in India. It flourished under the Liang (502–56), and about 520 the great Buddhist reformer P'u-t'i-ta-mo, or Bodhidharma, arrived in S. China from India and originated the school of Contemplatists in China. "He pointed to man's heart and nature as the important things in the attainment of Buddhaship, and made no mention of the written books." "In the middle of the sixth century, Buddhism seems to have extended itself over nearly all the empire. Something like a religious enthusiasm, indeed, seems to have existed among the people—inspired partly by the example and teaching of Bodhidharma, partly also by the zeal of several of the princes. Every household almost had been converted to the faith, and the numbers of those who had taken the vows was so great that the labours of the field were frequently neglected from lack of workmen. Instead of cultivating their farms . . . the people were always talking about 'the other bank'—that is, about the *pâramitâs*, or transcendent virtues." For the varying fortunes of Buddhism and the persecution of its adherents see Ecclesiastical, where reference is also made to the establishment in China of the Buddhist Church of Tibet.]

Taoism.—"From the time of the Chin and Liang dynasties, down to the Great T'ang dynasty, his [Lao Tzŭ's] doctrine and his name were glorified. He was promoted to be a God, and wonderful things were invented about him, and the *Tao* of which he spoke so much."—*Watters*, *Lao Tzŭ*, p. 110.

Christianity.—[The toleration of early days was due to indifference. The propagation of Christianity in China by the Nestorians began *c.* 505. The attitude of T'ang Tai Tsung (620) and his successors of that dynasty was favourable, but persecutions took place by Buddhists in 699 and by Confucianists in 715. For the history of the treatment of Christianity and its adherents by the State see Ecclesiastical.]

Legends.—[In *N. and Q. on C. and J.*, i. 148, a story is quoted (from a work written under the Tsin dynasty, 265–419, the *Sou shên chi* of Kan Pao) which is a version of the legend of St. George and the Dragon—but omitting St. George, as the maiden kills the serpent with the help of her dog. On pp. 20, 21 of Vol. ii is given a Chinese version of the story of Rip Van Winkle (or the German legend of the Monk of Heisterbach) relating how a traveller stopped to watch two old men playing at *choo-pu* on the hill-side, and, when he turned to remount his horse, found only its skeleton lying on the ground. In Vol. iii. p. 89, is quoted the story of Chang T'ien She, which resembles that of the Forty Thieves in the *Arabian Nights*, as regards the magic door, and the discovery of the mystic words, that will open it. But there is no mention of treasure, and the story ends differently. Chang's grandmother follows him to the cave and is accidentally shut up in it;—he is unable to open it again in order to release her, but the genie of the place appears and informs him "that the cave was a good *fêng shui* place, that if a man (when dead) was buried there, there should be a monarch born to his family in every generation, and if a woman, there should in the same way be a demon King born in her family. So saying, the genie vanished, and from that day the door was never opened." "After a lapse of time, Chang took a wife, and begot a son, who became the first Chang T'ien She and possessed an unlimited power over demons." "It is said that the office of Chang T'ien She is not hereditary now; any man can fill up the place when there is a vacancy, and a competition has to be made by the candidates, so that whoever is able, either by prayer or witchcraft, to transport the dead body of Chang T'ien She from his deathbed into the coffin prepared for the occasion, shall be considered as duly elected. It is curious to see that even the emperor and the more learned Chinese paid great respect to this individual." *Cf. Nevius*, p. 137.]

Exorcism.—"Chinese antiquarians are agreed that the fire-crackers of the present day merely imitate the crepitating sound of bamboos which were formerly burnt as a charm for exorcising evil spirits—a practice, the earliest recorded notices of which occur in two celebrated works, of which one is known to have been produced about the middle of the sixth century of our era, and the other is conjecturally attributed to the same period. These are the *King-ts'u-sui-she-ki*, which treats of the popular customs prevailing at various seasons of the year in the region now constituting the Provinces of Hupeh and Hunan,—and the *Shên-i-chwan* [*? ching*], a collection of mythological and fantastic legends. The former opens with the following passage: 'The first day of the first month is the day of the Three Beginnings (explained as the beginning of the year, the month, and the season). In the times of Confucius it was called *twan-yüeh*, or the month-regulator. At cock's-crow people arise, and their first act is to crackle bamboos by means of fire in front of their dwelling-places in order to drive away the malignant demon called *Shan-sao*.'" "Upon this passage . . . the *Shên-i-king* throws some additional light in the following statement respecting the 'malignant demon.' 'Among the hills in the Western parts [of China?] there exist beings in human shape, a foot or more in height, who are by nature very fearless. If attacked [or offended], they cause men to sicken with [alternate] heat and cold. They are called *Shan-sao*. By thrusting bamboos into the fire, and producing a crackling sound the *Shan-sao* are frightened (away).'" The belief in this demon was probably introduced from India in the middle of the sixth century.—*Journ. N.-C.B.R.A.S.*, N.S. vi. 76–7.

From the Restoration of Unity to the end of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

Soul, etc.—[The belief that the soul was present on the spot where the coffin was placed continued throughout this and subsequent Periods.]—*De Groot*, *Rel. Syst.*, i. i. 353–4. See also *Yu yang tsa tsu*, quot. *ibid.* i. i. 66.

[Personal attributes continued to be ascribed to Heaven.]—*Ch. Rev.*, xiii. 399.

[K'ung Ying-ta quotes Wang Pi (see previous Period) on the meaning of *T'i*.]

Dreams.—"In the *Pu khüeh* [*Pu Ch'üeh*], a work written during the Thang dynasty, we read: 'A descendant of the family Yang, Kin by name, was a good oneirocritic. One person having dreamt that a pine was growing before his door, and another that a date tree shot up on the top of his house, Kin said: "Pines are planted between the tumuli, and the character for date tree represents the idea of coming again, which in its turn symbolizes calling the soul." Both men died.' And the historical encyclopedia of the 11th century, entitled *Ch'eh fu yuen kwei* [*Ts'ê fu yüan kuei*], says: 'Li Yuh, who was a nobleman of the Imperial Banqueting Court, one day fell asleep during the daytime and dreamt that he ate pea-dates. On awaking he felt ill and said to his intimate friend: "I have been informed that the date tree is a reduplication of the word 'to come' and therefore is the symbol of calling the soul; my vital spirits now feel oppressed and dejected, so I shall not escape it." In the summer of the fifth year of the Thien-fuh period (A.D. 940) he breathed his last.'"—*De Groot*, *Rel. Syst.*, i. i. 75.

Diseases.—"When Li Tê-yü became Intendant of Chê Hi, the people of Chiang Ling believed in sorcery and deception by demons. If their parents or brothers were suffering from plague the whole family left the patient and ran away. So Tê-yü wished to change this evil custom and sent for the wise men of the village to reason the matter out with them. A few years after this the custom was accordingly changed."—*Ts'ê fu yüan kuei*, *Yüan chien lei han*, *c.* 125, p. 26*a*.

Divination.—"In Mr. Wang Chien's *Collections* there is an account of 'Hearing the Mirror.' It says: 'Holding the mirror he went out into the open street and heard the words of the passers-by in order to divine his good or bad fortune. The people of the present time imitated this example by holding a ladle."—*Ch'ü hsiao chiu wên*, *Ko chih ching yüan*, *c.* 56, *Hsiang lien ch'i wu lei*, p. 3*a*.

"One of the most illustrious representatives of this persuasion [Taoism] was the Patriarch Lü Tsû, about whom many curious stories are told, and to whom is attributed a very original and abstruse commentary upon the *Tao Te Ching*. . . . [A dream having showed him the vanity of ambition] he abandoned his high schemes, cheered his heart with wine and devoted himself to the practice of what may be called the convivialist phase of Taoist philosophy. Numbers of disciples followed in his footsteps. . . . His mystically-conceived interpretation of the great Taoist classic we have already referred to; but what gave him the widest celebrity he enjoyed was his wonderful talent in working the planchette. . . . [At] a planchette séance in China, the board is suspended over a tray of clean sand, and through a hole in it hangs a pencil. Incense is burnt, prostrations are performed, and the passing spirit is invoked. Then the planchette begins slowly to wave to and fro, and the pencil traces characters in the sand. . . . A capital description of a *fu luan*, or planchette séance, is given in the novel *P'in Hua Pao Chien*. . . . Lü Tsû was [thus] enabled to purvey much information, and his success in the art was such that he is invoked to this very day in Peking, and probably elsewhere, whenever the native mediums can be prevailed upon to give a séance. Among the most valued revelations vouchsafed through the mediumship of Lü Tsû were directions [for] the cure of diseases . . . [and] he has since been canonized as the Patron of Medicine, and temples are erected to his honour in all the provinces of China. There are four [at Peking, besides] a sanctuary dedicated to him in the Temple of the White Cloud, the great stronghold of Taoism, outside the Western Wall."—*Balfour*, *Leaves*, pp. 141–3.

"If anyone wished to dig a well he should do so on a clear night. If several basins of water were put on the ground the one which showed the larger and brighter stars would indicate the site of a sweet spring."—*Ko chih ching yüan*, *c.* 9, p. 1*b*.

Superstitions.—"The grossest forms of religious superstition were encouraged" by Hsün Tsung.—*Giles*, *Bio. Dic.*, p. 451.

[A battle was won in 817 by disregard of the superstition concerning unlucky days for warfare.]—*Yü lan t'ung chien lei tsuan*, c. 16, *Wu pei pu*, p. 19*b*. *Cf.* MILITARY.

"The miraculous has been introduced as a natural and necessary element [in the gravest philosophical speculations]. . . . Han Wên-Kung [says]: 'There are some things which possess form, but are devoid of sound, as for instance jade and stones; others have sound, but are without form, such as wind and thunder; others again have both form and sound, such as men and animals; and lastly, there is a class devoid of both, namely, *devils and spirits*.' . . . The cat washing her face is not, as with us, a sign of rain, but that a stranger is coming. . . . 'Strangers' in tea portend, as with us, the arrival of some unlooked for guest. . . . Aching corns denote the approach of wet weather—we do not quote this as a superstition—and for a girl to spill water on fowls or dogs will ensure a downpour of rain on her wedding day. Anyone who hears a crow caw should chatter his teeth three times, and blow; and two brooms together will bring joy and sorrow at the same time, as a birth and a death on the same day. 'Crows' feet' on the face are called 'fishes' tails,' and in young men mean what the widower's peak is supposed to signify with us."—*Giles, Ch. Sketches*, pp. 97–8.

"The Emperor Tang Ming Wang had an itching pain in his back. Lo Kung yuen broke a bamboo branch. It became a jade *ju yi*. He offered it to the Emperor to scratch himself with it. The Buddhist Kin kang san tsang, who was present, had in his sleeve a *ju yi* made of the seven precious things. In consequence the jade *ju yi* was immediately changed back to bamboo."—*Ch. Rev.*, xv. 309.

"When Chia Tan was in the north of Hua T'ai City he ordered an octagonal well to be dug in order to overrule the Yellow River."—*P'ei wên yün fu*, c. 53, p. 49*b*.

[Special powers continued to be attributed to swords. See *Yu Yang tsa tsu Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 10*b*; *Chih t'ien lu*, *ibid.* p. 10*a*; etc.]

"In the T'ang dynasty books, largely used by the orators of the tea-shops, we read of an intriguing favourite of the third Emperor of that dynasty, who coveted the position of Empress, which she afterwards gained (684–710). She managed to bring the rightful Empress into disgrace by making an image of the Emperor with his unspeakably-sacred personal name, and date of birth inscribed thereon. She then stuck five large nails of peach-wood (桃 *t'ao*, the tree of omen) into it, and secreted the effigy in the apartment of the Empress. Then coming in tears before the Emperor, she besought him to go thither at once, as his life was in danger. The image was found, and the guilt of the Empress seemed fully proved."—*N.C. Daily News*, April 13th, 1899.

[Superstition prevented the working of gold mines in the district of Si-an Fu.]—*Ch. Rev.*, xiv. 218.

Myths.—Wang T'ung "is a sharp opponent of Tauist myths and is very severe on those who without charity and integrity looked for the immortality of the heavenly genii. . . . Wang T'ung set the example of resisting the claims of fables to our acceptance and the Sung dynasty critics followed in the same track."—*Ch. Rev.*, xiii. 407.

Religions.—"At that time the books of the Buddhists far outnumbered those of the Confucianists, and religion seems to have progressed very well during the short period that the Sui dynasty endured. The last emperor, however, did not regard it so favourably, and he dismissed many monks to their homes, and caused several of the monasteries to be pillaged."—*Ch. Rev.*, ii. 7.

"Kau-tsu and Tai-tsung were on the whole not very favourable to Buddhism. In the reign of the latter, Hiuen-tsang made his pilgrimage to India (629–45). . . . The professors of Buddhism seem to have been about this time in the habit of practising necromantic arts, and imposing on the people by pretended drugs for conferring long life. The emperor Kao-tsung in 657 sent a number of these persons back to India. In the same year, this emperor found it necessary to issue an edict ordering monks and nuns to desist from receiving the adoration of their parents. During the period that the Empress Wu reigned for her son Chung-tsung (684 to 705) Buddhism was popular and in power. . . . About 686, a Chinese monk named Yi-ch'ing went to India to obtain sacred books. He also wrote an account of [another similar expedition some time previously]." "The partiality of most of the T'ang sovereigns for this religion has passed into a proverb. . . . By 819 Buddhism had pervaded the whole empire. . . . Monasteries and hermitages abounded everywhere. . . . Poets sang its praises, and emulated the religieux in strictness as to fasting and other religious exercises. The monks and nuns were richly endowed, and lived in dignified seclusion, but often in apathetic indolence. . . . The inferior classes were believers in it, says a Confucianist, through fear of punishments and calamities, and the upper classes delighted in it on account of its metaphysical speculations. . . ." "The emperor Wu (841–6) was under the influence of a Taoist who persuaded him to attempt the extirpation of [Buddhism]. The lands and other property . . . were all secularized; the images, bells and all other metallic articles, were melted down and made into coin, and the wood and stone were taken to make and repair public buildings." [Buddhism however recovered its prestige under the next emperor, and also under Yi-tsung (860–73) who was something of a devotee himself.]—*Ch. Rec.*, ii. 38–41. For further particulars of treatment by the state see ECCLESIASTICAL.

"Taoism did not extend itself widely as a form of popular worship till the T'ang dynasty."—*Trans. C.B.R.A.S.*, v. 83–98.

In A.D. 666 "the pure Tao of Lao Tzŭ began to be mixed up with alchemistic research and gropings after the elixir of life, Lao Tzŭ being at the same time canonized' as the 'Great Ruler of the Very Exalted Mysterious being,' the title being further enlarged by subsequent sovereigns."—*Giles, Bio. Dic.*, p. 417.

"They long endeavoured to find a beverage which would ensure immortality, and during the T'ang dynasty the Emperor and highest officers were carried away with their delusions. The title of 'Heavenly Doctors' was conferred on them, and a superb temple erected to Lau-tsz' in Chang-an, containing his statue; examinations were ordered in A.D. 674, to be held in the *Tao-teh king*, and some of the priests reached the highest honours in the State."—*Williams, Midd. King.*, ii. 214–5.

[Mohammedanism was first introduced into China either about 633 or 755. The sect "worshipped Heaven alone" and did not seek to convert the Chinese (*Milne, Life in China*, pp. 411–2). In 806–21 Manichæan temples were built in Honan Fu and T'ai Yüan Fu (*Ch. Rev.*, xvii. 115). Nestorianism was checked in 845 (*Ch. Rec.*, xii. 1–15).]

Exorcism, etc.—"This great statesman [Kuo Tsey] induced Tetsong to issue an edict reproving the superstitions of the times, and the prevalent fashion of drawing auguries from dreams and accidents."—*Boulger, Short Hist.*, p. 33.

P'êng Ch'êng, the author of the *Mo K'ê Hui Hsi*, says (Bk. 5, p. 6):—"Owing to the frequent conflagrations of the palaces of the Han dynasty, the soothsayers gave counsel that figures should be made representing the 'fish-tail constellation' in the Heavens, and placed upon the tops of houses, as a talisman against the evil. At present, since the days of the T'ang dynasty, one sees upon the roofs of old temple buildings figures which resemble a fish in the attitude of flying, with its tail pointing upwards; I know not when the name became changed to that of *Ch'ih wen*. The tail is not like that of a fish."—*Journ. N.-C.B.R.A.S.*, N.S. xii. 6, note.

In "the *Pen-ts'ao kang muh*, we find the following passage, quoted from the writings of Chen Tsang-khi, who . . . lived in the eighth century. 'Old coffin boards.—These are not poisonous; they conquer the influences of spectres, dissolve obstinate inner evils and pains in the heart and belly, and counteract asthmatic affections, as also perturbations caused by bad dreams. Those who are constantly under the influence of spectres and spirits should make a decoction of the wood in water and wine, adding a branch of a peach tree growing on the east side of the trunk, and they will vomit them out.'"—*De Groot, Rel. Syst.*, i. i. 328.

"Hsieh Shang once dreamt that his father told him saying: 'In the S.W. there will be a kind of vapour, and anyone affected by it will die. You should, on your staff, carve the shape of a tower. If you see the vapour coming you may point at it with your staff.' Accordingly Shang carved a little tower at the end of his staff and always kept it by his side."—*Chien k'ang pao lu, Ko chih ching yüan*, c. 19, *Kung shih lei*, p. 26 *a*.

"Besides the practice of alchymy, to which they are led in their search of the elixir of long life, the disciples of Laou-keun have at different times professed the science of magic, and their arts of imposition were, at various periods of Chinese history, practised upon the Sovereigns of the Country. Under the Tâng dynasty this superstition gained such credit that the title of *Tien-sze*, 'Celestial doctors or teachers,' was conferred on its professors: a superb temple was erected to Laou-keun, and his image placed in it."—*Davis, Chinese*, ii. 116.

907–960.

[Signs from heaven, such as the opening of rivulets, the troubling of the sea, etc., as before, indicated good government of the sovereign.]—*P'ei wên yün fu*, c. 33, p. 4*b*.

Sung Period (960 *to* 1280).—*Table VI.*

Idea of God.—Chu Hsi "says that 'by *Ti* is intended the Lord and Governor of heaven.'"—*Legge, Yi King*, Introd. p. 51.

Religions.—"Under the Sung family, it [Taoism] received a new impetus from the practice that then grew common of appointing persons by imperial decree to positions in the hierarchy of the Tauist heaven." "Every city then came to have its celestial protector, his temple and his worship." "The following rhapsody [was] addressed to him [Lao Tzû] by one of the kings of the Sung dynasty, nearly 1,000 years ago:

> "'Great and most excellent *Tau*,
> Not created, self-existent;
> From eternity to eternities,
> Antecedent to the earth and heaven,
> Like all-pervading light,
> Continuing through eternity:
> Who gave instruction to Confucius in the East,
> And called into existence Buddha in the West.
> Director of all kings;
> Parent of all sages;
> Originator of all religions;
> Mystery of mysteries!'"—*Trans. C.B.R.A.S.*, v. 83–98.

"Chronologically, Taoism should come next in order [to the *Ju Kiao*] but Buddhism takes the precedence of it in its position and influence in the empire, and accordingly occupies the second place in the Chinese enumeration."—*Nevius, China and the Ch.*, p. 81. The term *ju chiao* was adopted c. 1150.

"Buddhism and Taoism had by this time made advances towards tacit terms of mutual toleration. They wisely agreed to share rather than to quarrel over the carcass which lay at their feet; and from that date they have flourished together without prejudice. . . . That Buddhism continued to receive Imperial patronage under the Sungs is a fact confirmed by the recent discovery at Buddha-Gaya of certain Chinese inscriptions."—*Giles, Historic China*, p. 83.

"It is but justice to the Chinese to say, that in importing some of the Indian deities and their superstitions, they have wisely left behind *all* the indecencies and fanatic madness of Indian worship, and that such horrors as those enacted at Jaggernath and elsewhere, could never in the slightest degree be practised under a government like that of China."—*Davis, Chinese*, ii. 83–4.

"Mahomedanism is believed to have been introduced into Yünnan in or about the year 1275, and it made most progress among the so-called aboriginal tribes, the Lolos and the Mantzu."—*Boulger, Short Hist.*, p. 316.

"There is an extract in the Concordance, saying that there was during the Sung Dynasty at Kao-chang (Urum-tsi) a Moni (? Manichaean) Temple served by Persian priests."—*Ch. Rev.*, xvii. 115.

"A synagogue was built at K'ai-fung Fu in 1164, and the Catholic priest Ricci visited the colony in the sixteenth century. In 1850, certain Hebrew rolls were recovered from the few remaining descendants of former Jews: but there was then no one left who could read a word of them, or who possessed any knowledge of the creed of their forefathers beyond a few traditions of the scantiest possible kind."—*Giles, Historic China*, p. 37.

Cosmogony.—In the early ages "the half-inspired sage evolved a system of emblems whereby to express more clearly than by words the progressive development of all he saw around him, and this resulted in the Diagrams called after Fuh-hi." "The Chinese philosophy is, in its inception, essentially Pythagorean; or, to speak more correctly, the Pythagorean philosophy is essentially Chinese. The first symbol with which we are confronted is the 太 一, the Great One, or Monad of Pythagoras. This is the primeval Essence, self-existing and alone, from which proceeded, subsequently, the world. This Monad then divides, and two parts become the *Ying* and the *Yang*, or the Male and the Female Principles of Nature. The *Ying* is Heaven, the Father, the *Yang* is Earth, the Mother, and from these two springs all else." [As to the *Yin* and *Yang* see further *infra*.] In "the 49th Chapter or Section of the works of Chu Fu-tsze, in which he treats of the generation of the animated Cosmos, the first sentence runs as follows: 'In the entire Universe, where there is no *li* there is no *ch'i*, and where there is no *ch'i*, there is no *li*.'" "Of course the key to the whole system of philosophy is to be found in the proper translation of these two words. . . . The rendering we suggest is: . . . *ch'i* is Matter, *li* is Mind; and we submit that, studied with this in view, the mystic sentences are plain. Our first quotation will, therefore, read as nearly as possible thus:—'In the entire Universe, where there is no mind, there is no Matter; and where there is no Matter, there is no Mind.'" "To be perfectly just, however, we must premise that, although Chu Fu-Tsze ascribes to *li* the attributes of Mind, its prevailing idea—perhaps rather a hazy one—is that of supreme, self-acting Law. Of course, a physical idea implies force; but to translate the word *li* by force or motion would be to violate the proprieties of language. To express this idea, another character is called into play, viz.: *Tao*. The primary signification of this is road, course or direction, secondarily, process; while *li*, therefore may be translated the all-prevailing Mind or Law, *Tao-li* is necessarily the *operation* of that law. . . . The next paragraph we wish to quote is the third in order and runs [thus]:—'This Heavenly Mind (*li*) first existing, then most certainly Matter (*ch'i*) exists. The *ch'i* when accumulated forms *chih*, and Nature is then complete.' . . . That *chih* means tangible, visible substance, there is no doubt. . . . *Ch'i*, commonly translated Air, is Matter in its primordial and subtlest form; Matter, to use the modern phrase, in the embryonic stage, invisible, as Dr. Tyndall says, of itself, but possessing the inherent power of becoming visible. . . . *Ch'i tsi wei Chih*. . . . done into the faithfullest and concisest English at our command, runs simply thus: The accumulation of matter in its primordial or ethereal stage, produces Matter in its substantial form. . . . *Ch'i* is the ether that pervades all space, the embryo from which all material bodies (*chih*) are produced. *Li* is that Eternal Mind which dwells in and is commensurate with this ubiquitous ether. . . . " "With the Chinaman all is theory and speculation. He has not even the most rudimentary knowledge of chemistry, and still talks of wood, air, fire, earth and water as the five elements. And yet in his gropings he seems to have hit upon the grand idea long cherished by modern physicists, and which, maybe, will be placed upon a scientific basis some day, the resolvability of all the so-called elementary substances into one prime Element. This seems to have come intuitively to the Chinese mind, and the name by which the element is known is *ch'i*. From *ch'i* all things were evolved, and back to it they may all be traced. . . ." "One more quotation will suffice . . . :—'Being asked whether *li* positively existed before Heaven and Earth, he replied that before the existence of Heaven and Earth, there was most certainly this *li*. *Li* existing, then Heaven and Earth existed. If *li* had no existence, then also there could be neither Heaven nor Earth, nor Man, nor Things; none of these would have had any containing receptacle. *Li* existing, then *ch'i* exists, flows forth, pervades, generates, and nourishes the Myriad Existences—*i.e.* the Material Universe.'" "It is clear that in this passage Heaven and Earth mean simply . . . the Universe at large; and this Universe is directly attributed to the influence of the *li* or Creative Mind upon the *ch'i* or embryonic Matter. . . ." "Amplifications of this grand belief, the root of all religion, abound in the Chinese classics. As we have before pointed out, the word for Heaven is used not only to express the material firmament, but also for that Supreme and Intelligent Power which overrules humanity at large, and animates the entire world. Thus we have a greater than Chu-fu-tszo saying 天卽理也 *T'ien tsi li yay*—Heaven is the *li*, or . . . the Mind (of Things); and, again, what is more remarkable still 性卽理也 *Sing tsi li yay*—the Properties (of Things) are in the Mind;—that is are the manifestation of Heaven."—*Balfour, Waifs and Strays*, pp. 210–17.

"This dogma of materialism, however ancient it may be in its first origin, became especially cultivated, or, according to some, *originated* in China during the *Soong* dynasty. . . . The learning and science of the Chinese, such as it was, being then much in vogue, some celebrated commentators on the ancient books appeared about that time, the most famous of whom was . . . *Choo-tsze* [Chu Tzŭ who] . . . thus expressed himself: The celestial principle was male, the terrestrial female: all animate and inanimate nature may be distinguished into masculine and feminine: even vegetable productions are male and female, as, for instance, there is female *hemp*, and male and female *bamboo*. Nothing exists independent of the *Yin* and *Yang*.' Although the Chinese do not characterize the sexes of plants, . . . they use the above phraseology in regard to them; nor do they confine it to the vegetable and animal creation only, but extend the same to every part of nature. *Numbers* themselves have their genders: a *unit* and every odd number is male, *two* and every even number, female."—*Davis, Chinese*, ii. 66–7.

"In Li Shih's *Süh P'óh-wu-chi* (written in the 13th century A.D., Japanese edition, 1683, tom. ii. p. 3) a quotation from the *Ning-kwóh-lun* runs as follows:—Primitively there was no Liáu-Kién in Shuh (now Sze Chuen); this tribe emanated from red clay in a cave of Teh-yáng mountain, whence bits of the soil had begun to roll out, each roll enlarging them, so that at last thereby was created a couple, who gave birth to many." "I would suggest that the same belief [that troglodytes return into a subterranean other-world whence they emerged,] entertained by some aborigines in China, has revived itself among the Taôists, who used to call their paradise the 'Cave-Heaven' (Tung-Tièn), *e.g.* Twan Ching-Shih describes the 'Cave-Heaven' 10,000 *lis* in circumference and 2,600 *lis* in height (his 'Miscellanies,' Japanese edition, 1697, tom. ii. p. 1), and Li Shih enumerates thirty-six caves in the empire, all entitled 'Heavens' (*ibid.* tom. i, p. 8)."—*Nature*, Nov. 15, 1894.

Superstitions.—Chên Tsung "seems to have been naturally superstitious, and he gave himself up to fortune-tellers and soothsayers during the last years of his reign."—*Boulger, Short Hist.*, p. 38.

Jên Tsung's mother, who ruled during his minority "insti-

tuted surer measures against the spiritualists and magicians who had flourished under her husband and acquired many administrative offices under his patronage."—*Ibid.* p. 38.

In the *T'an Wên Lu*, by Li T'ien, it is stated that "a neighbour of Li T'ien was bewitched by a *Shan-siao* 山 魈; whereupon Li T'ien bade him make a crackling of bamboos, to the number of some tens of stems, in his inner courtyard on the night of the last day of the year, and at dawn, with the cessation of the sound, he was quiet and in peace."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 77. *Cf.* previous Period.

"Among the quotations from poets of the Sung dynasty which the *P'ei-wen-yün-fu*, the imperial thesaurus of K'ang Hi, preserves under the heading *pao-chu*, all turn upon this circumstance alone [the connection of the idea of exorcism with the use of fire-crackers]—being, indeed, evidently based on no other originals than . . . passages . . . from the *Shên-i-king*, etc. Thus Su Tung-po (born 1036, died A.D. 1101) writes in one of his poems: '*Pao-chu-king-lin-kwei*'—the cracker frightens off the demon from next door. And Wang Ngan-she, his celebrated contemporary (born 1021, died 1086), in a stanza descriptive of the New Year's ceremonies, writes: '*Pao-chu-shêng-chung-i-sui-ch'u*'—amid the resonance of crackers another year begins. Other poets of the same period have had recourse to the same idea." There is nothing to show "that the crackers were more than the simple bamboos which earlier writers speak of."—*Ibid.* vi. 79–80.

"At the time of the Sung dynasty . . . popular opinion about them [foxes] had changed again," and they were regarded as of good omen.—*Ibid.* viii. 47–8.

"A stranger to Foochow would be astonished to see group after group of people going round to all the houses begging on Chinese New Year's days. Instead of quietly asking for some charitable donation at the door-way as do other beggars, they sing some songs (of course unintelligible to a stranger's ears) like hundreds of birds chirping in the groves at the sign of the coming dawn. He would be still more puzzled to see that these people are clean in appearance and the clothes they wear are quite different from the ragged garments generally worn by ordinary beggars. These are the boat people going through the exercise of making themselves bogus beggars under the belief that by so doing it will free them from any sickness and misfortune that would otherwise befall them during the year." "This superstition originated some time before the 12th century. It is said that when the Emperor Chao Tan Wang, of the Sung dynasty, was dethroned, he fled from his palace; but his enemies being thirsty for his Majesty's blood, as well as for the state seal, pursued him. When he came to the bank of the Min River, being very closely pursued, he asked the boat people to take him over to the other side. That the boat people at that time, perhaps, were not so credulous as they are now-a-days, may be safely vouched as true, because when they saw no money forthcoming from the Emperor's purse (it is but fair to state here that they did not know he was the Emperor) they refused to give him the necessary trip and answered him simply with the well-known 'nothing for nothing.' Thereupon he implored them to have pity on him; but when he found all his entreaties could not move them he lost his temper, and, in his rage, pronounced a few fatal words which sealed the doom of the boat people up to the present day—what he said was 'that every one of these people must become a beggar, no matter how wealthy he or she might be.'" "An Emperor is supposed to be blest with a 'golden mouth' and any word that is uttered from this 'golden mouth,' will bring realization to the wishes of the utterer. Now this Emperor desired them to be beggars as a punishment for their unfeeling conduct, and beggars they eventually became. At first they paid no attention to what was said; but after a short time, there came an epidemic of sickness amongst them and the death-rate went up to such an alarming degree that they became convinced that the fate awaiting them could not be shaken off. Accordingly some of them, who were more credulous of the supposed power of a 'golden mouth,' went to try the virtue of those fatal words, perhaps unwillingly, and it is strange to say that, at the first house they asked for alms they felt the sickness had suddenly deserted them. Soon after all the others followed suit and it is needless to say that they all recovered their usual health. Thus this custom was adopted." "Another source says that the real authors of this story were the boat people themselves; they fabricated the story simply to hide the shame of their greediness. But it is a fact that any one who does not like the idea of begging will ask some one to take with him his or her name written on a piece of paper when he carries out the practice, thus avoiding having to perform a disagreeable duty."—*Echo*, quot. *Hongkong Tel.*, Dec. 31, 1891.

[It was regarded as unlucky to be born on the 5th day of the 5th moon (Dragon Boat Festival) (*Sung shu, Shih lei t'ung pien*, c. 6, *Sui shih pu*, p. 11*a*). Amber could heal wounds made by weapons (*Sung Wu Ti pên chi, Ko chih ching yüan*, c. 54, *Chü ch'u ch'i wu lei*, p. 3*a*).]

Fêng-shui.—It was not until the 12th century that *Fêng-shui* emerged from its rudimentary stage and was elaborated into a system of scientific geomancy. "Fêng-shui is wind-water, the first half of which, *wind*, cannot be comprehended, the latter half, *water*, cannot be grasped. It may be defined as a system of geomancy, by the *science* of which it is possible to determine the desirability of sites, whether of tombs, houses, or cities, from the configuration of such natural objects as rivers, trees, and hills, and to foretell with certainty the fortunes of any family, community, or individual, according to the spot selected; by the *art* of which it is in the power of the geomancer to counteract evil influences by good ones, to transform straight and noxious outlines into undulating and propitious curves, rescue whole districts from flood and pestilence. . . . It is merely necessary to build pagodas at certain spots, and of the proper height, to pile up a heap of stones, or round off the peak of some hill, [which has] a square and inharmonious aspect. The scenery round any spot required for building or burial purposes must be in accordance with certain principles. It is the business of the geomancer to discover such sites, to say if a given locality [is suitable,] . . . sometimes to correct errors [previously made.] . . . There may be too many trees, so that some must be cut down, or . . . too few, and it becomes necessary to plant more. Watercourses may not flow in proper curves, hills may be too high, too low, and of baleful shapes, or their relative positions one with another may be radically bad. Any one of these causes may . . . account for the sudden outbreak of a plague, the gradual or rapid decay of a once flourishing town. The Fêng-shui of a house influences not only the pecuniary fortunes of its inmates, but . . . their general happiness and longevity." [It is certain that the Chinese firmly believe in this, as is proved by the care they take in arranging their private houses, and choosing sites for graves in accordance with its principles.]—*Giles, Ch. Sketches*, pp. 142–5. For a comprehensive account of *Fêng-Shui*, see Eitel's *Fêng-Shui, or The Rudiments of Natural Science in China*. In the *Cornhill Magazine*, xxix, 337–48, it is stated that bones are disinterred when experience has proved the grave to have bad *fêng-shui*, and kept in earthen jars until a good site can be found, and that temporary wooden pagodas are sometimes put up as an experiment. See also *Davis, Chinese*, ii, 144, etc.

To Wang Chi, a scholar of the Sung dynasty, "is ascribed the first application of *fêng-shui* to housebuilding."—*Giles, Bio. Dic.*, p. 811.

Mongol Period (1280 *to* 1368).—*Table VII.*

"Though these people have the acutest intelligence in all matters wherein material things are concerned, yet you shall never find among them any knowledge or perception of spiritual things."—*Hayton*, in *Yule, Cathay*, i. cxcv-vi.

There seems to have existed a "low state of religious belief and the" only vigorous religion in China was Buddhism. "At first he [Kublai] treated with equal consideration Buddhism, Mahomedanism, Christianity, and even Judaism, and he said that he treated them all with equal consideration because he hoped that the greatest among them would help him in Heaven. . . . But his religious tolerance or indifference did not extend to personal matters. . . . Priests were appointed and specially enjoined to offer up prayers on his behalf before the people, who were required to attend these services and to join in the responses. Images of himself were also sent to all the provincial towns for reverence to be offered. He also followed the Chinese custom of erecting a temple to his ancestors."—*Boulger, Short Hist.*, p. 71.

"The Tartars, before they were converted to the religion of the Idolaters, never practised almsgiving. Indeed, when any poor man begged of them they would tell him, 'Go with God's curse, for if He loved you as He loves me, He would have provided for you!' But the sages of the Idolaters, and especially the *Bacsis* mentioned before, told the Great Kaan that it was a good work to provide for the poor, and that his idols would be greatly pleased if he did so."—*Yule, Marco Polo*, i. 432 (2nd ed.). *Cf.* MORAL SENTIMENTS.

"Among other points may be mentioned a great influx of Mahommedans, and consequent spread of their religion, about this time."—*Giles, Historic China*, p. 87.

"Marcus Sobensis writes that 'Agheus illuminated with the Faith Gebal and Huz and the coasts of S. India and the adjacent countries as far as Gog and Magog.'" "Ebedjesus says, 'All Persia, all parts of Assyria, and Armenia and Media and the regions round about Babylon, Huz, and Gala, to the confines of India, as far as Gog and Magog, received the priesthood from Agheus, the silk weaver, and disciple of the apostle Addeus.'"—*Ch. Repos.*, xvi. 166.

"Comestabularius, an Armenian, who about the year 1248, wrote a letter to the King of Cyprus concerning the Christians of Tanguth, says, 'This is the country out of which came the three kings to Bethlehem, to adore Christ; and the people of this country are Christians. I myself have been in their churches and seen paintings of Jesus Christ, and of the three kings, one presenting the gold, a second the frankincense, and the third the myrrh. Through these three kings they had the knowledge of the faith of Christ, and through them the Cham and all his people were made Christians. When they go to salute the Great Cham, they first enter the church, and salute the Lord Jesus Christ, and then go to salute the Cham. We found also many Christians dispersed through the east country, and many goodly churches, lofty and ancient, which had been despoiled by the Tartars. The Christians of the country, when they come into the presence of the Cham, who now reigns, he receives them with the greatest honour, uses them liberally, and suffers none to annoy them."—*Ibid.* xvi. 166.

The Franciscans were not interfered with throughout the Yüan dynasty. These "Emperors were constantly engaged in war, and indifferent to the various forms of religion propagated within their dominions. Probably they were inclined to favour Christians on account of their severe contests with Mahommedans in Western Asia."—*Ch. Rev.*, xii. 1–15.

[For Nestorian churches and monasteries see ECCLESIASTICAL.]

"Marco Polo just mentions their [Jews] existence at Cambulac, as do John of Montecorvino and Marignolli about the same time, and Ibn Batuta at an earlier date. In the Chinese annals of the Mongol dynasty the Jews are first referred to in 1329, and again in 1354, when they were invited to Peking in the decline of its power to join the army of the Imperialists. They are styled *Shu-hwuh* [*Shu hu*], or Jehudi, and must have been numerous enough to make them worth noticing with Mahommedans, and their help in men and means implored."—*Williams, Midd. King.*, ii. 271–2.

"We had many and glorious disputations with the Jews and other sectaries [at Peking]."—*John de' Marignolli*, in *Yule, Cathay*, ii. 341.

"In this vast empire there are people of every nation under heaven, and of every sect, and all and sundry are allowed to live freely according to their creed. For they hold . . . that every man can find salvation in his own religion. Howbeit we are at liberty to preach, without let or hindrance. Of the Jews or Saracens there are indeed no converts, but many of the idolaters are baptized; though in sooth many of the baptized walk not rightly in the path of Christianity."—*Andrew, Bp. of Zayton*, in *ibid.* i. 224–5.

[The existing native, etc., religions apparently underwent no change.]

"The thaumaturgic reputation assigned to the spirit of Chang Ngo-tsze [see MONARCHY—*Deities*] was confined for centuries . . . to the valleys of Szech'wan, until at some period antecedent to the reign of Yen-yeo, in A.D. 1314, a combination was arranged between the functions of the local God and those of the stellar patron of literature. . . . Imperial sanction was obtained for this stroke of priestly cunning; and notwithstanding protests continually repeated by orthodox sticklers for accuracy in the religious canon, the composite deity has maintained his claims intact, and an inseparable connection between the God of Literature connected by Imperial patent and the spirit lodged among the stars of Ursa Major is fully recognized in the State ceremonial of the present day."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 41.

[In a monastery at Hangchow were kept large numbers of animals supposed to be the souls of human beings.]—*Yule, Cathay*, ii. 119–20.

"The Great Kaan plants these trees all the more readily, because his astrologers and diviners tell him that he who plants trees live long."—*Yule, Marco Polo*, i. 426 (2nd ed.).

Marco Polo says that it was thought unlucky for an arrow to strike anyone's property, and that any cattle or goods struck by a chance shot from the Emperor's bow were exempted from taxation or duty, as "the Great Kaan says it would be an abomination before God, were such property, that has been struck by the divine wrath, to enter into his treasury."—*Ibid.* i. 425 (2nd ed.).

Ming Period (1368 *to* 1644).—*Table VIII.*

[For the worship of Heaven by the Emperor see ECCLESIASTICAL.]

"The doctrine of the literati is described as the first of the three 'religions' of the Chinese. This sect has no temples except that to Confucius; filial piety and the commemoration of ancestors are the corner-stone, but the ceremonies are intended for the benefit of the living rather than the dead. The aim of this sect and the purport of all its precepts is to secure public peace, popular tranquility, household economy, and the disposition of individuals to the practice of virtue."—*Simcox*, ii. 267.

Confucius was formerly enrolled among the deities of the empire with the title *hwang*, or king; but an Emperor of the Ming dynasty, thinking it an indignity that Confucius should only rank as equal in divine honours to the other gods and to himself, determined that none of the ordinary titles should be applied to him, but that the whole nation should express their special veneration and indebtedness to him by calling him *Ta Ching Che Shing Sien Shêng*, "the Great, Perfect, Most Holy Teacher."—*Nevius, China and the Ch.*, p. 145.

[The Chinese say that the first Ming emperor was, when young, a herd boy, who lost his parents early, and did not know where they were buried. He therefore instituted the ceremony called *Süh-ku* "Pitying the Unfortunate," commanding his officers to sacrifice thrice a year to the shades of those whose graves are neglected." See *Williams, Midd. King.*, ii. 257–9.]—*Nevius*, p. 142.

[For progress of Christianity see ECCLESIASTICAL.]

"In the Chia Ting Prefecture, at the foot of the Chin Têng Mountain, there was a deep pool. On the 'mau' day (7th day of 1st moon) the prefect of that place renewed the ancient custom of 'oil divining,' *i.e.*, pouring oil on the water and telling from the marks made whether it will be a year of abundance or of famine."—*Chin hsiu wan hua ku, Ko chih ching yüan*, c. 50, *Jih yung ch'i wu lei*, p. 21*b*.

Manchu Period (1644 *to* —).—*Table IX.*

"What then do we naturally find to be his religion? Not personal experience of the relation to the infinite and absolute, so much as a body of common interests, averaged, conciliated, and expressed in domestic and political institutions; in which the antithesis of heaven and earth reappears as that of the governing and the governed, and the active and passive principles—*Yin* and *Yang*—are represented by teachers and taught, by parent and child, by older and younger brother, and, to a certain extent, by man and woman. The adjustment of these relations, the preservation of that harmony of the universe which depends on their mutual fidelity and proportional work, is the purpose of religion. It is thus an affair of the State; not as religious master, but as religious representative,—the depositary of worship for the people, as its organized Middle Term between heaven and earth. And as the Emperor officially performs the national homage to Shangte, and to the superior guardian deities as under him, so the great local magistrates throughout the empire pay to the inferior gods their lesser dues. Meanwhile the popular religious sentiment, by no means resting in its final product of vicarious and mediatorial religion, is absorbed in the closer intimacies of the service of ancestors and of the forces of Nature, or *Fung-shui*. And these again follow the regulative ideal, moral and spiritual, in its inevitable middle ways. The burden of the Classics is the sacred and invariable 'Mean.' 'Be discriminating,' says the Shuking, 'and hold fast the Mean; for the mind of man is restless and prone to err.' 'In punishment, settle cases with compassion and reverence; hit the proper mean.' The text of the *Yking* opens with announcing four different principles, whose combination constitutes virtue, through mutual limitation and mediation, upon the basis that each shall have such culture as the interests of the others allow. 'Perfect,' says the *Chung-Yung*, 'is the virtue of the Mean; and rare its practice: the knowing go beyond it; the foolish do not reach it. Equilibrium is the great root of human action; and harmony the universal path that human feelings should pursue. The heaven and earth are in happy order, and all things will prosper.' 'Shun,' says Confucius, 'took hold of the two extremes in men; determined the Mean, and employed it in his government of the people. It was by this that he was Shun.' 'To go beyond is as wrong as to fall short.' 'The reason I hate holding to one point alone,' says Mencius, 'is the harm it does to principle. Taking up one point, it disregards a hundred others.'"—*Johnson, Or. Rel.—Ch.*, pp. 20–2.

"Even the religion of the Chinese is domestic, and centres in the natural affections. Like that of the Mongolian races in their whole extent, it consists mainly, as is well known, in reverence for ancestors; while the forms in which the cultus has been developed by this eminently social people are more genial and beneficent than those which characterize the nomadic life of the races of Central and Western Asia. Their family gatherings at the temples and tombs are as pleasant as they are pure, and probably as productive of kindly sentiment as any religious festivals or social reunions in the world. The tablets in which the souls of the departed are supposed to dwell are a perpetual admonition to concord within families, as well as for the millions who at one and the same period of the year are moved by a common impulse to pay devotion at these shrines. Ancestral halls are often built by associations of families, and the prohibition of marriage between persons of the same name expands the circle of sympathy. The relation

constantly maintained with unseen relatives is that of mutual care and help, in minute and tender superstitions whose influence reaches through social life, and pervades it with innumerable delicate forms of mutual service. Among these, the tenderness required of children towards their parents is to be mentioned as a school of sympathy."—*Ibid.* p. 46.

"It is tolerably manifest that Religion in China is but little more than a great art, or combination of arts, for promoting welfare in this present life and future salvation, by following certain lines of conduct and by propitiating or rendering harmless certain classes of invisible beings and agencies. This art is regulated by customs, rescripts, and partly also by written laws issued by the Imperial government; it is controlled to a certain extent by philosophy, and to a much larger extent by precedents set by the ancestors of the people."—*De Groot, Rel. Syst.*, ii. vii.

"It was the opinion of some among the Jesuits in China, that the better portion of the learned in that country had not given way to the material and atheistic system current during the Soong dynasty, but adhered strictly to the ancient religion, in which a Supreme and creative intelligence was acknowledged under the title of *Tien* or *Shang-ty* (the Supreme ruler). The Confucian philosophers consisted, according to them, of two sects. First, of those who disregarded the modern commentators and philosophists, and retained the same notions regarding the Creator of the universe that had been handed down from remote antiquity. Secondly, of those who puzzle themselves with the speculations of Choo-tsze and his school, as they appear in the work before mentioned, and endeavour to explain the phenomena of nature by the operation of material causes. Others of the Romish missionaries were persuaded that *all* the Chinese learned were no better than atheists, and that notwithstanding the express declaration of the Emperor *Kâng-hy* [K'ang Hsi], in his communications with the Pope, wherein he averred that it was *not* to the visible and material heaven that he sacrificed, but to the true Creator of the universe, no faith could be placed in their explanations."—*Davis, Chinese*, ii. 76–7.

"In China, as in all other countries, there exist sincere believers and a great number of the indifferent." "Religious hatred, however, has no place among our national customs [*cf.*, however, *Persecution*]; to me it is a source of amazement. I can understand that one may hate—a person, for instance; but a religious idea—a religion!—As to atheism, it has been called a product of modern civilization. We are not yet sufficiently civilized to have no belief."—*Tcheng-ki-tong, The Chinese Painted by Themselves*, pp. 18–26.

"Except that there is no Sunday, and the curious idea of 'praise' has never entered a Chinaman's mind, a 'good man' in China—which means in this connection exactly the same thing as a pious or religious one—is very much a counterpart of the good Englishman. He visits the church or temple with quite as much or as little understanding as most of ourselves of the reason why he does so; and says prayers—but only when he has anything to pray for; he pours out a libation or scatters a thank-offering for his food, and moreover does not forget an acknowledgment, often daily, to his ancestors. In chastity perhaps inferior, in sobriety decidedly superior to our average selves, he is infinitely more charitable, especially to relatives; in his private, but not in his public capacity. As to a future life he is totally indifferent on that subject so long as his head is kept on his shoulders in this one, in order that he may make his bow in decent form when he arrives in any other sphere there may be. In 'natural religion,' therefore, a Chinaman differs little from ourselves." "In 'faith,' 'doctrine,' and 'dogma' it is different; and I do not believe any power will succeed in drumming any one of the three into the Chinese mind, which is much too clear to take on trust any mere insistence upon alleged facts which cannot be proved by plain evidence."—*Parker, China*, pp. 280–1.

Soul, etc.—"All Chinese have a deep veneration for the idea of a soul, or the continuity of life; this idea is derived partly from the old Shamanistic or natural religion, and partly from the Buddhist notion of transmigration. Hence the great care of the dead, the love of funeral ceremonies, the readiness to spend money upon graves, the desire to propitiate the ghosts of ancestors, the yearning for a son, the strong family sentiment of unity, and the strict subordination of younger to elder. Hair-splitting doctrine has no charms for the Chinese mind, which, however ill-trained, is essentially intellectual and liberal."—*Ibid.* pp. 287–8.

"In the person of the Grand Lama of Thibet (whose soul on quitting the body is supposed instantly to animate that of an infant) the doctrine of transmigration is said to be practically illustrated."—*Davis, Chinese*, ii. 88.

"The belief in the resurrection of the dead has waned away in the process of time. As civilization advanced, cold experience taught the sons of the Empire of the Midst that death was real. Nevertheless . . . numerous practices created by the said belief have survived. Nor has the conviction been lost that the manes continue to hover about the body and to be intimately connected with it, a conviction naturally arising from the old belief that they might at a suitable moment again enter the corpse and resuscitate it."—*De Groot, Rel. Syst.*, i. i. 348.

The "official rescripts sufficiently prove that the belief in the presence of the soul on the spot where the coffin is deposed, is still entertained by the present emperors."—*Ibid.* i. i. 353–4.

"Even the dead, in China, are not left in undisturbed repose. To move a coffin, requires a previous consultation with the almanac or the geomancer, but during the twelfth month it is safe to 'move the earth.' During the greater part of our January, people are seen on the hills moving graves to some other spot. The idea of this move represents the horse, or, rather, the devil at play. It is not that the deceased may lie nearer to the fond hearts of those who loved him and think of him; it is that his restless and dissatisfied ghost is for some reason attacking the relatives, causing them loss in business or sickness in the home. This fear of the dead has nearly smothered out what we . . . call filial piety."—*N.-C. Herald*, April 25th, 1900, p. 746.

"At a village near Ningpo there is a fisherman who fishes in the river to earn his rice. He is fifty years old, and had a wife, but she never had borne him a child. Last month he was out in his boat casting his net, when he heard the voice of an infant crying among the rushes of the bank, and on drawing near to see, found a baby boy wrapped up in a sort of nest of rushes. He at once knew that a child had died, and that its soul had come back to the world of man again and was inhabiting this little body. He took it home, and his wife fed it with soup and rice water, when it soon ceased crying; and the old couple took such a fancy for the foundling that they adopted him then and there as a son, giving him the name of *Shih-lai*, 'the picked-up one.'"—*Hu pao*, quot. *N.-C. Daily News*, April 11th, 1889.

In 1878 a blacksmith at Shanghai burned his infant child to death on his forge, because, "this is the third time this spirit has come to us" (his wife had previously had two girl children who sickened and died) "and if I do not burn it, we may be troubled by it again."—*Woman's Work*, ii. 142.

[When a baby is seriously ill, its father walks through the city streets, carrying its clothes at the end of a bamboo pole and crying "Return, Return"—in the belief that some evil spirit has tempted the child's soul away and so caused the sickness.]—*Bryson, Child Life in Ch. Homes*, p. 24.

[With this compare a note in *N. and Q. on Ch. and J.*, i. p. 105, where a correspondent ("Jay Tea") says that, in the neighbourhood of Shanghai, women who have sick children will, if they are feverish and delirious, intonate by the hour together: "*Ah-di-à-kué-lê-ba!*—Little brother, come home!"—the idea being that the child's soul is wandering away, and needs to be called back.]

"It is quite natural man should imagine that the souls of the dead retain the shape of the body which they possessed during life. This must be true of the Chinese in particular, seeing they are convinced that body and soul keep together after death, a conviction which calls up the body immediately before their eyes whenever they think of the soul. They believe that a beheaded man wanders about a headless spectre in the World of Shades. Such spectres are frequently to be seen in walled towns, especially in the neighbourhood of places of execution. Here they often visit the people with disease and disaster, causing a considerable depreciation in the value of the houses around such scenes. Whenever an execution takes place, the people fire crackers to frighten the headless ghost away from the spot; and the mandarin who has superintended the bloody work, on entering the gate of his mansion, has himself carried in his sedan chair over a fire lighted on the pavement, lest the headless apparition should enter there along with him; for disembodied spirits are afraid of fire. On August 22nd, 1849, the Governor of Macao having been assassinated near the Barrier by some Chinese, who severed his head from his body and fled on [to] Chinese soil with this bloody testimony of the murder, the native inhabitants of the port declared that the spectre was often seen riding up and down the isthmus, looking for his head; and these rumours inspired such terror, that no one dared go home through the Barrier after nightfall (*v. Ch. Rec.*, xix. 456). In the 'Celestial Empire' of Feb. 7th, 1883 (page 78) we read: 'The Chinese have a theory that a headless corpse in this world wanders about a headless ghost in the next, and they adopt the subterfuge of fixing a wooden head to a corpse, thinking thereby that the spirits will not know the difference. A case of this kind has lately occurred. It will be remembered that the head of the mandarin who was murdered in Quangse Road (Shanghai), could not be found. Search was made for it without success, so the compradore, who was a friend of the deceased, has had a wooden head made and placed in the coffin with the body of the murdered man. This having been done, the corpses of the mandarin and his wife were removed from Quangse Road for burial.'"—*Ibid.* i. i. 355.

"They used the following method to restore her to life. They procured a large goose, put the goose's bill into the dead woman's mouth and beat the goose unmercifully. The theory they hold is that if the goose under the unmerciful beating calls out, by so doing it will bring the woman's breath back and she will be saved."—*N.-C. Herald*, Jan. 3rd, 1900.

"An old woman who received baptism had to give up heathenish practices, which had been to her the means of making a living. When small-footed women or others were unable to go to the temples to worship, this woman used to be summoned, carefully instructed as to the details of the case, and sent to pray and go through all the usual ceremonies in their stead. Another branch of her business was the calling home of the souls of children, this being supposed to be necessary when a child is badly frightened, bitten, or injured. The method is to light a fire, burn much paper money, and, while beating the ground vigorously with a knife to expel or drive off evil spirits, to coax back the departed soul by the promise of all sorts of sweetmeats. On the last day of the year mothers go through these ceremonies, whether their children be well or ill, to expel all the evil influences of the year. The two branches of this woman's profession, worshipping of images and recalling of souls, afford a very good instance of how the two great systems of religion, Taoism and Buddhism, are mixed up in the Chinese mind."—*Report of Med. Miss. Hosp. at Tungkun*, 1891.

"The constables were afraid of incurring the displeasure of the spirits and being seized by the soldiers of the Infernal Regions. (Fits and other sudden attacks of illness are explained in this way. Sometimes the wrong man is arrested, and his spirit is sent back to earth by the Judge in Purgatory, *i.e.*, he recovers.)"—*Giles, Historic China*, p. 159.

"An idea prevails among the Chinese that the sum total of human life must always be the same, a birth here being compensated by a death there, and *vice versâ*."—*Ibid.* p. 206.

Ancestor-worship.—"The only forms of worship which are universally adopted are Ancestral Worship, the worship of the Kitchen God, and the worship of Heaven and Earth at the new year."—*Nevius, China and the Ch.*, p. 152.

"There are two objects of worship, as the Chinese aver, to be found in every family, viz., the Ancestral Tablet, and the Kitchen God. [The worship of] the latter is as universal as that of the former."—*Doolittle, Social Life*, ii. 81.

"The hold of the Buddhist priesthood upon the mass of Chinese consists far more in the position they occupy in relation to the rites performed in honor of the dead than in their tenets. . . . Buddhism takes hold of the common life of man, offers relief in times of distress, escape from a future hell at a cheap rate, and employment in a round of prayers, study, or work, ending in the nirvana," but the religion in which "the heart of the nation reposes" is ancestor-worship.—*Williams, Midd. King.*, ii. 235–6.

"To worship ancestors and pay them honour is a duty as important as that of prayer amongst Christians, and there is none greater or more popular. . . . This worship exists throughout China, in the humblest houses as well as in the most opulent. . . . Death does not break the bond of family affection; it in some sort deifies it and makes it sacred. The dead are not forgotten. . . . We carry our dead into the fields, upon the hills that surround our cities, as high, as near to heaven as we can. . . . The ceremonies connected with ancestral worship take place in China every year, in the spring and autumn. These ceremonies have gratitude for their particular characteristic, and are carried out with great solemnity. The anniversaries are the occasion of family reunions." "In wealthy families, the ancestral temple is large enough to contain apartments, where members of the family not residing in the same town can be received. One may even see tables laid out for school purposes, and as the temples are usually built in the country, they sometimes during the summer answer the purpose of pleasure villas. In numerous families assemblies in these temples are very frequent; for instance, on the occasion of marriages, and at the period of examinations." "All family festivals are held in presence of the family, that is, in the midst of its ancestors and at their house. They are absentees who are not forgotten. These usages are the same in every province of China. In every village, where nearly all the inhabitants are relations, may be seen a chapel dedicated to the ancestors. It is our parish church." "The Emperor honours a functionary who has fulfilled with devotion and intelligence the high charges confided to him during his life-time, not by raising a statue to him, but a temple in which his posterity will celebrate the ancestral cult. At the anniversaries the Emperor sends delegates to represent him. The Temple is inscribed with the name and titles of the deceased, and recalls the eminent services he has rendered to the State."—*Tcheng-ki-tong, Ch. Painted by Themselves*, pp. 118–22.

"The paintings, or effigies, which are also objects of worship, are taken after death. Though they may to some degree resemble the individual whom they represent, they are very unlike the portrait of a living person. They have also their peculiar name, which serves still further to mark the difference between them and portraits of the living. These effigies are generally brought out and worshipped only at the beginning of the new year, on the birthdays of the deceased, and when they are honoured with theatrical exhibitions." The tablets "sometimes date back a thousand years. In connection with ancestral temples are often found genealogical tables, but many temples with small incomes are unable to procure them, on account of the trouble and expense. . . . These temples are constructed by the wealthy in honour of their immediate ancestors, and at first contain only the tablets of a few generations. As the family increases from age to age, though it may contain many poor members, it generally includes enough wealth to keep the temple in repair and provide for its expenses. It is very common for persons of property at their death to leave a piece of ground for the use of the family temple, the yearly proceeds of which are added to a common fund for repairs and providing sacrifices and theatricals." Tablets of women and unmarried men not generally found in temples. "Abandoned characters" cannot share in the ceremonies of the family temple while living, or have their tablets placed there after death. They "are said to be 'expelled from the family.'" Those who die abroad are, if possible, buried at home. Some Chinese say of the sacrifices offered to the dead, that the spirits eat the "impalpable essence" of the food, others, that the action is entirely symbolical and only intended to express their feelings of love and gratitude towards their deceased parents. "The worship of the Kitchen God is just about as ancient as [ancestral worship] and . . . practised in every family. The Kitchen God has no temple and no image. It is worshipped under the representation of a paper engraving, generally about a foot square, which is pasted on the kitchen range. This may be regarded as the household divinity of China. It is supposed that it takes cognizance of everything which transpires in the family, and makes a report at the close of the year, in the presence of *Yuh-hwang-ta-ti*. The night when he is supposed to take his departure is . . . a very important occasion. All the members of the family are present, and a feast is given . . . intended to induce him to make [a] favourable report at head quarters. At the close of the feast, the paper god is removed from the kitchen range, and burned . . . and the kitchen is for a few days without a god. On the first day of the new year, a new paper is procured, and the Kitchen God is invoked to resume his place in the family."—*Nevius, China and the Ch.*, pp. 132–4.

"Notwithstanding the worship of Heaven is reserved for the Chinese Emperor . . . the adoration of heaven by the people is by no means uncommon. Persons in the habit of practising it sometimes have a little incense-vase fastened to the outside of their doors. In this they place a lighted incense-stick, and then, with uplifted hands, they stand and worship. This seems to be regarded as a higher and more spiritual homage than that offered to idols in temples, and is practised somewhat ostentatiously. . . . If you ask the worshipper what he is doing, he will say, 'I am worshipping heaven.' . . . If . . . asked whether he means the [sky] or the clouds, or the heavenly bodies, he will answer 'No'; and, forced to give some explanation, he will probably . . . say, 'Heaven is our father, and earth is our mother; and heaven and earth produce all things; and so I worship heaven and earth.' . . . After . . . gaining a little knowledge of the gospel as preached by missionaries, they are very apt to express their assent and approbation, declaring that it is identical with the worship of heaven and earth." "The common adage *Kih tseh hu tien*,—'In your extremity you cry to Heaven' [seems to show that they regard it as a power beyond and above the gods and spirits.]"—*Ibid.* pp. 159–60.

Tree and serpent worship, etc.—[Tree and serpent worship exist in China, as part of the unauthorised popular religion. The principal sacred tree is the banyan (*sung shu*), old trees being most reverenced. The chief (perhaps the only) seat of this worship is at Amoy. The peach-tree is also reverenced, and it is said that no Chinese will use it as firewood. It is the symbol of longevity and married happiness; and occupies a prominent place in Taoist mythology. Another sacred tree is the *wu-tung shu* (? *Elaeo-cocca verrucosa*), "the national tree of China," in whose branches the phœnix is said to roost, when he makes his appearance.]—*Balfour, Leaves*, pp. 149–50.

"The peepul, *pu-ti* (*Ficus religiosa*) at the south and the *Sophora* at the north, with perhaps other aged trees, are worshipped for long life. Special efforts are made from time to time to build or repair a temple or pagoda, in order to insure or recall prosperity to a place, and large sums are subscribed by the devout."—*Williams, Midd. King.*, ii. 259.

"Serpents . . . are connected in the Chinese mind with *Hsüan T'ien Shang Ti*, or supreme Ruler of the Sombre Heavens, who is generally represented as using one as a foot-stool."—*Balfour, Leaves*, p. 151.

"Serpent worship is by no means uncommon in this neigh-

bourhood [Amoy.] . . . In the temple of Heuen-tien-shang-ti [*Hsüan T'ien Shang-ti*] . . . the feet of [that idol] are placed—one on a serpent, and the other on a turtle. When persons come to worship the idol, they rarely fail to pay their respects to one or other of these two."—*Ch. Rec.*, iii. 107.

"The nearest approach to serpent-worship I have met with in China exists in Chiou-hu-pwang, a large town of some 10,000 inhabitants, on the right bank of the Min, about 100 miles west from Foo-chow. There is in this town a . . . temple (Shê Wang Miau) dedicated to the Serpent King. . . . [His] image represents a man in a standing posture, with a sword in his hand." "An annual festival is held on the 3rd, 7th and 12th days of the seventh month . . . [when] the people form in a long procession, and march through the streets of the town . . . carrying living snakes. . . . It is considered a very meritorious act to carry a snake in the procession, [and the more there are, the greater the good luck secured to the town.] Some time before the festival a public subscription of money is taken . . . [and] an enormous quantity of sweetened rice-flour cakes prepared, each weighing about 3 lb.; and three of these cakes are given to every one who carries a snake in the procession." These snakes are caught for the purpose, and released after the procession. They are said to be harmless—but it is believed that in any case bites can be miraculously cured by the application of ashes from incense-vases in the temple.—*Ch. Rec.*, iv. 307.

[It is believed throughout China that a cobra will always avenge an injury; and this is shown by several proverbs, *e.g.* 'To strike a venomous serpent, and not kill the animal, provokes it to seek revenge.' Another says, 'To see a snake and fail to kill it, exposes others to dangers, but to wound and not slay the animal, causes it to harbour avenging feelings for myriads of years.' "Belief in the vindictiveness of [snakes] is fetichistic in origin. Chinese philosophy regards all organic matter as endowed with life; it is an axiom that the kosmos is alive, or that 'the firmament and this planet are alive,' . . . and in carrying out the conception, qualities are attributed to animals which assimilate them to mankind." "Natural results attend snake wounding, supernatural consequences follow snake killing. When the animal is simply maimed, its vindictiveness can only be appeased by planting its fangs in the flesh of the aggressor; but when it is killed, an unknown supernatural power mysteriously intervenes and soon causes the death of the offender; in other cases the spirit of the animal takes violent possession of the slayer, whom it impels to suicide. Consequently cobras are shunned, rather than pursued and attacked; instances of supernatural revenge on their part are not common, and cases of revenge by biting are very rare; but both are [on record.]" "In Wenchau city and department cobras are extremely numerous, entering dwellings in quest of rats; yet I have never seen a victim of their revenge. Mendicants are often serpent-dealers, making collections of snakes of various kinds in cage-like baskets of peculiar construction. [Buddhists sometimes buy these, to free them.] . . . Snakes are nourished by beggars, who carry them in their hands, and going from shop to shop" frighten people into almsgiving. "A beggar having captured a brace of [cobras], proceeded to extract their fangs, but . . . one escaped after having suffered injury;" it afterwards came back, and bit the beggar, who died. "In its chapter on snakes, an authoritative encyclopædia (*Yüan chien lei han*) names the 'hooded serpent' of the Lower Yangtsze, which is destructive of human life, and which, if injured, should be promptly despatched, as, if not slain, it will never cease aiming to avenge itself; although the man sought for may be in a crowd of thousands, the serpent will unerringly discover and despatch him." This snake, with others, has disappeared from the coast swamps since they were drained. "The hooded python was sometimes 70 to 80 feet long, tail barbed, or perhaps, like the Boidæ, having claws so great as to seize men and cattle. . . . It emitted a vapour which sometimes concealed it from view, and which itself was poisonous, inasmuch that criminals, condemned to the death penalty, sent to the neighbourhood of its lair, perished within ten days." "Hysterical subjects are most liable to those possessions affording peculiar psychic phenomena." "Persons affecting spirit possession throw themselves into mock trance, and then throwing themselves into sham ecstasy, sometimes emit utterances to impose on spectators." Several examples are given; one seems to show that the python might be a form assumed by a human being (a wizard?) or conversely. "Snake-killers who escape vengeance while yet in human form, are liable to retribution in a lower stage of existence. For example, a bull was one night heard bellowing in its stall, when it was discovered that it had been killed by two serpents which had attacked it, one at the head and the other at the flank. By common consent [this] was explained by injuries which the serpents had received from the human precursor of the slain animal. Sometimes a slain snake, being also born as a man, will, unconsciously to himself, be impelled to wreak vengeance on his former foe, by murdering the man into whose body that foe had entered." "Folklore also furnishes anecdotes which ascribe gratitude, as well as vindictiveness to serpents." "Where serpent worship chiefly abounds, the snake spirit or god protects its worshippers from serpent virus, and punishes serpents that inflict injuries without cause, allowing them to bite only in retaliation. In the district of Nancheng, Kiangsi, where serpents abound, a temple exists for the worship of the snake-god, who renders snake-bites innocuous, and responds to all prayers addressed to him by sacrificing worshippers." "An account is recorded of a snake temple in Fuchow, the god of which destroys serpents that have causelessly injured worshippers."—*Ch. Rev.*, xvii. 145–51.

Li-Hung Chang, on one occasion performed acts of worship to a water-snake, in order to prevent an overflow of the Yellow River. Five large serpents, said to be over 1000 years old, are worshipped in Fuhkien. They are believed to have the power of assuming the human form. "'I have known a case where thousands of men and women have gathered round a serpent that had been killed by the roadside, and have worshipped it for nearly a month. The worship stopped only when it was found that the report of its efficacy to heal disease, etc., was untrue.'"—*Balfour, Leaves*, pp. 151–2.

"Hedgehogs are regarded with a certain amount of reverence, and rats and mice are said to be worshipped by the Tsai-li Hui, or Fellowship of Reason, which seems to have degenerated of late years. The fox is supposed to have the power of changing itself into a beautiful woman, and deceiving the unwary. Fox-myths are nowhere so deeply rooted in the minds of the people as in China and Japan."—*Ibid.* pp. 151–2.

Deities, genii, devils, ghosts, etc.—"Chinese ideas of dignity would represent the conventional Deity, who must be clothed in some form, attired after the fashion of native Emperors or sages."—*Parker, John Chinaman*, p. 181.

"Every magistrate is officially required to perform various idolatrous ceremonies at the temples. The objects of worship are numerous, including many others besides those forming the 'herd of inferior sacrifices,' and new deities are frequently made by the Emperor, on the same principle that new saints are canonized by the Pope. The worship of certain hills and rivers, and of spirits supposed to preside over particular cities and districts, has prevailed among the Chinese from ancient times, long before the rise of Rationalism or introduction of Buddhism, and is no doubt the origin of this official worship. In every city the *Ching hwang miao* [*Ch'êng-huang miao*], *i.e.*, 'City and Moat Temple,' contains the tutelar divinity of the city called *Ching-hwang*, with other gods, and here on the solstices, equinoxes, new and full moons, etc., officers repair to sacrifice to it and to the gods of the land and grain."—*Williams, Midd. King.*, ii. 202.

The *Ch'êng Huang Miao* "are regarded much in the same light as the Yamuns, or residences of the city officers. Accordingly, in addition to the Chêng-hwang, or ruler of the city, the temple is filled with images of inferior officers and servants. In the back part are private apartments containing images of the Chêng-hwang's wives, and a room completely furnished, with a bed (which is made every day) and clothes-racks, clothes-presses, etc. Shoes [etc.] are frequently presented to the Chêng-hwang and his wives, whose clothes are changed with the changing seasons." "As the business of the Chêng-hwang is supposed to call him occasionally away from the temple, a smaller image is made, about the size of a man, which is borne through the streets, as officers are, while the larger one always remains in its place in the temple." As Chinese officials are continually changing, "the gods of this temple do not, like others, have permanent names. The same images answer from year to year, but the individual spirits are supposed to change. It is believed that a man in the province of Kiangsi, called *Chang-tien-sz*, who has an office which is transmitted in his family from one generation to another, is possessed of means of communicating with spirits, and he is continually consulted [as to which spirit is in power in any particular city]." "But the people are also interested in the *Chêng-hwang-miao*, and . . . perform [ceremonies] in it, though they are not a part of the State worship, being entirely voluntary. They look up to the idols which it contains as their protectors, and often appeal to them when they are wronged by their fellow citizens, or fail to obtain justice from their rulers. . . . Ten large idols [are found in the temples of a *Fu* city]. The first is *Hia-ti-sz*, who is supposed to take charge of the garments with which the dead are buried. After the death of an individual, an accurate list is made of his clothes, and . . . transmitted [by burning] to this god, whose business it is to see that the possessor is not robbed of them on his way to Hades. . . . *Fuh-luh-sz*, who presides over happiness and wages; *Chau-tsu-sz*, who presides over cursing and railing, keeping an accurate account of all sins of this kind which are committed; *Li-yih-sz*, who presides over boundaries; *Sang-chan-sz*, who presides over childbirth; *Tsai-sang-sz*, who presides over the slaying of animals; *Kiai-ngeh-sz*, who presides over persons in distress; *Wan-yih-sz*, who presides over the pestilence; *Suh-puh-sz*, the quick avenger, and *Yiu-shau-sz*, who adds length of days. The Quick Avenger is worshipped more than all the other gods together. . . . He is applied to for revenge by those who have been falsely accused; those who have had property stolen [etc.]. . . . The suppliant goes to the temple, with a priest or master of ceremonies, who writes a *fu* or charm, and nails it with a chicken's head before the god . . . [to arouse him and bring] the importance of the case distinctly before him. A paper is also burned, stating the character of the offence, and . . . the matter is left in the hands of the god. Persons bitterly enraged against each other sometimes meet before this god to ask him to be the arbiter of their difficulties, and go away from his presence satisfied that the matter will be properly disposed of. . . . Some present their grievances before the god [secretly] for fear of irritating the opposite party by a knowledge of the course that they are pursuing; some are frightened into the performance of duty by a threat of having their case brought before *Suh-puh-sz*. It is commonly reported that guilty persons who have been accused before this god are often seized with extreme mental and bodily anguish and die uttering incoherent expressions respecting their crimes and the punishment they are suffering."—*Nevius, China and the Ch.*, pp 136–140.

[The God of War, and the god of literature (see *infra*), both deified men of past ages, also have to be worshipped by the officials.]—*Ibid.* p. 140.

[*Deified Heroes* are prominent men in Chinese history, and have been deified by the express authority of the Emperor. The most of these gods are of comparatively recent origin. The births of but few date farther back than the Sung dynasty. . . . The title or office of a god is derived from the reigning sovereign.]—*Ibid.* p. 143.

[When a community cannot secure sufficient money to secure the public appointment and recognition . . . they sometimes erect their temple and enshrine their god without (it). There are seven degrees thus conferred. Sometimes persons are deified by the Emperor while still living . . . The dead are also often . . . advanced to a higher grade . . . Most of those deified by the Emperor of his own accord are persons who have lost their lives in his service. . . . Of all the gods, only the deities of the highest class attain to the title of *ti* which belongs to the Emperor, who seems to regard it as an act of condescension to share this title with them, and adds to his own title the character *hwang*, meaning greatest.]—*Ibid.* pp. 143–4.

[Of the gods which are known and worshipped throughout the whole Empire, there are comparatively very few. The highest honours are awarded to Confucius.]—*Ibid.* p. 144.

[*Yuh Hwang Ta Ti*, chief of all the gods, has temples erected to him exclusively, and his image occupies a prominent place in Tauist temples (see *infra*). The people seldom pay homage to him, however, and when they do, it is rather in the form of adoration than petition, as he is regarded as too far removed in dignity from mortals to take any immediate cognizance of individual wants.]—*Ibid.* p. 145.

"The God of War is everywhere worshipped and has temples erected to him throughout the empire. During the present civil war in China, the Emperor has heaped new honours upon him, professedly on account of alleged deliverances, but no doubt principally to inspire confidence in the fortunes of his dynasty."—*Ibid.* p. 145.

"The God of Wealth though inferior to many of the other gods in rank, is no doubt the one most regarded. He has not only large temples erected solely in honour of him, but every shop contains a small image of him in a little shrine, before which incense is continually burned."—*Ibid.* p. 145.

"A temple dedicated to this divinity [Wên-ch'ang, God of Literature] by the State exists in every city of the empire, beside others erected as private benefactions or speculations, in which, as a general rule, *Wên Ti*, the patron of study, is worshipped in conjunction with *Wu Ti*, the god who favours the profession of arms. Wherever *Wên Ti* is worshipped, there will also be found a separate representation of *Kw'ei Sing*, showing that while the official deity has been allowed to 'borrow glory' from the popular God, and even to assume his personality, the independent existence of the stellar spirit is nevertheless sedulously maintained. The place of the latter in the heavens above is invariably symbolized by the lodgment of his idol in an upper storey or tower, known as *Kw'ei Sing Koh* or *Kw'ei Sing Low*. These buildings are also often to be found separately, having no connection with the temples of the official deity, and in such cases are either attended by Taoist fortune-tellers who make a livelihood from the fees accruing at the altar, or else form part of the numerous private halls of study (*Shu Yüan*) connected with preparations for the Literary Examinations which abound in every Chinese city. The students who assemble here at stated intervals have thus the means at hand of worshipping the patron of their profession and of conciliating his favour with incense and prayers. Thus it is evident to how great a degree the ancient stellar divinity still emphatically monopolizes the popular idea of a guardian assigned to literature and study, notwithstanding that the deified recluse of Tszet'ung has been added in this capacity to the State pantheon for upwards of five hundred years."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 41–2.

"The Dragon . . . is a universal and prominent object of worship among the Chinese. [His] domain embraces all seas, lakes, rivers and ponds. . . . All the living creatures of the water are his subjects, and peculiar phenomena of clouds, celestial appearances, and water-spouts are ascribed to his presence and agency. [He] is regarded . . . as a real existence which many profess to have frequently seen. . . . Paintings and representations of the dragon are often seen, presenting the same uniform appearance. [The original portrait was painted under the *Tsin* dynasty, by order of an emperor to whom the dragon appeared.] There is a whole hierarchy of inferior dragons subject to him. It is also believed that there is a certain animal, living in subterranean caverns . . . , which is assisted in its journey to the sea, by a spontaneous flood of water passing from the place of its concealment to the nearest stream, and often destroying houses and crops in its progress. [Such floods are often heard of.] This superstition is not local, but general; and . . . proclamations are sometimes issued by the officers, calling upon the people to hunt and destroy these animals. . . . The examinations consist in attempts to leap over a high wall, or dragon-gate." "The inferior dragons, like the Dragon King, are supposed not to have material forms, except as they assume them. . . . Many [rivers, ponds, and streams] are specified as the dwelling-places of dragons. In times of drought, the people resort to these places to pray for rain, and sometimes the civil officers go in person." [Any reptile found near the 'dragon-pool' is regarded as the assumed body of the dragon, and carried to the magistrate's yamên to be worshipped.] People sometimes commit suicide in a dragon-pool, in order to obtain rain, and are deified afterwards. There are temples to the Dragons throughout the Empire—in which he is always represented as a man."—*Nevius, China and the Ch.*, pp. 120–3. See also *Matignon*, pp. 18-28.

"At this point [of the Grand Canal] is the temple of the 'dragon king,' or genius of the watery element, who is supposed to have the canal in his special keeping."—*Davis, Chinese*, i. 137.

"The Chinese have erected temples in Hainan to the Tyfoon Mother, a goddess whom they supplicate for protection against these hurricanes."—*Williams, Midd. King.*, i. 57.

"The less noted gods, which have only a local fame, are almost innumerable." They are persons canonized on account of their virtues.—*Nevius*, p. 146.

"Every section and country has its local god and local temple. . . . These temples furnish places for the inhabitants of each neighbourhood to meet for deliberation on topics of general interest. . . . Men of each class or occupation have their own peculiar deities."—*Ibid.* p. 147.

"The religious notions of the masses are vague and chaotic. . . . Confused with the multiplicity of gods, some try to worship them all, for fear that the true one, or rather the most important one, should be neglected. . . . While the general government formally and ostensibly denounces the popular idolatry, as it is the stereotyped custom to do, the Emperor and officials of every rank contribute immense sums of money to build, repair, or beautify the temples. Officers, after attending to the . . . rites of the State religion, worship with the common people in Buddhist or Taoist temples, or both."—*Ibid.* p. 151.

"The demonolatry of the learned has gradually become so incorporated with popular superstitions that there is now little practical distinction; everyone is willing to worship whatever can promise relief or afford assistance."—*Williams, Midd. King.*, ii. 202.

"Literary men are generally atheists or pantheists. Stil. they will say that it is very desirable for the common people, and women, whose moral perceptions are obtuse, and who cannot think, to have idols set before them to awe and restrain them, and out of regard to the general custom, or from force of habit, they will perhaps worship with them. . . . I saw, [however] a tract, written by a man of this class, denouncing idolatry as essentially corrupt and debasing, inconsistent with reason and the teachings of Confucius. . . . These representations and appeals, however forcible, have but little effect."—*Nevius*, p. 152.

[Nevius estimates the number of temples throughout the whole of China, at, approximately, one million, including Buddhist, Taoist and *Miao* (or temples for the worship of deified heroes).]—*Ibid.* p. 152.

"A Chinaman will often derive hope in times of adversity and affliction by turning to the beneficent ruling power, the

'*laou teen*, or old Heaven!' an expression which is then, in his mouth, very like that of '*le bon dieu*' in the mouth of the common Frenchman under similar trials."—*Meadows, Ch. and their Rebellions*, p. 18.

[New sects have sprung up from time to time, some formally renouncing idolatry, but all have died out again of themselves, or been prescribed and exterminated.]—*Nevius, China and the Ch.*, pp. 160–1.

"In one instance that missionary [Gutzlaff] saw a marble bust of *Napoleon*, before which incense was burnt in a temple."—*Davis, Chinese*, ii. 96.

"A woman 68 years of age, [who] had been connected with Buddhism, Taoism, and several other sects, called respectively the Vu-we (胡 回), Sin-t'in (先 天) and No-mi (未 尠) religions, at last became the head of the Vu-we religion, and had many disciples. . . . She was a vegetarian for 30 years. Connected with her house she had a small temple, and many idols which she constantly worshipped; the goddess of mercy she worshipped for more than 20 years. So earnest in her devotion was she, that it was said the gods were very fond of her [and her intercession was sought by her friends and acquaintances."]—*Woman's Work*, ii. 39.

[Idols were supposed to remain blind unless the eyes were painted in.]—*Exchange* (Hsin Chên, Honan), quot. *N.-C. Herald*, July 31st, 1899, p. 233.

[*Scarth* (*Twelve Years*, pp. 18–19) says that women seem to be the chief frequenters of temples. It is very rare to see men worshipping the idols.]

"The *Sien-jin*, genii, or *Yao kuei*, imps or fairies, are beings who, by certain precautions escape death, and with ethereal bodies, capable of assuming different forms [animate or inanimate, or of remaining invisible] enjoy an uninterrupted existence of dreamy happiness, either separated from or mingling with [men] at pleasure. They exist in various degrees of development or grades of attainment, and it is their continual aim to rise higher in the scale. [Their principal] abode is four sacred mountains, far in the unknown ocean, separated from the abodes of men by a sea filled with a subtile fluid called *Joh-shwuy*, 'weak water,' on which not even a feather will float. The *Shin Sien Tung Kien*, . . . a work of four large volumes, gives an account of the history and character of more than three hundred *Sien-jin*."—*Nevius, China and the Ch.*, pp. 125–6.

"That class of *Yau-kwei* which afflict men acquire their power, not by the authorized method of subjecting the body and mind to certain disciplinary rules, but by clandestinely stealing the vital principle from man. Nightmare and starting in sleep are attributed to attempts of this kind. Dreams incident to some states of bodily ailment and weakness are also attributed to these spirits. Persons thus affected endeavour to rid themselves of their nocturnal assailants in different ways. [One is] to utter curses and imprecations on the offending spirit. If this means fails, one or more persons in robust health are called to occupy the same room with the invalid, as it is supposed that an influence emanates from the bodies of strong and robust persons which the spirits cannot withstand, and that they principally attack those who are weak and delicate. Should the spirit refuse to yield to such means, a sword which has been wet with human blood is brandished over the bed of the sufferer, or the services of a person who professes to shoot spirits are obtained. Mirrors are suspended in different parts of the room, in order to frighten the spirit, and to detect his presence and position by reflection, though he should endeavour to avoid a direct view. The last resort, when all other means have failed, is that of making a formal complaint at the office of *Chang tien sz*" [see *infra*]. 'The largest class of spirits is supposed to be that of the spirits of the dead, called *kwei*. As it is generally believed that the soul is after death required to atone for its sins by confinement in Hades, until it is permitted to appear in another state, the Chinese find some difficulty in accounting for so many *kwei* on earth. The most consistent theory is that which supposes that they are spirits whose crimes are not sufficient to keep them in hell, and whose time for reappearing has not yet arrived. To the agency of these spirits almost every variety of disease is attributed. Their object in these inflictions is to obtain food, or rather the scent and exhalations of food. Accordingly . . . a diviner is called to determine whether sickness is due to the agency of spirits or not, and if it is, to tell what kind of *kwei* it is, and what its demands of food are. At funerals a feast is generally prepared for the spirits supposed to be the associates of the deceased, in order to secure a good understanding between him and his new acquaintances." "During the months of August and September, when diseases are unusually prevalent, the people suppose that the gates of hell are opened and the spirits turned out for a kind of holiday. At this time they are honoured with ceremonies performed throughout the country, called *Fang-yin-kau*, or *Shi shih* (*cf. Williams, Midd. King.*, ii, 257, 258)." "In the province of Chekiang, it is generally believed that there is a place called Sang-chau, where a great part of the inhabitants are *kwei*, who come out in the afternoon and mingle with the people. It is said that they may be distinguished by their using paper instead of copper money, and by their not casting a shadow in the moonlight. It is also believed that in the *hien* city Fung-tu, in the province of Sz-chwen, there is a street called *Yin-yang-kiai*—'Street of the Dead and Living'—one side of which is inhabited by men, and the other by spirits." "The Chinese have a large number of books on this subject, among the most noted of which is the *Liau-chai-che-i*, a large work of 16 volumes." "It is believed that there is another class of ghosts, called *Kiang-shi* [vampires, whose] . . . bodies do not decompose at death, and the united soul and body are permitted during the night to range about at pleasure. Some bodies change their form so as to resemble beasts of prey, but some retain their original form and appearance. . . . [These] if they eat any material food, are immediately transformed into living men, only differing from other mortals in being unable to behold the light of day. . . . If the sun [shines] upon them, they die instantly." "*Tu sien*, signifying a spirit in the body, designates a familiar spirit, by the assistance of which it is believed that persons are able to tell fortunes and converse with the dead. They are supposed to be the spirits of those who are not permitted to reassume a body on account of obligations incurred during a former state, from which they have not yet been absolved. They repay their debts by serving their benefactors who have preceded them in coming again into the world, in enabling them to acquire wealth by fortune telling. They do this by dwelling in their bodies as familiar spirits and being their medium of communication with the unseen world. Persons supposed to be possessed of these spirits are visited by multitudes, particularly those who have recently lost relatives by death. . . . The fortune-teller, after a conversation with the applicant, invokes the aid of his or her spirit . . . whose attention and active co-operation are signalized by sundry contortions of the body and a spasmodic jerk of the neck. The spirit is then directed to gain the desired information." "Some of these fortune-tellers who have no indebted spirit . . . are obliged to devise means to secure the assistance of one. . . . They first procure a little image made of [willow-wood], for which they then obtain a spirit. . . . Some go to a grave-yard, and after feasting the ghosts of the dead, make an arrangement with one to reside in the image. The image is then worshipped for several weeks continuously, and left out of doors during the night, to be wet with the dews of heaven, and drink in virtue from moonbeams, after which it is regarded as an oracle." "Another method . . . consists in writing on the little image the characters representing the horoscope of some clever living person whose spirit is desired, and then worshipping the image, and leaving it outdoors until this person dies, and his spirit enters the image, which, it is said, will surely take place in a very short time." "Those found possessed of these images sometimes fall under the suspicion of having produced the death . . . of some lately deceased person in the neighbourhood, and may be accused, tried, and condemned . . . for murder." [Communications are obtained by means of the "planchette," as described by various writers.] [Other spirits called *Wu tung*, steal, and frighten people, transferring money, etc., from those they dislike to their favourites; they also produce rappings in houses, and appearances of flame, so as to drive out the inhabitants. Perhaps this story has been suggested by the *ignis fatuus*. They can be bought off by a feast.]—*Nevius, China and the Ch.*, pp. 162–8.

The Chinese "have the greatest dread of offending [the earth-spirit,] and hardly dare to move a clod of earth for fear of incurring his displeasure." [Before laying the foundation of a house, digging a grave, etc., a ceremony is performed called *Kao tu* ("informing the earth") when worship and sacrifices of food are offered. If this is neglected, the person will, it is believed] "be punished by violent pains, if not protracted disease or death."—*Ibid.* p. 124.

"As I sat smoking in front of the fireplace, [in a Man-tsu inn at Ta-tsian-lu], which was exactly like a range, only built of stone instead of iron, I placed my feet on a raised hearth in front of the fire. All the women present at once threw up their hands and screamed violently . . . [and] informed me that I had offended the household god, who dwelt on the hearth-stone."—*Cooper, Travels*, p. 220.

"While standing smoking on the deck in front of my cabin, I happened to expectorate over the bow, when one of the boatmen pulled me violently on to my back, amid the howling of himself and mate. . . . Philip explained to me that I had, according to Chinese superstition, offended the wind-god. . . . They were . . . very much put out, and said that we should know to-morrow whether the god was angry or not; if he was, we should have a foul wind, and his wrath would have to be appeased with fire crackers."—*Ibid.* p. 29.

"Hwa-Kwang-ta-te, the genie of fire, has his day in November, just when the Chinese begin to dread the fearful fires that ravage their slenderly built dwellings. Tsew-seen, the spirit that presides over wine, has his festival in the autumn."—*Scarth, Twelve Years*, pp. 85–6.

"In Central China the people believe that when a man dies his spirit must appear before the 'Clothes-stripping Court,' where devils eagerly tear off the garments of the wretched victim. To guard against this treatment, a red robe is put next the skin of the person supposed to be dying, to befool the devils who will see the red colour of the garment and be satisfied that they have drawn blood. Chinese have been known to wear this garment unremittingly for months, after having recovered from an attack of illness," and dying persons are dressed in it when removed from the bed (see FUNERAL RITES).—*N.-C. Herald*, April 25, 1900, p. 746.

"A general belief is that, when a child dies, it is because an evil spirit, or devil, takes a fancy to it and carries it off. . . . These spirits prefer good children, and do not care so much for dirty or ugly children or any that have lost a limb. They are fondest of a pretty boy and especially one that his parents love very much. From these strange beliefs have arisen stranger customs," such as the biting off by mothers of the little toes of male babies to save them from the evil spirits.—*Exchange* (Hsinchêu, Honan), quot. *ibid.*, Aug. 28, 1899, p. 438.

"In the winter some children are clad in tiger skin from head to foot. Many others wear caps made to represent tigers' heads, while almost all wear cloth shoes with fierce tiger faces worked on them. All this to deceive the evil spirits into thinking that they are ferocious tigers." "Parents may love their children very much, and yet for that very reason give them horrid names, to make the evil spirits believe they do not care for them, *e.g.*, a handsome lad may be called 'Jeng Niu' (Rejected Cow)," etc. Another device was "to have a boy's trousers made of different colours, one leg red and the other leg blue. They reason somewhat after this fashion:—The evil spirit, flitting quickly by on one side says to himself: 'There is a boy with blue trousers that I must have some day,' but when he comes back he does not recognise him, as this time he sees him from the other side, which is red."—*Ibid.* p. 438.

"The evil spirits are also supposed to know that little girls are not of much account. Sometimes a pet son is given a girl's name and made to wear one ear-ring, to make the devils think he is only a little girl."—*Ibid.* p. 438.

"On our way to the hospital daily [at Hsinchên, Honan] we pass between two houses with their front doors opposite to each other. A baby having been born in No. 1 house, they called it 'Cat Cow.' Shortly afterwards, a baby was born in No. 2 house opposite, and for fear of the spirit of the cat baby, they called this one 'Dog Cow.' By-and-by another baby arrived at No. 1 house, and so that it would not be afraid of the dog, they called it 'Tiger Cow'; but in the course of human events, a second child came to No. 2 house, which they called 'Rifle Cow,' so that it could kill the tiger. The last arrival is at No. 1 house, and reasoning on the same principle, they have, for obvious reasons, called it 'Sledgehammer Cow.'"—*Ibid.* p. 438.

"The deities of some few temples have acquired great celebrity by giving important intimations to their worshippers in [dreams]. On certain days, generally the last great festival of the year . . . people . . . arrive at the temple before night, burn incense, make prostrations and present their prayers before the gods, and then lie down in some part of the temple, generally on the cold floor, to wait for a dream. . . . To avoid the inconveniences of going to a remote temple, a person sometimes makes his bed in the kitchen to beg a dream of the Kitchen God."—*Nevius, China and the Ch.*, pp. 192–3.

"A case of hallucination greatly interested us [at Ya Chou] two days since. A young married woman on her way home at dusk encountered a demon in the form of a woman, who commanded her to commit suicide by opium poisoning. 'But I have no money,' objected the woman, who seems to have yielded wholly to the demands of the demon. 'Pawn your jacket and buy opium, sugar, and garlic, mix them together and they will be pleasant to eat,' was the demon's counsel, which under its personal supervision was literally carried out with this result that, at the third watch, the woman seemed to be dying. She was in a bad way, undoubtedly, making the most astonishing statements as to talk of the demon and its power over her. However, by long-continued and strenuous efforts she was saved and now the interested circle of her friends is fully engrossed in the discussion of the demon's identity. At length they have fixed upon the ghost of a woman who some years since poisoned herself with opium in an adjoining yard. Their method of reasoning is as follows. Whenever a person commits suicide the spirit of the suicide becomes demonised and is condemned to wander about for three years. When this period has elapsed the demon appears to a selected victim and induces this one to follow suit in a like manner of suicide. Thus those who die by hanging seek a victim whom they induce to hang himself likewise; if by opium, then to take opium; and so on—a pretty vicious kind of circle. Having thus found a victim the demon re-enters society in the body of some child, and the round of existence in the human family commences anew. In a case like this it would seem to be somewhat hazardous to choose a friend or partner in any sense, since one has no guarantee as to the previous character of the chosen. It seems to be infinitely more comforting to believe in one innings for each person, but the Chinese do not favour such a plan, apparently. Fearful enough to surround themselves with demons and ghosts, they are always on the hunt to find some way of escape from them, only to augment the number of their tormentors."—*N.-C. Daily News*, Apr. 11, 1899.

"The Soochow women say that children are possessed by the spirit of different animals on different days, and act out the nature of such animals. The day that a child is good and quiet is called 'the cat's day'; when it is bad and noisy, it is 'the dog's day.'"—*Woman's Work*, iii. 17.

The Chinese believe that cats, in order to attain more quickly to the rank of spirits (which a fox can accomplish, by legitimate means, in 1,000 years) worship the full moon and absorb a vivifying principle from its rays. They also, by contact, draw the vital warmth from the bodies of human beings. "It is generally believed that a host of evil spirits which afflict . . . men . . . have their origin in this manner, and are destined sooner or later to be destroyed by lightning, as no less subtle agent can affect them."—*Nevius, China and the Ch.*, pp. 126–7.

Confucianism.—"When a Chinese is asked how many systems of philosophic or religious belief exist in his country, he answers, *Three*—namely *Yu* [*Ju*], the doctrine of Confucius . . .; *Fo*, or Budhism; and the sect of *Taou* [*Tao*], or 'Rationalists.' It must not, however, be inferred that these three hold an *equal rank* in general estimation. Confucianism is the orthodoxy, or state religion of China; and the other two, though tolerated as long as they do not come into competition with the first, have been rather discredited than encouraged by the government. 'First (it is observed in the Sacred Instructions) is the honourable doctrine of the *Yu*, and then those of *Fŏ* and *Taou*."—*Davis, Chinese*, ii. 78.

"We have a religion of the literary class which corresponds to the degree of culture of the most enlightened body in the empire. This is the religion of Confucius, or rather his philosophy: for his doctrine is that of the founder of a school who has enunciated moral maxims, but has not meddled with speculative theories upon the destinies of man, and the nature of the divinity." "To think, will and know are the three steps of that education which begins with awakening, and ends with science, and whose text-book contains the finest maxims that ever philosopher wrote upon humanity." "We must not imagine, however, that the doctrine of Confucius is confined to maxims or to advice, without pointing out a precise method. There is a most exact method in that doctrine, and it is really a practical course of moral education. I will try to explain the plan of it." "The principle upon which the system rests is to maintain the reason within fixed limits. Confucius said the human heart is like a galloping horse which 'heeds neither rein nor voice;' or like a torrent descending the rapid slopes of a mountain, or like a fire breaking out. These are violent forces, which we must hope to keep within bounds, maintaining their power without allowing them to develop. He said that the human heart has an invariable ideal—Justice and Wisdom, and that the five senses are so many powers of seduction turning it away from that ideal. [He] advises his adepts . . . to arm themselves beforehand against the danger of these seductions, and the invincible weapon he gives them is Respect." "Respect is the general sentiment which extends to every action of life. The first cause of corruption is negligence." "It is Respect extended to all the acts of life, above all the most insignificant, which turns away unhealthy influences, and gradually performs the patient work of education." "Confucius teaches us to observe that the five senses as they are defined, constitute faculties, but not endowments. Man, however, has received endowments from Nature, and he enumerates them . . . a respectful physiognomy, soft speech, acute hearing, piercing sight, passionless reflection. These particular states of our faculties should be unremittingly developed." "The basis, therefore, of the philosophic system of Confucius is Respect, as Charity is the basis of the evangelical doctrine. Respect addresses itself to actions; Charity to individuals—or to speak more precisely to 'our neighbour.'" "Confucius leaves every one free to worship God as he pleases. . . . This system which consists in raising the heart of man, in order to direct all his thoughts to God as a consequence of moral good, lacks neither grandeur nor logic. Confucius has a number of small means to overcome great errors; it is like homoeopathy applied to the diseases of the mind. He forbids, to cite one of these means, fixed ideas—that is, prejudice. He says all men are the same, the ancient and the modern; and the good of the one is the same as the good of the other: they do not differ. To imitate the ancients in the wisdom of their conduct and to endeavour to know them, are the best means to know one's self." "In a word, he tries to create a general point of view uniting

all consciences. No one will escape its magnetism ; and without reserve, without the conception of another ideal, every spirit will turn towards the sun of the moral world to receive its beneficial light." "The ancient worship sanctioned by Confucius admitted neither images nor priests, but merely certain ceremonies forming the rules of a cultus. These ceremonies are but little noticed by minds occupied with the principles."—*Tcheng-ki-tong, Ch. Painted by Themselves*, pp. 18–26.

"The State religion has been so far corrupted from its ancient simplicity, as given in the *Shu King* [*Shu ching*] and *Li Ki* [*Li chi*], as to include gods terrestrial and stellar, ghosts infernal, flags, and cannon, as well as idols and tablets, the effigies and mementoes of deified persons."—*Williams, Midd. King.*, ii. 196.

"This State religion, is, therefore, a splendid and wonderful pageant ; but it can no more be called the religion of the Chinese than the teachings of Socrates could be termed the faith of the Greeks. It is, however, intimately connected with the *Ju Kiao* [*Ju Chiao*], or 'Sect of the Learned,' commonly called Confucianists by foreigners, because all its members and priests are learned men who venerate the classical writings. It is somewhat inappropriate to designate the *Ju Kiao* a religious sect, or regard it otherwise than as a comprehensive term for those who adopt the writings of Confucius and Chu Hi and their disciples. The word *ju* denotes one of the literati, and was first adopted A.D. 1150, as an appellation for those who followed the speculations of Chu Hi regarding the *tai kih* [*t'ai-chi*], or 'Great Extreme.' This author's comments on the classics and his metaphysical writings have had greater influence on his countrymen than those of any other person except Confucius and Mencius ; whose works, indeed, are received according to his explanations."—*Ibid.* ii. 199–200.

Buddhism.—"According to Buddhism, the material world is an illusion ; man should endeavour to isolate himself in the midst of nature,—to abstract himself. It is the doctrine of contemplation in God,—that is to say, in the immaterial essence. The aim of this ideal life is to produce ecstasy ; then the divine principle takes possession of the soul, penetrates it, and death consummates the mystic union. Such is the abstract principle of that religion which has its temples, altars, and a pompous ritual. I may add that the Buddhist monks, who live in vast monasteries, possess great riches."—*Tcheng-ki-tong, Ch. Painted by Themselves*, p. 26.

"Choo-tsze has said, the doctrine of Fŏ regards neither heaven nor earth, nor the four regions. Its only object is the establishment of its sect, and the unanimity of its members. The religion of Fŏ . . . is that of Bud'h, in the precise shape which that superstition has assumed throughout Thibet, Siam, Cochin-china, Ava, Tartary, and Japan. The extensive dissemination of Budhism in countries foreign to India, its original birth-place, must necessarily be ascribed in a great measure to the rancorous persecution it experienced from the Brahmins, whose hatred towards this heresy gave rise, as soon as they became the predominant sect, to the most cruel treatment of the *reformers*, for such the Budhists appear at first to have been."—*Davis, Chinese*, ii. 78–9.

"The present condition in China of the religion of Fŏ is very far from flourishing, and the extensive and magnificent establishments, which have been founded in former times, are evidently in a state of dilapidation and decay. It is rarely that one meets with any of their nine or seven-storied pagodas in tolerable repair, though one or two of these striking and elegant objects occur in almost every landscape."—*Ibid.* ii. 94.

"Though the Confucianists in successive centuries persecuted Buddhism with fire and sword and put forth their best literary efforts to nullify its influence, they not only failed to stop the progress of Buddhism, but got themselves so imbued with Buddhist ideas, and so impressed with Buddhist pretences of magic power, that to the present day the most thorough-paced Confucianist goes without any scruple through Buddhist ceremonies, on the occasion of weddings or funerals, or in cases of illness, epidemic or drought."—*Eitel, Buddhism*, p. 32.

"It is certainly wrong to say, that the Chinese are all Buddhists. But it is equally wrong to suppose that only the members of the Buddhist hierarchy in China can be counted as Buddhists." "And yet the whole of the Chinese people is influenced to a certain extent by the doctrines of Buddhism. Tauism is but Buddhism in native dress. The doctrines of transmigration, of hell and a future paradise in heaven, have penetrated far and wide among the mass of the people. The Chinese Government, though giving Confucianism official preference, freely countenances the Tauist imitation of the Buddhist hierarchy and ceremonial, and frequently deputes officials to attend Buddhist ceremonies of worship. The Buddhist rosary actually forms part of the official dress of every mandarin. The Imperial mausolea are under the official charge of the Buddhist clergy, Buddhist shrines abound in the Imperial palaces, and the Imperial household constantly requisitions the ministrations of Buddhist priests. As it is at Court, so it is all over the Empire. Almost all Chinese are Confucianists in theory, and most of them will, as a matter of argument, declare Buddhism to be rank heresy, but in practice they freely combine Buddhist rites and ceremonies with the traditional ritual of orthodox ancestral worship. There is hardly a wedding, or a case of serious illness or a funeral in China, where the services of Buddhist (or Tauist) priests are not employed. There is hardly a town in China which has not a temple full of pictorial representations of hell, and there is not a village in China which does not arrange, in the course of the seventh month of every year, for a series of masses to be read and requiems to be sung by Buddhist (or Tauist) priests for the benefit of the dead. Even in those Confucian preaching halls, which have been established in South China by zealous Confucianists, in order to expound Kanghi's Sacred Edict in opposition to the chapel preaching of Protestant missionaries, the walls are generally covered with placards exhorting people to morality by means of arguments based on the Buddhist doctrines of hell and metempsychosis. It is not too much to say that most Chinese are theoretically Confucianists, but emotionally Buddhists or Tauists. But fairness requires us to add that, though the mass of the people are more or less influenced by Buddhist doctrines, yet the people as a whole have no respect for the Buddhist Church and habitually sneer at Buddhist priests."—*Ibid.* pp. 33–5.

"A recent decree of the Empress ordering a bevy of bonzes to pray for rain in one temple, and a posse of Taoists in the other, shows that both religions are officially patronised in China."—*Ch. Rev.*, xiv. 50.

"All Buddhist 'doctrine'" is discredited in China by men of intellect now, and so are priests as professors of it ; but the true and simple teaching of Shakyamuni survives ; and, as priests possess glebes ; are independent ; and are usually travelled and sometimes even well-read men, with a leisured taste for calligraphy and antiquity, they often enjoy the respect and companionship of the learned. Both they and their temples are more popular with women than men like to see, and in some provinces there is moral laxity. . . . When men die, the families, and especially the women, like to have a few priests in, and they are not particular as to doctrine, or even as to religion, so long as chaunting and processions of some sort go on. . . . The fact is that, politics aparts, the Chinese take an easy and broad-minded view of all religions, and would never persecute anyone so long as no gross immorality or interference with administration, custom and liberty took place. The Mussulmans in North China are never in the least interfered with, because they have the same good sense (like the early Jesuits had) to fall in with popular feeling, and 'let things be.' It is only in Yün Nan and Kan Suh, where Mahometans have become rather aggressive, that wars and persecutions have taken place, the faults, as usual, being on both sides."—*Parker, China*, pp. 283–4.

"In China . . . we find no evidence of a special system. All the books, early and late are mixed together in one heterogeneous collection. Though no doubt the books of the Great Vehicle have by far the preponderating influence, yet books of various ages are still studied, and different schools in China have adopted different degrees of the newer doctrine."—*Davids, Buddhism*, p. 208.

"Buddhism has, we believe, a firmer hold upon the Chinese —that is, upon their minds and hearts—than any other moral influence to which they are exposed. In spite of the alleged scepticism of the Chinese in matters relating to faith, there are few people so completely under the guidance, and indeed mastery, of the Unseen. The next world, and the existence of invisible and intelligent agencies are to them realities . . . which have a very strong influence on their public, private and inner life. It is not to be wondered at therefore that their most potent spiritual system should contain in itself not beliefs and speculations merely, but precepts . . . of a sufficiently practical nature to appeal to the common sense of those brought under their sway. Decision of character and force of will are strongly advocated in Buddhist works of instruction as necessary to the accomplishment of any task worth undertaking ; the vacillating man is likened to a piece of iron without temper ; the undecided woman resembles dry grass, which has neither root nor stem. Under the entire Heaven, says a philosophic poet of this school, there is nothing difficult; the difficulty is only to be found in the mind of man. . . . Nor do the teachings of Buddhism permit the cultivation of that dreamy state of mind, that foretaste of Nirvana . . . to so great a degree as may be generally supposed. 'Rest not too long in lonely places and alone,' writes an old Buddhist literate. . . . 'A man who rests too much alone is, to other men, as dry wood to a flourishing tree covered with blossoms and fruit : places of rest are loved by all, as the world is full of turmoil and confusion, but pleasant retirement weakens the spirit.' But the most remarkable precept of all is one which perhaps was borrowed from Confucius. 'Know thyself,' says the Buddhist : 'this serious duty no one, not your nearest friend, the best of fathers and the tenderest of mothers, the most affectionate of daughters and the most dutiful of sons can ever perform in your place. Examine yourself, seek to know your own instincts and passions.'" Buddhism, "a most extraordinary mixture of materialism and mysticism," is purely negative and entirely atheistic. "Matter is looked upon as eternal" [and the universe is governed by eternal and immutable laws—without a lawgiver. The wealth of ceremonial observances attached to this negative creed almost recalls Comtism.] "The third essential article in the Buddhist creed. There exists, we are told, an Eternal Law, which, when it is effaced from the memory of man, may be . . . recovered, solely and entirely by the . . . genius and wisdom of certain extraordinary personages called Buddhas, who appear successively and at certain intervals during the different series or succession of worlds. 'These Buddhas announced this law to all reasonable beings then existing. The principal object of this doctrine is to show to these beings the means of setting themselves free from the influence of the passions, and of becoming isolated from everything that exists ; so that men, being emancipated from the action of all good and evil influences, which forces mortals to turn in a vortex of existence without end, may attain to that state called Nirvan, or complete repose.'" "The monastic system is an important element in Buddhism."—*Balfour, Waifs and Strays*, pp. 135–41.

"There is an inferior grade of divinities which have not yet reached the condition of Buddha, and are called *Poo-sa*. They are still imperfect in knowledge and virtue, though far in advance of ordinary men. As they are nearer mankind in the scale of being, they are supposed to be in closer sympathy with him and more approachable. For this reason they are most worshipped by the people."—*Nevius, China and the Ch.*, p. 84.

Taoism.—"There are a few Taoists yet to be found, who are almost entirely uncontaminated by the follies and impostures of modern popular Taoism, and who may be said to represent the true apostolic succession in the Taoist church. In certain instances, some old worthies, who have been dead and gone for centuries, are believed by the simple mountaineers of China to be still alive. Far away in the mountain range which stretches from Peking across . . . Chihli and Shantung, there is one very sacred peak, called the Mount of a Hundred Flowers. . . . There [are said to] live, partly embedded in the soil, certain ancient Taoist hermits. By a long course of absolute conformity with nature, they have attained to immortality. . . . To use a Taoist phrase, their faces are washed by the rains of heaven, and their hair combed by the wind. Their arms are crossed upon their breasts, and their nails have grown so long that they curl round their necks. Flowers and grass have taken root in their bodies, and flourish luxuriantly : when a man approaches them, they turn their eyes upon him, but do not speak. No wild beasts will attack them, for they are in harmony with all nature. Some of them are over 300 years old, others not much more than a century ; but all have attained to immortality, and some day . . . their bodies, which have been so long in wearing out, will collapse from sheer withdrawal of vitality, and their spirits be set free. . . . [The sincere and devout Taoist, however, does not always become a hermit.] He is often in the world, and occupies high offices of State. But circumstances make no difference to him. . . . [Whether] living in a mean and dirty lane, and drinking from a gourd, [or] in the palace itself, the trusted minister of a monarch . . . he retains the same incorruptibility, the same indifference to power. . . . China has had many such Ministers, and she is rightly proud of them."—*Balfour, Leaves*, 136–9.

"The ideal man of Confucius was, first and foremost, an officer or Minister of State ; and this conception has flourished among the Chinese down to the present day. As a recoil, however, from the worldliness of the Confucian standard, we have the bright ideal of the Taoists, who look upon wealth and honours as illusion, and see the true Sage rather in him who abandons himself to quietism, contemplation, and the cultivation of his natural endowments."—*Ibid.* p. 140.

"To preserve themselves from plague, famine, sickness, and other calamities, . . . they invite some of the Tao-sse, or masters of the sect called Tao. These recite public prayers in the temples of the idols, and in the houses of those who have contributed to the expenses of the ceremony, and to each of whom these Tao-sse have given a sheet of paper on which are written the names of the deities presiding over the evils from which they seek deliverance. These papers are set up, with some incense-sticks, on a porcelain vase full of uncooked rice. After having caused homilies in honour of these deities to be publicly chanted, these masters, accompanied by some musicians, by two men carrying a paper boat, and by a crowd of curious spectators, go to the temples and from house to house. After having recited some formulas, and performed certain ceremonies, in each house, they receive the sheet of paper which they had given, put it into the boat, and carry off the rice for their own use. Having finished their rounds, they go to the bank of the river, burn the boat, with all the papers contained in it, and let the ashes be carried away by the stream."—*Nouvelles Lettres Edif.*, iv. 310–11 (ed. of 1818).

"It is said that the representatives of the head of the [Taoist] sect have still a large establishment in the province of Keang-sy [Chiang-hsi], where numbers flock from all parts to obtain cures for diseases, or to learn their destinies. The sect appears, in fact, to have degenerated very much from the character and tenets of the original founder, and many who wear the garb of the Taou-sze are at present little better than cheats and jugglers, professing to have communication with demons. The chief point of distinction in garb, between them and the rest of the Chinese, is the mode in which they dress their hair, which is fastened at the top of the head by means of a pin or skewer, somewhat after the fashion of the people of Loo-choo. It is by many degrees the least popular or predominant sect of China ; its superstitions now engage only a few of the most ignorant, and the Taou-sze are but rarely seen."—*Davis, Chinese*, ii. 116.

"Only the priests of this sect are regarded as its members ; they live in temples and small communities with their families, cultivating the ground attached to the establishment, and thus perpetuate their body ; many lead a wandering life, and derive a precarious livelihood from the sale of charms and medical nostrums. They shave the sides of the head and coil the rest of the hair in a tuft upon the crown, thrusting a pin through it, and are readily recognized by their slate-colored robes. They study astrology and profess to have dealings with spirits, their books containing a great variety of stories of priests who have done wonderful acts by their help. . . . Since that time [7th cent.] they have degenerated, and are now looked upon as ignorant cheats and designing jugglers, who are quite as willing to use their magical powers to injure their enemies as to help those who seek their aid."—*Williams, Midd. King.*, ii. 214–5.

"In some places the votaries of Tao, on the third day of the third month, go barefoot over ignited charcoal ; and on the anniversary of the birthday of the High Emperor of the Sombre Heavens, 'they assemble together before the temple of this imaginary being, and having made a great fire, about fifteen or twenty feet in diameter, go over it barefoot, preceded by the priests, and bearing the gods in their arms. The previous ceremonies consists in chanting prayers, ringing bells, sprinkling holy water, blowing horns, and brandishing swords in and over the flames in order to subdue the demon, after which they dart through the devouring element. They firmly assert that if they possess a sincere mind they will not be injured by the fire, but both priests and people get miserably burnt on these occasions. Yet such is the delusion, and the idea the people entertain of the benefit of these services, that they willingly contribute large sums to provide the sacrifices and pay the performers.'" "This ceremony is practised in Fukien . . . but is not very general, for the Chinese are the antipodes of the Hindus in their endurance and relish for sufferings and austerities in the hope of obtaining future happiness."—*Ibid.* ii. 215. See also *Medhurst, China*, p. 168.

"The Rationalists worship a great variety of idols, among which *Yuh-hwang Shangti* is one of the highest ; their pantheon also includes genii, devils, inferior spirits, and numberless other objects of worship."—*Williams, Midd. King.*, ii. 215–6. *Cf. supra.*

"Confucianism has been adopted by the Chinese in its original form, while Tauism has been obliged to change its form in order to secure its perpetuation. . . . [Its] special characteristic is *materialism*, and in its development it includes a theory of the universe, and a professed science of astrology and alchemy. Matter is regarded as eternal. The grosser forms of different substances tend downwards, and constitute the solid material of the earth ; the more refined essences tend upward and wander through space, possessed of individuality and life, and constituting, when they assume visible forms, the stars which look down from their spheres upon the lower worlds. While the earth is composed of the grosser, and the heavens of the more refined forms of matter, so also the body and the soul of man are similarly constituted." "The five special substances or elements of which the universe is composed, are metal, wood, water, fire and earth. The sublimated essences of these elements form five of the planets, respectively called metal star, wood star, etc. These stars sustain mysterious and important relations to the world and its inhabitants, and exercise a powerful influence on the harmony of the universe and the destinies of men. They may, and often do, descend to earth and become gods in order to enter into nearer relations with men, and undertake some special work of benevolence for them. In this way many of the gods of Tauism are identified with certain stars, or are stars personified." "In connection with this system, alchemy attempts the investigation of the essences of matter, and especially the discovery of some method of . . . changing [its] outward forms. [The elixir of life, and secret of turning other substances into gold.] Astrology endeavours to find out the peculiar characters of

different stars, and determines their relations to the birth of individuals and events in the histories of individuals and nations."—*Nevius, China and the Ch.*, pp. 114–29.

[There is a triad of divinities presiding over the intellectual universe, viz. :—(1) *Yuen shi ts'ien tsun*, "the honoured one of heaven first in time," residing in the uppermost heaven (Tauism assumes a series of heavens, one above the other) called the "jade stone pure region." He created the 3 worlds, brought countless spirits into existence, sets the stars in motion, and is "the source of all true doctrine, in himself immaterial and spontaneous." (2) *Lung pau ts'ien tsun*, "the honoured one of heaven who is valued and powerful," lives in "the upper pure region," produced the sacred books, calculated the succession of time, and divided the ages into Kalpas, and determined the movements and interaction of the *Yin* and *Yang*. (3) Lau-tzŭ himself, under the name of *Tai shang lau kiun*, "the most eminent good ruler," who has appeared on earth under various names at different times. He communicates to men the doctrines uttered by the first of the Triad, and collected in books by the second. He lives in "the very pure heaven." Subordinate to this supreme Triad are several divinities of which the highest is *Yu-hwang-ta-ti* (or shang-ti), "the great jade emperor," "the ruler of the *physical* universe," dwelling in "the pure jade stone palace in the tract of stars." Generally occupies the most prominent position, though his place in the great hall is not unfrequently followed by *Chin-wu-ta-ti* or some other idol, no regular order being observed. The ruler of earth, *H'eu-tu*, "spirit of imperial earth, ruler of the soil," lives in a palace made of 7 precious stones, and presides over fruits of the soil, mountains and rivers. Next come a series of star-gods : astrology being a prominent part of Tauism. *T'ien-hwang-tu-ti* lives in the Pole Star, rules the North and South poles, and regulates the affairs of heaven, earth, and man. The Great Emperor of the North Pole, living in the star *Sing Chu* (near the Pole) regulates the movements of the sun, moon and planets, and presides over the stars. The Spirits of the South Pole, and of the star *T'ai yih* are beneficent divinities. "Among the most important idols of Tauism is *Lu-tsu*, corresponding somewhat in character to *Kwan-yin*, one of the Buddhist Devas, the Buddhist goddess of mercy (but regarded as a masculine being), and, like her, though an inferior deity, he is a great favourite with the people, because he is supposed most to pity them in their distresses, and often to have come from heaven for their relief. This is the great medicine-god of China, from whom the people buy prescriptions. He not only occupies a prominent place in Tauist temples, but has temples [of his own] and also occupies a place in the Buddhist pantheon." [His story is told by *Balfour*, in "A Taoist Patriarch." See *Leaves*, p. 136 seqq.] Other idols of Tauism :—"*Lue-kung* and *Lue-po* are known as the Thunder-God and his wife. The former is generally represented with a beak and claws, and sometimes with wings, agreeably to the superstition that electricity exists among the mountains in the form of birds. He holds in his hands a hammer and a drum, with which he is supposed to produce thunder. He 'fills all regions with his assumed forms. . . . He spoke the book *Yuh ku pan king*. He overcomes demons, and is the father of all living beings.' *Lue-po* is represented with mirrors attached to her hands and feet, whose reflections when turned in different directions, produce lightning." "The goddess *Tau-mu*, is represented with eight hands and is identified with a constellation in the northern heavens. She is supposed to have the power of prolonging and shortening life." "Prominent . . . in Tauist temples are . . . the *San Tsing*, or 'Three Pure Ones,' one of which is generally regarded as a personification of Lao-tzŭ. It is supposed to be their special office to communicate instruction to mankind." The sun and moon are also worshipped. "The *San Kwan*, or *San Yüan Kwan*, or 'Three Rulers,' generally called *Tien Kwan*, *Ti-kwan*, and *Shwuy-Kwan*, that is 'Rulers of Heaven, Earth, and Sea,' are indispensable gods of Tauism. They are represented as three brothers, who, on account of their remarkable gifts during life, were after death advanced to these stations of dignity and importance. They are also described by Taoist writers as a trinity in unity." "The Dragon, which is a universal and prominent object of worship among the Chinese, may properly be classed among the gods of Tauism." Next to these is *Hien t'ien shang-ti*, "high emperor of the dark heaven," or "great military emperor," also called "the spirit of happiness"—who assumed a human form, and transformed himself 82 times in order to instruct men in the three national religions. Several persons belonging to different periods of history are worshipped as *tsu*, "patriarchs." The most ancient are called "imperial rulers" ; the chief being the statesman Wang-hi, who imparted to men the doctrines of heaven and immortality. Another series of seven writers (not earlier than the tenth century) are called "the Seven True Men of the South." One of them is Peng lwoh lin, who wrote Taoist hymns. The seven writers from North China, called the "Seven True Men of the North," belong to the 12th and 13th centuries. (One is a woman, wife to the chief of them.) *Teu Mu* ("aged dame of the great rivers") is a female divinity, imported from India, addressed as Queen of Heaven (*cf. Nevius, Tau Mu*). "The god of literature is *Wên Chang* [who] has promoted all the three national religions ; he equals in authority the three rulers of heaven, earth and sea, and assists candidates for office, and in the examinations." Among mountain deities, *Tung Yoh*, who presides over Tai Shan in Shantung, is the chief. "He is said to have appeared in many successive ages as the teacher of Taoist doctrines. He presides over the present and future life, and the rulers of Hades are subject to him." "Another object of worship . . . is . . . the *Tu-ti Poo-sah*, or Earth God. The idols of this class . . . are everywhere seen by the roadside. They are lowest in dignity of the gods of China, and on that account the worship of them is regarded as most important and indispensable, for the same reason that a citizen has more to do, practically, with the petty officers of his village than with his sovereign. . . . The images . . . are generally [small,] made of stone, and found in unfrequented as well as populous places. They are seen in little shrines a few feet high in the open country, or in resting-houses or pavilions by the roadside. In the lists of the gods, they correspond to the country constables, who have the charge of small neighbourhoods. Not only different neighbourhoods but hills and bridges have their *Tu-ti Poo-sah*. Like other gods [these] are supposed to be good men of former times, but they are so numerous and insignificant that they are not designated by particular names, but only by the general name *Tu-ti* coupled with the names of the places over which they preside. But . . . they also worship the divinity of the earth without an image. Respecting this worship the Chinese have very confused and conflicting views. They speak of this divinity as a divine emanation from the earth, or an all-pervading, life-giving influence. . . . They have the greatest dread of offending [him] and hardly dare to move a clod of earth." Confucius is ranked among Taoist deities, as "the honoured one of heaven who causes literature to flourish." The living head of the Taoist religion, a person of the Chang family is honoured under the name of "heavenly teacher." "Several other . . . historical celebrities are honoured as gods according to their fame on earth ; thus *Hu tsu*, an ancient physician,—an alchemist of the third century,—and others." "Many of the national gods or deified heroes of China, might properly be regarded as belonging to Tauism, and many of the superstitious practices of the people . . . seem . . . to belong to this system." "Divine honours are paid to those who have received titles from the State, as a part of the national religion, but there is no special form of worship in the Taoist books. They are such as *Kwanti*, the god of war, the protectors of districts, departments, and lesser territorial divisions. They are of the same class with the personages honoured by the literati in the Confucian temples, who receive similar titles." "Worship is principally paid to the inferior deities, who are not [too high] to concern themselves in the affairs of men." "Tauism, on account of its native [?] origin, or more pretentious character, or . . . both, . . . is preferred to Buddhism by the Chinese rulers, and Tauist priests and forms are constantly made use of in the State worship." "Idols in Tauist temples are generally smaller than those of Buddhism, and, unlike the latter, many of them are found in a second or upper story. [Both temples and images of both religions are very much alike.] [Tauist] priests are comparatively few." "The object . . . of the Tauist is to become a *Sien-jin*, that is, one of the genii. . . . To the attainment of this state of blessedness, three things are requisite : the cultivation of the heart, a peculiar discipline for the body, and the elixir of life. . . . The [first] consists in leading a life of retirement, austerity, and meditation. The peculiar regimen to which the body is subjected is designed to husband and retain the natural energies of the physical system, and increase its vitality." [*Kung-fu*—see KNOWLEDGE.] "The work of preparing the elixir of life, which is called *Lien-tan*, must be performed by each devotee for himself. Having collected the proper ingredients, they are put in a large kettle and boiled over a fire, neither too hot nor too cold, for a period of eighty-one days. It is said that if the devotee has been laborious and conscientious in his previous preparation of mind and body, the attempt will prove successful ; if not, all his efforts will be unavailing. Few at the present day have any idea of becoming *Sien-jin*, or regard the priesthood in any other light than as a means of obtaining a livelihood." "While the above mode of becoming *Sien-jin* is regarded as the proper and authorised one, it is supposed that the same end may be attained in a shorter and easier way by the use of magic, the invocation of evil spirits, and by obtaining in different ways the principle of vitality from other human bodies. This class of *Sien-jin*, though possessed of equal powers with others, are regarded as unauthorised intruders, doomed to a violent and untimely end." It is thought that they can be killed by lightning. Animals can also become *sien-jin*, legitimately or otherwise. "Comparatively speaking, there is little to attract women to Tauist temples. . . . There is, however, a system of fast-days which is the source of some small gain to the priests." "There are fast days connected with the worship of certain idols, and the observance of these days is supposed to secure the favour and protection of these different idols. Some women observe the fast-days of one idol, some of another, and some of several at the same time, and when the prescribed days are completed they resort to the temples to celebrate the event with thanksgiving, and are expected to leave more or less money with the priests. It is common, when an individual is sick, for different members of his family to assume vows to perform each one a different fast, for his benefit. Children also, as a mark of filial piety, sometimes undertake fasts for the benefit of their parents. On the birthdays of the different gods, the temples are also visited by considerable numbers of women. The money derived from this ordinary worship, from occasional services at funerals, etc., and proceeds of the lands connected with the different establishments, serves to keep the buildings in repair, and supports the few priests connected with them." "The following are prominent among [Tauist religious practices] : "*Fah hih*, 'Sending a dispatch' is performed in cases of sickness. A statement of the worship . . . performed, is written on a piece of paper, together with a [prayer for help.] This paper is burned by the officiating priest, who professes to determine by observing the process of burning whether the god returns a favourable or unfavourable answer." "*Shang-tien-piau*, 'Sending a message to Heaven,' also consists in burning a paper on which the message is written. The performer . . . feigns sleep while the paper is being burned, and it is believed that his soul leaves the body, conveys the message to heaven, and brings back an answer." "Another ceremony called *Hwa-fu*, 'Writing a charm,' consists in writing a few unintelligible characters, or delineating a rude representation of a god on a small piece of paper, which is regarded as representing or securing the presence of some divinity. Such pieces of paper are sometimes hung over the bed of a sick person as a spell." "A few of the more expert Tauist priests are [said to have] a knowledge of enchantments, which they generally profess to have derived from some of the genii. By repeating incantations, they are believed to have the power of inflicting evil upon men and calling spirits to their aid. . . . A book of six volumes, called *Wan fa kwei tsung*, a 'Collection of a Thousand Magical Arts,' contains a description in detail of different kinds of magic, sorcery, and juggling." "There is connected with Tauism a class of books designed to promote the cultivation of virtue and gratuitously distributed by those who wish to acquire merit. . . . One of these is the *Yuh lih chau chwen*, which gives the punishments of hell [for] different crimes. . . . The *Kung kwo keh*, or 'Graduated Scale of Merit,' gives the comparative amount of merit or demerit belonging to different actions. Other works of the same character, and moral tracts on the cultivation of the different virtues, are frequently circulated by the rich."]—*Journ. N.-C.B.R.A.S.*, Dec., 1859, pp. 309–14 ; *Nevius, China and the Ch.*, pp. 114–29.

Mohammedanism.—"At that time [*circ.* 1690] the Mohammedan Church had made many converts among the tribes on the western borders of China and even within its limits, and the whole of Central Asia was occupied by warlike races, who were among the most energetic propagators of Islam."—*Boulger, Short Hist.*, p. 144.

"A few adherents of this sect are now found in every part of the empire [but fewer in the south than in the north-west.] Occasional mosques are seen in the Eastern provinces. There is one small one in Ningpo ; and a few years since I found a rather imposing one in Hang-chow, and an interesting class of persons connected with it. In the north-western part of the empire there are large Mohammedan communities, and in some places they are said to form one-third of the population." "They practise circumcision ; observe nominally one day in seven as a day of rest ; proscribe the use of swine's flesh, bear decided testimony against idolatry, and, like the Jews, keep themselves in a great measure separate from the rest of the population. . . . They have relaxed a good deal in the strictness of their religious performances, and they conform to some of the idolatrous rites of the other sects."—*Nevius, China and the Ch.*, p. 81. The number of Mohammedans early in the eighteenth century is given as half a million (*Milne, Life in Ch.*, p. 413), and *Williams* (*Midd. King.*, ii. 271) states "the number throughout the region north of the Yang Tzŭ River . . . probably exceeds ten millions. In some places they form a third of the population ; a missionary in Sz'chuen reckons eighty thousand living in one of its cities." "They do not worship Buddha, nor pray to the dead, nor sacrifice to spirits. What they reverently honour is what we represent by one character, *T'ien*, or heaven." The motto on their mosques and for their services is "Pure and True" (see *Milne*, pp. 413–6).

Shamanism.—"Mongolia swarms with lamas, and the government at Peking aids in supporting them in order to maintain its sway more easily over the tribes, though the Manchus have endeavoured to supplant the civil authority of the Dalai-Lama and banchin-erdeni, by partially aiding and gradually subdividing their power."—*Williams, Midd. King.*, ii. 233–4.

Judaism.—"There are colonies of Jews at Hangchow, Soochow, and elsewhere, possessing, or having possessed, many precious relics of their ancient ritual."—*Balfour, Waifs and Strays*, p. 205.

"In all probability this sect took refuge here about the third century of the present era, but not later, coming from India across the north-western boundary of China. At first they numbered seventy clans, but at present not more than one-tenth of this number exists, and of these seven families not above 200 individuals survive. They are chiefly located in the centre of Kaifung city, and in the vicinity of their synagogue. A few are shopkeepers, some are peasants ; but the majority are sunk in poverty and misery ; almost destitute of raiment and shelter, so poor, indeed, that some of the materials of the synagogue premises have been sold by the professors to supply the wants of their families. Still they retain their distinctness from the surrounding masses of Mohammedans and Pagans, although by the mere name of their religion. Originally they were called followers of the *Tienchuh* religion, that is the Indian religion, *Tienchuh* being the Chinese name for India, from which country this sect is reported to have come. But, instead of this appellation, they now go by the name *T'iau-kin-kiau*, cutting the sinew sect, because everything that they eat, mutton, beef, or fowl, must have the sinews taken out. The rite of circumcision is still practised on males, within one month after birth. Of festivals, one is 'for perambulating round the scriptures' ; this is the twenty-fourth of the eighth month. Their Sabbath is the European Saturday. They intermarry only among themselves, nor is it permitted to marry two wives. They are forbidden to eat pork. In the observance of Divine service, they have to wash their bodies before entering the synagogue ; and for this purpose, on each side of the holy place, there is a bath. During the service, they face the west, in the direction of Jerusalem, or rather, as near that direction as they know. In the performance of sacred worship, the priest at one time used to wear a blue head-dress and blue shoes ; hence the name by which Jews have gone in China, "the blue-bonnet Moslems." The people are not permitted to enter the temple with their shoes on their feet, nor the women with napkins on their heads—the common head-dress among the Chinese females of Honan province. However, the expectation of the Messiah seems to have been almost entirely lost. The elder of the two Chinese Jews informed us that he remembered people talking of Hebrew teachers, at Kaifung, who had died a little before he was born, or about fifty years since. The Rabbi was called '*Mwanlah*,' that is *Mullah*. Besides him, there are two officers—the one, 'the sinew-extractor,' the other, 'the preacher of doctrines.' At this time, there seems to be none able to decipher Hebrew writings. Indeed, they have begun recently to amalgamate themselves with the myriad pagans and Mohammedans in the vast population of Kaifung, which must amount at least to one million." "Although the Jews must have entered China so early in the Christian era, it appears that their synagogue was not built here before the close of the twelfth century, or nearly 1,000 years after their entrance. Jewish professors used to call this building 'the temple of *Yih-sze-lo-hi-nieh*,' in which possibly there is an attempt at expressing the name of Israel phonetically ; but the inscription over the door is 'the true and pure temple.' According to the accounts brought by the Chinese investigators, the synagogue itself stands within a third enclosure. Here there is one large hall, eighty feet deep and forty feet wide, the roof of which is covered with green tiles. In this stands a seat, 'Moses' seat,' about a foot above a wooden floor, where, on grand festive seasons, the Rabbi took his seat under a large red satin umbrella held overhead, which is still preserved in the building. Here, too, was a cell for depositing 'the twelve tubes containing Heaven's records,' or the copies of Hebrew scriptures already spoken of." "Our Messengers copied many inscriptions within the synagogue and on its various pillars, some in Chinese, a few in Hebrew characters. . . . Over a tablet in Chinese, similar to what is found in Mohammedan mosques or Buddhist temples, with the customary formula 'May His Imperial Majesty live for ever,' etc., there is this Hebrew inscription :—'Hear O Israel ! Jehovah our God is one Jehovah. Blessed be the name of his glorious kingdom for ever and ever.' [Statement made to Chinese messengers sent to K'ai Fêng Fu :] "Thus our religion has been handed down from one to another. It came originally from India. Those who introduced it in obedience to God's commands were seventy clans. [The names are given.] About 1166, Yen-too-lah built the synagogue in Kai-fung capital. But as this temple required some one to look after its concerns, there were appointed certain men [who are named] themselves

upright, intelligent and able to admonish others. They had the title of Mwan-lah. So that up to this time [*i.e.*, when the tablet was written, A.D. 1489], the sacred vestments, ceremonies and music, are all maintained, according to the prescribed pattern. . . . Yen-toolah fixed the foundation and commenced the work, towards the completion of which all the Jewish families contributed. In this manner were provided the sacred implements and furniture, with the cells for depositing the sacred writings.'"—*Milne, Life in China*, pp. 405–8, 410.

Christianity.—"Though Nestorians, Mazdéans, Manichæans, Jews, and other Western sectarians had been alternately tolerated and suppressed at various times between the seventh and the thirteenth century, they had never been clearly separated, in the popular mind at least, from Buddhists and Mussulmans, of which they were considered perverted forces. At first there was no hostility to speak of [towards Christianity], but the attitude of the less prudent Roman Catholics in the seventeenth century towards the time-honoured custom of 'ancestor-worship' (which is really much the same as the annual visits to cemeteries in vogue in France and Italy) sowed the germs of future trouble. The disputes of the Jesuits, Dominicans, and Franciscans involved the Pope and the Manchu Emperor in antagonistic polemics: persecution was the result, and for two centuries Christianity only existed in the provinces by stealth [*v. infra*]. The treaty of Nanking (in 1842), and still more that of Tientsin (in 1858), gave a fillip to propagandism; and now perhaps there are 500,000 nominal Christians in the empire, *i.e.*, about one for every thousand souls, and it must cost about £500,000 a year to give them ghostly comfort."—*Parker, China*, p. 285.

"It is quite a mistake to suppose that the Chinese masses entertain any hostile sentiments towards religious feeling as such; they respect it, in whatever form; and the gentle doctrines of true, simple Buddhism, which possess so much that is (externally at least) similar to those of true, simple Christianity, have . . . on the whole, exercised a lasting effect for good on the Chinese mind; so do medical missionaries and really charitable school teachers exercise a decidedly good effect upon the Celestial mind of to-day; but by kindness, not by dogma. What causes trouble is the clashing of militant doctrine with the village customs and social habits naturally dear to the rustic mind."—*Ibid.* pp. 285–6.

"The Emperor Kanghe issued an edict tolerating the Christians. This was in consequence of the great persecution that the missionaries were subjected to from the Mandarins; the report of the Board of Rites was most favourable to the character of all the Christians then resident in China . . . [stating] that the empire was indebted to them for the many and sincere efforts which they had rendered during the civil and foreign wars. . . . The Europeans are tranquil; [and] do not excite trouble in the provinces. Besides, their doctrine has nothing in common with the false and dangerous sects of the empire, and their maxims do not lead people to sedition. About this period . . . Kanghe [was cured of an illness by Gerbillon, and] assigned the missionaries apartments . . . and had a church built within the palace, which was . . . opened March, 1702."—*Martin, China*, pp. 260–1.

"Unfortunately, disputes between rival missionary societies led to an untimely difference of opinion upon the subject of ancestor worship between the Emperor and the Pope, since which time politics have been inextricably mixed up with Western religion in China, and persecutions have never entirely ceased."—*Parker, China*, p. 90.

Christianity once had a fair chance (in the reign of Kanghi), of becoming the religion of the Empire, but that chance was sacrificed to bigotry and intolerance, and is not likely to recur. "A respectable Chinaman will tell you that only thieves and bad characters who have nothing to lose avail themselves of baptism, as a means of securing [well-paid and easy situations in the service of missionaries]. Educated men will not tolerate missionaries in their houses." "[A poem, placarded] at a place called Lung-p'ing, near . . . Hankow, will give a faint idea of native prejudice against the propagation of Christianity in China." [It denounces the foreign doctrine as "destroying reason, corrupting morals, and deceiving and exciting the foolish."]—*Giles, Ch. Sketches*, pp. 192–200.

"The principal source of hostility [to Christianity under Kang-Hsi] seems to have been the *Li Pu* . . . and worried by its importunities, the Emperor at one time issued a proclamation against the Christian religion; but the missionaries, in addition to their other attainments, proving themselves political diplomatists of no ordinary skill, and rendering certain services in connection with Russia which laid the Court under exceptional obligations, the manifesto was rescinded shortly after its promulgation."—*Balfour, Waifs and Strays*, p. 122.

[At Lao-ling in Shantung, a place unvisited by any missionary, an old man had a dream, in consequence of which (at the suggestion of a friend that he should consult the Roman Catholic missionaries there) he went to Tientsin, met with the English Methodist Mission, and, returning home with some books, founded the Christian congregation which has since been formed at Lao-ling.]—*Nevius, China and the Ch.*, pp. 377–8.

Missionaries are welcomed at first as a novelty, in districts previously unvisited by foreigners, but "the same scenes are seldom if ever repeated in subsequent visits. When the missionary has left town, and the popular commotion has subsided, his character and employments are calmly discussed. Some shrewd scholar, who knows something of us, and has perhaps read Christian books, [will say something like this:] 'It is a pity that you should have been carried away by excitement, and treated this foreigner with so much respect, and spoken of his new and dangerous doctrines so flatteringly. The religion which he would introduce is exclusive, intolerant, revolutionary. It strikes at the root of all our cherished civil and social institutions.'" "When we visit a place the second time, we find that the former excitement and interest has been succeeded by suspicion, alarm, and an almost studied coldness of manner on the part of the people; [though some few inquirers] may come to us privately."—*Ibid.* pp. 334–5.

[Influence over converts was ascribed to magic arts.]—*Ibid.* p. 369.

"The whole number of Protestant native Christians is at present [1869] about four thousand . . . principally in 'the five treaty ports,' which have been occupied about 25 years."—*Ibid.* p. 375. But see *supra*.

[For a summary of the progress of Christianity since its introduction see *supra*, previous Periods, and ECCLESIASTICAL.]

[For statistics of Romanist missions see *De Courcy, L'Empire du Milieu*, p. 253.

Predestination.—[Giles says that in theory all Chinese are believers in predestination; but they are far too practical to let their actions be influenced by fatalism—except in the case of gamblers, opium-smokers, etc.—whose will-power has been so weakened by indulgence as to leave them a prey to despair. The popular belief is that calamity sometimes overtakes people as a punishment for sins committed either in this or some previous life, and that it is no use trying to escape. This belief shows itself in some curious customs, *e.g.*, a municipal regulation in force to the effect that if a coolie laden with wine or oil slips and falls on a wet or stormy day, he is held responsible for damage done, but not so if the weather is fine and the ground dry; the idea being that, in the latter case, the mishap must be due to the direct agency of Heaven. "The burning of an ice-house" is a proverbial expression for some overwhelming disaster against which no human care or foresight could guard. "Yet when emergencies arise, we do not find the Chinese standing still . . . but working away to stop whatever mischief is going on, as if after all the will of Heaven may be made answerable to human energy."—*Giles, Ch. Sketches*, pp. 164–7.

Myths.—"One thing is observable in these fictions, characteristic of the Chinese at the present day; there is no hierarchy of gods brought in to rule and inhabit the world they made, no conclave on Mt. Olympus, nor judgment of the mortal soul by Osiris; no transfer of human love and hate, passions and hopes, to the powers above; all here is ascribed to disembodied agencies or principles, and their works are represented as moving on in quiet order. There is no religion, no imagination; all is impassible, passionless, uninteresting. It may, perhaps, be considered of itself as sensible as the Greek or Egyptian mythology, if one looks for *sense* in such figments; but it has not, as in the latter countries, been explained in sublime poetry, shadowed forth in gorgeous ritual and magnificent festivals, represented in exquisite sculptures, nor preserved in faultless, imposing fanes and temples, filled with ideal creations."—*Williams, Midd. King.*, ii. 142.

"A parallel to the old nursery tale of the loadstone mountain in the sea . . . is found here in a commonly believed myth to the effect that in this little river that runs past our door, and just above the town of Wulung, the river has a loadstone bed, and boatmen who cast anchor in that spot, must cut their cables, for they can never hope to raise their anchors again."—*Exchange* (Hsinchên, Honan), quot. *N.-C. Herald*, Aug. 28, 1899, p. 438.

Spiritualism.—"Hearing an unusual commotion in the house of a neighbour . . . I obtained permission to go in, and, on entering, found that a woman who it is believed can hold communication with departed spirits, had been invited to the house. . . . This woman, who was about 30 years of age, and looked pale, haggard, and unnatural, was seated in front of a table, upon which were burning two candles and several sticks of incense, while a quantity of paper money was burning on the floor around her. . . . There were present 9 or 10 women, 15 or 16 children, and 3 or 4 men—the men, however, did not appear to be much interested, and were not in the room during the performance. As I entered the room, the medium . . . had just fallen back in her chair apparently quite exhausted. . . . After taking a stimulant, she recovered somewhat, but was requested to hold further intercourse as soon as she felt able. Referring to some deceased person of whom they had been speaking she said: 'I saw So and So,' and went on to describe his dress, appearance, etc., which quite satisfied her hearers. Half an hour elapsed, and she again resumed her seat,—fresh candles and incense were lighted, paper money burnt, and doors closed preparatory to another revelation. The medium covered her head with a dark cloth, and sat for a time perfectly motionless; then suddenly her whole frame became convulsed, and she writhed as if in agony, making a low gurgling sound in her throat, and finally pouring forth a volley of words, which were uttered so rapidly, in such an unearthly voice, and with so much convulsive effort, that it was difficult to understand all she said. . . ." "The poor [widow] asked some questions about [her husband]: he (professedly) replied, . . . 'I am in Hades, because my creditor Yang would not allow me to live, as I could not pay the debt I owed him; he is not satisfied with harrassing me here, and making me miserable, but I fear will not allow our son to live; therefore, you must do what you can to [pay] the debt, by wearing the meanest clothes, eating the poorest rice, and endeavouring to earn what money you can.' The poor woman kept replying 'That I will do,' as these charges were given for her. . . . After continuing this for 20 minutes or more, the medium's body again moved convulsively, whereupon one of the women . . . seized her, and begged the spirit not to depart; but it was in vain, she sank back exhausted and apparently lifeless, while her attendant fanned her, repeating over her in a monotone, '*Hsi*' (her name) 'return; Hsi, return.'"—*Woman's Work*, i. 16–17.

"He . . . related to me how certain people in China communicate with spirits. A mode common amongst women is as follows: On the thirteenth day of the moon the female spiritualists shut themselves up in a room; a bamboo basket, something like our clothes basket, is placed upside down on a table, with a chop-stick laid on the bottom; two women grasp the lower rim with their right hands, while a third . . . bowing her face to the ground, continues crying out, 'Have you come yet? have you come yet?' After some time spent thus, the spirit's presence is announced by the rapping of the chop-stick on the basket; he is then interrogated as to the age of those present, which he tells correctly by a rap for every year. Other questions are then put, generally relative to the prospect of a husband or of children. . . . He assured me that he had never heard of foreigners indulging in this amusement. He informed me that the practice was considered low among the Chinese, and that few people indulged in it, as they were afraid, and many Chinese, whom I have spoken to on the subject, appeared to be well aware of the practice, and to believe in the communication with spirits, but they invariably spoke of such doings as bad and disreputable."—*Cooper, Travels*, pp. 96–7.

"The spirits of the unseen universe are directly invoked by the Chinese, chiefly in cases of illness. In matters which involve merely pecuniary interests, such means as Planchette and various other indirect ways of consulting the oracle are preferred, being at once simpler and less costly to the inquirer. A man who wishes to learn the probable result of an enterprise he has in view, will drop into some roadside temple and will lay a small fee upon the altar. The attendant priest lights a fresh candle or a new stick of incense; and the suppliant, after making the usual series of prostrations, reverently takes with both hands a kidney-shaped piece of wood which has been split into two halves so that each half shall have one flat and one convex side. These are raised above the head and dropped to the ground before the altar; and from the combination which results, namely, (1) two convexes, (2) two flats, or (3) a flat and a convex, a propitious or unpropitious answer is deduced, being (1) negative, (2) indifferent, and (3) affirmative, respectively. The more elaborate method, or that form known in Europe as spiritualism, is to engage the services of a medium, generally a Taoist priest, whose body is for the time being occupied by the God. This state of divine 'possession' is brought about in the following manner. The medium takes a seat, while his brother priests or confederates arrange the usual altar, light candles, and burn incense, and invoke the presence of the deity required. After a short interval, one of them advances towards the medium and performs certain movements, apparently mesmeric passes, by which a state of unconsciousness is induced; whereupon the God takes possession of the temporarily unoccupied body. From that moment every word uttered by the medium is held to be divinely inspired, or, more properly, the very words of the God, who simply uses the medium as his mouthpiece."—*Giles, Historic China*, pp. 326–7. For account of *séance* see *ibid.* pp. 327–9.

Planchette.—"Written communications from Hades are obtained by suspending a pencil over a sanded tray, which the departed, after being duly invoked, seize, and write on the sanded platter, or sometimes the pencil is stuck into the edge of a hemispherical basket, which two operators on opposite sides of the tray poise on the tips of their fingers, at right angles to the pencil, which is then allowed to touch the surface of the sand. Presently the operator, who has the most imagination, begins to move his fingers, the one opposite yielding to the impulse, and legible characters are marked on the sand, forming the supernatural communication."—*Ch. Rev.*, xvii. 150. *Cf.* also HABITS AND CUSTOMS for its use as a game.

Charms, etc.—"Charms are common. One bears the inscription, 'May you get the three *manys* and the nine *likes*'; another, 'To obtain long eyebrowed longevity.' The three *manys* are many years of happiness and life and many sons. Old brass mirrors to cure mad people are hung up by the rich in their halls, and figures or representations of the unicorn, of gourds, tigers' claws, or the eight diagrams are worn to insure good fortune or ward off sickness, fire or fright. Stones or pieces of metal with short sentences cut upon them are almost always found suspended or tied about the persons of children and women, which are supposed to have great efficacy in preventing evil. The rich pay large sums for rare objects to promote this end."—*Williams, Midd. King.*, ii. 256.

"The Buddhists issue small books, called Girdle Classics, containing prayers addressed to the deity under whose protection the person has placed himself. Spells are made in great variety, some of them to be worn or pasted up in the house; while others are written on leaves, paper, or cloth, and burned, and their ashes thrown into a liquid for the patient or child to drink. These spells are sold by Rationalists, and consist of characters like *fuh* ('happiness') or *shao* [*shou*] ('longevity'), fancifully combined. The god of doors, of the North Pole, Pwanku, the heavenly astronomer, the god of thunder and lightning, or typhoons, the god of medicine, demigods and genii of almost every name and power, are all invoked, and some of them by all persons. In shops the word *shin* [*shén*] is put up in a shrine and incense placed before it, all objects of fear and worship being included under this general term. The threshold is peculiarly sacred, and incense sticks are lighted morning and evening at its side."—*Ibid.* ii. 257.

"The written spells which the Chinese sometimes use consist of mystical compounds of various characters, or words, in which astrology is generally introduced, with the eight diagrams of Fo-hy, the twenty-eight lunar mansions, the five planets, etc. Some of these spells are kept about the person, others are pasted on the walls of rooms. 'Occasionally,' observes Mr. Morrison, 'they are used as cures for sick persons, by being either written on leaves which are then infused in some liquid, or inscribed on paper, burned, and the ashes thrown into drink, which the patient has to swallow.'"—*Davis, Chinese*, ii. 143.

"Among the principal [talismans] are 'money-swords,' as they are called, consisting of a number of ancient copper coins, each with a square hole in the middle, fastened together with a piece of iron, shaped like a sword with a cross hilt. These are suspended at the heads of sleeping couches and beds, that the supposed guardianship of the Sovereigns, in whose reigns the coin was issued, may keep away ghosts and evil spirits. They are chiefly used in houses or rooms where persons have committed suicide, or suffered a violent death; and sick people sometimes resort to them in the hope of hastening their recovery. . . . The Chinese have commonly a firm belief in, and consequently a great dread of, the wandering spirits of persons who have come to an unfortunate end, and which they denominate *kuei*."—*Ibid.* ii. 139.

"A common Chinese talisman is the 'hundred families' lock,' to procure which a father goes round among his friends, and having obtained from a hundred different parties a few of the copper coins of the country, he himself adds the balance, to purchase an ornament or appendage fashioned like a lock, which he hangs on his child's neck, for the purpose of *locking* him figuratively to *life*, and making the hundred persons concerned in his attaining old age. Another charm worn by children is a figure of the *Ky-lin*, a fabulous animal supposed to have appeared at the birth of Confucius, and therefore ominous of promotion and good fortune to the young. On the 5th day of the 5th moon, sprigs and cuttings of the *Acorus calamus*, and a plant called by the Chinese *gae*, are placed at the doors of houses to prevent all manner of evil from entering. The 'Peach charm' consists of a sprig of that tree covered with blossoms, which, at the new year, is placed at doorways for the same purpose as the foregoing. The *pa-kua*, or eight mystical diagrams of Fo-hy, cut in stone or metal, are often worn as charms; and the bottle gourd, a curious species of the genus *cucurbitus* closely resembling a bottle, is represented in ornaments as an emblem of longevity. We have before stated that the dried gourd itself, hung round the waists of children living in boats, frequently saves their lives by floating them until picked up after they have tumbled overboard."—*Ibid.* ii. 141–2.

"Arsenic is, or at least once was, according to the books, believed to possess talismanic properties in preventing the approach of wild animals, and is borne as an amulet by hunters

and woodmen. It keeps off snakes."—*Journ. N.-C.B.R.A.S.*, N.S. ix. 179.

[Mantse "women twist the peel of an orange (removed in a single piece) into their hair, as a protection against illness."—*Cooper, Travels*, p. 217.

"*Tabu.* The Chinese say *hwei* (=avoid), and have a very complicated science on the subject, popular and literary."—*Parker, John Chinaman*, p. 364.

"The principle of *tabu* has always had a wide extension in China. Emperors' private names may not be uttered or printed; parents' ditto must be avoided; and, generally, the whole system is and has been developed into an occult art, according to the tastes of each dynasty. But apart from this there is the popular *tabu*: mothers affect hideous names for their children, such as 'cur,' 'dung,' and so on, in order to throw the devils off the scent, should they wickedly desire to pick off attractive sons. In Canton the practice pervades the whole of social and family life; thus an almanac is called *t'ung-shing* ('generally victorious') instead of *t'ung-shü* ('general book'), because *shü* also means 'defeat.'"—*Ibid.* p. 211.

"That spoken words possess power and influence, is a belief of general prevalence in the Chinese empire. . . . It prompts the people of Amoy to avoid calling a coffin by the right word for it, *viz.*, *koaⁿ ts'â* [*kuan ts'ai*] and to style it 'boards,' or 'longevity boards,' or 'longevity wood'—all innocent and even good-omened terms. . . . The same people also use the expressions *pán p'e* [*pan p'ei*] 'embryo of boards,' and *toā ts'ù* [*ta ts'u*] 'great house,' the latter almost exclusively in combinations, such as *jîp toā tsù* [*ju ta ts'u*] and *khiā toā ts'ù* [*ch'i ta ts'u*] 'to enter and to dwell in the great house,' which means in plain English to be coffined."—*De Groot, Rel. Syst.*, i. i. 325.

Superstitions.—"In a decree by the Emperor Kang-hi treating of various natural phenomena . . . he remarks that by slitting the ears and nostrils, horses become secure against the power of lightning."—*N. and Q. on C. and J.*, i. 106.

"An English merchant in Shanghai, at the time of the Taying attack, met his Chinese servant carrying home a heart, and asked him what he had got there. He said it was the heart of a rebel and that he was going to take it home and eat it to make him brave."—*Tylor, Early Hist. of Mankind*, p. 131.

"Several large turtle were sent on board the Canton River steamers last night to be returned to their watery home when clear of the harbour. Just at this time of year when the turtle are plentiful in these waters numbers are brought into Hongkong marked with an inscription in Chinese, and then shipped to be discharged clear of the harbour, the only explanation you can get from the Chinese is 'Belong good Joss,' and a celestial smile." "Another Chinese custom is to release snakes wherever a wreck has taken place, the idea being that the snakes swallow the souls of the drowned and take them ashore. After the sinking of the Huang Tai by the Empress, several baskets of snakes were despatched by a local steamer and released in the vicinity of the wreck."—*S. China Morning Post*, July 5, 1904.

"Recumbent iron images of an ox are scattered up and down along the banks of dangerous water-courses. They are supposed to prevent overflows. The story connected with each one is usually that it flew down from heaven to an especially exposed point, usually making flight at night. Nobody saw it. Incense is burned before it. I know of some eight or ten within a couple of days' walk of this city [Ts'ingkiangp'u], along the Yellow River, the Grand Canal, and the Hongtsz Lake."—*N.-C. Herald*, lxviii. 998.

"In the Taoist *Book of Rewards and Punishments*, the modern Taoist 'Sermon on the Mount,' we find among the list of sins the words, 埋蠱厭人, which refer to the practice of *Ciurp Creadh*." "And very recently, it was my lot to be a witness, and to some extent an actor, in a present day instance of the same thing."—*N.-C. Daily News*, Apr. 13th, 1899. *Cf.* previous Periods.

"We remember the following tale was circulating in Amoy in 1886. A notable citizen of that port, in dying, suddenly began to bleed at the nose. His son, a bad character, who knew himself to be such, was so affrightened at the sight that he dropped on his knees, solemnly promising henceforth to behave better, whereupon the bleeding stopped immediately."—*De Groot, Relig. Sys.*, ii, 12.

"Amongst the Chinese superstitions is that of carrying a dog about in a chair when rain is wanted. The merriment excited by the buffoonery is supposed to 'make the angels weep'—rain."—*Ch. Rev.*, x. 73.

[In 1817 the absence of rain was ascribed by the Emperor Chia Ch'ing to the unlawful secretion of 50 escaped rebels; and, in the following year, "calumnious accusations" caused the "ruin and death of a multitude of innocent people" by provoking darkness, a violent wind, and a thunderstorm, etc.]—*Williams, Midd. King.*, i. 466.

"The officers and literati, though acknowledging the folly of these observances, and even ridiculing the worship of senseless blocks, still join in it. As an example of this: In 1867 a severe drought near Peking called forth a suggestion from a censor that if a white tiger were sacrificed by the Emperor to the dragon the rain would be liberated; for 'it was his powerful enemies which kept the rain-god from acting.' . . . Devotees sometimes become irritated against their gods, and resort to summary means to force them to hear their petitions. It is said that the Governor in Canton, having repeatedly ascended in a time of drought to the temple of the god of Rain, dressed in his burdensome robes, through the heat of a tropical sun, on one of his visits said: 'The god supposes I am lying when I beseech his aid, for how can he know, seated in his cool niche in the temple, that the ground is parched and the sky hot?' whereupon he ordered his attendants to put a rope around his neck and haul his godship out of doors, that he might see and feel the state of the weather for himself. After his excellency had become cooled in the temple the idol was reinstated in its shrine, and the good effects of this treatment were deemed to be fully proved by the copious showers which soon after fell. The Emperor himself on such occasions resorts to unusual sacrifices, and sends his relatives and courtiers almost daily to various temples to pray and burn incense. Imperial patronage of the popular superstitions is sought after by the officers in one way and another to please the people, but it does not involve much outlay of funds. One common mode is to solicit his Majesty for an inscription to be placed over the doorway of a temple, or memorialize him to confer a higher title upon the god. On occasion of a victory over the rebels in Kwangtung in 1822, the shrine of a neighbouring deity, supposed to have assisted in obtaining it, received a new title commemorative of the event, and a temple was built for him at the expense of government."—*Ibid.* ii. 204–5.

"While distress existed in the neighbourhood of Ningpo, in 1849, on account of inundations and continued rains, the magistrates went frequently to a temple to implore the gods [for fine weather]. At last, when the weather looked as if it were about to clear, the priests recommended an unfailing remedy; they told the magistrates to put the gods *out in the rain*, and see how they liked it! This was accordingly done, and fair weather followed."—*Scarth, Twelve Years*, p. 150.

"During the recent drought in the North of Chib-li the Emperor and the Princes made repeated supplications at the various shrines in and around the Forbidden City, imploring the gods to send the needed rain and avert a repetition of the famine of 1867. . . . In his distress His Majesty sent a special officer to the town of Hau-tan in Kwang-ping-fu, just on the borders of Ho-nan, to bring from thence an iron plate which was kept in a well outside the town: this well, called *Kiao-lung-tsing*, lay within the precincts of a temple dedicated to *Lung-wang*, or the Chinese Neptune. The plate is described as shaped like a gourd, about six Chinese inches long, and half an inch thick. It bears the inscription 'May sweet rains be diffused copiously.' The officer sent for it, reported his arrival in the Gazette, and carefully placed it in the *Ch'ing-hwang miao* or Palladium Temple, on the altar of the Dragon King. The common notion among the people is, that this iron plate acts as a key to lock the mouth of the dragon, and in his uneasiness, he will hear the prayers for rain in order to have the troublesome bandage removed. . . . The worship is all done by officials, no plebeian dares to interfere in this matter, nor even go into the temple at this juncture. About ten days after it came, copious rain [fell] and the iron plate was sent back to Hau-tan to be replaced in the well. [Shortly afterwards, an Imperial decree was issued, relating the circumstances, and conferring on the well (which had already been canonized in 1867, as the 'Well of the Dragon-God'), the additional title of 'Efficacious Answering Holy Well.']"—*Ch. Rec.*, iii. 155–6.

"The people of Hua-Hsien had determined to make a desperate attempt on the 20th of last month to induce the gods to bring rain. Ten men were chosen to walk the streets of their city, wearing nothing but their trowsers, each carrying in his teeth an iron rod about seven feet long, first allowing it to be pierced right through both cheeks. Fortunately for the poor victims there was a thunderstorm on the 19th."—*Exchange* (Hsinchên, Honan), quot. *N.-C. Herald*, July 31, 1899, pp. 232–3.

[Attempts made during eclipses to frighten away the dragon of the heavens from swallowing the moon.]—*Ibid.* p. 233. In 1850 Tao Kuang changed the day on which the year began to avoid its coinciding with an eclipse of the sun, but the decree was disregarded by the people (*Boulger, Short Hist.*, pp. 234–5).

"The people, generally alarmed by the comet, which they assert prognosticates impending evil, are resorting to extreme measures,—sinking surface wells in their fields to water by hand, and assembling in large numbers in the cities to compel the Magistrates to worship at the city shrines. The Prefect has issued a mandate forbidding the slaughter of animals for food."—*N.-C. Daily News*, Aug. 24th, 1907.

"The Chinese tell us that during the past six months, the region of Soochow has experienced three remarkable events. The first was the great wind-storm, which originated in a fight between the dragon and a rainbow. . . . The second was a result of the first, for this wind blew with such a mighty breath on a portion of the Great Lake, that the waters were carried clean away, and in one day there was gathered from its muddy bed, 40,000 cash worth of fish. The third is the severe snow-storms and cold this winter, and all together portend some coming event that is to spread consternation far and wide."—*Woman's Work*, i. 99, 100.

"The 'Man in the Moon' is supposed to negotiate all marriages by tying together with a red silken cord those whom he destines for matrimony. Hence the red thread used at Chinese marriages."—*Ch. Rev.*, xiv. 51.

"The *Shen Pâo* mentions a curious superstition of the Formosan savages. They are in the habit of cutting off their enemies' heads, filling their mouths with wine, and drinking the wine mixed with the blood as it passes out through the reeking gullet, under the impression that the draught will secure them long life."—*Ibid.* xvi. 377.

"The Taoists [as well as adherents of other sects] attribute occult virtues to the peach. Mr. Mayers, quoting from the *Huang-Ti-Shu* . . . tells us that on one occasion, two brothers . . . T'u Yu and Yu Liu, who had power over disembodied spirits, passed the ghostly regions in review beneath a peach-tree, and having bound all those who worked evil against mankind with scarlet withes, threw them as food to tigers. In memory of this, it was customary for officials on the last day of the year to have figures cut in peach-wood mounted upon reeds, and to paint the likeness of a tiger upon the doorway as a talisman. At present, adds Mr. Mayers, the names of the two brothers are pasted on the entrance doors of Chinese houses on New Year's Eve, to guard the dwelling from harm. Peaches, too, figure largely in Chinese fairy tales and mythology. . . . Some [say] that, properly speaking, the peach is an emblem, not of longevity, but of death. . . . It seems certain that, according to ancient writers, peaches were not admissible in sacrifice, that those with double kernels were a mysterious but unfailing poison, and that the premature fructification of one species of peach-tree was a harbinger of national calamity."—*Balfour, Leaves*, pp. 147–8.

Supernatural beings were supposed to reward charitable actions. The custom in China is for the rich to erect bridges and dams from charitable motives, and in order to obtain benefits in return from the unseen powers."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 287.

"The ordinary Chinaman is instinctively afraid of night and darkness," apparently on account of the spirits supposed to be abroad at such times.—*Giles, Ch. Sketches*, p. 61.

"Many farmers and breeders of stock keep a monkey in their folds, believing that his presence is a safeguard to the cattle against all the ailments to which they are subject."—*Gray, China*, ii. 158.

"Bats . . . are looked upon as good omens, and constantly depicted as an emblem of felicity on various objects of use or ornament." "The Chinese look upon rooks as unlucky birds, whose visits prognosticate visits still more unpleasant from the *mandarins*. There is, however, a species of white-necked crow, for which they have a high veneration," it being said to have "once performed some essential public service."—*Davis, Chinese*, ii. 142–4.

[It is a Cantonese notion that the touch of bats causes baldness, and will injure the eyes. An idea of this kind probably protects the bats from cruelty. A Chinese explained the injury to the eyes by saying that bats have a fine lime among their fur, which would get into the eyes if rubbed with the fingers after touching them, and so cause blindness.]—*Ch. Rev.*, xv. 178.

Foxes "are now once more considered rather unlucky (see the *Yüan Chien Lei Han* 淵鑑類函, ch. 431). The appearance of a black fox, again, augurs the approach of universal peace and prosperity, among the people of the north. At present it is only when the ordinary fox comes into one's house, that he is deemed of bad omen, and no importance is attached to the encountering of one on the road, though Mr. Doolittle seems to intimate that in North China the sight of a fox is considered a sign of good luck (*Social Life*, ii. 457). As a general rule, however, he is regarded as a creature of no good omen, and to be avoided rather than courted."—*Journ. N.-C.B.R.A.S.*, N.S. viii. 48.

"The superstition of 'possession by the fox' is very prevalent in [Fuh-Kien]. Two instances of sickness have occurred amongst the schoolgirls, and the parents believed they were 'possessed.'" Priests were sent for to perform ceremonies of exorcism. The illness in one case was pneumonia.—*Woman's Work*, iii. 138.

"It is said in the [Chinese] 'Chapters on the properties of auguries,' that there exists in the 'Green-hill Kingdom,' a divine animal called the *Nine Star-fox*, which is of a reddish hue, having four feet and a nine-fold tail, and which whines like a child. When eaten, it prevents people being hurt by deleterious miasmas and poisonous matter. The name . . . has an astrological origin. The 6th Lunar Mansion *ki* has as a synonym the name of *fox-star*. This constellation, in the remotest antiquity, once indicated by its rise the third month of April. Now it is known that foxes copulate in February, and [the cubs are born] in April. . . . This was probably the reason why the name of fox-star was given to the constellation which indicated the third Chinese month and the birth of foxes which when young, are easier to be caught than the old, wiry parents This constellation is quite near that of *wi* [*wei*], or the tail, consisting of the nine stars of the tail of *Scorpio*, which may have given rise to the name of *nine-tail-fox* for a certain species of eatable fox, born . . . when these constellations are visible. This astrological connection may suffice to explain why, notwithstanding the strong scent of the fox, its flesh was eaten as a cooling preventive against the coming heat of summer. . . . The hare was considered in China as a divine animal, especially the red one. 'The tables on the properties of auguries' say that the red hare is an auguric animal which only appears when virtuous kings reign. The appearance of albino hares only took piace when kings were merciful and bounteous to old men. It is known also that the Chinese call the dark spots in the full moon the *hare*; on which account the hare is called 'the essence of the full moon.' This has, again, a natural reason, because hares like to play and gambol on fine and clear moonlight nights. The astrological relation which the *moon* (as the female principle in opposition to the sun as male principle) has with the *earth* (as female principle in opposition to the male principle or heaven) made of the *hare* the presiding genius of the earth, and rendered it sacred on that account."—*N. and Q. on C. and J.*, ii. 68–9.

"Similar notions [*i.e.*, that the husband must do no hard work for some time before the birth of a child] occur among the Chinese of West Yunnan."—*Lubbock, Orig. of Civ.*, p. 15.

"The Chinese believe that certain actions performed by the husband during the pregnancy of his wife will affect the child. If a dish of food on the table is raised by putting another dish or anything else below it, it is not considered proper for the husband who is expecting the birth of a child, to partake of it, for fear the 2 dishes should cause the child to have 2 tongues. This result, it is supposed, however, will only happen if the food so raised is eaten in the house where the future mother happens to be."—*Ch. Rev.*, xi. 401.

"It is thought that the pasting up of the red papers containing antithetical and felicitous sentences on them, as at New Year's time, by a man under similar circumstances, and this whether the future mother sees the action performed or not, will cause the child to have red marks on the face or any part of the body. . . . A case is said to have occurred in which the evil effects were obviated, or rather obliterated by the red papers being torn down after the birth of the infant, and soaked in water, when, as the red disappeared from the paper, so the child's face assumed a natural hue."—*Ibid.* pp. 401–2.

The women of Soochow "have no formulated system of belief. They have inherited by tradition only a mass of idle tales and crude notions. . . . They not only hate the trouble of thinking, but have been taught from childhood that they have no business to think. . . . In the opinion of an intelligent Chinaman to whom I appealed for information, but one twentieth of the women in Soochow . . . can read, and of these very few are even what a Chinaman would regard as well educated. . . . Some of the women have notions of their own about such things [as the origin of the world, etc.] and say that 'in the period of darkness and confusion, when heaven and earth were not, an old woman followed by a dog, emerged from chaos, and . . . heaven and earth arose under their care.' [When asked] where that first old woman, and that first dog came from . . . they reply with nonchalance, 'That does not concern us.'" "They believe that there is a life [after death]. The tortures of hell are kept before their minds by the coarse representations in the temples. In their own homes, they often have gaudily coloured pictures of a land of flowers, birds and music, over which the goddess of mercy sheds her smile. But their real ideas on the subject are vagueness itself. At the best, existence to them in other worlds means simply a highly magnified form of the woes or joys of this earth-life . . . Thus I have been told of a venerable woman who had made it the aim of her life to attain such a degree of merit as would ensure her becoming after death the wife of a god, in whose temple she constantly and devoutly worshipped. When she lay upon her death-bed, the priests promised her that they would, after her decease, perform a service . . . which would elevate [her spirit] to the coveted position." "The majority of Soochow women have no such lofty aspirations. They would be satisfied with simple exemption from toil . . . or with the assurance that they shall not be relegated to earth in some specially abhorred form, [*e.g.*] that of a cat. A woman

once solemnly told me, when some cats had [been howling] on the roof, that they were animated by the souls of [quarrelsome women] who had formerly [lived in] these streets, and now did penance, 'howling through the world.'" They believe in houses being haunted by the spirits of former dead inhabitants. "Several times a year [the women] visit the principal temples in the city and its neighbourhood, offering incense, paper money and candles, at the various shrines. I have been informed that the poorer women spend in this way from three to five dollars a year each, and the wealthy ladies from thirty to forty dollars apiece. . . . There are 50 Buddhist nunneries in Soochow, averaging 6 or 8 nuns to a house. Women are the chief supporters of these. Individuals buy an interest in the private prayers of the nuns at a price ranging from a few cents to several dollars. . . . Many of the temples of Soochow are supported chiefly by the contributions of women," some of them very poor. One temple at Soochow was built about 1877, with money collected chiefly from women, to receive the stone image of a god, which had been thrown into a canal by the Taeping rebels. "Last autumn, when the alarm of locusts was heard in the land, and a species of worm was actually making havoc in the fields, numbers of women purchased from the priests of this temple strips of paper that had been dipped in the waters before its door, and afterwards hung these strips at intervals through their vegetable patches, with prayers to heaven to avert the ravages of the insects." Near Soochow is a ruined temple to the Goddess of Mercy, 600 years old, believed to have been miraculously raised in a single night. "The aged women are the great conservators of all these superstitions. They tell us of wonderful deliverances in their own experience, wrought by the Goddess of Mercy. They tell us that they *know* other gods have also appeared in answer to prayer, narrate to their listening households stories that, learned and believed in, are handed down as truth to successive generations."—*Woman's Work*, ii. 22–6.

"Children, when eating their bowls of rice, are taught not to waste (it) by being told that for every grain of rice they leave they will have a pock-mark on their faces, or, sometimes (if boys) that their future wives will be pock-marked." The Hakkas say of an infant smiling in its sleep, that it is wandering in Paradise, and the Cantonese, that the à P'o (the female guardian genius of infants) is teaching it to smile. Also that, if a baby smiles it is a sign that the father will become rich. They have a saying: 'At the first smile (or laugh) the family door opens (to prosperity); at the second, great wealth is amassed.'"—*Ch. Rev.*, xv. 177–8.

"The following are a few of the superstitions of the people at Canton:—i.—During the festivities of the new year a kind of thin-shelled bivalve is eaten, because of the sound of the name like 'prosperity.' . . . So of a kind of orange for 'luck.' . . . So of a fish for 'profit.' . . . ii.—Coffins are called 'long life boards,' and it is considered unlucky to speak of death without some kind of circumlocution. iii.—The chair-bearers calling to people in the street to give way, call out carrying such and such things in their hands. If empty-handed, they say: 'You, with the lucky hand,' to avoid a sound like 'murderer.' . . . So notices are put up on houses for rent. . . . iv.—Almanacs are hawked about the streets as *t'ung shêng* instead of *t'ung shu*, because gamblers do not like 'losing' the game. v.—The poles of a sedan-chair are called *chiao shêng*, instead of *chiao kang*, because the latter has an unlucky sound. It is almost impossible for a foreigner to avoid shocking the Chinese by a disregard of matters of this kind, even when trying to be polite and courteous. It is a feeling allied to superstition which leads them to call their children such names as 'little worms,' 'dogs,' etc."—*Ibid.* i. 61, 62.

"They have the most absurd superstition in regard to the ill-luck that attends the elevation of dwellings above a certain height; and the erection of a gable end (which they denominate by their character for *metal*, approaching to the same shape) will fill a whole family with consternation, until certain ceremonies have been performed to dispel the 'evil influence.'"—*Ibid.* i. 366.

"The Chinese are by no means always logical in their superstitions. While on the one hand they use old coffin wood as a medicine, on the other hand they are obstinately opposed to cooking their food over it, saying that such a fire may emit influences which, entering the food, would poison those who eat of it. Old boards, obtained after a lapse of years when the family thinks it proper to exhume the corpse and transfer the bones to an urn of earthenware, are consequently left about the spot as useless. Not even beggars will pick them up, although this class of people are not chary about laying their hands on whatever they can catch. Country people, however, sometimes use them for the construction of dams in wet rice-fields, for bridging over narrow water-ditches, for troughs to feed their pigs, and the like. If the wood has originally been of first-rate quality and suffered but little in the ground, the boards are not seldom used in the manufacture of circular and oval guitars, for, as the Chinese pretend, instruments made of such wood produce music of particularly agreeable sound."—*De Groot, Rel. Syst.*, i. i. 329.

"It is a prevalent opinion that any mourner of the first degree [see FUNERAL RITES] who picks a flower before the twenty-seven months have elapsed, thereby furthers the decay of the corpse in the grave. No doubt this superstition is owing to the belief in the mysterious connection between the dead and trees or plants."—*Ibid.* ii. i. 593.

"For some obscure reason, perhaps for no reason at all, it [the 'water-bed' on which dying persons are placed] is . . . made up of three boards. This is sufficient ground for most natives of Amoy never to lie down or to sleep on a bed consisting of this number of boards; if they did so, they might meet with an untimely death, anyhow fall a victim to misfortune. For the same reason it would be excessively rude, even impudent, to offer a guest a couch or a bed made of these boards. Once, in 1877, on one of our journeys through Fuhkien province, having put up for the night in a small boat because there were no better lodgings in the place, our servant, otherwise a very intelligent specimen of the 'boy' class, obstinately refused to sleep on the floor of the cabin, simply because he had noticed two parallel seams there; he took up his quarters for the night on the open poop, under a rough November sky. No doubt this superstitious fear must be classed with the objections which many of ourselves would certainly raise on being ordered to sleep in a case shaped exactly like a coffin."—*Ibid.* i. i. 9.

"Coffins, even when empty, may bring ill luck upon the living. Some very superstitious people, especially of the female sex, are therefore accustomed to turn their faces the other way whenever they meet with a coffin, nay, to take to their heels and beat a retreat; others pertinently refuse to enter a coffin shop, or even to pass through a street where the coffin makers dwell. In order to counteract or neutralize the bad influences emanating from coffins, people are in the habit of pasting upon the board of the upper and the lower end a sheet of paper of a red, evil-destroying colour, inscribed with the character 'felicity,' or 'longevity.' Such charms are considered sufficiently effective, written characters being . . . not merely dead figures, but things essentially endowed with the faculty of producing the reality they represent."—*Ibid.* i. i. 325–6.

"It would be a mistake to conclude . . . that dreaming about coffins portends ill luck. On the contrary, such dreams are generally believed to foretoken a high amount of bliss; they will raise the dreamer, his children or other descendants to official dignities, which . . . are more coveted by a Chinaman than anything else. The reason for this is simply, that a coffin and a mandarin are both denominated by the same word *kwan* [*kuan*], while, moreover, the written character for coffin is composed of the elements 'wood' and 'a mandarin.'"—*Ibid.* i. i. 326.

"Vital power is specially assimilated with the *Yang*, the chief part of the Cosmos, identified with light, warmth, and life. . . . Such products of Nature as are deemed to be imbued with *shen*, *i.e.*, afflatus derived from this *yang* element, have always been believed in China to be capable of strengthening the vital energy, and consequently have been widely made use of as elixirs of life and as medicines. As such we have instanced the cock, jade, gold, pearls, and the products of pine and cypress trees. . . . As a direct consequence of the said ideas, all these things have, since remote ages, been placed inside, upon and around the dead, in order to imbue them with vital energy, and so, besides preserving them from decay and facilitating their resurrection, to enable them to bestow vitality upon their offspring, causing the latter to live to a great age hale and healthy. Now, combining these ideas with the idiosyncrasy of man in general, to believe that which one wishes really is, then it is as natural . . . that the Chinese should take it for granted that corpses, coffins, and graves, when prepared in accordance with all the rules of the art of burial, become the *ne plus ultra* of seats of *Yang* matter or, what is essentially the same thing, embodiments of *shen* afflatus. A coffin or grave therefore can, according to these reasonings, produce first-rate medicaments, health-restoring, life-sustaining. Moreover, whereas things imbued with *Yang* counteract the influences produced by the element *Yin* . . . parts of the equipment of corpses and parts of coffins and graves neutralize the effects of the *Yin*, in other words, they paralyze all agencies of evil and death assimilated with the latter element. As a matter of fact, the Chinese do what these theories teach them must be salutary, deriving from their coffins and tombs both medicines for curing the sick and amulets for warding off evil."—*Ibid.* i. i. 326–7.

"Almanacs circulate largely amongst all classes of the people. Copies of cheap editions may be had for a few coppers at every native bookshop or bookstall. As they carefully point out which days in the course of the year are fit or unfit for proceedings and enterprises of importance, such as building or repairing houses, starting on a journey, making tombs, marrying, burying, and the like, no book can be compared to an almanac for its general usefulness. Indeed, whosoever strictly follows its instructions will always be happy and rich, while the man who disregards the same will surely fall a prey to all sorts of disaster."—*Ibid.* i. i. 99.

"My teacher has been telling me that during these few days, from the 10th of the 12th month (January 20th) until the New Year (February 10th) the gods pay no attention to what is transacted on the earth. . . . [No days in this interval are unlucky.] Every year there is a change in the government of the spirits [which] takes place [at this time]. There are supposed to be sixty of these spirits, who [rule, each] for one year. . . . They rule from the different points of the compass: for instance, this year, the ruler takes his seat in the West, the next in the W.S.W. . . . and so on, thus making the circuit of the compass five times in sixty years. . . . The ground on that side of the house facing [the throne of the reigning spirit, must not be dug up], for this, they say, is like digging into the god's head [and will probably be followed by a death in the family.]"—*Woman's Work*, iv. 95–6.

"The fact of a person's being born on an unlucky day is regarded as having an unfavourable influence on his whole life, and is taken into account in divination by the different methods. A girl born under the . . . 'Broom Star' is looked upon with suspicion; and it is supposed that the family which receives her as a bride will have their house swept clean of its luck. A woman born under the star *Hien-chi* is supposed to be in particular danger of dying in childbed. The manner in which the danger is averted is singular. Mistaking the first character of the name for another of the same sound, meaning *salt*, they make it to mean Salt Lake, and have some vague suspicion of evil connected with it. Some time before the confinement . . . a quantity of salt is secretly thrown by one of her friends into a jar of water used by the family; and if a person, not knowing what has happened, tastes of the water, and remarks upon its saltness, the spell of the Salt Lake is broken. This may serve as a specimen of a large number of tricks or charms . . . resorted to . . . to avert anticipated evil."—*Nevius, China and the Ch.*, pp. 191–2.

[For superstitions relating to the dragon, causes of draught and disease, the acts of daily life, birth, marriage, death, eating, sleeping, etc., see *Matignon*, pp. 18–65.]

Fêng-shui.—"According to a general theory of correspondences of very wide application, the earth is supposed to bear a resemblance, in its organization, to living beings, having its veins and arteries, and a principle of life pervading the whole, which principle is *fung shwuy*. As some parts of the body are more vital than others, so it is believed that *fung-shwuy* exists in some places in a greatly concentrated and intensified state. The advantages expected from the vitalizing influences of such places are vigour of body, family prosperity and means in business, to be enjoyed by those living [near] them; but the blessings most prized and sought for are those which result to children [when their] parents are buried in these auspicious spots." [See *Williams, Midd. King.*, ii. 246–7.] "The reasons given by natives, to show that their ideas on this subject are more than imaginary, are such as the following: It is said that tombs selected and prepared [beforehand] present when opened very different appearances, indicating the nature of the ground and the degrees of the vitalizing principle which it contains. Some emit a vapour or gas, the presence of which is regarded as . . . auspicious. In some are found fresh leaves of trees and flowers, and in some snakes and reptiles, which are supposed to be the spontaneous production of the life-giving earth. [But Edkins (*Ch. Rec.*, iv. 276) says that it is a very bad sign for 'a snake to grow of itself in the tomb,' and 'presages restlessness for the bones of the dead and the future of the living.'] It is said that the superior character of some tombs is proved by the fact that lamps have been lighted in them when they were made, and found burning years afterwards. The evidence for these reputed facts is [usually] . . . 'the people say so.' The fact that bodies have been found in some places unchanged by decomposition gives a show of reason to this universal superstition." "'Luck doctors'—*fung-shwuy sien-sang* are sometimes (not necessarily) Buddhist or Taoist priests. Their failures are accounted for by the theory that luck changes its locality,—or, sometimes, that the influences of a good site may be vitiated by the character of an individual. In civil wars, each party tries to destroy the ancestral tombs of the other; as was done during the Taiping rebellion." "An official announcement, made by the governor of Kwang-si, in 1855, stated that the ancestral tomb of Yang-sin-tsing, then the leading spirit of the insurgents, had been destroyed, and that there was found in it a tortoise with green hair, which was killed." Sometimes a family attempts to injure the *fung-shwuy* of another, by defacing a tomb, and cutting down the trees near it. This offence is treated as a criminal charge, and severely punished. Situations propitious in one year may be unpropitious in another: and thus burial is sometimes delayed till an auspicious date arrives. A story is told at Ningpo of a poor man named Du, who died in the time of the Ming dynasty, who received a pauper's funeral and was accidentally buried in a most auspicious place; his son afterwards rose to a high official position. "This story probably originated in the fact that many members of the Du family held offices under the Ming dynasty." *Fung-shwuy* as applied to house-building: "Six stars are supposed to preside over the different parts of Chinese houses. . . . The building on the left side is under the auspices of the star Green Dragon, that under the right under those of the White Tiger, and so on. The dragon dislikes filth, and the tiger is afraid of heat; so refuse must not be thrown in front of the left side, that is, under the Dragon's nose, and the kitchen must not be built near the head or the tail of the Tiger. The back part of the right side must not be built high, as the elevation of the Tiger's tail indicates that he is about to pounce upon his prey. [If these rules are disregarded, there will probably be] deaths in the family. These are the general and important principles of house-building, which are level to the understanding of the people; the minutiæ of the science . . . are left to professional house-planners, who are governed to a great extent by their peculiar fancies. . . . A man is supposed to gain a great advantage by having his house higher than his neighbours. [Hence the objection to houses, and especially churches, erected by foreigners, *e.g.*, the R.C. Cathedral at Ningpo.]" "It is the unvarying custom in many places in China, whenever a new house is built, to suspend lanterns on high poles for several nights in succession after the erection of the framework, in order to attract luck. . . . A great noise is also kept up during the night by gongs. The neighbours . . . resort to the same means to avoid their luck being drawn away from them, each family striving to have its lanterns the highest. . . . A house is considered unlucky, not only when it is surrounded by higher ones, but when the corners of other houses point to it. [This] is counteracted by figures of warriors with drawn swords, and lions and tigers with open mouths and other similar devices, which are placed on the tiling of the house [fronting the dangerous quarter]. Mirrors are also sometimes used to reflect evil influences back. The idea, in these cases is not simply that of a negative evil, consisting of the abstraction of the luck which the house would otherwise be possessed of, but that of a positive influence the very reverse of *fung-shwuy*. A house standing at the terminus of a street, where the road branches off on each side, is supposed to be subjected to the same evil influence, from the stream of bad luck flowing along the street and beating against it. A stone slab is generally seen erected at such places, bearing the inscription *Tai shan shih kan tang*—'I am, or I represent, the Ta shan rock, and I am not afraid to withstand you.'—The construction of canals and bridges is largely influenced by *fung shwuy*, and in the case of the latter, gives rise to frequent lawsuits, as the position of a bridge may be favourable for one family and unfavourable for another. Bridges are often built very low, so that the covers of boats have to be taken off in passing under them at high water. This is done for the sake of those dwellers in the neighbourhood who fear their luck may be injured by a high structure."—*Nevius, China and the Ch.*, pp. 162–78.

Miss Laurence says that the propitious quarter in China is the South; the North that whence evil influences come. "Hence the beneficial influences of the South must on no account be shut out, and on the North a barrier must be erected." She speaks of the low bridges on the canals near Ningpo, and says she offered to pay all expenses to have the one at Ts'in-ka raised, but was told, "Certainly not; not for $100,000, for the luck of the place would be gone." Islands are made in canals, to secure the luck of some grave or village near them. This superstition operates to preserve "the few fine trees that are allowed to grow in China."—*Woman's Work*, ii. 35.

"The *Fung-shui* superstition is denounced in Yung-cheng's 'Sacred Edict' among the impostures and false doctrines the practice of which is subject by law to the penalty of death. The passage in which this is stated, occurring in Section VIII of the Imperial paraphrase . . . may be thus translated: 'Taking a prominent part in deluding the people with false doctrines of any description, obtaining money by false pretences under the guise of official authority, believing in the false stories of the necromancers and geomancers (*yin yang fung shui*), etc., etc.—all these are punishable with death.'"—*N. and Q. on C. and J.*, ii. 69.

Charms, Exorcism, etc.—"Chang-tien-sz, a man who resides in Kiang-si, is supposed to possess authority over spirits [and even gods] throughout the Empire . . . [which] is exercised by means of charms and enchantments, and a seal of acknowledged authority among spirits, which has been transmitted to him from his ancestors. A paper, stamped with this seal, and containing a statement of the [case] is, by being burned, transmitted to some god, who is instructed to see that the offending spirit is caught, punished, and restrained from further [mischief]. It is stated that these steps will not only prove successful, but that before the messenger arrives with his

complaint, his approach, with all the circumstances of his mission, are minutely placarded outside of the palace gate of the spirit king."—*Nevius, China and the Ch.*, pp. 163–4.

At Ngee-too "a great religious ceremony had just taken place, namely, praying for forgiveness of sins and deliverance from an epidemic which had been for some time prevalent. . . . [It] was neither Buddhist nor Taouist, but belonged to the true popular polytheistic religion of China, [and] consisted in procession and litanies, while fowls had been sacrificed, and their blood sprinkled on the door-posts. All the houses, both inside and out, were decorated with green boughs and garlands of wild flowers, in token that the atonement had been made, and the scourge of sickness removed. . . . This ceremony is very common in the western provinces of China, but I have never . . . witnessed it in the eastern."—*Cooper, Travels*, p. 195.

"In Formosa, if a man is ill, his friends send to a temple for an idol, at the same time burning a bundle of incense. The idol is brought to the patient's house, accompanied by a diviner or 'medium' called Tan-kee. They commence their operations by burning incense and paper; then, when the drum and gong are beaten, the Tan-kee speaks a few words quickly and then appears to lose his senses; he jumps about, gesticulates wildly, and moves his head like a madman, for about an hour before commencing to deliver communications from the Spirit; meantime a great noise is kept up by the drum and gong. When [it] ceases, the Interpreter explains everything that the Medium has said. Then the whole family . . . cry and kneel down before the Tan-kee, with a bundle of burning incense-sticks in their hands, and thus seek to enter into conversation with the Spirit residing in the idol, through the Tan-kee and the Interpreter." "If the patient is very ill, the Tan-kee will cut his tongue or arm, and write a few charms with the blood; one will be posted on the door of the bedroom, . . . one will be worn by the man . . . and one will be burnt, and its ashes swallowed by the patient to drive out all evil influences from the body, it being feared that devils may get into the man." "For a performance like this, no charge is made on the first two occasions, but for repetitions, thirty or forty cents, for the purchase of incense, will be accepted." [The writer goes on to show by quotations from the Classics, that these practices could never have been countenanced by Confucius.]—*Ch. Rev.*, xv. 304.

"When, in Amoy, a person who has attended the dressing or coffining of a dead body feels indisposed, his family consider this a sure proof that his vital spirits have suffered by contact with the deceased, and they decide at once that the corpse must be applied to for an antidote. The wife of the sick man, or another matron of the family, immediately repairs to the house of death. There, with incense sticks in her joined hands, making obeisances to the coffin, she informs it of the object of her coming, and picks up some of the chips which the carpenter has cut away while levelling the pegs that join the case and the lid, or, if everything has already been swept away, she cuts off a few particles of wood from a corner of the coffin. Taking them home, she places them with some tea in a pot, makes a decoction from the mixture, and gives it to the sick man to drink as a medicine. Should the corpse have already been buried, a little earth is fetched from the grave and used instead, the result being, as people believe, just as effective. Persons who fall sick after attending at the exhumation of a corpse, are restored to health by a decoction of chips from the old coffin."—*De Groot, Rel. Syst.*, ii. 327–8.

"There is a class of quasi-religious quacks at Tien-tsin, known as *Tsai Mên T'ou*, who profess to worship *Hung I T'ai Shang T'ien Ti* and other gods, and to effect cures of diseases."—*Ch. Rev.*, xvii. 115.

"The *shou i*, or 'longevity garment,' purports in the first place to prolong the life of the owner, who therefore frequently wears it, especially on festive occasions, in order to allow the influences of longevity, created by the many characters wherewith it is decorated, to work their full effect upon his person. On the anniversaries of his birth he will scarcely ever neglect doing so, it being generally acknowledged amongst the Chinese that it is extremely useful and necessary then to absorb a good amount of vital energy, in order to remain hale and healthy during the ensuing year. Friends and kinsmen who throng the house to take part in the festivities will then, as a rule, greatly admire the dress, and tender their reiterated congratulations to the happy wearer, whose children have been so filial and so blessed by fate as to have bestowed a present of such delicate and precious description." "Besides prolonging the life of the owner, the longevity garment purports to insure a long life to his descendants as well." "Like the hair-pins . . . grave clothes prepared during life are made by preference in a year which has an intercalary month."—*De Groot, Rel. Syst.*, ii. 61–3.

"As for evil-destroying amulets derived from coffins, as such, nothing is in Fulkien so highly prized as armlets of jade, which have been for years on a corpse in the grave [*v.* FUN. RITES]. . . . All of those we have seen on the wrists of the living, had partly or entirely turned black in consequence of their long contact with the mass of corruption. It is said, however, that some people cannot be persuaded to wear such disgusting ornaments."—*Ibid.* ii. 328.

The good qualities of the hair-pins for the dead "are considerably increased by having them made in a year which has an intercalary month. It is, in fact, easy to be understood that, whereas such a year has one month more than an ordinary year, the life-prolonging power of a pin made in the course of it must necessarily surpass by one-twelfth that of others."—*Ibid.* i. i. 57.

"Under the name *ch'i-iû* [*shih-yu*], 'corpse-oil,' the luminiferous liquid of the lamp [placed at a corpse's feet] plays an important part in the black art. Women generally ascribe to it the power of creating discord between married people; hence many a principal wife, if jealous of a concubine who enjoys more of their common lord's love than herself, does not shrink from smearing the dangerous stuff on the garments of her rival, feeling sure she shall in this way put a stop to the good understanding which excites her jealousy. People also say that many women go so far as to lay up secretly a little quantity of such oil, in order to have it always ready at hand when required for bad purposes of the kind, *e.g.*, in behalf of dear friends who want a dose. It is quite natural that people who feel convinced that souls bear a deep grudge against any one who robs them of their oil, also believe that they strike wives, guilty of such an act, in the very first place in their matrimonial happiness; in fact, nothing can be dearer to a Chinese woman, absolutely uneducated as she is to any feelings of higher order, than the animal affections of her husband. Besides, the oil, symbolizing the separation of the dead from the living, cannot but have a *separating* influence on a couple who are brought in close contact with it."—*Ibid.* i. i. 23–4.

"The idea of exorcism, dating . . . as far back as the sixth century, has remained inseparably connected with the use of fire-crackers down to the present day."—*Journ. N.-C.B.R.A.S.*, N.S. 6. 79.

"Very frequently [at Hang-Chow] a party of seven old women . . . meet for what is called a 七人佛. 'Seven persons Buddha.' . . . Fever has entered a house may be, or a special vow has been made, and having ascertained that some particular demon is displeased, the [family] hire these women to give up a whole day to incantations: each old woman brings 100 rice-straws, 700 in all. [Sitting round a table at the street door of the house] they count one straw for each repetition of the name of Buddha, and pass the straws from one to another in rotation, till all the 700 straws have gone round so many times. When this service is over, the straws are tied in a bundle and burned, being changed, it is believed, into golden straws in the spirit world, enabling the irate demon to open a shop and engage in a thriving business, thus diverting his anger from the suffering family. These old women . . . have three meals of rice and 100 cash each for their trouble, but this is far cheaper than hiring Buddhists or Taoist priests for a more elaborate ceremonial, therefore the services of these women are in great demand."—*Woman's Work*, i. 28.

"Chêng Chou . . . is especially noted for its superstitions with regard to the charm-curing of diseases and exorcism of devils."—*Peking and Tientsin Times*, Oct. 11, 1902.

"The purchase of a building lot, and especially the selection of a grave, involve much expense, sortilege, and inquiry. When a succession of misfortunes comes upon a family, they will sometimes disinter all their relatives and bury them in a new place to remove the ill luck. Before a house is built a written prayer is tied to a pole stuck in the ground, petitioning for good luck, that no evil spirits may arise from beneath; when the ridge-pole is laid another prayer is pasted on and charms hung to it to insure the building against fire; and lastly, when the house is done it is dedicated to some patron, and petitions offered for its safety. Prayers are sometimes offered according to forms, at others the suppliant himself speaks." "Answers are looked for in various ways. . . . Contingent vows are often made, and useful acts performed in case the answer be favorable. . . Persons sometimes insult the gods, spit at them or whip them, or even break the ancestral tablets, in their vexation at having been deluded into foolish deeds or misled by divination. Legends are told of the vengeance which has followed such impiety, as well as the rewards attending a different course; and the *Kanying Pien*, or 'Book of Rewards and Punishments,' has strengthened these sentiments by its stories of the results of human acts."—*Williams, Midd. King.*, ii. 262–3. For the priests of exorcism see ECCLESIASTICAL.

[Magic and sorcery, the possession of astrological books, and superstitious associations in general, as well as religious processions, are prohibited under severe penalties in Book IV of the Code of Laws.]

Divination.—"The old methods of divination have fallen into disuse, and I cannot say how far other methods are sanctioned by the government, but the diviners and soothsayers, of many kinds, form a considerable and influential class of society."—*Legge, Ch. Class.*, III. ii. 335, note.

"Of course all divination is vain, nor is the method of the Yî less absurd than any other. The Chinese themselves have given it up in all circles above those of the professional quacks, and yet their scholars continue to maintain the unfathomable science and wisdom of these appended treatises!"—*Legge, Yî king*, Introd. p. 43.

"No people are more enslaved by fear of the unknown than the Chinese, and none resort more frequently to sortilege to ascertain whether an enterprise will be successful or a proposed remedy avail to cure. This desire actuates all classes, and thousands and myriads of persons take advantage of it to their own profit. The tables of fortune-tellers and the shops of geomancers are met at street corners, and a strong inducement to repair to the temples is to cast lots as to the success of the prayers offered. One way of divining is to hold a bamboo root cut in halves, resembling in size and colour a common potato, and let it drop as the petition is put up. Sometimes the worshipper drops it many times, in order to see if a majority of trials will not be favorable, and when disappointed the first time not unfrequently tries again, if mayhap he can force the gods to be more propitious. The devotee may determine himself what position of the blocks shall be deemed auspicious, but usually one face up and one down is regarded as promising."—*Williams, Midd. King.*, ii. 260. See also *Davis, Chinese*, ii. 146; *Legge, Ch. Class.*, III. i. Prol. p. 197.

"The fortune-tellers also consult fate by means of bamboo slips bearing certain characters, as the sixty-four diagrams, titles of poetical responses, or lists of names, etc. The applicant comes up to the table and states his desire; he wishes to know whether it will be fair weather, which of a dozen doctors shall be selected to cure his child, what sex an unborn infant will be, where his stolen property is, or any other matter. Selecting a slip, the diviner dissects the character into its component parts, or in some other way, and writes the parts upon a board lying before him, joining to them the time, the names of the person, five planets, colors, viscera, and other heterogeneous things, and from them all, putting on a most cabalistic, sapient look, educes the sentence which contains the required answer. The man receives it as confidently as if he had entered the sybil's cave and heard her voice, pays his fee, and goes away. Others, less shrewd, refer to books in which the required answer is contained in a sort of equivocal delphian distich."—*Williams, Midd. King.*, ii. 261.

"The combinations of double and single lines, contained in the Yĕ-King [I Ching] and denominated *Kuâ*, may be seen depicted on the circles of the Chinese mariner's compass. Of these, Dr. Morrison observed that they 'are called the signs, forms, or species of all things in nature, and seem somewhat like the intelligible numbers of Pythagoras, as the monad, duad, and so forth, of which nothing either certain or important is now known.' . . . Whatever use Pythagoras made of his 'intelligible numbers,' the only intelligible use that is made of them in China is for the purposes of imposture, in fortune telling or divination."—*Davis, Chinese*, ii. 68.

[Nevius, in ch. xiii of *China and the Ch.*, describes various modes of divination,—that by the Eight Diagrams of the Yih King (pp. 179–82) quoting from the preface of the *Poh shi ching tsung* (a work written in the 48th year of K'ang Hsi) on the right method of divination, and the right spirit in which to set about it,—professional fortune-tellers, sometimes blind (p. 182), —divination by copper cash (*ki-ko*) (p. 183)—by the *swan ming*, or *pi ming tsz*, "examining the eight characters" (pp. 184–186), in which the answer is obtained by the use of hidden arts, and is not, as in *ki-ko*, a response given by the gods,—astrology (p. 186)—blind fortune-tellers at Ningpo, who go about playing on a guitar (p. 188). "Comparing the six characters" for marriage contracts is done by fortune-tellers. Divining by means of birds, snakes or turtles, which indicate the slips of paper containing a response (p. 189). "Map of the three lives"—diviners tell the applicant what his previous incarnation has been, and what the rest will be. Physiognomy—palmistry—divining by "feeling the bones,"—lucky days (p. 190). Year of birth associated with one of the twelve animals of the Chinese zodiac (p. 192). "A person born under a particular character or animal, must not engage in any important work or public ceremony on days the names of which contain a character clashing with the character occurring in his birth-year."]

"There really are certain principles [of divination] derived from books written on the subject, and absolutely essential to success." [There is a fixed scale of charges for consultations.] "In case he merely wants an answer on a given subject, he puts his question and receives a reply at once on a slip of paper. But if he desires to have his fortune told, he dictates the year, month, day and hour of his birth, which are written down by the sage in the particular characters used by the Chinese to express times and seasons. From the combinations of these and a careful estimate of the proportions in which the five elements —gold, wood, water, fire and earth—make their appearance, certain results are deduced upon which the details may be grafted according to the fancy of the fortune-teller. . . . Few Chinamen make a money venture without first applying to the oracle and certainly never marry without first arranging a lucky day. . . . The supply [of fortune-tellers] is not more than adequate to the demand, albeit they swarm in every street and thoroughfare of a Chinese city."—*Giles, Ch. Sketches*, pp. 70–72.

[Marriage is forbidden between people having in their horoscopes corresponding signs in the two halves of the zodiac —e.g. mouse and horse, ox and sheep, tiger and monkey, are all forbidden alliances. Six years' difference in age between the parties is considered very unlucky, while one year is fortunate, and two not bad. This is on account of the *Yin* and *Yang*. The *hour* of birth is considered to influence the destiny more than the day—so that a bad day may be counteracted by a good hour.]—*Woman's Work*, ii. 33.

"A large number [of the fires] must . . . be considered as the results of that stupid belief in fatalism, which tends to paralyze effort and to banish caution. Hence the thriving trade that is carried on by fortune-tellers and calculators of destiny." "That the wiser and better portion of the Chinese, however, are occasionally above the influence of this grovelling sentiment, seems proved by the existence of a treatise in their language, wherein it is shown that a man may 'lay the foundation of his own destiny'; or, in other words, that *conduct is fate*."—*Davis, Chinese*, ii. 136–8.

[For divination, magic, sorcery, etc., see also *supra, Taoism.*]

[For divination of the wishes of the dead by means of coin see FUNERAL RITES.]

KNOWLEDGE.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

Astronomy.—"In China, the stars had been already named, the seasons determined by means of culminating stars, and a fair approximation made to the length of the year. The zodiac had been divided into 28 constellations and the places of the sun and moon determined by their position among the stars. As regards the sun, at least, this implies no small skill in the art of observing, as the stars are not visible in the day-time. While the Chinese shewed such an aptitude for observation, they displayed a remarkable deficiency in the power of generalisation and in drawing the legitimate deductions from the data collected."—*Journ. P.O.S.*, ii. 187–8.

"In astronomy, they knew . . . the order of eclipses. . . . They also used an instrument for observing the meridian passage of stars so as to fix the time of the four seasons of the year."—*Ibid.* ii. 142.

"The Chinese have the honour of recording the oldest eclipse of the sun and also the oldest of the moon."—*Ibid.* ii. 200.

"The astronomical knowledge of the Chinese was almost certainly derived from their kinsmen in Mesopotamia, but during the ancient monarchy great importance was attached to the correctness of astronomical observations. The emperor had fixed the length of the year at 366 days, and certain clans or families, to whom these calculations were assigned, were instructed to observe and publish the precise dates of midsummer and winter, and of the spring and autumn equinoxes. The verification of Chinese chronology is based upon the position of the constellations referred to in these instructions (*Legge*, i. 20–28)."—*Simcox*, ii. 23.

"The directions of Yaou to his astronomers, to determine the equinoxes and solstices by reference to the stars culminating at those seasons, could not be the inventions of a later age. The equinoxes were then in Taurus (Pleiades) and Scorpio, and the solstices in Leo and Aquarius. . . . No compiler, ignorant of the precession of the equinoxes, which was not known in China till long after the Christian era, could have framed them with such an adjustment to the time of which he was writing."—*Legge, Ch. Class.*, III. i. Prol. p. 50.

"Some admirers of the Chinese cite this eclipse [in reign of Chung K'ang] as a proof of the early proficiency attained by the Chinese in astronomical calculations. I find no ground for that belief in the text. Indeed, for many centuries later, the Chinese were unable to predict the position of the sun accurately among the stars. They relied wholly on observation to settle their calendar year by year and seem to have drawn no conclusions or deductions from their observations. Their calendar was continually falling into confusion. Even at the beginning of this [Manchu] dynasty, when the Jesuits came to China, the Chinese astronomers were unable to calculate accurately the length of the shadow of the sun at the equinoxes and solstices. It seems to me therefore very improbable that they could have been able to calculate and predict eclipses."—*Journ. P.O.S.*, ii. 195–6.

[In the "Great Plan" (*Shu ching*, Pt. V. Bk. IV. 8) the "five arrangements" are stated to be:—the year, the month, the day, the stars and planets, and the zodiacal signs, and the calendaric calculations. "This division of the Plan is substantially the same as Yaou's instructions to his astronomers. The language is too brief to tell us what improvement had been made in the science of astronomy between the time of Yaou, and that of king Woo" (*Legge, Ch. Class.*, III. ii. 328, note).]

[The "gem-adorned turning sphere" and the "gem transverse tube" are astronomical instruments—possibly an armillary sphere and an observing-tube—mentioned in the *Shu ching*, Pt. ii. Bk. i. ch. III. 5; see *Legge*, III. i. 33.]

Chronology.—"Yaou commanded He and Ho, in reverent accordance with their observation of the wide heavens, to calculate and delineate the movements and appearances of the sun, the moon, the stars, and the zodiacal spaces; and so to deliver respectfully the seasons to the people."—*Shu ching*, Pt. i. ch. II. 3; *Legge*, III. i. 18.

"The emperor said, 'Ah! you, He and Ho, a round year consists of three hundred, sixty, and six days. By means of an intercalary month do you fix the four seasons, and complete the determination of the year. Thereafter, in exact accordance with this, regulating the various officers, all the works of the year will be fully performed.'"—*Ibid.* Part i. ch. II. 8; *Legge*, III. i. 21–2.

"Yaou certainly commanded his officers to use intercalations;—how they did so we cannot tell. Previous to the Han dynasty, Chinese history does not furnish us with details on the subject of intercalation."—*Legge, Ch. Class.*, III. i. 22, note. See the views of *Gaubil, Le Chou-king*, p. 7, n. 4.

"The Chinese month has always been lunar; and as twelve lunations come short of a solar year by nearly 11 days, it is necessary from time to time to insert an extra month to preserve a general correspondence with the solar year. The statement of Yaou (*Shoo*, Pt. I. par. 8), that the year consists of 366 days, was made with a view to facilitate the process of intercalation which he ordered his astronomers to conduct. But to reckon the solar year at 366 days would occasion an error of a whole month in 40 years; so that in the course of his long reign of 100 years Yaou might have seen great cause to shorten the solar period. It would seem, however, that neither he nor his successors made any attempt to obtain more accurate numbers, and that in fact their intercalation was regulated by the natural recurrence of the seasons, and rude observations from year to year."—*Legge*, III. i. Prol. p. 99.

"When the Emperor Yao had been on the throne seventy years . . . a kind of plant called *lik-kiep*, the calendar-plant, grew on each side of the palace stairs. On the first day of the month it produced one pod, and so on, every day a pod, to the 15th, while on the 16th, one pod fell off, and so on, every day a pod, to the last day of the month; and if the month was a short one (of 29 days), one pod shrivelled up, without falling." [The authorities quoted are *Tchu shu ki nien*, Part II. 1; The *Kang kien y tchi luh* (which says this was in the 45th year of Yao); *Hwang Pu-mi, Ti wang she ki: Tai ping yü lan*, k. iv. fol. 7, *verso*. The calendar-plant seems to have been derived from the sacred tree of Babylonia, which was probably originally the date-palm.]—*Lacouperie, Calendar Plant of China*, p. 2; See also *Bab. and Or. Rec.*, June, 1888, ii. 149–59.

"The Chinese began by noting lunations—that is, periods (of 29½ solar days more or less) over which the moon apparently travelled in such a way as, at the end of each period, to bring herself in the same relation to the sun as when she started. The most ancient word for 'year' seems to have meant 'a course'; then a year was 'a star period'; then 'a sacrifice'; and finally 'a harvest.' The earliest Chinese day began at dawn; then at cock-crow; and finally at midnight: it also seems that the idea of 'daily day' is only an extension of the idea, 'first day of the moon.' In fact, in our own times the popular Foochow name for 'a month' is a 'month day.'"—*Parker, China*, p. 292.

"The *Book of Rites* tells us that 'in the 12th moon the sun completes his orbit, as the moon her lunation; and the stars resume their places.' At a very early date it was discovered that the course of the sun roughly corresponded to twelve lunations, but that it was necessary to add a thirteenth moon now and then in order to square off the sun with the moon. Observing, by means of a pole, the maximum length of the sun's shadow at noon, in winter the Chinese acquired the notion of a 'winter arrival,' which is exactly our word 'winter (sol)stice,' or '(sun)stand.' The year is divided into twenty-four 'joints-vitalities,' of which each alternate one is called a 'central vitality,' this last apparently meaning 'the instant the sun enters a zodiacal sign.' If a month has no 'central one' in it, *i.e.* if the entry takes place exactly at the junction of two lunations, then a moon is intercalated, and the first of its 'joints' belongs to the 'central one' of the preceding moon, whilst the second belongs to the first joint of the next moon."—*Ibid.* pp. 292–3.

"The Chinese then proceeded to start off each new year with a lunation and a day having some fixed relation to the solstice. In the oldest times this point changed several times, but was usually much as now, the differences being, like those of the Russian, Julian, and Gregorian calendars, only a few days."—*Ibid.* p. 293.

"Dr. Legge suggests that the new dynasties introduced a new beginning of the year when the errors in the calendar had accumulated so as to alter the correspondence between the solar and the political year; and the prominence given in the Shoo-King to the regulation of the seasons was not dictated by pure enthusiasm for astronomical science. Such regulation was regarded as an outward and visible sign of sovereignty like the possession of a Board of Historiographers. And we may charitably assume that the political importance of a due regulation of the calendar and the timely prediction of eclipses was the cause of a sanguinary clause, quoted from the 'Statutes of Government' during the reign of the fourth king after Yu, and therefore very possibly as ancient as the Canon of Yao: 'When they (the astronomical class or families) anticipate the time, let them be put to death without mercy; when behind the time, let them be put to death without mercy.'"—*Simcox*, ii. 23–4.

"The Hea had begun the year with the month 寅, the first of spring. The Shang removed the commencement of the year a month back, beginning it with 丑."—*Legge, Ch. Class.*, III. i. 192, note.

"Under the Chow dynasty [according to Mao Ch'i-ling], the new sovereign succeeded of course to the throne immediately on the death of his predecessor, but his first year was reckoned only from the first month of the year which followed. The practice of the Shang sovereigns was different. A month after the death of an emperor, the style of the year was changed, and what remained of it was reckoned to the first year of his successor. This was the view of Gan-kwŏ and Ying-tă."—*Ibid.* III. i. 192, note.

[Whether the practice of altering the commencement of the year began with T'ang, and was, as Lin Che-k'e supposes, unknown before the Shang dynasty, is a disputed point.]—*Ibid.* III. i. 215–6, note.

Geography.—"[The Yü-kung] attracted me by reason of the grand simplicity with which it depicts the geography of a great part of the country I had just visited. Many touches revealed a better comprehension than that possessed by the Chinese of later times. I was unable to find any trace of what commentators have read into the book—viz. a description of superhuman mechanical achievements, which would at once stamp it as mythical. On the contrary, I found occasion to admire its exact love of truth, its moderation, and in spite of the *naiveté* of its point of view, its accuracy in the statement of problems which were often extremely complicated."—*Richthofen, China*, i. 276.

[The work indicates considerable geographical knowledge, in the 23rd cent. B.C., of the situation of the K'un lun mountains, Kokonor, and Tsaidam.]—*Ibid.* i. 226. *Cf.* however, *Legge*, III. i. III.

[For the maps of the nine provinces said to have been engraved on the nine copper urns in the time of the Emperor Yü, see *ibid.* i. 368–9, 372.]

Chemistry—[In the "Great Plan," the five elements are given as:—water, fire, wood, metal, and earth (*Shu ching*, Pt. V. Bk. IV. 5; *Legge, Ch. Class.*, III. ii. 325, notes).]

Medicine, etc.—[A fair knowledge of medicine derived from tasting the flavours of herbs, etc., is ascribed to the mythical sovereigns (Huang Ti, Shên Nung, etc.). To Huang Ti is ascribed a work on the Fundamental Principles of the Vital Organs. See *Shih wu yüan hui*, c. 36, p. 1*a*; *Shih lei t'ung pien*, c. 62, pp. 6*a*, 6*b*, 7*b*; *P'ei wên yün fu, Ssŭ chih yün*, c. 4*b*, pp. 14*b*, 16*a*; *Yüan chien lei han*, c. 322; *Fang shu pu*, p. 6*b*, etc.]

Philosophy.—"Neither creation nor cosmogony was before the mind of the author [of the *I ching*]. . . . His theme is the Yî,—the ever-changing phenomena of nature and experience. There is nothing but this in the 'Great Treatise' to task our powers;—nothing deeper or more abstruse."—*Legge, Yî king*, Introd. p. 44.

[*Yin* and *Yang* occur with their mystical application only once in the *Shu ching*.]—*Legge*, III. ii. 527, note.

Political science.—"Good government depends on sovereign and minister not shrinking from the difficulties of their position" (*Legge, Ch. Class.*, III. i. 53, note). It consists "in the nourishment of the people,—not the bare support of their bodies, but the sustenance and development of their whole being" (*ibid.* p. 56, note). "In Government the great thing is for the prince to pursue the course of his virtue, which will be seen in his knowledge of men, and giving repose to the people" (*ibid.* p. 68, note).

History.—"When the great encyclopœdist of the 14th cent., Ma-twan-lin, tells us that the 'pencil of the recording officer has been busy from the time of Hwang ti,' he is only repeating earlier and veracious writers, whose records reach into the remote past without coming to a time when the pencil was *not* at work. The commentators explain that if the emperor gave a charge to any officer or prince, it was the duty of an official called the 'Recorder of the Interior' to write it upon tablets and to do so in duplicate; and no public duty was esteemed more sacred than to keep a veracious record."—*Simcox*, ii. 16. See also *Legge, Ch. Class.*, III. i. Prol. pp. 12–13.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

"In that age, medicine, physics, mathematics and astrology were taught in a confused *mélange*. In this *mélange*, some truths were held and perceived with precision, such as that the earth was round [see, however, *infra*] and suspended in space, but for one true principle five or six false ones were believed in with equal tenacity."—*Journ. P.O.S.*, ii. 144.

Mathematics.—"The Duke of Chou designed a multiplication table of 'nine' and fully explained the methods of arithmetic, and the abacus was thus invented."—*Liu Fêng Shih shih, Ko chih ching yüan*, c. 49, *Jih yung ch'i wu lei*, p. 7*b*. See *Wylie, Ch. Researches*, pp. 163–4. Arithmetic was based on the "Nine Sections" of the legendary Emperor Huang Ti (p. 162). There are hardly any references to the science before the Burning of the Books (see ABS. MON.).

"China . . . knew, eleven centuries before Christ, the properties of the right-angled triangle" (*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 264), which "were taught in the Government schools" (*Journ. P.O.S.*, ii. 144).

"It was known that, if a gnomon four feet high be set up on a round terrace and three feet be marked off from the base of the gnomon, the square of four added to that of three, making twenty-five, will be the square of the hypothenuse, or the distance from the top of the gnomon to the point to which three feet is measured. So much of science was taught in China 3000 years ago and it was applied to find the height of the sun from the earth and the size of the earth."—*Ibid.* ii. 144.

"Architecture is introduced with the gnomon and its shadow. A vessel of water is hung up by a string so as to obtain a level. . . . To have his work strictly according to the cardinal points he [the artificer] marks the shadow of his gnomon. For imperial use there was a gnomon of which the length was 8 feet, or 5⅓ of our English feet. They had the plumb-line, by which they could make the pillars of wood, which supported the roof, perfectly straight. They had also the mason's rule, which they called *kwei* 規, and they used it to secure that the bricks of their walls should be laid evenly, and the walls themselves be both horizontal and vertical."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 263.

[*Wylie, Ch. Researches*, p. 230, says the *Chou pi suan ching*, a tract on the elements of trigonometrical observation and the rudiments of astronomy, is thought to be a relic of the Chou dynasty.]

[For the military origin of vital statistics see GEN. GOVT.]

Chronology.—"Like every other nation, the Chinese soon got into a mess with their superfluities, and each successive dynasty fumbled about as best it could in order to give the people an intelligible fixed time for sowing the crops. The earliest records having been destroyed, no one knows exactly what the ancients did to get through time. Confucius never spoke of either calendars or a future life, as being two subjects on which he had no definite information. We are, however, told in the *Book of Rites* that the sixth lunation of the Chou dynasty was the fourth of the Hia; and in the opinion of that distinguished sinologist the late Alexander Wylie, the Chinese possessed a work treating of Plane and Solid Mensuration, Equations, and Trigonometry even before our era. Owing to this venerable connection between crops and stars, however, the successive astronomers had conceived a peculiar notion that each spot of the earth, and to a certain extent each person, was under its own star, and was subject to the influences of that star. Hence the Court 'recorder' kept regular notes of what had happened under such stars, to each place and prominent person: thus he gradually foretold the events which would probably arrive. This explains why astrology and divination were treated by the First Emperor as positive sciences like medicine (which after all is, as distinct from surgery, apt to be even in our own times as vague as divination). It also explains why Chinese calendars are imposed on subject states; why to this day lucky days are chosen for solemn events; and why tyrants have appropriated particular months for the commencement of their reigns. I am disposed to think that the abnormally long reigns of the semi-mythical emperors are to be accounted for by the early Chinese having begun a new 'year' not only at the winter but also at the summer solstice."—*Parker, China*, pp. 293–4. See also *Hirth, Anc. Ch.*, p. 98.

"The Chow dynasty removed the commencement of the year farther back still [than the Hsia and Shang], and made it begin with the second month of winter (the month 子)."—*Legge, Ch. Class.*, III. ii. 283, note.

"The Chinese astronomers of those times counted the day when the sun and moon were veritably in conjunction to be the first day of the moon. The time of a lunation was divided into the time of brightness and the time of obscurity; the passage from the obscure to the bright time was described as 'the death of the obscure,' and the passage from the bright to the obscure time as 'the birth of the obscure.'"—*Ibid.* p. 570, note.

"During the Chow dynasty, intercalary months were placed at irregular intervals, but most frequently at the end of the year." "The Chinese seem even then to have had no idea of the proper interval between two intercalations, which is now known to be 32 or 33 months on an average."—*Ibid.* III. i. Prol. p. 99.

In the time of the Han dynasty "we find what is called the Metonic cycle well known. It is not mentioned as any discovery of that age. See the 'History of the Former Han' by Pan Koo (班固), finished about A.D. 80, in the 律曆志, 第一, 下, where the whole process is fully described. No doubt it came down to the Han from the Chow, and was probably known in China long before Meton reformed the Athenian calendar according to its principles, B.C. 432."—*Ibid.* III. i. 22, note; and see *Wu Ch'êng, Chin wên Shang shu tsuan yen.*

"When Wen Wang founded the Chow dynasty, a new period of comparatively brilliant improvement in science commenced. The able statesman and poet Chow Kung studied the science of numbers. The sundial was used to mark the hours and the clepsydra . . . was also introduced. Each day, for greater exactness, was denoted by two cyclic characters instead of one."—*Journ. P.O.S.*, ii. 143–4.

"The invention of the cycle of 60 is ascribed to Hwang-te (B.C. 2636), and in particular its application to years is affirmed to have commenced in his reign; but this is a mere fiction. It was not applied to years even in the time of Confucius. The cycle consists of two sets of characters; one set of 10, and one set of 12,—which are combined in couples, odd to odd and even to even, making in all sixty combinations." "The 'twelve terrestrial branches,' as they are called, were first invented, in all probability, to distinguish the twelve spaces into which the horizon is divided. . . . Their names and order are as follows:—

1. 子 *tsze.*	2. 丑 *ch'ow.*	3. 寅 *yin.*	4. 卯 *maou.*
5. 辰 *shin.*	6. 巳 *sze.*	7. 午 *woo.*	8. 未 *we.*
9. 申 *shin.*	10. 酉 *yew.*	11. 戌 *seuh.*	12. 亥 *hae.*

The common mode of expression 建子, 建丑 etc., 'to set up *tsze*,' 'to set up *ch'ow*,' etc., refers to the tail of the Great Bear pointing to *tsze, ch'ow*, and the other ten divisions of the dial [see *infra*]. *Tsze*, the first character, always indicates due north, and the middle of winter." "The application of the cycle to days is undoubtedly a very ancient practice. But it would seem from a passage in the *Shoo*, Pt. II. Bk. IV. par. 8, that the days were originally arranged in tens *only*, by means of the 10 'celestial stems.' These are:—

1. 甲 *kea.*	2. 乙 *yih.*	3. 丙 *ping.*	4. 丁 *ting.*
5. 戊 *mow.*	6. 己 *ke.*	7. 庚 *kang.*	8. 辛 *sin.*
9. 壬 *jin.*	10. 癸 *kwei.*		

Yu is made to say, 'I remained with my wife only the days *sin, jin, kwei, keă*.' These are the last three and the first of the above set of characters, and the natural inference from their use here is that they were invented to divide the month into three equal parts (three decades); and that in course of time they were combined with the twelve branches to make the

famous Chinese cycle of *sixty*. The first mention of the cyclical name of a day is found in the Shoo, Pt. IV. Bk. IV. p. 1. It is said to have been in the 12th month of the first year of the emperor T'ae-kĕă. The current chronology makes this year to be B.C. 1752. But the chronology is utterly valueless; and we have no sufficient data by which to verify the day. Moreover, this is the only instance of the use of the cycle which occurs before B.C. 1121 of the same chronology. In the Books of Chow it is frequently employed." "The state of confusion in which Chinese chronology is found to be, down to the time of the Eastern Chow, and the fact that not a single instance of the application of the cycle to years can be found till after the classical period, are sufficient to satisfy us that this invaluable method of dating years was never used in ancient times."—*Legge, Ch. Class.*, III. i. Prol. pp. 96–7.

"Even after Meton and Callippus the Chinese calendar must have been founded on very 'rude' observations indeed" of the rising and setting of certain stars. "The rapid derangement of the months, and consequently of the seasons during this period, however, most probably arose from the adoption of some erroneous system of intercalation, invented to supersede the troublesome observations of the stars from month to month. And the consequence was, that the knowledge of the stars came to be cultivated only for purposes of astrology."—*Ibid.* p. 91.

"A very ancient and characteristic method of determining the seasons and months of the year, to which the Chinese are fond of alluding, was by the revolution of Ursa Major. . . . The ancients knew nothing of the five planets. No reference to them as *five* can be found in the classics. On the contrary, they seem to have supposed, as the Greeks did before Pythagoras, that Lucifer and Hesperus were two stars." "And the references to the five planets in the Chow Ritual, and in the three annotated editions of the Chun Ts'ew, are evidence of their later origin. The same may be said of the use of the planet Jupiter for astrological purposes, which belongs to the time of the Contending States, or to the early Han. At that time the period of Jupiter was supposed to be exactly 12 years, so that he gave a year to each sign of the zodiac, therefore he is always called the *year star*."—*Ibid.* pp. 93–4.

Ssŭ-ma Ch'ien says in his chapter on the calendar: "When the empire ceased to be well-governed, the correct succession of new moons was not transmitted to the feudal barons. After the emperors Yeu and Li (who died B.C. 770 and 827 respectively), the influence of the Cheu dynasty fell away, the officers ceased to take account of the times, nor did the emperor announce the new moon. The sons and pupils of the official astronomers and mathematicians became scattered, either in different parts of China, or among barbarian races. The ceremonies performed for the sake of good and ill luck were in consequence much neglected, and not offered in complete form."—*Journ. R.A.S.*, xviii. 15.

Chemistry.—[Charcoal was used as a disinfectant and insecticide.]—*Simcox*, ii. 47.

Magnetism.—"The general opinion among the Chinese . . . that the duke of Chow made the 'south-pointing chariot,' cannot be received as resting on a historical foundation. . . . The truth, I imagine, is this, that the Chinese got some knowledge of the compass—found it out themselves, or learned it from India—not long before the Christian era, and that then the fables about the making of south-pointing chariots in more ancient times were invented."—*Legge, Ch. Class.*, III. ii. 537, note.

Astrology.—"There is a passage occurring under the year 564 which speaks of the people of the Sung country learning by the stars to foresee what heavenly retribution for crimes would happen (*Legge, Ch'un ch'iu*, p. 439)."—*Journ. R.A.S.*, xviii. 9.

"'The officer known as Pau chang shi rules the stars in heaven, and takes note of their changes with those of the sun, moon, and planets, in order that it may be seen what changes will take place on earth, and whether they will be fortunate or unlucky. Viewing the lands as corresponding with certain stars, the empire of nine provinces is so subdivided that each feudal territory has one or more constellations which control it, and in each of them can be seen its good and ill fortune.' . . . The remaining duties of the astrologer are found to be connected with observing the winds and other meteorological phenomena in order to foreknow good and ill luck."—*Ibid.* p. 13. For the use of astrology in forecasting events see also *Divination*.

[Lacouperie says that the traders (Indian and Arabian) who settled in Shantung about 680 B.C. imported the following items of knowledge:—A hybrid list of names of the twelve Babylonian months. A list of 10 names which may be those of the old Semitic months. A Babylonian list of 12 Zodiacal names. "These three items were chiefly used for astrological purposes."]—*West. Orig.*, p. 90.

Astronomy.—"A writer of this [Han] period says the pre-Confucian system of astronomy was Ptolemaic, i.e., 'the heavens were round like a canopy, the earth flat like a chess-board.'"—*Parker, China*, p. 296.

"The early part of the Book of History contains Babylonian astronomy. . . . It was during this period [1300–609 B.C.] that the dial, the clepsydra, the zodiac of twelve signs and the astrology of the Babylonians were introduced into China. . . . China continued to receive additions to her knowledge during the Babylonian supremacy and afterwards at the time of the Persian empire. First came astrology, then mythology, and later Tauist philosophy. We cannot account for Chinese astrology or mythology or for the Tauist philosophy without allowing for a considerable importation of foreign thought during the period extending from about B.C. 820 to B.C. 380."—*Ch. Rev.*, xiii. 418–9.

"About B.C. 800, the astronomy of the Mesopotamian plain was fully developed in China and it led to a closer study of the stars," but chiefly with an astrological object (*v. supra*).—*Journ. P.O.S.*, ii. 144.

"The astronomers of the Chou dynasty were familiar with the use of the gnomon; and their observations, which have been checked by European savants, have proved correct."—*Hirth*, p. 119. *v. supra, Mathematics.*

"The most common and the earliest division of the ecliptic is that of the 28 mansions. These are of very unequal extent, and consequently very inconvenient for any purpose but that of astrology. The apportioning of 7 of these mansions to each of the cardinal points is also nothing more than an astrological device." "The angular value of the 28 mansions varies from 1° to 30°, and modern books differ materially from the older ones as to the dimensions of each. Even the four great divisions differ more than 30° one from another. The following are their respective lengths as given in the introduction to Yung-ching's *Shoo-king*. The circle was divided into 365¼ degrees:—

The 7 Northern Constellations embrace		98¼	degrees.
,, Western	,,	,, 80	,,
,, Southern	,,	,, 112	,,
,, Eastern	,,	,, 75	,,
	Total	365¼	,,

This division of the ecliptic is, with some slight variations, common to the Arabians, the Hindoos, and the Chinese;—a fact which seems to point to the common origin of these races, or to their inter-communication at a period of which history gives us as yet no information."—*Legge, Ch. Class.*, III. i. Prol. pp. 94–5.

[Of the 28 stellary divisions of the Chinese sky, we find 8 mentioned in different odes (*Shih ching*, I. ii. X.; iv. VI.; x. V.; xv. I.; II. v. VI. and IX);—viz., *Shên*, *Mao*, *Ting* or *Ying-shih*, *Ho-hsing* or *San-hsing* (corresponding to the division *Hsin*), *Niu*, *T'ien-pi*, *Tou*, and *Chi*. We see here also the notion about the constellation *Chih-niu* (corresponding to Lyra), and the mention of the Celestial river,—the Milky Way (II. v. IX.; III. i. IV.; iii. IV. 1). Finally in the same ode (st. 6) the planet Venus is indicated by two different names, according as she appears in the east or in the west. II. iv. IX. contains the mention of the celebrated solar eclipse of B.C. 776, which is the first certain date of Chinese chronology. The importance attached to the observation of the stars may be deduced from the celebrity of the observatory of king Wên (III. i. VIII.). Before king Wên, his ancestor duke Liu (18th and 17th cent. B.C.), had already determined the four cardinal points by observation of the solar shadow (III. ii. VI. 5). See also *Richthofen, China*, i. 404–15.]

"Besides this inconvenient system of unequal constellations or mansions, the Chinese have, in common with western nations and the Hindoos, the division of the Zodiac into twelve equal parts or signs. This improvement was probably also introduced in the end of the Chow, or the beginning of the Han dynasty. . . . We do not find that the ancient Chinese made much practical use of the 12 signs; and even to the present day the 28 mansions of the moon have retained their place in preference to the more scientific division."—*Legge, Ch. Class.*, III. i. Prol. p. 95.

"The Chinese believed the earth to be a plane surface; 'straight, square, and large' . . . measuring each way about 5,600 *le* (= 1,500 miles), and bounded on the four sides by 'the four seas' (*Shoo*, Pt. II. Bk. I. 13; Pt. III. Bk. I. Pt. ii. 14–23). The North sea and the West sea were of course purely imaginary. The earth was motionless, while the sun and the moon and the starry heavens were continually revolving with great rapidity. This is the fixed belief of the Chinese even at the present day. The sun was estimated to be about 15,000 *le* (= 4000 miles) from the earth, and it was supposed that the city of Loh was in 'the centre of heaven and earth,'—the middle of the Middle Kingdom (*Shoo*, Pt. V. Bk. XII. 14). In other places the shadow of a perpendicular gnomon was not due north and south at noonday, or else it was too short or too long; but here it was not found to deviate in either direction, and its length on midsummer-day was to the length of the gnomon as 15 to 80. The distance assigned to the sun is in fact the earth's radius, and was a natural inference from the plane figure of the earth, taken in connection with the different elevation of the sun in different latitudes. From the same premisses it was also inferred that the shadow would be all awry at noon in places far east or far west of Loh;—those on the east being too near the morning sun, and those on the west too near the evening sun." See the legend quoted. "The writers of the early Han dynasty hesitate not to affirm that the experiment to prove the deviation of the shadow at noon was made with all the necessary apparatus,—clepsydras, gnomons, etc., and found successful. But the clepsydra is not mentioned in any authentic writing of earlier date than the Han; and we may safely conclude that this, as well as some other instruments mentioned by interpreters of the classics, and in the Chow-le, was unknown to the ancient Chinese. The clepsydra is described by Aristotle (B.C. 384–322)."—*Ibid.* pp. 90–1. See also *Journ. P.O.S.*, ii. 200, and *cf.* SUNG PERIOD.

"On the 29th of August (new style), B.C. 775 [? 776], occurred an eclipse of the sun. It is commemorated in the She King, Pt. II. Bk. IV. Ode iii., as 'an announcement of evils by the sun and moon.'" "This eclipse . . . is the first of the long list of eclipses, by the mention of which Chinese history from the 8th century before Christ acquires more certainty than belongs to that of the earlier ages."—*Legge, Ch. Class.*, III. ii. 615, note.

"Lunar eclipses are also recorded, but not so carefully as those of the sun."—*Parker, John Chinaman*, p. 34.

[For a table of the eclipses recorded by the Chinese between 775–494 B.C., see *Legge, Ch. Class.*, III. i. Prol. pp. 103–4.]

[For the *Kai tien* system of astronomy see *Journ. R.A.S.*, xviii. 16–18, and *Chou pi suan ching*.]

Geography.—"In the third and fourth centuries before Christ, China came to know many stories of the ocean. They were aware that the sea surrounded the land on all sides and that the earth is round. They obtained this information mixed with descriptions of foreign religion, divinities, animals and plants. Some unknown Chinese writer, the master of a refined style, made a book on Chinese and foreign geography."—*Journ. P.O.S.*, ii. 145.

Of the nine provinces "maps were made showing their principal rivers, lakes, and mountains, their products and articles of trade, and other useful details."—*Hirth*, pp. 119–20.

"Triangulation, in the exact sense in which the word is understood in Europe, was probably never applied by the Chinese even to a small district, much less for large portions of the empire. . . . Their imperfect methods were sufficient, where only a small area was in question, but in fitting the maps together, the inaccuracy was at once apparent, as the mistakes were necessarily added together. They might to some extent have been eliminated by exact astronomical determination of places, but for this their knowledge was insufficient. The length of the shadow at noon was for a long time the only means of fixing the latitude; but even in this they never attained the precision of the Alexandrine scholars. The amount of error increased with the size of the areas over which the single maps were united into one; and in this way they never got beyond a caricature, such as we see in the representations of China, taken from native sources, in the atlases of Ortelius, Mercator, Hondius, Blaeuw, and others."—*Richthofen, China*, i. 390.

"In the sixth part of the Chou-li, which . . . probably belongs to the latter part of the Chou dynasty, it is said (xliii. 19) of the office of the *Tsiang-jin*:—'In laying out a capital city, they level the ground with the help of water and the plumb-line. With the help of the plumb-line they erect a post [evidently the vertical staff of the gnomon, which was eight feet in length]. They take observations by means of its shadow. By drawing a circle round the post, they examine the shadows cast by the rising and the setting sun. By day they add together the shadows cast at noon on different days. By night they observe the North Pole. In this way they determine the morning and evening, or east and west.' The circumstance that, in this and similar passages, the easier method by means of the compass is not mentioned, makes it doubtful whether the latter was known to the Chinese in the first century of the Chou dynasty."—*Ibid.* i. 388. See also p. 378.

"In the 33rd book of the Chou-li several officials are mentioned who had to occupy themselves with geography. The first class of these were the *Tshi-fang-shi*, of whom it is said:—'They are entrusted with the care of the maps of the empire. . . . They have to distinguish the provinces and districts of the principalities and counties; the populations, who are designated as the four *I*, the eight *Man*, the seven *Min*, the nine *Me*, the five *Yung*, the six *Ti*; and, further, the quantity and value of the more important products. 'Other duties follow, connected with statistics.' Then it is said that 'they distinguish the principalities situated in the nine great provinces of the empire.' . . . The provinces are now mentioned and briefly described. The Chinese love for set formulas is here much more apparent than in the *Yu-kung*. Every province must have its sacred mountain, its great lake, its river, and its irrigation-reservoirs. Then we have the enumeration of commercial products, principal crops, kinds of domestic animals, and (in figures quite impossible to accept) the relative proportions of the male and female population. [The provinces are here named, two not being mentioned in the *Yu-kung*.] If the description is compared with that in the older work, its scantiness and deficiencies are plain, not only as regards geographical information, but also as to productions."—*Ibid.* i. 374–5.

Meteorology was not separated from astrology. "It is related that on one occasion, when Confucius was about to set out with a company of the disciples on a walk or journey, he told them to take unbrellas. They met with a heavy shower, and Woo-ma asked him, saying, 'There were no clouds in the morning, but after the sun had risen you told us to take umbrellas. How did you know that it would rain?' Confucius said, 'The moon last evening was in the constellation Peih, and is it not said in the She-king, "When the moon is in Peih, there will be heavy rain?" It was thus I knew it.'"—*Legge, Ch. Class.*, i. Prol. p. 122.

Anatomy.—"The ancient Chinese used metal models to exhibit man's inner structure."—*Little* (*Mrs. A.*), *Int. Ch.*, pp. 266–7.

Medicine.—"The art of healing was practised among the Chinese in their pre-historic times, but the first quasi-scientific efforts, of which we have any written record, belong to the period with which we are now dealing. The physicians of the Chow dynasty classified diseases under the four seasons of the year:—Headaches and neuralgic affections under *spring*, skin diseases of all kinds under *summer*, fevers and agues under *autumn*, and bronchial and pulmonary complaints under *winter*. They treated the various diseases that fell under these headings by suitable exhibitions of one or more ingredients taken from the five classes of drugs, derived from herbs, trees, living creatures, minerals, and grains, each of which class contained medicines of five flavours, with special properties, as follows:—Sour, for nourishing the bones; acrid, for nourishing the muscles; salt, for nourishing the blood vessels; bitter, for nourishing general vitality; and sweet, for nourishing the flesh. It was a standing regulation that all potions administered to the ruler of a State should first be tasted by his Prime Minister; and the public at large was warned against rashly swallowing the prescriptions of any physician whose family had not been three generations in the medical profession."—*Giles, Historic China*, pp. 9–10.

[Treatment was regulated according as the complaint was internal, external, or arose from "unguarded indulgence in meats and drinks," these three classes being attended to by three classes of specialists. The first "employed the five flavours, five kinds of grain, and the five kinds of medicinal herbs, in order to treat diseases. They made use of the five different kinds of climate, the five different sounds (of moaning), the five different colours, in order to ascertain whether the patient would live or die; in the second place they observed the changes which took place in the nine apertures [eyes, ears, nostrils, mouth, urethra, rectum]; in the third place they paid attention to the movements of the nine viscera." The second "had charge of medicines applied externally (plaisters)." The third "had charge of regulating the king's six kinds of diet, the six kinds of drinks, and of the component parts of rare viands." And there was a further class of physicians who had charge of the health of the "low-born and ignoble."]—*Gingell*, pp. 102–3.

[Jade and sulphate of soda were supposed to have the power of reinforcing the vital spirits and promoting long life.]—*De Groot, Rel. Syst.*, i. i. 271–2; *Journ. N.-C.B.R.A.S.*, N.S. vi. 142.

"The reason why Chinese medicine is burdened with useless astrological notions and antiquated physics is because its chief books were composed and its chief principles elaborated in that post-Confucian age, when the Babylonian philosophy completed its conquest over the Chinese intellect, and when astrology and physics were first crystallized into their present shape. Chinese medicine is therefore in bondage to a system of notions half Mesopotamian and half native which dominated in the atmosphere of Chinese thought two thousand years ago. One part is truth and has a high value. Six parts are fanciful and useless. Acupuncture and the burning of the down of the mugwort (moxa, the down of the *artemisia*) on the skin are both very celebrated methods of cure and were used in China five hundred and eighty years before Christ, as we learn in the Tso-chwen. . . . It was a stone needle that the Chinese first employed, which shows the antiquity of the practice."—*Journ. P.O.S.*, ii. 146–7. See also *De Groot, Rel. Syst.*, vi. 946–7.

[Feeling the pulse was a method of diagnosis. Shun Yü-i by this method could tell the time of life and death, and what remedies would be effectual and what not. The pulse was regarded as indicating the proportion of the *yang* and *yin* principles, which were increased or decreased accordingly.]—*Tzŭ shih ching hua, c.* 116, p. 2*b*; p. 4*a*; p. 2*a*.

"Acid [things] ruled the spleen; salt [things], the lungs; pungent, the kidneys; bitter, the liver; sweet, the heart. When the five superior viscera were completed, then flesh was

produced. The spleen could produce the diaphragm ; the lungs, bone ; the kidneys, brain ; the liver, skin ; and the heart, flesh. When the five flesh were completed, then the nine passages of the body were formed."—*Kuan Tzŭ, Ko chih ching yüan*, c. 11, p. 1*a*. In *ibid.* c. 22, p. 27*b*, *huo chi* congee is said to have immediately cured the severe illness of Prince Yang.

[A "kind of religious pathology" or mesmerism, called *kang fu*, adopted simultaneously with medical treatment, consisting of burning of incense, muttering of incantations, and moving the patient's limbs with the object of bringing his mind into *rapport* with that of the operator (a Taoist priest), was much in vogue at this time, but prohibited later.]—*Giles, Historic China*, pp. 315–7.

"The nature of . . . sulphide of mercury was thoroughly understood by the early Chinese operators. The power of raising men to the rank of the eight jolly immortals called *Sien*, or 'genii,' was asserted of this mysterious substance which defied heat and came forth a pure and mobile metal."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 145.

"*Cannabis Indica* was used as a sedative 230 years before our era."—*Cont. Rev.*, July, 1895.

Philosophy.—The Chou dynasty saw "the long and stormy genesis of *natural ethics*, transmitting the eternal lessons and appeals of Confucius, Mencius, and Lao-tse."—*Johnson, Or. Rel.—Ch.*, p. 441.

"The age of the Sophists . . . may be said to extend from the 7th century, when Lao-tze, the founder of Taoism—or the Doctrine of the Way—was born, to the fall of Chow, or more accurately the rise of T'sin in the middle of the 3rd century B.C."—*Simcox*, ii. 87.

Lao Tzŭ's "philosophy, if in the face of" the "insufficiency in its tradition we can use the term, impresses one as transcendental, when compared with Confucius's applied moral philosophy." "Confucius's teachings . . . are devoted to practical life and its requirements ; whereas Lau tzĭ's work, as we may conclude from the disconnected fragments in which it is presented to us, must have been full of mystic abstractions."—*Hirth, Anc. Hist.*, p. 239.

"He was the founder of an abstruse system of ethical philosophy which was destined first of all to lose its original character in wild speculation and alchemistic research ; then to be supplemented by an admixture of Buddhist ritual and creed ; and finally to drag out, side by side and on friendly terms with its Indian rival that loathsome combination of knavery and superstition so familiar in the *Taoism* of to-day. But the 'Tao' of Lao-tsŭ, as we learn from the only brief treatise bequeathed by him to posterity, was simply the 'path' of rectitude ; and the utterances by which he sought to guide mankind along it to a haven of perfect virtue contain nothing of the mysticism imported into the system by his later disciples, still less of the absurdities by which . . . his pure philosophy became ultimately corrupted and transformed. 'Three precious things I prize and hold fast,' said Lao-tzŭ—'Humility, Compassion, and Economy.'"—*Giles, Historic China*, pp. 13–14.

"The first [period of Chinese philosophy] began with Confucius, who was born B.C. 551, and ended with Mencius (Măngtsze) who died about B.C. 317. . . . [It] lasted for seven generations. It was separated by an interval of thirteen hundred years from the second. . . . Both were periods of revival of ancient learning, and of further development. Both embraced several celebrated philosophers besides those mentioned ; but in each case it was the originator and closer of the epoch who became most celebrated." The writer says that Confucius did not originate Chinese learning, and proceeds to give an account of Fu Hsi, Wên Wang, and the 8 Diagrams, of which he says :—"The Eight Diagrams formed an illustrative figure intended to elucidate Fuh he's theory of the universe, a theory adopted after careful reflection on all animate and inanimate nature within his ken. They are in so far the foundation of Chinese philosophy ; but it must not be assumed that learned Chinese conceive any occult power to lie in them." "Apart from the labours of Confucius himself, the permanent literary results of this [epoch] . . . are contained in . . . the Four Books, composed by different members of the school which he founded. The last contains a record of the ethical and political teachings of Mencius, who . . . closed the first epoch."—*Meadows, Ch. and their Reb.*, pp. 329–33.

"If we had to describe what is at once best and most characteristic in Chinese thought in terms of Western literature, we might say that the Chinese philosopher was a compound of Goethe, Emerson, and Madame de Genlis. He has something of the calm, cool, rational humanity of the author of Faust, and a great deal of the same faith, in the efficacy of social, literary, and dramatic discipline, as a moral force, displayed by the author of Wilhelm Meister. For the rest, his affinities with Goethe are included in his affinities with Emerson, whose obligations to the great German are not so easily defined. Like Emerson, the Chinese sage has broad, vague sympathies and intuitions of a righteous kind, and a strong, though hazy, apprehension of the analogies and sequences in the world of nature and man. Like Goethe, he has the courage of his discernment, and asserts the moral and political importance of social minutiæ ; but he dwells on them with an affectionate diffuseness which suggests the court or the schoolroom rather than the study."—*Simcox*, ii. 85–6.

"Dr. Morrison justly observes that 'Confucius was engaged in politics all his life ; and even his ethics dwell chiefly on those social duties which have a political bearing. A family is the prototype of his nation or empire, and he lays at the bottom of his system, not the visionary notions (which have no existence in nature) of *independence* and *equality*, but principles of *dependence* and *subordination*—as of children to parents, the younger to the elder, and so on. These principles are perpetually inculcated in the Confucian writings, as well as embodied in solemn ceremonials, and in apparently trivial forms of mere etiquette. . . . These principles and these forms are early instilled into young minds, and form the basis of their moral sentiment : the elucidation and enforcement of these principles and forms is the business of students who aspire to be magistrates or statesmen, and of the wealthy who desire nominal rank in the country ; and it is, in all likelihood, owing chiefly to the influence of these principles on the national mind and conscience, that China holds together the largest associated population in the world."—*Davis, Chinese*, ii. 46–7.

"'The empire brought to a state of happy tranquillity' (天下平. See 大學, 經, par. 4, 5 ; etc.) was the grand object which he delighted to think of ; that it might be brought about as easily as 'one can look upon the palm of his hand,' was the dream which it pleased him to indulge in (*Ana.* III. xi ; *et al.*). He held that there was in men an adaptation and readiness to be governed, which only needed to be taken advantage of in the proper way. There must be the right administrators, but given those and 'the growth of government would be rapid, just as vegetation is rapid in the earth ; yea, their government would display itself like an easily-growing rush' (中庸, xx. 3)."—*Legge, Ch. Class.*, i. Prol., pp. 102–3.

"This readiness to be governed arose, according to Confucius, from 'the duties of universal obligation, or those between sovereign and minister, between father and son, between husband and wife, between elder brother and younger, and those belonging to the intercourse of friends' (中庸, xx. 8). Men as they are born into the world, and grow up in it, find themselves existing in those relations. They are the appointment of Heaven. And each relation has its reciprocal obligations, the recognition of which is proper to the Heaven-conferred nature. It only needs that the sacredness of the relations be maintained, and the duties belonging to them faithfully discharged, and the 'happy tranquillity' will prevail all under heaven. As to the institutions of government, the laws and arrangements by which, as through a thousand channels, it should go forth to carry plenty and prosperity through the length and breadth of the country, it did not belong to Confucius, 'The throneless king,' to set them forth minutely. And indeed they were existing in the records of 'the ancient sovereigns.' Nothing new was needed. It was only requisite to pursue the old paths, and raise up the old standards (see 中庸, xx. 2)."—*Ibid.* pp. 103–4.

"Confucius' idea, then, of a happy, well-governed State did not go beyond the flourishing of the five relations of society which have been mentioned ; and we have not any condensed exhibition from him of their nature, or of the duties belonging to the several parties in them. Of the two first he spoke frequently, but all that he has said on the others would go into small compass. Mencius has said that 'between father and son there should be affection ; between sovereign and minister righteousness ; between husband and wife attention to their separate functions ; between old and young, a proper order ; and between friends, fidelity' (*Mencius*, III. Pt. I. iv. 8). Confucius, I apprehend, would hardly have accepted this account. It does not bring out sufficiently the authority which he claimed for the father and the sovereign, and the obedience which he exacted from the child and the minister."—*Ibid.* p. 104.

"With his "ideas—not very enlarged—of the relations of society (*Legge*, i. Prol. pp. 104–5 ; see DOM. MAR.), Confucius dwelt much on the necessity of personal correctness of character on the part of those in authority, in order to secure the right fulfilment of the duties implied in them. This is one grand peculiarity of his teaching." The influence of example is very great. But in the directions for the cultivation of the personal character of the ruler, the philosophy is defective. The government he taught was a despotism. "He allowed no 'jus divinum,' independent of personal virtue and a benevolent rule." His views on the ground of "the great relation of the governor and the governed," were probably those contained in the *Shu ching* (see *Legge, Shoo-king*, V. i. Sect. I. 2, 7). "The moment the ruler ceases to be a minister of God for good, and does not administer a government that is beneficial to the people, he forfeits the title by which he holds the throne, and perseverance in oppression will surely lead to his overthrow. Mencius inculcated this principle with a frequency and boldness which are remarkable. It was one of the things about which Confucius did not like to talk. Still he held it. It is conspicuous in the last chapter of 'The Great Learning." Its tendency has been to check the violence of oppression, and maintain the self-respect of the people, all along the course of Chinese history."—*Ibid.* pp. 105–7.

Confucius' views on government "are adapted to a primitive, unsophisticated state of society. He is a good counsellor for the father of a family, the chief of a clan, and even the head of a small principality. But his views want the comprehension which would make them of much service in a great empire. . . . There has been a tendency to advance, and Confucius has all along been trying to carry the nation back. Principles have been needed, and not 'proprieties.' The consequence is that China has increased beyond its ancient dimensions, while there has been no corresponding development of thought. Its body politic has the size of a giant, while it still retains the mind of a child." And "Confucius makes no provision for the intercourse of his country with other and independent nations. He knew indeed of none such. China was to him 'The Middle Kingdom,' 'The multitude of Great States,' 'All under heaven.' Beyond it were only rude and barbarous tribes. He does not speak of them bitterly, as many Chinese have done since his time. In one place he contrasts them favourably with the prevailing anarchy of the Empire. . . . The only passage of Confucius' teachings from which any rule can be gathered for dealing with foreigners, is that in the 'Doctrine of the Mean,' where 'indulgent treatment of men from a distance' is laid down as one of the nine standard rules for the government of the Empire. But 'the men from a distance' are understood to be *pin* and *leu* simply,—'guests,' that is, at the imperial court ; and 'visitors,' or travelling merchants. Of independent nations the ancient classics have not any knowledge, nor has Confucius."—*Ibid.* pp. 107–9.

"It was the chief endeavour of the sage to correct the vices which had crept into the state, and to restore the influence of those maxims which had been derived from the *ancient kings*, as Yaou, Shun, and others, celebrated in history or tradition. That he was sincere, and that his professed love of reform was not a mere stepping-stone to his personal ambition, or an instrument to serve his private ends, was proved by the readiness with which he abandoned the station to which his talents had raised him, when he found that his counsels were unavailing, and his influence inadequate to the restoration of order. That portion of modern China which lies to the north of the great Keang, was then divided into a commonwealth of states, of which the native kingdom of Confucius formed only a constituent member ; and through these various countries he journeyed in a condition of simplicity and comparative indigence, devoting himself to the instruction of all ranks, and to the propagation of his precepts of virtue and social order. Such was the success of his endeavours, and the weight of his influential character and good example, that he is said to have reckoned, at length, as many as three thousand disciples or proselytes, of whom seventy-two were more particularly distinguished by their devotion to their master, and their practice of his precepts. He was now sought after by the rulers of the several states, and employed in high offices tending to mature his knowledge and experience ; but at length retired to the company of his chosen disciples, to study philosophy, and compose or compile those celebrated works which have handed down his reputation to after ages, and become the Sacred books of China."—*Davis, Chinese*, ii. 42–3.

"Among the moral doctrines of this great Oriental teacher might be noticed some which have obtained the universal assent of mankind, and which cannot be surpassed in excellence as rules of conduct. He taught men 'to treat others according to the treatment which they themselves would desire at their hands,' and 'to guard their secret *thoughts*,' as the sources and origin of action. In common, however, with every other scheme of philosophy merely human, there is much to condemn in the principles of the Chinese sage. He carried his inculcation of filial duty to so absurd and mischievous an extent, as to enjoin it on a son 'not to live under the same heaven' with the slayer of his father ; or, in other words, to exercise the *lex talionis*, and put him to death. This pushing to extremes of the paternal claim has (as we have before hinted) been the constant device of Chinese statesmen and rulers ; the tendency being to strengthen the authority of the *Emperor*, founded as it is in the rights of a father over his children. Confucius was renowned for his unpretended humility and modesty ; but this portion of his mantle has not descended on his disciples of the present day ; for if distinguished occasionally by some of the virtues of *stoics*, they resemble that sect still more in the high tone of self-sufficiency of pride which marks the conduct of the Confucians to all who have not the honour to profess the state religion of China."—*Ibid.* ii. 43–4.

"Confucius makes a distinction between sincerity absolute and sincerity acquired. The former is born with some, and practised by them without any effort ; the latter is attained by study and practised by strong endeavour. The former is 'the way of Heaven' ; the latter is 'the way of men.' 'He who possesses sincerity,'—absolutely, that is,—'is he who without effort hits what is right, and apprehends without the exercise of thought ;—he is the sage who naturally and easily embodies the right way. He who attains to sincerity, is he who chooses what is good and firmly holds it fast. And to this attainment there are requisite the extensive study of what is good, accurate enquiry about it, careful reflection on it, the clear discrimination of it, and the earnest practice of it.' In these passages Confucius unhesitatingly enunciates his belief that there are some men who are absolutely perfect. . . . He disclaimed being considered to be such an one himself, but the sages of China were such. And moreover, others who are not so naturally, may make themselves to become so. Some will have to put forth more effort and to contend with greater struggles, but the end will be the possession of the knowledge and the achievement of the practice." "Tsze-sze adopts the dicta of his grandfather without questioning them, and gives them forth in his own style at the commencement of the fourth part of his Treatise. 'When we have intelligence resulting from sincerity, this condition is to be ascribed to nature ; when we have sincerity resulting from intelligence, this condition is to be ascribed to instruction. But given the sincerity, and there shall be the intelligence ; given the intelligence, and there shall be the sincerity.'" "Tsze-sze does more than adopt the dicta of Confucius. He applies them in a way which the sage never did, and which he would probably have shrunk from doing. The sincere, or perfect man of Confucius is he who satisfies completely all the requirements of duty in the various relations of Society, and in the exercise of government ; but the sincere man of Tsze-sze is a potency in the universe. 'Able to give its full development to his own nature, he can do the same to the nature of other men. Able to give its full development to the nature of other men, he can give their full development to the natures of animals and things. Able to give their full development to the natures of creatures and things, he can assist the transforming and nourishing powers of Heaven and Earth. Able to assist the transforming and nourishing powers of Heaven and Earth, he may with Heaven and Earth form a ternion.' Such are the results of sincerity natural. The case below this—of sincerity acquired, is as follows,—'The individual cultivates its shoots. From these he can attain to the possession of sincerity. This sincerity becomes apparent. From being apparent, it becomes manifest. From being manifest, it becomes brilliant. Brilliant, it affects others. Affecting others, they are changed by it. Changed by it, they are transformed. It is only he who is possessed of the most complete sincerity that can exist under heaven, who can transform.'" "In the 24th chapter there is a ridiculous descent from the sublimity of the two preceding. We are told that the possessor of entire sincerity is like a spirit and can foreknow, but the foreknowledge is only a judging by the milfoil and tortoise and other auguries ! But the author recovers himself, and resumes his theme about sincerity as conducting to self-completion, and the completion of other men and things, describing it also as possessing all the qualities which can be predicated of Heaven and earth."—*Legge, Ch. Class.*, i. Prol. pp. 51–3.

"It may be doubted whether any substantial addition has been made since this period to the range of speculative thought in China ; the doctrines and in most cases the works of these writers are still familiar to the learned ; and even those which are not officially recognised as books to be 'taken up' at the Government examinations, have a more than merely literary interest, because they shew how comparatively slight are the widest differences which spontaneously divide the beliefs and opinions of the black-haired people. The teaching of Confucius himself may be summed up as inculcating imperial democracy, filial piety, and the rules of propriety. The conception of the duty of rulers and the duty of sons met within his written sayings did not originate with him, and rites and ceremonies undoubtedly were observed long before his time ; but it seems probable that he brought into prominence the idea to which China owes, perhaps, most of her merits and defects,—that, namely, of turning every moral precept into a rule of propriety ; so that every point of conduct from least to greatest may be embraced under the same set of regulations, while every virtue for which occasion can be foreseen may be enforced as 'proper,' and vice discountenanced as unfashionable."—*Simcox*, ii. 87–8.

"Confucius appeals to the reason and self-respect of individuals, while inviting them to reform themselves, or to adhere spontaneously to the rules of propriety ; the ruling classes of his day declined to accept the invitation, and to such a flat rejection he had no answer ready. Active resistance or vehe-

ment denunciation are courses for which no rules can be given, since they imply the want of mutual respect and consideration upon which the rules of propriety are based. The revolt of disinterested energy against oppression finds no prompting in his works; but Mencius, though not himself a revolutionist, might have inspired revolutionaries, and perhaps did so in Persia centuries later (i. 128). Potentially there was more difference between Mencius and the master he acknowledged than between either of them and Mih or Chuang-tze, but Mencius did not point to any practical outlet for the feelings he may have stirred; and public opinion in China, as soon as it felt the need for an official philosophy, pronounced itself unequivocally in favour of the tamer and less militant teaching of Confucius." —*Ibid.* ii. 88. For Confucianism as a religion see RELIGIOUS IDEAS.

Yang Chu, "a philosopher of the 4th [? 5th] cent. B.C., mentioned by Mencius and Chuang Tzŭ, founded a school of ethical *egoism*, as opposed to the extreme *altruism* of Mo Ti" [see *infra*].—*Giles, Bio. Dic.*, p. 899.

[Yang Chu, who lived about 500–400 B.C., has been called the Epicurus of China, and is described in the chapter devoted to him by Lieh-tzŭ as preaching a kind of caricature of Taoism, to the effect that men can do no better than follow their inclinations, however selfish and vicious, and everything will be all the same in the end. Lieh-tzŭ strongly condemns him and "says roundly that men who care nothing for integrity and everything for eating are no better than fowls and dogs, and need never hope for the respect of their fellow-men, for they will never get it."]—*Balfour, Leaves*, pp. 123–9.

"Yang and Mih [or Mo = Mo Ti, Mo Tzŭ], the founders of two opposite schools, which Mencius regarded it as his mission to confute, had a narrower ambition, and their leading principles applied only to human conduct. Yang's doctrine, as stated by Mencius, is 'Each one for himself' (*Works*, iii. ii. ix. § 9, vii. i. xxvi. § 1), and the reports of his sayings (none of his writings exist) represent him as a despondent Hedonist and Egoist. According to him the pains of life outweigh its pleasures, and the imagined compensations of posthumous renown are a delusion. Death comes soon or late to all, and the infamous tyrant who is cut short in his sins may have got more enjoyment out of his life than the ruler who has spent his days in hardship, toiling for the service of his people. 'The virtuous and the sage die; the ruffian and the fool also die. Alive they were Yao and Shun; dead they are so much rotten bone. Alive they were Këeh and Chow: dead they are so much rotten bone. Who could know any difference between their rotten bones? While alive, therefore, let us hasten to make the best of life; what leisure have we to be thinking of anything after death?' (*Legge, Life and Works of Mencius*, p. 93)."—*Simcox*, ii. 89.

"It is sometimes argued at the present day, in the West, that this doctrine, 'Let us eat and drink, for to-morrow we die,' must prevail both logically and in practice, wherever the human taste for pleasure is not controlled by revealed religion. Confucius himself, as Dr. Legge observes, though not irreligious, is emphatically *un*-religious, and the same remark applies to the mind of the people of whom Confucius is the chosen teacher; yet so far from the crude Epicureanism of Yang Choo having proved dangerously attractive, he alone has found no champions in posterity, and has added nothing to the common stock of Chinese ideas, except so far as the Taoists have borrowed from him some phrases, in disparagement of laboured virtue."—*Ibid.* ii. 89.

"The leading doctrine of Mih [5th and 4th cent. B.C.] seems so entirely edifying that the general reader will doubtless share the surprise expressed by Dr. Legge and the Prince of Literature, Han-wen-kung, at the zeal with which he is denounced by Mencius, and the habit, which seems to have been common, of bracketing Yang and Mih together, as the authors of disturbing speculations. Mih's principle, according to Mencius, is: To love all equally, and he objects to this as ignoring and denying the special regard due to a father or a sovereign. But from the summary of his views given by a disciple, it seems more as if it were the universality and reciprocity of such affection than its equality which is meant to be insisted on. Mih does not wish people to love their fathers less, but to love everybody else as well (*Works*, iii. ii. ix. § 9). In this he seems to go somewhat beyond Confucius, who explains 'reciprocity,' the one word upon which a rule of practice might be based, by a negative version of the golden rule, not to do to others what we would not have them do to ourselves. But Confucius avowedly regarded the 'loving of relatives' as the chief field for the exercise of the human virtue of benevolence. When questioned concerning the principle of returning kindness for ill-treatment, he said, 'With what then will you recompense kindness? Recompense injury with justice (*Analects*, xiv., xxxvi. §§ 2, 3. Cf. *Plato, Republic*, i. § 332 ff.), and recompense kindness with kindness."—*Ibid.* ii. 89–90.

[Mo Ti "showed that under the altruistic system all calamities which men bring upon one another would altogether disappear, and that the peace and happiness of the Golden Age would be renewed."—*Giles, Hist. of Ch. Lit.*, p. 41. See also *Simcox*, ii. 90–1.

[The works of Lieh-tzŭ were described by a nephew of Marquis Tsêng as bearing a close resemblance to the Bible. It seems doubtful whether Lieh-tzŭ had a real existence (he is said to have flourished *c.* 400 B.C.), and the book bearing his name is evidently of a composite character. T'ang Hsüan Tsung (713–56) raised it to the dignity of a classic by the title of *Ch'ung hsü ching* or Sutra of Fulness and Emptiness.]—*Balfour, Leaves*, p. 83.

"The first chapter contains speculations respecting the nature and attributes of God, and the processes of creation, which, as far as they go, are striking enough and illustrative of that singular independence and originality of thought which forms so honourable a characteristic of the Taoist school. Here for instance is a piece of transcendentalism which occurs on the second page of the book. It would have shocked Confucius.

"'The Origin of Life and Motion.

There is a Life that is uncreated;
There is a Transformer who is changeless,
The Uncreated alone can produce life;
The Changeless alone can evolve change.
That Life cannot but produce;
That Transformed cannot but transform.
Wherefore creations and transformations are perpetual,
And these perpetual creations and transformations
continue through all time.
They are seen in the Yin and the Yang;
They are displayed in the Four Seasons.
The Uncreated stands, as it were, alone;
The Changeless comes and goes;
His duration can have no end.
Peerless and One—His ways are past finding out.'"

"The philosopher, taking as his text a very obscure passage in the Tao Tê Ching—though he quotes the Book of the Yellow Emperor as his authority—then proceeds to show how it is that the Creator is uncreated and the Transformer changeless; averring that the Supreme Power is self-produced, self-transformed, self-shaped, self-manifested, self-intelligent, self-powerful, self-exhausting, self-reposing: though, he adds, to speak of these phenomena as actualities, in the common acceptation of the term, is inaccurate. Then he [describes] the evolution of the visible universe [which proceeded by four stages: the Great Calm, the Great Inception, the Great Beginning, and the Great Concretion. . . . Several passages are quoted, and also a number of the illustrative stories and parables used to enforce Lieh-Tzŭ's main moral of contentment with one's lot in life and resignation to—or rather rejoicing in—death—"the common lot of men . . . rest for the virtuous and a hiding away of the bad . . . just a going home again." Some of these are of great beauty.]—*Ibid.* pp. 86–123.

"Mencius occupies a place midway between Confucius and the various phases of heterodox mysticism."—*Simcox*, ii. 86.

"The distinctive merit of Mencius' philosophy, as compared with the teachings of Confucius himself, is its application to state life, starting, of course, in true Confucian spirit from family relations and filial duty; but his feelings in this respect are essentially democratic, the prosperity of the people being his first care, and loyalty to the sovereign, as taught by Confucius, being of secondary importance. It was not sufficient for governments to provide for the physical welfare of the masses; it was also their duty to educate the people. He despises power and external grandeur if not backed by justice and righteousness; but he is an idealist and expects the world to be better than it can ever be. He does not respect history, and books do not inspire him as infallible. . . . But it would seem that his antagonism was directed mainly against warfare, about which the 'books' had so much to say and which he condemned in the strongest terms, and that he was not so much opposed to the 'Book of History' as to its contents, which did not condescend to prove his theories. Man should and need not fight; he ought, according to Mencius, to be benevolent, for 'the benevolent man has no enemy'—that is what a sovereign should be. Those who boast of their skill in making war are to him great criminals; and all the wars described in the *Ch'un-ts'iu* are unjust. To King Hui of Liang he advises the benevolent administration of government, by lenient punishments, light taxation, etc., thus he would soon be backed by a people who could dispense with warfare, being strong enough to oppose the 'strong mail and sharp weapons' of his enemies, the troops of Ts'in and Ch'u, '*with mere sticks in their hands*' (*Legge, Mencius*, p. 11)."—*Hirth, Anc. Hist.*, pp. 288–9.

"Among the many philosophers who from the days of Confucius down to the end of the Ch'ou dynasty helped to raise decadent China to such a high intellectual standard Mencius impresses us as the clearest in judgment. He is certainly not a mystic; and in common-sense argumentation, by which he tries to sift his problems to the bottom, his work contrasts favorably with the *Tau-tō-king*." It "covers a wide range of philosophic thought, but . . . man in all his relations is its chief concern. In this respect he goes much more into detail even than Confucius, and when compared with him, his detail is characterized by a certain moderation in accepting the observance of outer formalities." "All the important phases of Chinese social and official life are discussed" and his book "appeals to the sympathy of all . . . whose principle of life is" the "never ending self-education of character. . . . Considerably more of the disciple's thought than that of the master himself seems to have retained its eternal value. Benevolence and justice are the great virtues which should govern man's actions in all his relations; of these relations the most important is that between sovereign and people; and sovereigns should cultivate these virtues in the first instance. . . . But . . . the great lesson he gives to humanity at large, is the education of one's personal character. Character is more important than cleverness. Man's life ought to be a constant strife in subduing one's passions, in order to attain to perfection by the dominancy of ethical principles and the suppression of sensual instincts; and all this striving for perfection should not be undertaken for the sake of external rewards, but for the pleasure one takes in perfection itself." "In his political views Mencius was decidedly loyal to the traditional position of the Ch'ou emperor; and he denounced the decadence of his age as being the result of the neglect of loyalty" and lamented the lapse of ancient customs cementing this loyalty. He "devoted a good deal of thought to questions of political economy and to politics generally. He advocated tutelage over the people, though on liberal principles."—*Ibid.* pp. 291–6. See also *Simcox*, ii. 86–7; *Legge, Ch. Class.*, vol. ii.

There remain "the doctrines of the philosophers who had the audacity *not* to approve of Yao and Shun, and the ingenuity to give profounder reasons for the paradox than those advanced by the cynicism of Yang. Confucianism and the Classics agree in conceiving it to be the business of the individual to rule his passions and regulate his conduct so that his life may be in harmony with the permanent influences of heaven and earth, and they agree in considering that the true wisdom of the ruler of men lies, not in imposing his own will upon them from without, but in enabling them to follow, with the tranquillity of external nature, the satisfaction of their normal impulses and desires. The familiar names of Yao and Shun represent to Chinese imagination the realization of this ideal." "At the beginning of the 3rd century B.C. this version of the teaching of antiquity had become again, thanks to the exertions of Confucius, thoroughly familiar to the generations whose lot was cast in the historic period known as the Warring States. The orthodox opinion was that the Middle Kingdom had degenerated, for the third time, as it had done before, prior to the restoration of the virtues of antiquity under Thang the Successful and the never-to-be-forgotten Wen and Wu." "There may have been some excuse for Confucius, who had, as it were, like Hilkiah, re-discovered the Book of the Law, and might hope to inspire a new restorer of the empire; but when centuries had gone by without this result doing anything but recede in probability, it was not unnatural for men to say, If the doctrine of Yao and Shun presided over the foundation of our State, Yao and Shun must have advised amiss or the Commonwealth would not have reached this hopeless plight. But, while Yang and Mih diverge from the ancient paths in directions which bring them nearer to the erratic individualism of Western Europe, Chuang-tze and the philosophic Taoism, of which he is the ablest exponent, differ only from classic orthodoxy in going yet a degree or two beyond the point at which this orthodoxy appears to us most characteristically and exclusively Chinese."—*Simcox*, ii. 91–2.

"Chuang-tzŭ, who denounced Hui Shih as "a man who talks away about everything without reflecting," is himself regarded as a sophist by orthodox Confucianists, and argued (much in the style of the Greek Gorgias) that everything in the Universe is both existent and non-existent.]—*Balfour, Leaves*, pp. 153–7.

"Chuang-tze represents the orthodoxy of his time as regarding the 'discussion of holiness and wisdom and the practice of charity and duty to one's neighbour, as the utmost points attainable' (*Giles, Chuang-tzŭ*, p. 262)," as opposed to the "adherents of Lao-tze," who "make it their aim 'not to interfere with the natural goodness of the heart of man.'"—*Simcox*, ii. 92.

"'There has been such a thing as letting mankind alone; there has never been such a thing as governing mankind' (*Chuang-tzŭ*, p. 119). . . . 'Only bald men use wigs; only sick people want doctors'; and if the State is in a healthy condition, it will only want to be left alone (*ibid.* p. 152)." "This thesis is insisted upon in a variety of forms, with copious illustrations. . . . But the argument is evidently exaggerated in protest against such teaching as that of a later philosopher, Seun-king, who, unlike Mencius, insisted that the nature of man is evil, and 'self-denial and yielding to others are not to be found in it' (*ibid.* p. 77. He was in office 271–264 B.C.), and that it can only be converted to propriety and righteousness by the influence of teachers and laws."—*Ibid.* ii. 93.

"Notwithstanding the quaintness of the style, and the looseness of the reasoning, it is evident that the ideas which Chuang-tze represents are those of a rather aged society. It is always a sophisticated age that believes in the prehistoric bliss of a state of nature; the last word of philosophy is generally a doubt as to the possibility or the value of philosophic certainty: religions begin by inculcating moral duties, and end by denouncing the worthlessness of mere morality, and the spirit of antinomian quietism flourishes when the law and morality of a period have visibly broken down. In the age of the Warring States, robbers of every degree abounded, princes, ministers and heads of clans robbed one another, and private adventurers who adopted the same career in some cases obtained a renown co-extensive with the empire. At the self-same time, philosophers and philosophic schools were multiplied and sages sprang up everywhere, and the people crowded after them excitedly. If the sages did not produce the robbers, the robbers must have produced the sages, unless both alike were the fruit of a general disregard of Tao."—*Ibid.* ii. 93.

"Lao-tze teaches that perfection does not consist in charity and duty to one's neighbour, but in yielding to the normal condition of things. 'Therefore the truly great man, although he does not injure others, does not credit himself with charity and mercy' (*Chuang-tzŭ*, p. 204). He does not seek wealth, nor yet praise for disregarding it: perfect wisdom and virtue are spontaneous, easy, and unmeritorious; their crowning fruit is inaction and indifference, the former so far as the man himself, and the latter so far as his relation to external objects is concerned. Vice is not represented as good, or virtue as evil; but laborious virtue is proved to be a mistake, because the virtue of sages and sovereigns has not availed to keep the world at peace. It is not a virtue, according to Chinese philosophers, to labour in vain, and the Taoists, having satisfied themselves that action modelled upon the examples of Yao and Shun was socially unfruitful, proceeded to include abstention from such vain efforts in their ideal of personal morality. Men have the same duty to the State as to their own body, and the weariness which comes of much serving is an offence against the latter. 'Let there be absolute repose, and absolute purity; do not weary your body, nor disturb your vitality, and you will live for ever. . . . Cherish and preserve your own person, and all the rest will prosper of itself' (*ibid.* p. 127)."—*Ibid.* ii. 93–4.

"The original idea of philosophic Taoism was no doubt that to apprehend all truth it was necessary to cultivate a state of intellectual passivity, in which the superficial distinctions between being and not-being disappear. But the disappearance of these distinctions has a further result; for if Not-being is the same as Being, why should not inaction produce the same results as action, or rather, since inaction is the higher and purer state, results much greater and more valuable? The Classics themselves recognise the idea of immaterial influences radiating from the person of the virtuous sovereign, and the occult action attributed to the possessors of Tao is scarcely more mysterious than that; but while the Confucianists practically contemplate only an imitative or contagious virtue, among those exposed to the harmonising and instructive influence of a Yao or Shun, the Taoists, having lost hold of the limitations of sublunary experience, see no reason why the inactive master of the Way should not remove mountains and live for ever, as well as ramble at pleasure in transcendental space."—*Ibid.* ii. 94.

"Chuang-tze himself does not indulge in much more magical formulæ than Hegel, and his anarchism is only a degree more radical than that of the Shoo-King. He looks upon life and death as immaterial, because both befall in the course of nature, and neither affects the eternal essences of things. Nature, as the great parent, comes in for some of the filial piety which in China is independent of special gratitude for any benefactions over and above the first great gifts of life and nurture. A son must go where his parents bid him, and to a philosopher there is nothing terrible in the idea that his flesh and bones will be scattered over the fair surface of the world, to reappear in fresh combinations. 'For those who accept the phenomenon of birth and death in this sense, lamentation and sorrow have no place,' even at the death of friends; and the desire 'to prolong life, and to do away with one's end,' incurs [according to Lieh Tzŭ, a disciple of Lao Tzŭ] the condemnation due to one who misunderstands his destiny (*Balfour, Leaves*, p. 89)."—*Ibid.* ii. 94–5.

"On the whole, the criticism, assigned to Confucius by this author himself, can hardly be improved upon. 'These men,' he said, 'travel beyond the rule of life. I travel within it; consequently our paths do not meet' (*Chuang Tzŭ*, p. 84). China has two ideal characters—the sage or scholar in office, who 'turns night into day in his endeavours to compass the best ends,' and the sage or scholar in retirement. Confucius wishes the sage to be employed, though admitting that it may be his duty to retire if debarred from executing his virtuous intentions.

The Taoists, on the other hand, see in this daily and nightly toil itself a divergence from the true way, and regard the retired scholar as having chosen the better part."—*Ibid.* ii. 95.

[During the golden age of philosophy in China, there were a set of men, called by the Chinese "garrulous quibblers," who stood in the same relation to Confucius and Lao-Tsze, as did the Greek sophists to Plato and Socrates, propounding and defending paradoxes in order to show their skill in argument. Hui Shih (Hui Tzŭ, 3rd and 4th cent. B.C.) was one of the most famous; he maintained that "heaven is no higher than the earth, that a mountain is as level as a pool," etc.]—*Balfour, Leaves*, pp. 153–7.

"Disinterested logic-chopping, about the hard and white (to which a philosopher of the Chao State devoted a separate treatise), the like and the unlike and the identity of opposites, leads to no practical result, moral or material. The Chinese comment on Hui-tze and his congeners is: 'Of what use was he to the world? . . . Alas for his talents. He is extravagantly energetic and yet has no success. He investigates all creation, but does not conclude in Tao. He makes a noise to drown an echo. He is like a man running a race with his own shadow. Alas!' (*Chuang-tzŭ*, p. 454). All that portion of Western metaphysics—and it is surely not small—which might be described in these terms, as the endeavours of a man to race with his own shadow, was thus rejected in advance, after a brief trial, as of no value to the Middle Kingdom. The chief object of the typical sophist is 'to contradict others and gain fame by defeating all comers.' But this is a dark and narrow way; Confucianists and Taoists agree in desiring a doctrine which shall unite and harmonise instead of provoking controversy, and they agree also in desiring to embrace ethics and physics alike in their theory of the universe."—*Simcox*, ii. 88–9.

"Seun-tsze [Hsün Tzu] . . . a philosopher and politician, whose opinions had great authority about B.C. 255, taught a doctrine, at variance with one of the principal beliefs of Confucianism, [viz.] that man's nature is vicious. One of the twenty chapters into which his works are, at the present day, divided, is entirely devoted to its establishment. Now Seun-tsze also maintained the necessity of governing by physical force. It is admitted by the historians and philosophers of authority, that he was a man of great ability, and of the best intentions, but it is added that his 'doctrines were low'; that in particular, in the one doctrine, 'man's nature is vicious' the 'grand basis' of morality was missed, and that, though he himself did not anticipate the calamities to which his views led, they nevertheless, when carried out to their legitimate consequences by his scholar Le She, a councillor of Che hwang [*Shih Huang*], proved the cause of the much execrated burning of the Sacred Books by that Emperor, and formed the springs of his essentially despotic rule. And, as the power of his house ended with his own life, while the power of the Han dynasty, which followed, and which lasted for centuries, was established by a rule of '*jin e*, benevolence and righteousness,' the disastrous character, alike for prince and people, of Che hwang's policy, is pointed to, as a grand historical example of the consequences of government by physical force, emanating from the doctrine that man's nature is vicious."—*Meadows, Ch. and their Reb.*, p. 390.

"The two social ideals of Chinese thinkers [which influenced the course of Chinese history for more than 2,000 years] are anarchy with the ills of nature tempered to the masses by imperial benevolence, and anarchy with the ills of nature tempered to the wise by philosophic quietism."—*Simcox*, ii. 96.

"The co-existence of political and philosophic discord which characterized" the period of the Warring States (480–221 B.C.) "was a matter of general observation. The official history of the first Han Dynasty observes: 'Amid the disorder and collision of the Warring States, truth and falsehood were still more in a state of warfare, and a sad confusion marked the words of the various scholars' (*Legge, Confucius*, 6th edit. i. 3)."—*Ibid.* ii. 97.

"The men of letters, of whom Confucius is the best known, and Mencius the ablest representative, could scarcely be expected to exercise much influence during these ages of turbulence [end of Period]. The mental activity of the class was nourished from three sources: the doctrines of the ancient worthies, whose ideal of a paternal democracy was preserved in the Shoo and the earliest odes; the satirical protests of virtuous ministers out of work, embodied in the later odes; and lastly, the mental restlessness of their own time, when political instability and social disorders had stimulated a new, if somewhat niggling, intellectual activity, corresponding in circumstance to that of the mediæval Schoolmen, and approximating in its character to that of the Greek Sophists."—*Ibid.* ii. 82.

Political economy.—[Confucius's theory of the production of wealth was crude as judged by modern standards. For the arguments of Mencius in favour of division of labour, see *Legge, Ch. Class.*, ii. Prol. pp. 52–3, 56–7, and text pp. 123–32.]

"Kwanyiwu contended that the wealth of a nation was dependent upon the productive power of the agricultural and manufacturing population. Agriculture was one of the most important elements of national wealth, but could not alone satisfy the wants of the community. If there were no manufacturers, or not a sufficient number of them, to purchase the agricultural production, the agricultural population would not be able to get a profit from its surplus. As to the manufacturing population, Kwanyiwu held that a nation with industrial people would be more prosperous, and the increase of her wealth quicker, than in those nations which consisted of agricultural people only. Kwanyiwu's opinion on capitalists was favourable. He said that rich merchants could render good service to their country; but he did not want millionaires. He advocated that the wealth of a nation should not be held in the hands of a small body. Kwanyiwu was a free-trader, and it was certain that he would not have converted himself into a leader of tariff reform so long as the commercial conditions of his State were strong enough to compete with foreign trade. Confucius was not an economist, and said very little about economics. But he seemed to have known everything, and economics was not beyond his knowledge. In one of his books Confucius said, that the chief principles of economy were these, that the proportion of population in the class of productives should be large and in the class of unproductives small. The power of production should be rapid, while the expenditure of the Government should be moderate. It was quite clear that these few words nearly covered the whole field of economics treated by modern economists. Mengtze,' a great philosopher and politician in China, had economic ideas similar to those of Confucius, Kwanyiwu's view was chiefly directed towards revenue, while the views of Confucius and Mengtze were devoted to social more than to political economy. Neither Confucius nor Mengtze spoke of money-making themselves. They advocated that the real gentleman should love not money, but virtue."—*N.-C. Daily News*, May, 1909.

History.—Even in its imperfect state, the *Shu ching*, or Classic of History, "is a most interesting document, and apart from its historical character, and description of the great flood, it supplies more than hints regarding the principles of government, astronomy, music, agriculture, and other subjects of great importance to our knowledge of those ancient times."—*Wylie, Ch. Researches*, pp. 210–11. See also *Legge, Ch. Class.*, III. i. Prol. pp. 1–9.

"The Shu-king, although hardly a historical authority, and containing many incredible traditions, also avoids miracle-legends; and three books, offered as belonging to it on the recovery of its text, and called 'Natural Prodigies' have fallen away for want of repute."—*Johnson, Or. Rel.—Ch.*, p. 476.

"Whether this work be, as Cuvier called it, 'a moral and political romance,' or, as Cibot asserted, 'the oldest and most remarkable monument of antiquity that we possess,' or whether the truth lies between these two judgments, it seems plain that its object is to provide an ethico-political norm for educational purposes rather than to present a continuous history. It has no chronology. It is a collection of old records, registers, maxims, edicts, royal and ministerial utterances, all tending to illustrate the duties of ruler and ruled."—*Ibid.* p. 487.

"The 'Bamboo Books,' a very old chronicle, running parallel with the Shu, are also, in their original form, free from this element [of miracle-legends]; and the mass of fable which accompanies the text, probably from much later hands, is treated with entire contempt by scholars (*Legge*, Prol. to the *Shu Ching*, 106)."—*Ibid.* pp. 476–7.

"Confucius and Mencius are equally sober historians, and no monarch previous to Yao is mentioned in their writings. (The Hitse, appendix to the Y-king, is now ascribed to a different hand from Confucius. The Kia-yü, which recounts fables in his name, is not received as genuine history.)"—*Ibid.* p. 477. See also *Legge, Ch. Class.*, i. Prol. p. 86.

"The *Ch'un ts'ew*, the last of the five [Classics], is the only one actually written by Confucius, being the history of Loo, his native state, from 722 to 484 B.C. As an incipient effort in the art of history making, it appears to have called forth much admiration and eulogium in early times; but, consisting as it does of a very bald detail of state occurrences, it can scarcely maintain a high position in the judgment of unbiassed critics."—*Wylie, Ch. Researches*, pp. 211–2.

"The matter-of-fact Chinese are no exception to the rule [in the use of the imagination as constructive of pre-historic times]. Their rationalistic genius, however, is apparent, even in the way in which they have conceived their primitive history; and in this respect, as in many others, it brings them into nearer relations with the best modern science than belong to the other Oriental races." "It is true they have fabulous dynasties, beginning with Pwan-ku, as first organizer of chaos, and reaching on for hundreds of thousands of years; lines heavenly, earthly, and human, all previous to Fo-hi and Hwang-te, mythical founders of the State (*Mayers, Ch. Man.*, pp. 361–6; *Mém. conc. les Ch.*, vol. xiii.; *Journ. As.*, Feb., 1846). This primal world was peopled with grotesque, semi-human beings and elemental prodigies (*Ch. Repos.*, 1842). But such fables originated in the later degenerate schools of the Tao-sse, and in books composed during the Han, or possibly as late as the twelfth century (*Mém. conc. les Ch.*, i. 101, 127, 158). They do not represent the national faith. Neither of the recognized historians pretends to commence history before Fo-hi, 2,850 B.C. [? 2953]—a very moderate antiquity compared with the claims of Buddhist or Egyptian dynasties (*Carre, L'Ancien Orient*, vol. i.). No intelligent Chinese believes in the Pwan-ku legends any more than we do in Jack the Giant Killer or Scandinavian troll-wives."—*Johnson, Or. Rel.—Ch.*, pp. 475 6.

The "rationalistic spirit has not forbidden imagination to create its ideal pictures of prehistoric times. Yet the sense of a real distinction between the naturally possible and impossible, and the reference of old records to the test of present experience in the laws of life, have prevailed in China as nowhere else in the ancient world." "This superiority in historic perception is partially due to the habit of referring everything to concrete social and public uses, uncontrolled by religious classes or institutions." "In the ideal picture given of the age of Fo-hi and his successors, we find no nearer approach to supernaturalism than the reference to a very early period of what is properly the result of later growth. The longevity of these patriarchs is so controlled by good sense, as in no case to exceed very much the natural span of life. Their achievements are not wonder-working, but useful inventions, which re-appear, wearisomely enough, in every picture of the mythic cycles, however remote and fanciful (*Mém. conc. les Ch.*, xiii. 176–214). . . . The utilitarian instinct, keeping close to positive knowledge, is lifted by the religion of patriarchalism into a force of imagination capable of building with some freedom on these fields of primitive life. What the Chinese throw back into this period is what most conduces to well-being and positive civility."—*Ibid.* pp. 480–1.

"The assured and sober tone, as well as the great detail of the historians, persuade us that their work cannot but be founded on such documents as they claim to have used. What was thought of the nature of these sources may be illustrated by a conversation recorded of Tai-tsung [A.D. 627]. To his request to be allowed to see what the Board of History had set down about his government, the officer replied:—'No emperor has ever to this day been permitted to do that.' 'Would you write it down, if I did wrong?' 'Prince, I should be filled with pain; but could I, with such a function as mine, dare be false? Nay, more; this very conversation will itself be put, in full, into the Annals' (*De Mailla*, Pref., p. v.)."—*Ibid.* p. 486.

"As we come down to the 'Age of the Warring States' which ended in the destruction of feudalism, and the unity of the empire under the T'sin, a far greater distinctness of details indicates that we are on solid historical ground. The object of narrative seems here to be almost wholly biographical. The Sse-ki chapters are a gallery of war portraits (*Plath, Bay. Ak.*, Feb. 1870, p. 224), and the accounts which have been drawn up from a host of authorities (especially from the *Sse-ki* and the *I-sse*, in which works Plath finds 'a clearer idea of the period than can be formed of many epochs of Western history') by the German Orientalists, Plath and Pfitzmaier, give minute details of internecine warfare between the kingdoms. The total want of significance for us in Chinese names, and the monotony of the narrative, make the story of these wars very dismal reading; and the effect is aggravated by its painful incongruity with the lofty teachings of the Shu-king. Yet it is no worse than the constant satire on the Christian beatitudes presented in the military history of Christendom. We are constantly reminded of Milton's abstract of the old chronicles of the Saxon Heptarchy, and of the strifes of the Hebrew tribes in the time of the Judges."—*Ibid.* p. 493.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

Mathematics.—"The study of arithmetic has attracted attention among the Chinese from very early times, and the notices found in historical works indicate some treatises even extant in the Han dynasty, followed by a great number of general and particular works down to the Sung dynasty. ['Subsequent to this period (Shih Huang Ti) the works (on arithmetic) are too numerous to admit of recording even their titles' (*Wylie, Ch. Researches, p.* 164).] . . . The Hindu processes in algebra were known to Chinese mathematicians, and are still studied, though all intellectual intercourse between the countries has long ceased."—*Williams, Midd. King.*, ii. 67.

"At the commencement of the Christian era, they adopted the decimal system of notation introduced by the Buddhists, and changed their ancient custom of writing figures from top to bottom for the Indian custom of from left to right."—*Williamson, Journeys in N. China*, i. 33.

Chronology.—"It was not till 221 B.C. that a new beginning was appointed for the year."—*Simcox*, ii. 100.

"The Ts'in dynasty (255–206) began the year with the new moon nearest after this 'arrival' [*v.* previous Period], and they counted up the 'superfluities' of each and all the twelve lunations until they amounted to a whole extra lunation. This extra moon was always considered the same for chronological purposes as the one preceding it; thus 'extra sixth moon' is the moon after the sixth; but it is still the sixth, and the regular number twelve thus remains for ever. It is as though we should always call the 29th of February '28th (B),' and consider it part or duplicate of the 28th."—*Parker, China*, p. 293.

The "last month of autumn, the ninth from the first month of spring, was the last month of the year with the dynasty of Zhin."—*Legge, Li Ki*, i. 294, note 1.

"There can be no doubt that before the Han dynasty a list of sovereigns, and of the lengths of their several reigns, was the only method which the Chinese had of determining the duration of their national history. And it would still be a sufficiently satisfactory method, if we had a list of sovereigns and of the years each reigned, that was complete and reliable. We do not have this, however. Even in the early part of the Han dynasty, Sze-ma Ts'een's father and himself were obliged to content themselves with giving simply the names and order of most of the rulers in the dynasties of Shang and Hea. The lengths of the several reigns in the standard chronology have been determined, mainly, I believe, to make the whole line stretch out to the years which had been fixed on astronomical considerations for the periods of Chung-k'ang of the Hea dynasty and of Yaou. . . . The Bamboo Books contrive to shorten many of the reigns, so that those periods shall be less remote than they are commonly placed by about 200 years."—*Legge, Ch. Class.*, III. i. Prol. pp. 83–4.

"The system of dating from the beginning of an Emperor's *nien hao*, or reigning style, began with the Han Emperor Wu." [140 B.C.].—*Ch. Rev.*, xiii. 52.

"The Han dynasty held the third 戌 day after the winter solstice to be the last day of the year [臘]. This word is of the same origin as 獵, to hunt, because on this day the captures of the chase were sacrificed. Owing to the Chinese giving a cyclic character to days as well as months and years, it is possible to count back events within one day to the remotest antiquity. The ursurper Wang Mang made the 12th moon of his predecessor's reign the first of his own. The reason why a 戌 day was fixed on is thoroughly Chinese in its complexity. The Han dynasty's symbol of government was 火; but fire is at its height at mid-day [午] and weakest at sunset [戌, or 7–9 p.m.]; therefore the year should go out on a 戌 day."—*Ibid.* xiii. 54.

"It was in the Han dynasty that it was first attempted to construct a chronological scheme of the history of the empire. For this purpose its scholars employed the well-known cycle of 60 years. . . . The cycle, as it is now universally recited and written, was not employed before the end of the Former Han dynasty, *i.e.*, until after the commencement of our Christian era, to chronicle years at all:—its exclusive use was to chronicle the days. . . . 'For chronicling the years there were the 10 stem names of *oh-fung*, etc., down to *twan-mung*, and the 12 branch names of *shĕ-t'e-kih*, etc., down to *juy-han*. The way of later times, to say that such a year was *kĕă-tsze*, and so on, was not the ancient way' (*Ku Yen-wu*). 'When did this practice of borrowing the cycle names to chronicle the years commence? It commenced in the time of the usurper Mang' (A.D. 9–22). The statement of this writer, that the ancients chronicled years by the names *oh-fung, shĕ-t'e-kih*, etc., is very questionable. . . . So far as my reading has gone, there cannot be produced a single unchallengeable example of the naming of any year by any cycle characters whatever, previous to the termination of the Chow dynasty." "In the Shoo itself the current cycle is used to chronicle days, and days only. Years are specified according to their order in the reign of the sovereign to whom they are referred. Such specification of years, however, is in our classic exceedingly rare."—*Legge, Ch. Class.*, III. i. Prol. pp. 82–3.

"The first attempt to arrange the years in cycles of sixty is found in Sze-ma Ts'een's Historical Records, in a *table* constructed for the purpose of intercalation, and extending over a period of 76 years, the first year being B.C. 103 [? 104]. But instead of using the Chinese cyclical characters, he employs words of two and three syllables, which, considered from a Chinese point of view, must be pronounced barbarous." They were probably of foreign origin. "The characters before in use for the cycle of 60 days were soon substituted for the longer names: but not without some diversity of opinion as to where the cycle should commence. In the chronological Tables given in the Historical Records the cyclical characters have been supplied by a later hand, from B.C. 840 downwards; but in every case the authority of the scholars of Tsin (A.D. 265–419) is quoted. . . . So then the cycle of 60 years cannot have commenced earlier than the Han, and owes its present form to the scholars of Tsin; although the Chinese for the most part still glory in the delusion that it was invented by Hwangte,

(60 × 75 =) 4500 years ago."—*Ibid.* pp. 97–9. See also *Simcox*, ii. 29.

"In the year B.C. 104, the Chinese began to publish an annual almanac and have continued it ever since. The almanac as it now is has a scientific basis, but it is crammed full of superstitious notions of luck, of evil and good physical influences, of the five elements ruling the days in succession, of prophecies of good and evil attached to days. All this is the effect of Han dynasty opinion."—*Journ. P.O.S.*, ii. 148.

"The Chinese divide time by using different cycles, each always starting afresh immediately after it has run off, and . . . one of these is composed of the names of twelve animals, arranged in the following unchanging sequence:

1. 鼠 the Rat.	7. 馬 the Horse.
2. 牛 the Ox.	8. 羊 the Goat.
3. 虎 the Tiger.	9. 猴 the Monkey.
4. 兎 the Hare.	10. 雞 the Cock.
5. 龍 the Dragon.	11. 狗 the Dog.
6. 蛇 the Serpent.	12. 猪 the Pig.

Moving regularly in perpetual rotation, these twelve names are used to count years, months, days, and even hours, and each of these periods is supposed to come under the special influence of the coinciding animal. As the same holds good for the other cycles . . . elements considered of great importance are offered for divination and necromancy." "The principal amongst these is a combination of two cycles numbering respectively ten and twelve characters, arranged in the following order:—

kiah	yih	ping	ting	wu	ki	keng	sin	jen
[chia]	[yi]	[ping]	[ting]	[wu]	[chi]	[kêng]	[hsin]	[jên]
甲	乙	丙	丁	戊	巳	庚	辛	壬
子	丑	寅	卯	辰	巳	午	未	申
tszĕ	ch'eu	yin	mao	ch'en	szĕ	wu	wei	shen
[tzŭ]	[ch'ou]	[yin]	[mao]	[ch'ên]	[ssŭ]	[wu]	[wei]	[shên]

kwei; kiah yih ping ting, etc.
[kuei]; [chia] [yi] [ping] [ting], etc.

癸。 甲 乙 丙 丁, etc.
酉 戌 亥。 子 丑, etc.

yiu suh hai; tszĕ ch'eu, etc.
[yu] [shu] ["hai]; [tzŭ] [ch'ou], etc.

. . . After six rotations of the upper and five rotations of the lower cycle, a full cycle of sixty biliteral terms is formed. This has been used at least since the beginning of the Christian era, to count in a perpetual rotation the years, months and days, thus denominating each by a binomium of characters. The cycle of twelve, or the so-called 'twelve branches' (十 二 支), is also applied to the horary periods of the day (the so-called *ch'ên* 辰 or *shi* [*shih*] 時), the symbol *tszĕ* [*tzŭ*] corresponding to the period from 11 p.m. to 1 a.m., *ch'eu* [*ch'ou*] from 1 to 3 a.m., and so on. Consequently every Chinaman has a horoscope of seven characters which indicate the year, month, day and hour of his birth, and these are firmly believed to determine his fate for ever. It is accordingly of the utmost consequence to avoid any risk of having bad influences exerted upon them by performing acts of importance in years, months, days and hours denoted by other cyclical names. The question then is, *which* cyclical terms work badly upon each other, and to what extent; and China fortunately possesses almanacs which solve this riddle. Indeed, on one of the first pages of those books one is sure to find the twenty-two symbols of the two cycles, strangely mixed up together and arranged in a circle which passes for a production of deep wisdom and ingenious calculation, though nobody can tell us on what principle it is based; diametrical lines passing through the circle enable anyone to see which symbols are situated opposite or nearly opposite to each other and in consequence thereof destroy each other's influence."—*De Groot, Rel. Syst.*, i. i. 44, 103–4.

"It was an easy step, from the original application of the 'twelve branches' to the months, to a duodecimal division of the day; but according to native authorities this was not adopted till the time of Han. It does seem strange that the Chinese should have existed so long without any artificial division of the day; and yet in recording eclipses, where the time of day is a most important item, it is never mentioned."—*Legge, Ch. Class.*, III. i. Prol. p. 96.

"Sze-ma Ts'een . . . does not indeed tell us that they [the Chinese] became acquainted with the cycle of Callipus, either through the Bactrians or the Hindoos; but there is scarcely a shadow of doubt that this was the case. In no other way can we account for the sudden appearance, in Ts'een's History, of a method so far in advance of anything known before in China, and one which had been already employed in the West for more than two centuries. The cycle of Callipus is simply this:—4 × 19 = 76 years = 27,759 days = 940 lunations. . . . The reformation of the Chinese calendar by Sze-ma Ts'een and others, with the help of these numbers, dates from the winter solstice of the year 104 B.C. In order to make this epoch appear as perfect as possible, they overlooked minor differences, though amounting to a whole day in the case of the solstice, and declared that new moon, and winter, and midnight, all coincided, at the commencement of the first of the cycle. From this remarkable epoch all dates before and after were to be calculated by the new method. In constructing a calendar for short periods, or even for a century or two, the method was invaluable; but with unlimited faith in its perfection, the Chinese scholars of that day proceeded to solve by means of it all difficult problems of ancient chronology; and here of course it led them astray." "The chronology of the whole period embraced by the Shoo rests on nothing better than mere conjecture, and imperfect astronomical calculations, made after the reformation of the calendar in the 2nd century B.C. We can have no hesitation therefore in rejecting it."—*Ibid.* p. 100.

"Sz-ma Ts'ien and his father had both been 'recorders' at Court. In his original capacity of astrologer . . . it came about that Sz-ma Ts'ien was instructed [in 121 B.C.] by the Emperor to reform the calendar, which he accordingly did, in conjunction with two successive commissions of *savants*. Amongst many improvements in instruments and systems of observation, one result of these commissions stands out very prominently: three lunations were added to the year B.C. 104, and in all future years the first day was ordered to begin, not as above described so soon as possible after the solstice, but with the lunation during which the sun enters a point in the ecliptic sixty degrees beyond the winter solstice. As one Chinese author says: 'Now for the first time were there clear notions about New Year's Day': and all of them agree that this was one of three great turning points in chronology. This innovation is therefore of extreme importance to us in calculating back Chinese dates, more especially as the birth of Christ occurred during the confiscated period of three months, 104 years later. The day was now divided into eighty-one parts, and the lunation was fixed at $\frac{43}{81}$ of a day over twenty-nine days. A day which included in anticipation the odd half was called a 'male day'; and the day from which the odd half was excluded was called a 'female day.' From this time, too, dates the introduction of 'style dates,' or rather the perfection of the idea which had been incompletely put in action in B.C. 164. Up to then each year had been as our legal years still are: 'First James the Second,' and so on; but ever since then, each Chinese James or John has been in the habit of adopting a 'style' like 'Old Glory' or 'Big Deeds.' This is not so bad when a monarch adheres, as the present dynasty has done, to one style during each whole reign; but when he changes it capriciously every year or two, history gets rather confused."—*Parker, China*, pp. 294–6.

"A short usurping dynasty . . . which intervened for a few years between the Western and Eastern Han, in A.D. 9 appropriated one month (the last) of his predecessor's reign; but I do not know if this act in any way affected chronology. The Eastern Han dynasty (A.D. 25–220) found it desirable to make modifications (A.D. 84) in this reformed calendar; further improvements were made in 'orreries'; and eclipses of the moon were either first discovered or were 'located' in some way I cannot understand. The man who found out all this, one Liu Hung, detected an error of $\frac{35}{10000}$ of a day in the odd quarter of a day which had to be added annually, thus making one day after every 1,460 days. About this time an apparatus half concealed in the earth [see REST. OF UNITY] . . . was invented."—*Ibid.* p. 296.

In the palaces of Chin and Wei red threads were used to measure the shadow cast by the sun. "After the winter solstice the sun's shadow increased by one thread."—*Ching Ch'u sui shih chi, Ko chih ching yüan*, c. 49, *Jih yung ch'i wu lei*, p. 13*a*.]

[A method of measuring the hours by means of a piece of bamboo, marked with the figures of the hours placed in a jar of water, which receded as the water oozed out, is mentioned in *Chêng i, ibid.* c. 1, *Kan hsiang lei*, p. 11*b*.

"In the Books of the Han dynasty" [ended A.D. 263], "the circuit of the heavens is divided into 365¼°; and a degree of the heavens is made to correspond to a day of the calendar. At that time it was taken for granted that a circuit of the heavens" [a sidereal year] "was the same as a circuit of the year" [a tropical year].—*Gaubil, Le Chou-king*, p. 7, n. 4, quot. *Legge, Ch. Class.*, III. i. p. 21, note.

Magnetism.—"The property of polarity was known about six centuries before it was applied to make a land compass [A.D. 600]."—*Journ. P.O.S.*, ii. 153.

"The magnetic needle was used . . . in boats and carriages made for the emperors. There was a wooden figure the hand of which was fitted with a powerful needle and the arm which held it was loosely mounted at the shoulder so as to keep a southerly direction when the figure was turned round. This toy was in use in the first century."—*Ibid.* ii. 153.

Astronomy.—That the Chinese cycle of sixty years is a cycle of Jupiter, as it was with the Hindoos and that they have also the twelve signs, is an argument in favour of the Chinese having borrowed their astronomy from the West before the Christian era. "Another proof that the Chinese borrowed from the Hindoos is the use they made of conjunctions of the five planets. The rise of the Han dynasty, it is asserted, was marked by one of those conjunctions. And as the Hindoo era, *cali-yug*, commenced (B.C. 3102) with a conjunction of all the planets, so the Historian of Han places a conjunction of all the planets in the reign of Chuen-heuh (B.C. 2513—2436, mod. chr.), just at the time when that emperor is said to have corrected the calendar, and fixed the commencement of the year in February. . . . These ancient conjunctions of the planets are utterly unworthy of credit. There was a rough approximation to such a conjunction at the commencement of the Han dynasty, in May, 204 B.C. But the only real conjunction of the five on record is that of Sep. 15, 1186 A.D., in the Sung dynasty. The Chinese in this matter seem to have been servile imitators of the Hindoos; and the Hindoos in their turn borrowed from the Greeks. When the expression 'ts'eih ching' (七 政), 'the seven directors,' is taken in the sense of sun, moon, and five planets, and applied to days, the idea is obviously and confessedly western."—*Legge, Ch. Class.*, III. i. Prol. pp. 100–1.

"The diplomatic missions and military expeditions sent by the Chinese to central Asia brought them into contact with Greek civilization, as well as that of Persia. They learned the epoch of Callipus in astronomy and that the moon shines by borrowed light."—*Journ. P.O.S.*, ii. 148.

"In the period B.C. 100 to A.D. 580, the Chinese . . . used bronze astrolabes to observe the stars."—*Ibid.* ii. 149.

"The first observation of these solar phenomena [sunspots and sun-shadows], according to the *T'u Shu Tsih Ch'êng*, was in the year B.C. 28; and . . . only one other instance is recorded anterior to the birth of Christ, namely, in the year 20. . . . These two phenomena have, together with the two afterwards recorded in the years A.D. 188 and 300, been classed as *black shadows* (*hei ch'i*) on the sun and not as *sunspots* (*hei tzŭ*)."—*Journ. N.-C.B.R.A.S.*, N.S. xii. 91.

Geography.—"It was in the Han dynasty that the Chinese began to hold" indistinct views respecting the antipodes.—*Journ. P.O.S.*, i. 7.

"The Chinese Government cannot be said to have been indifferent to the discovery of the sources of the Ho. The Han . . . sent out special officers to trace the stream to its fountain-head," but their efforts were unsuccessful. *Cf.* later Periods.—*Legge, Ch. Class.*, III. i. 134, note.

[Loss of dominion over territory caused the name to disappear from the annals, as in the case of the Kuen-lun regions, until replaced by speculations of the learned or by rediscovery of the locality in compliance with imperial edict.]—*Richthofen, China*, i. 226.

"Khotan or Khoten is mentioned for the first time, under the name of Yu-tien, in the Chinese annals of the Han dynasty, in the second century B.C. In this period, however, and in the centuries immediately following, we find only geographical notices and those relating to contemporary events."—*Ibid.* i. 48.

"An office for map-making existed under the Han. A commentary of the second century B.C. says . . . that in the Han dynasty, the making of maps was entrusted to the Sz-kung or Minister of Public Works. The method of mapping is not known in detail. . . . A centralised system of survey does not appear to have existed, . . . but the making of the maps was always the business of the provincial administrations. Even, these, however, seem in general only to have issued regulations, but to have left the carrying out of the same to the heads of departments (*fu*) and by these again to the presidents of districts (*hsien*). The system of each district having its own maps, and these being united into a whole, first in each department, and then in each province seems to be very ancient. This arrangement resulted in surveys of very unequal accuracy. . . . Besides the surveys for making general maps, measurements of arable lands for purposes of assessment have been executed from the earliest times, and the size of the very small allotments into which it is divided is accurately known. These measurements are still renewed from time to time, near rivers which frequently change their course; and the assessment of the land-tax revised accordingly, but cadastral maps, in the strict sense of the word, seem never to have been made. Generally speaking, there is a lack of interest in detail, so far as the practical ends of administration can be attained without it; but, where they require it, nothing is too trifling to be carefully registered. The requirements of officials, travellers, and students of geography are fully met by general maps, giving mountains, rivers and towns, with their names, and marking roads and boundaries. The maps, nevertheless, are made with the peculiar conscientiousness characteristic of all Chinese records. No river is marked which does not really exist, and nothing unknown or indefinite is laid down. The instruments used are of the simplest kind, as the Chinese have never invented anything more perfect in this respect, [and have made but a limited use of foreign appliances]."—*Ibid.* i. 388–90.

Botany.—"On the 1st day of the 1st moon, at sunrise, the date-tree should be struck with the back of an axe. This was called *chia tsao*. The commentary [says]: 'If it be not struck, its flowers would bear no fruit, for the seeds might drop of themselves.'"—*Tzŭ shih ching hua*, c. 42, p. 4*a*.

"Someone said that the *t'u ssŭ*, a medicinal plant like sesamum, had no root; but it was explained that it was not the case that it had no root, but that it did not attach itself to anything."—*Lü Shih Ch'un ch'iu*, c. 141, p. 1*a*.

"On the highest mountain tops there were no fine trees, there being too much male power (*yang*). Under the largest trees there was no beautiful grass, there being too much female power (*yin*)."—*Liu Hsiang Shuo yüan, Tzŭ shih ching hua*, c. 142, p. 3*b*.

Alchemy.—"It is fairly certain . . . that alchemy was not known to the Chinese until between two and three centuries later [than Huai Nan Tzŭ], when it was introduced from the West [about A.D. 150]. . . . Lao Tzŭ urged his fellow-mortals to guard their vitality by entering into harmony with their environment. Chuang Tzŭ added a motive, 'to pass into the realm of the Infinite and make one's final rest therein.' From which it is but a step to immortality and the elixir of life."—*Giles, Hist. of Ch. Lit.*, pp. 72–3.

Anatomy, Medicine, Surgery, etc.—[The operation of opening the arm and scraping the bone to remove poison originated in Hua T'o performing it on Kuan Yü, Governor-General of Ching Chou, who had been wounded by an arrow.]—*P'ei wên yün fu*, c. 63, *pên* 4, p. 55*b*.

"Dr. Hua . . . is a mighty skilful physician, and such a one as is not often to be found. His administration of drugs, and his use of acupuncture and counter-irritants are always followed by the speedy recovery of the patient. If a sick man is suffering from some internal complaint and medicines produce no satisfactory result, then Dr. Hua will administer a dose of hashish, under the influence of which the patient becomes as it were intoxicated with wine. He now takes a sharp knife and opens the abdomen, proceeding to wash the patient's viscera with medicinal liquids, but without causing him the slighest pain. The washing finished, he sews up the wound with medicated thread and puts over it a plaster, and by the end of a month or twenty days the place has healed up. Such is his extraordinary skill."—*San kuo chih*, quot. *Giles, Hist. of Ch. Lit.*, p. 278. See also *Giles, Historic China*, pp. 47–9, and *Ch. Rev.*, i. 278.

[Among the medical works of the period are *Shih i tê hsiao fang*, "Proved Prescriptions of Generations of Physicians," by Wei I-lin, and *Pên ts'ao yen i pu i*, "General Ideas omitted from the *Pên ts'ao* supplied," by Chu Chên-hêng. See *Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu*, c. 10, *Tzŭ pu I chia lei*, p. 14*a*, and *I hsüeh chien chin lu, I chi mu lu*, MS. copy (unpaged).]

"Men born on firm earth were valorous; on weak earth, delicate; on yellow earth, large; on sandy soil, small; on 'pacified' earth, beautiful; and on waste earth, ugly."—*Huai Nan Tzŭ, Ko chih ching yüan*, c. 10, p. 1*b*.

"Running water does not turn putrid, nor is the pivot of a door eaten by ants. The human body, blood, and breath are just the same. When a body does not move, the marrow does not circulate; when the marrow does not circulate the breath is suffocated. If it takes place in the head it causes swelling or paralysis; if in the ear, deafness; if in the eye, blindness; if in the nose, shortness of breath; if in the belly, swelling of the abdomen and decay; if in the feet, paralysis of the limbs and numbness."—*Lü Shih Ch'un ch'iu, Tzŭ shih ching hua*, c. 116, p. 2*a*.

"The pure essence of the liver represents wood and its vital fluid, *chên*, the 51st diagram; its colour is azure; its shape like that of a hanging gourd; and its passage communicates to the eye."—*Ko chih ching yüan*, c. 12, p. 5*b*. In the *Po hu t'ung, ibid.* c. 11, p. 18*b*, it is compared to a tree with its branches and leaves.

[Barrenness was attributed to insufficiency of the female power or principle (*yin*) and to inflammation of the blood.]—*Pên ts'ao pei yao*, c. 2, p. 4*a*.

[Medicinal effects were attributed to various fruits—fruit of date-palm to assist respiration, dates for heart and lung trouble, kernel or juice of the olive for choking, etc.]—*Shih lei t'ung pien, Kuo pu*, c. 84, pp. 7*b*, 8*a*, 17*a*, 18*b*, etc.

[P. Cibot says that cinnabar was first used internally as a medicine by the Chinese, towards the end of the 3rd century B.C.]—*Mém. conc. les Ch.*, xi. 306. See also REST. OF UNITY.

"Wang Mang issued an edict that wine should be considered the chief of all medicines."—*Shih huo chih, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 1*a*.

[A tonic medical decoction for the cure of rheumatism is mentioned in *Pên ts'ao pei yao*, c. 1, p. 26*b*; fine powder from persimmon cakes for coughs in *Shih lei t'ung pien, Kuo pu*, c. 84,

p. 4*b*; and vinegar kept for several years as a cure for toothache in *Ko Hung hou fang*, *Yüan chien lei han*, *Shih wu pu*, *c.* 391, p. 16*a*.]

[Anæsthetics are said to have been invented by a doctor named Chua [? Hua] To in the 3rd century, who is also said to have suggested trepanning as a cure for headache.]—*Simcox*, ii. 130.

"A simple decoction of hemp was used in China 1,700 years ago as an anæsthetic in surgical operations, according to a newly-discovered Chinese manuscript in a Paris library."—*Hongkong Daily Press*, Jan. 21st, 1902. See also *Giles*, *Historic China*, p. 161.

[Hua T'o was extremely well versed in medical treatises and medicines. He only used a few kinds of medicines and acupuncture and blistering only in a few spots [on the body]. If the sickness took a vigorous course inwards where it could not be attacked by either of these remedies he ordered [the patient] first to drink wine and then when unconscious from intoxication he cut open his stomach and back and excised the seat of the disease. If it was in the stomach or intestines, he cut a part of them out, cleansed it by washing, and got rid of the diseased portion, and having sewn all up again pasted on a superior kind of plaster. In four or five days the wound was healed, and in one month the place had resumed its former appearance.]—*Hou Han shu*, *Shih lei t'ung pien*, *c.* 62, pp. 8*b*–9*a*. See also pp. 9*b*–10*a*, and *Tzŭ shih ching hua*, *c.* 116, p. 3*a*.

[Acupuncture and feeling the "six pulses" were much resorted to. In the former a needle was used instead of the *pien* stone of the ancients, but the stone needle was not yet obsolete (*Shih lei t'ung pien*, *c.* 62, p. 7*b*].—*Ibid. c.* 116, p. 3*a*.

"Thread of mulberry bark is mentioned in Chinese history as suitable for sewing up dangerous gashes in the body."—*Ch. Rev.*, xiv. 49.

[Numerous works on medicine, surgery, and pathology were produced. See *Yüan chien lei han*, *c.* 322, *Fang shu pu*, pp. 7*b*, 4*a*; *Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu*, *c.* 10, *Tzŭ pu i chia lei*, pp. 5*a*, 5*b*; *Chang Chung-ching shang han lun yüan wên ch'ien chu*, *c.* 1, *Fan li*, pp. 1*a*, 1*b*, 4*a*, 4*b*, etc.; *Shih lei t'ung pien*, *c.* 62, p. 10*a*; etc.]

Political economy.—"The men of letters for the most part remained faithful to the belief that poverty and wealth were equal and correlative evils; but there were not wanting apologists for the existing state of things, who forestalled, after the Chinese fashion, most of the arguments, which have been invented since, in praise of the social utility of wealth. Poor people, it was said (*Sacharoff*, *Ueber das Grundeigenthum in China*, p. 14), who have no property of their own, are able to take a farm from the rich and live as tenants. In time of want and famine, the poor apply to the wealthy for a loan of bread or money. Shopkeepers, artisans, and all the minor industries are supported at the expense of the rich. They make special contributions to the revenues of the State, officials apply first to them for assistance, and thus they are the support of high and low alike. It is true they enjoy great advantages, but when their labours and sacrifices are considered, it will be admitted that they deserve a proportionate reward; even if some act as heartless oppressors of the poor, that must be dealt with in other ways, not by depriving them of property acquired by their personal exertions! If the modern Chinese undervalue the deserts of the trading class, it is evidently not for want of having had the opposite doctrine set before them."—*Simcox*, ii. 111–2.

"The classical doctrine as to the connection between crime and poverty found an able exponent in Ch'ao Ts'o, a general who fell a victim (155 B.C.) to the hostility of the nobles, provoked by his steady resistance to any revival of the feudal system." "'Crime,' he says, 'begins in poverty; poverty in insufficiency of food; insufficiency of food in neglect of agriculture' (*Giles*, *Gems of Ch. Lit.*, p. 74); and he dwells upon the moralizing effect of the tie which holds a man to the soil from which he draws his nourishment in exactly the same spirit as the modern Chinese scholars. . . . Jealousy of the merchant's larger profits is frankly expressed and justified; these men rear no grain crops, their women spin no silk, yet they draw from the labour of others rewards far exceeding those which compensate the husbandman for his necessary toil. The love of gold, silver, and jewels seems to this early economist to be the root of all social evil. . . . The conclusion, that grain should, as far as possible, be treated as the staple currency, is not quite satisfactory. But there is an element of truth in the somewhat Lycurgean theory, and at all events the influence of kindred ideas on the economic development of China has been too considerable to be ignored."—*Ibid.* ii. 112.

"Unfortunately, Chinese scholars had failed to follow the economic ideas of their great teachers [see LATER FEUDAL PERIOD]. They thought that as 'money is the root of all evil,' so economics should not be studied, lest it stain their virtue. They failed to distinguish the difference between the meaning of money making and economics. This great mistake had led economic thought in China, since the time of the Han dynasty, to fatal results."—*N.-C. Daily News*, May, 1909.

"The foreign element of thought had its effect on political science. The statesmen who appeared after Mencius were of Tauist tendencies and liberals in politics. The new ideas of the time operated through them powerfully and the consequence was the overthrow of the feudal system. New ideas worked upon society and produced a revolution which was synchronous with the conquest of China by the military power of Ch'in shi hwang. The age of conservative tradition lasted from B.C. 2300 to B.C. 220. The age of liberal imperialism was then introduced and has lasted ever since. . . . They have only made two experiments in government, the feudal and the imperial. . . . The idea of republicanism never occurred to them."—*Journ. P.O.S.*, ii. 147.

Ethics.—"Yang Hsiung (53 B.C.–A.D. 18) propounded an ethical criterion occupying a middle place between those insisted upon by Mencius and by Hsün K'uang, teaching that the nature of man at birth is neither good nor evil, but a mixture of both, and that development in either direction depends wholly upon environment."—*Giles*, *Hist. of Ch. Lit.*, p. 93; *Bio. Dic.*, p. 901.

"Buddhism as a religious philosophy, appealed to the same class of minds as Taoism, and its greater vogue in China since its introduction is only owing to the fact that it provides for the 'retirement' of persons who are neither scholars nor sages [*cf.* LATER FEUDAL PERIOD]. Buddhism, like Confucianism, has something for all classes, but it provides no formula for practical every-day life; and as the Chinese, like their national teacher, are practical and positive rather than devout, all their serious interests are regulated by Confucius, and only the idle after-beliefs, superstition pure and simple is left for Buddha."—*Simcox*, ii. 95–6.

History.—"History took a mature form and, in the hands of writers of genius, became a noble art and chief aid in Chinese culture, second only to the classics. Philology [? -ists] studied the characters and made dictionaries. . . . Statistical writers wrote on the population and described the empire topographically."—*Journ. P.O.S.*, ii. 148.

The Han "gathered up the past into an epoch of *historians*. Here belong the classic catalogues; that vast cyclopædia, the Sse-ki, covering fifteen hundred years; the reconstruction of the recovered books; the invention of paper, and the compilation of the old 'root characters' for the better transmission of thought."—*Johnson*, *Or. Rel.—Ch.*, p. 441.

"The revival of letters (150 B.C.) after the downfall of the T'sin was the pivot, not of [the] . . . whole literary history only, but of the national life of China; since it assured that supremacy of the literary class which is her motive force. Out of that purgation by fire arose the ethical and historical writings of Confucius in their enduring form. . . . It is evident . . . that the fires of T'sin were far from effectual in any department. The catalogue of the Han revival gives systematic report of thirteen thousand works recovered or gathered in all branches, comprising those of nearly two hundred schools in philosophy, discussing many of our own problems in civil and social science, as well as covering the astrological and divinatory systems which the developed fetishism of the nation had produced. Pan-kou, the compiler, a rationalist of the thinking classes, was not only without faith in these latter systems, but mourns over the degeneracy of his time amid the wealth he records; over careless habits of study, and neglect of the sages. He describes the nine leading schools as a reunion of sick people waiting a physician in a desert. This longing for the past is in the ordinary tone of Oriental philosophers, and no more conclusive against the value of the age he represents than the dissatisfaction of a modern critic whose eye is on an ideal *future*."—*Ibid.* p. 440.

"The earliest historian among the Chinese is Sz'ma Tsien, who flourished about B.C. 104, in which year he commenced the *Sz' k'i*, or 'Historical Memoirs,' in one hundred and thirty chapters. In this great work, which, like the Muses of Herodotus in Greek, forms the commencement of credible modern history with the Chinese, the author relates the actions of the Emperors in regular succession and the principal events which happened during their reigns, together with details and essays respecting music, astronomy, religious ceremonies, weights, public works, etc., and the changes they had undergone during the twenty-two centuries embraced in his Memoirs. It is stated by Rémusat that there are in the whole work five hundred and twenty-six thousand five hundred characters, for the Chinese, like the ancient Hebrews, number the words in their standard authors. The *Sz' K'i* is in five parts, and its arrangement has served as a model for subsequent historians, few of whom have equalled its author in the vivacity of their style or carefulness of their research."—*Williams*, *Midd. King.*, i. 675–6.

"The *She ke*, by Sze-ma Ts'ëen, in 130 books, . . . is much praised for its style, and is exceptional in its arrangement. Commencing with the mythical period of Hwang-te, it reaches down to the emperor Woo-te of the Western Han. A great part of the materials had been collected by Sze-ma T'an, the father of the author. It is divided into five sections: 1, imperial records; 2, chronological tables; 3, eight treatises on rites, music, harmony, chronology, uranography, sacrificial service, watercourses, and weights and measures; 4, genealogical history of the princes; 5, narratives of persons and countries. Much of the original work is lost."—*Wylie*, *Ch. Researches*, p. 217.

"The narrative was subsequently taken up by Pan ku a century and a half later, and completed after his death by a gifted sister, who brought the work down to Wang Mang's usurpation of the throne."—*Giles*, *Historic China*, p. 38.

"Even after the fires of T'sin a single century sufficed to show Prince Ho-kien in possession of several thousand volumes, and the lists of the Han cover every department of study with works that had survived the barbarian edict. Historical researches are believed to have been greatly stimulated by the materials brought together with immense industry during the period which succeeded the persecution of letters."—*Johnson*, *Or. Rel.—Ch.*, p. 485.

"The praises of Père Amyot, contrasting the sobriety of the Chinese historians with the credulity of chroniclers in most other nations, who in similar case would have drawn up labored genealogies and made a wilderness of mythic fancies about Fo-hi and his predecessors, do not seem to be overstrained. These scholars were in fact ripened fruits of the institution of official historiographers. Their function was to study with care the national dynastic annals, recorded and sealed up from public view by these officials age after age, and to compare them with other historical material, amply provided by the national tastes,—vases, inscriptions, astronomical records, and oral traditions. They recognized as fully as we do the distinction between legendary lore and authentic record, and are as fully on their guard against supernaturalism as the critical European inquirer. The writers of the great Chinese histories belonged to a family famous for many generations for their achievements in this difficult function, a family whose reputation was a national treasure. The father of Sse-ma-thsian, consigning to him on his death-bed the task of continuing his great work, said: 'Our ancestors have been illustrious in historical functions from the days of the third dynasty: study their writings.' Like the great Italians, these high officials were at once statesmen and scholars, wrote books and led armies. The 'Grand Historiographer' was a man of the world, a magistrate, who had practical knowledge of the characters of men and of the events of the time; and was educated in the closely criticised task of investigating the truth without fear or favor (*Amyot; Ma Tuan-lin; Remusat, Nouv. Mél. Asiat.*, ii. 132–46)."—*Ibid.* pp. 477–8.

"Even the dynastic lists down to the eighth century, B.C., are far from being accepted by these historians as equally credible with the later annals. But their soberness appears still more in their rationalistic treatment of history itself. Rémusat said of Sse-ma-thsian . . . that in his annals of two thousand five hundred years he never admitted a fabulous account. It would probably be more correct to say that he admitted no miracles. [His accounts of Yao and Shun may be legendary. Chalmers (*Orig. of Chinese*) likens them to Geoffrey of Monmouth's account of the Britons before Cæsar's invasion]."—*Ibid.* p. 476.

Learning.—"But the most remarkable of all events connected with our present period was the general revival of learning and authorship. The Confucian texts were rescued from hiding places in which they had been concealed at the risk of death; editing committees were appointed, and immense efforts made to repair the mischief sustained by literature at the hands of the 'First Emperor.' The schoolmen of the day expounded the records and teachings of the great Sage according to their lights; and although the practical outcome of their labours was later on scattered to the wind by the genius of one man, the bulky commentaries they put together still survive, to be perused by the curious and accepted by the few. . . . Authorship was then enabled to make a fresh start—the very start indeed that the 'First Emperor' had longed to associate with his own reign, and had attempted to secure by such impracticable means."—*Giles*, *Historic China*, pp. 37–8.

"In 190 B.C. the law for the suppression of literary works was repealed by the emperor of the Han then reigning, and a stimulus was given to learning. The historian of the Western Han, which came to an end in A.D. 24, gives a catalogue of works in the imperial library, comprising classics, philosophy, poetry, military tactics, mathematics, and medicine, consisting of 11,292 sections by more than 500 authors."—*Wylie*, *Ch. Researches*, p. 209.

"The princes of the house of Lieu gathered round them a choice school of literati and engaged them in discussions on the history of early times and on philosophical and religious dogmas. They talked about Confucius and Lau tsï, and wrote books for the princes and for the emperor. The subjects on which they wrote were politics, history, popular mythology, architecture and astronomy, and they compiled these works in prose or in poetry. A good number of them remain to us."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 269. The revival was checked by the insurrection which brought the Later Han dynasty to a close.

Period of Disruption (221 *to* 589).—*Table IV.*

Mathematics.—"Before the abacus came into favour in the 14th century, the counting slips called *ch'eu* were in use for a period not less than fourteen centuries and probably more. That kind of bamboo slip called *ch'ien* 籤 used for casting lots in Tauist temples was also employed in part during the same period to count with." "The verb 算 *swan*, calculate, was also employed as a noun to denote bamboo slips used as counters."—*Journ. P.O.S.*, i. 165, 164. Ivory tallies were also used, see *Chin shu*, *Ko chih ching yüan*, *c.* 49, *Jih yung ch'i wu lei*, *p.* 7*b*.

"In A.D. 442, they sent an expedition to measure the shadow cast by the sun on the south side of the gnomon at the solstice of summer in order to determine the latitude."—*Journ. P.O.S.*, ii. 149.

"The . . . duodenary cycles . . ." are "declared by Rémusat to have been incontestably introduced by the Kiehkia-sz or Kirghiz."—*Ch. Rev.*, xiii. 431.

Geography.—"The Chinese Buddhist Fa hien has visited India and written a popular book on the countries through which he passed. Hindoos have taught the Chinese . . . the geography . . . learned by pupils at that time in Buddhist monasteries in the cities of India. China has thus acquired a dim idea of the splendour of the Roman empire."—*Journ. P.O.S.*, ii. 149.

[China was supposed to be surrounded by eight broad oceans.]—*Yen t'ieh lun*, *Tzŭ shih ching hua*, *c.* 6, p. 3*a*.

[In the annals of the Northern Wei and Northern Chou it is said that all peoples west of Kao Chang had deep-set eyes and prominent noses, and that they know neither politeness nor justice, but the inhabitants of Khotan are described as having racial similarity to the Chinese.]—*Richthofen*, *China*, i. 48.

Natural history.—"In natural history, a variety of useful and ornamental plants have been introduced, some from central Asia, and some by sea in the dhows of Arab traders."—*Journ. P.O.S.*, ii. 149.

Botany.—"The *chên* (榛), hazel, is of the same class as the *li* (栗), chestnut; its bark and leaves are like those of the *li*, and its fruit is small but like that of the *chu* (杼), a kind of chestnut, its taste is also the same as that of the *li*. There is another kind whose branches and leaves are like the *liao* (蓼), a species of *polygonum*; it grows more than one *chang* high. It is produced plentifully in Shang T'ang in Liao Tung. The *chên* mentioned in the Odes ('there is *chên* in the hills') had leaves and branches like the *li*; its fruit was like that of the oak, and its taste the same as that of the *li*. Its branches and culms were suitable for making candles."—*Lu Chi Ts'ao mu su*, *Ko chih ching yüan*, *c.* 76, p. 11*b*.

Chronology.—"In 237 the usurping Wei dynasty absurdly shifted a spring month into summer, but in 240 it had to go back to the old way. The first Sung dynasty . . . advanced one step further: a specialist constructed an orrery or globe out of steel [*v. infra*], and in 445 introduced a new calendar. About A.D. 438 it had been discovered that the moon had very small but definite 'superfluities' at the kalends, ides, and quarters. . . . At any rate, the year was found to consist of 365·2425 days—that is, of ·0011 less than it had been before."—*Parker*, *China*, pp. 296–7. See also *Ch. Rev.*, xiv. 49.

"Ts'ae Ch'in says that he [Yu He: died about the middle of the 4th century] was the *first* to distinguish the sidereal year from the tropical, and to bring forward the doctrine of the precession of the equinoxes, which he estimated at one degree in 50 years." He reckoned the circuit of the heavens [= the sidereal year] at 365°·26, rather more than 365¼, and the circuit of the year [= the tropical year] at 365·24 days; rather less than 365¼."—*Gaubil*, *Le Chou-king*, p. 7, n. 4, quot. *Legge*, *Ch. Class.*, III. i. 21–2.

"Under the Sung dynasty [*i.e.*, the northern Sung, which succeeded the Tsin], Ho-Ching-t'een [about the middle of the 5th century] made another alteration in these reckonings, and estimated the circuit of the heavens at 365°·255, and the tropical year at 365·245 days."—*Ibid.* p. 7, n. 4; *Legge*, III. i. 22, note. See also *Nan shih Ho ch'êng-t'ien chuan*, *P'ei wên yün fu*, *c.* 101, pp. 39*a*, 34*a*.

"Over another half-century again elapsed, when, under the same dynasty, one Tsu Ch'ung-chï first discovered an annual error in the sun's movement, owing to the shifting of the North Star one degree from its supposed permanent station. Meanwhile the Toba Tartars were by no means idle; instruments

came from India, probably brought by one or other of the Hindoo bonzes then so influential in North China. In 452 the Tobas introduced a new calendar which had been invented in a petty state called Northern Liang, then under strong Western influence."—*Parker, China*, p. 297.

[The division of the day into 940 parts which now obtained was different from that of the Han dynasty (*Legge, Ch. Class.*, III. i. 23, note).]

[A clepsydra in which one pint of water oozing out of a vessel corresponded to one *k'o* (about 15 minutes), is described in *Hou Wei li han lou k'o fa, Ko chih ching yüan, c.* 1, *Kan hsiang lei*, p. 12*b*.

Chemistry.—"The Tsin dynasty is closing and the Sung dynasty is commencing. The alchemists have been busy in the laboratory and they have combined charcoal with sulphur and saltpetre. Soon the fire-works will be elaborated which are destined to lead later on to the knowledge of gunpowder."—*Journ. P.O.S.*, ii. 149.

"As regards gunpowder . . . it is concluded that—1stly. No proof of its invention by the Chinese can be adduced. 2ndly. There is reason to believe that it may have been introduced from India or Central Asia about the fifth or sixth century of our era. 3rdly. The invention probably found its way into China in connection with the manufacture of fire-works for purposes of diversion; and supplanted at some unascertained period the practice of producing a crepitating noise by burning bamboos as a charm against evil spirits."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 82. See also WEAPONS.

Astronomy.—"The Chinese have made attempts at various times to calculate the distance of the sidereal heavens [see LATER FEUDAL PERIOD]. In the History of Tsin the result of a calculation is given with amusing minuteness. It is said:—'By the method of right-angled triangles the distance between heaven and earth was found to be 81,394 *le*, 30 paces, 5 feet, 3 inches, and 6 tenths!' Another calculator gives 216,781½ *le*. The diameter of the sun is given by one writer as 1000 *le*; and he is said to be 7000 *le* below the heavens (the firmament)."—*Legge, Ch. Class.*, III. i. Prol. p. 91. See also *Chin shu T'ien wên chih, Tzŭ shih ching hua, c.* 2, p. 4*b*.

"Slowly and reluctantly did the Chinese astronomer awake to the recognition of the fact that the position of the equinoxes in the ecliptic was shifting from age to age. With the traditions of 2000 years embodied in the classical literature of his country, and engraven on the tablets of his memory, and with the alteration of a whole sign in the position of the equinoctial points staring him in the face, his mind remained sealed against the entrance of the new idea; and went on in its old ruts by sheer *vis-inertiæ*. . . . The first man in China who took notice of the precession lived in the 4th century of the Christian era (Comm. on Canon of Yaou, p. 21). He was separated from Yaou by a period of 2600 years!"—*Legge, Ch. Class.*, III. i. Prol. p. 96.

"While the Chinese determined the equinoxes and solstices by means of culminating stars and so determined the position of the sun,—though they must have perceived that his position at these epochs was slowly changing,—yet it was the fourth century after Christ ere they discovered the precession of the equinoxes, *i.e.*, about 500 years after it had been discovered by Hipparchus. The name given to the pole star in different dynasties brings out this point more clearly."—*Journ. P.O.S.*, ii. 188. See also ii. 149.

"It is a noteworthy fact that just about the time when Sanskrit influence was being felt in China, the Sung Emperor, A.D. 428, cast an orrery or celestial globe [渾儀] out of steel. The historians say that this was identical with the more ancient 璣衡 which had for generations been used in order to examine the celestial bodies, and to divide the stellar spaces."—*Ch. Rev.*, xiv. 49. See also *Giles, Bio. Dic.*, who gives Ch'ien Lo as the name of the scholar who re-constructed the armillary sphere, and *cf. Wu Chih Lu Chi chuan, P'ei wén yün fu, c.* 101, p. 29*a*.

"It is now generally admitted that the Chinese were the first to discover Sunspots." See table, pp. 94–5.—*Journ. N.-C.B.R.A.S.*, N.S. xii. 92.

"The first observation of an undoubted Sunspot may be said to have been made in the year A.D. 301. From 301 to 1617, both inclusive, fifty-six observations of Sunspots and eight of Sun-shadows have been recorded; but there are long intervals which contain no mention of these solar phenomena."—*Ibid.* xii. 91.

About 500 "one Chang Tsz-sin discovered that the mutual path of the sun and the moon had an outside and an inside; also that the five planets had quick, slow, and retrograde motions, besides being sometimes apparently stationary."—*Parker, China*, p. 297.

[The *Kai tien* system of astronomy (*v.* LATER FEUDAL PERIOD) is also described in the Chin dynasty astronomy as given in the Chin history.]—*Journ. R.A.S.*, xviii. 17.

Meteorology.—[The Chinese belief in a connection between physical phenomena and political events has induced them to be very careful in recording the former, so that we have a guide to chronology in records of eclipses, etc. Many of the portents recorded appear to be apocryphal; others, regarded as miraculous when they happened, might be explicable in the present state of knowledge. "Red rain" is said to have fallen near Nanking and K'ai-fêng-fu, in A.D. 300, and again in A.D. 1336; it is also reported as occurring in Kiang-si in 1879, or 1880. Black rain fell in the reign of Hung Wu, and the Yang-tzŭ river is more than once said to have turned red like blood. The principal disasters recorded are famine, droughts, inundations and the ravages of insects.]—*Balfour, Leaves*, pp. 158–60.

Medicine, etc.—"Koh Hung, an alchemistic author of the fourth century" says: "'Grease of jade is formed inside the mountains which contain jade. It is always to be found in steep and dangerous spots. The jade-juice after issuing from those mountains, coagulates into such grease after more than ten thousand years. This grease is fresh and limpid like crystal. If you find it, pulverize it and mix it with the juice of herbs that have no pith, it immediately liquifyes; drink one pint of it then, and you will live a thousand years. . . . He who swallows gold will exist as long as gold; he who swallows jade will exist as long as jade. Those who swallow the real essence of the dark sphere (heavens) will enjoy an everlasting existence; the real essence of the dark sphere is another name for jade. . . . Bits of jade, when swallowed or taken with water, can in both these cases render man immortal.'" "Both minerals have . . . for a long series of ages held a prominent place in alchemy, or the great art of preparing the elixir of life and the philosopher's stone."—*De Groot, Rel. Sys.*, i. i. 272–3.

The benefit to the teeth of movement, usually obtained by masticating fibrous substances, was recognized by Dr. Pao. "Some one asked: 'How can the teeth be made firm?' Pao P'u Tzŭ answered: 'They should be nursed with *hua ch'ih*, kidney, and soaked with secretion. If in the morning one strikes one's teeth 300 times they will never become loose. Another way is to hold a decoction of *yüan tang*, a *shê chih* pill, or alum pill in the mouth; though the teeth were loose they will become firmer, and if there were worms in them they will die immediately. If one takes *lin fei* powder, the teeth would grow again after being shed."—*Pao P'u Tzŭ, Ko chih ching yuan, c.* i. p. 28*a*.

"Eating too much sugar benefits the flesh, but harms the bones; too much of bitter things benefits the bones, but harms the sinews; and too much of pungent things benefits the sinews, but injures the nerves."—*I lin, Ko chih ching yüan, c.* 11, p. 1*b*.

"In Ko Hung's prescription for choking it says: 'The man dining with the one seized with the choking fit should hold his chopsticks in his hand and say: What are these? The choking one should perform the act of swallowing and reply: Chopsticks. The other should add: If you swallow it down you will immediately find relief.'"—*Shên hsien chuan, Shih lei t'ung pien, c.* 73, *Ch'i yung pu*, p. 17*b*.

"The Taoist priest Li Kên melted lead and tin to make his medicines, which he rolled into pills as large as peas and threw them into the cauldron, using an iron spoon to stir them."—*Pao P'u Tzŭ, ibid.* p. 17*a*.

"There was a man who had a swollen heel which gave him pain. None of the surgeons could diagnose his case, but Hsü Chih Ts'ai said: 'This is the bivalve shell disease, caused by his going to sea and hanging his feet in the water.' To this the patient replied: 'You are quite right.' Accordingly Chih Ts'ai cut open the swelling and produced two bivalve shells as big as the seed of the elm tree."—*Pei Ch'i Shu Hsü Chih-ts'ai chuan, Tzŭ shih ching hua, c.* 116, p. 3*b*.

["Cooling medicine" was said to be dangerous in cases of blood-vomitting and hæmaturia.]—*Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu, c.* 10, p. 6*a*.

"The general use of hot tea as a beverage has . . . contributed to the remarkable freedom from epidemics of modern China: the water boiled for tea is rendered innocuous, and besides, since the habit of taking hot drinks has been formed, it has become usual for those who cannot obtain tea, to drink always *hot* water, instead of cold."—*Simcox*, ii. 130.

"The Caesarian operation (剖脅) is mentioned in Chinese history. About A.D. 285, the Tartar king of Kharashar sent his son to serve as a page at the Tsin Court. His Tartar wife was *enceinte* for 12 months, and finally was cut open; the child lived." *Ch. Rev.*, xiii. 430.

"T'ao Hung-ching, whose style was T'ung-ming, was naturally fond of [studying] medical works, and prepared a supplementary edition of Shên Nung's *Pên ts'ao ching* ('Canon of *Materia Medica*'), in 3 *chüan;* the *Chên Kao*, in 10 *chüan;* and the *Chi yen fang* ('Collection of Proved Prescriptions'), in 5 *chüan*. Almost everyone who consulted these works and made use of [the advice they contained] recovered exceptionally quickly."—*Liang shu, Yüan chien lei han, c.* 322, *Fang shu pu*, p. 10*a*.

"Ko Hung, who gave himself the style Pao P'u Tzŭ, wrote the *Chin kuei yao fang*, in 10,000 chüan."—*Chin shu, Shih lei t'ung pien, c.* 62, p. 7*b*.

"Lei Hsiao wrote out the *Lei Kung P'ao chiu lun* ('Lei Kung's Treatise on Burning and Blistering')."—*I hsüeh chien chin lu*, MS. copy (unpaged).

[For the titles of other medical books written during this period see *Ch'in ting Ssŭ k'u ch'üan shu chien ming, c.* 10, *Tzŭ pu i chia lei*, pp. 5*a*, 6*a*, 13*a*; *Chin shu, Yüan chien lei han, c.* 322, *Fang shu pu*, p. 8*b*; p. 11*a*; *Nan shih Chang Jung chuan, Tzŭ shih ching hua, c.* 116, *Fang shu pu*, p. 3*a*; *Wei shu Ch'ui Yü chuan, ibid.* p. 3*b*.]

Philosophy.—[In the interval between the two periods of Chinese philosophy (*i.e.*, between A.D. 317 and 1034), Chinese thought was practically stationary except for certain speculations repudiated by the school of Chow-tsze, as perversions of the teaching contained in the King. . . . The philosophers of both periods, including Confucius, though they professed to adhere rigidly to the Sacred Books, were nevertheless to some extent original thinkers.]—*Meadows, Ch. and their Reb.*, p. 335.

From the Restoration of Unity to the End of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

Chronology.—"One Liu Ch'oh detected an 'advance and a backwardness' in the sun's motion, and he made a new calendar."—*Parker, China*, p. 297. Another calendar was introduced by Li Ch'un-fêng in 640: see *Ch. Rev.*, xiii. 399, and *T'ang shu T'ien wén chih, P'ei wén yün fu, c.* 101, p. 31*b*.

"Artificial horizons are mentioned at this time."—*Ibid.* p. 297.

"When the illustrious T'ang dynasty had reunited the Empire and gained direct rule over Turkestan, ideas on a larger scale seem to have been exchanged with the West; the old globes and orreries were collected and compared, and after this a fixed system was introduced. An instrument called 'the circuit of heaven,' cast in copper, was in use for illustrating the Ptolemaïc system as distinguished from the 'globe theory.' That Hindoos had influence over the calendar is specifically mentioned, for it is stated that they 'understand the Metonic cycle very well, and keep their records upon palmyra leaves.' It is also certain that 'West Asia' was responsible for a calendar called the *Kiu Chih* (Nine Holdfasts), which, however, was found 'too loose' for general use. About A.D. 665 a very brilliant astronomer named Li Ch'un-fêng introduced a new machine consisting of three concentric circles, representing the ecliptic, the sun, moon, and stars, and the four cardinal points. He also wrote a commentary on the ancient book upon Mensuration [see ABS. MON.]. . . . This zealous scientist pointed out that the divisions of the Metonic cycle and the 72-year period were both irregular, and he introduced a system called 'entering the kalends,' in order to escape the painful spectacle of the moon reappearing on the last day of a lunation. . . . I suppose this is the 'central vitality' and intercalary question cropping up again in another form. . . . Like all Chinese tyrants, she [Empress Wu] tried (in 687) her hand at shifting the moons to suit her whims [changing the 11th moon to the *chêng yüeh*, the 12th to the *la yüeh*, and the *hsia chêng yüeh* to the *i yüeh*], but in 700 it was found necessary to leave the order of months as before [see *Ch. Rev.*, xiii. 400]. A very distinguished bonze named Yih-hing, shortly after her death, introduced a new calendar called the *Ta-yen*, and made some calculations (concerning the varying length of the first days of the moon, and eclipses of other minor dependent bodies) so profound that I cannot even translate them. Alexander Wylie says *Ta-yen* also means a formula analogous to the Hindoo *Cuttaca*. Envoys were certainly sent to Ciampa (the modern 'Faifo' inland from Tourane) to take observations, and possibly they learnt Hindoo methods there; for I noticed many Hindoo ruins when I visited Kwang Nam hard by. In the year 725 a hydraulic wheel was constructed, moving automatically in a direction contrary to the heavens; it was sunk in the ground so as to leave half the sphere above the surface. Two wooden men fixed to it struck a bell every two hours, and a drum every quarter. Two other wheels outside it carried representations of the sun and moon, their motions being regulated so as to fit in with the real time of those bodies [see also *Ch. Rev.*, xiii. 399–400]. In the year 744 the dates began to be counted by *tsai* (courses) instead of *nien* (harvests), but this innovation did not last long. In 761 an attempt was made to put the year back to the winter solstice, but it failed. Nearly a century after all this, one Sü Ang detected 'three errors' in the supposed duration of solar eclipses, and emphasised his discovery by introducing still another calendar. Apparently the allusion is to first contact, totality, and last contact; for modern Chinese astronomers, in describing eclipses, always speak of these, and besides introduce two other sub-phases, one on each side of totality."—*Ibid.* pp. 298–9; and see SUNG PERIOD.

"I have not yet come across any statement setting forth when New Year's Day was put on again to its original place; but I think it must have been in 700."—*Ibid.* p. 300.

"The Fu Lin State hung up a large steelyard; it was weighted with 12 gold [or metal] balls, representing the 12 horary periods. When each period came round, a metal ball fell down. It never varied by so much as a hairsbreadth."—*T'ang shu, Shih lei t'ung pien, c.* 75, *Ch'üan hêng pu*, p. 12*a*. Other contrivances are also mentioned, such as measurement of the length of the day by needle-work by the palace ladies (*T'ang tsa lu, Ko chih ching yüan, c.* 49, *Jih yung ch'i wu lei*, p. 13*a*), by 12 *hibiscus* leaves planted in a stream (*ibid. c.* 1, *Kan hsiang lei*, p. 15*a*), etc.

Magnetism.—"The magnetic needle was fitted with graduated circles not earlier than the seventh century."—*Journ. P.O.S.*, ii. 153.

"The question . . . presents itself, why did China begin with the floating compass and afterwards abandon it? The facts show that the use of the mariner's compass [see following Period] by the Chinese originated in the geomancer's compass which had already been employed on land in the T'ang dynasty. The doctrine of *fêngshui* had at that time become a profession and those who gave it their attention found it possible to make a handsome income by studying professionally any proposed sites for graves or houses and stating in documentary form the probability that they would prove lucky to the owner. These luck prophets used a sort of wooden horizon such as that of our globes, but smaller and having in the centre a hollow or cistern in which a magnetic needle floated on water. Outside of the needle cistern are circles in great variety divided into eight parts for the milfoil divination, 360 parts for the sexagesimal arrangement, ten and twelve parts for the hours, twelve parts for the months, twenty-eight parts for the constellations of the Zodiac, and some other varieties. By using this compass in the T'ang dynasty they found that the needle pointed not due south but east of south to the extent of about three degrees. It so happened that the Chinese professors of *fêngshui* were among the first to observe the variation of the compass. This fact is an additional proof of the correctness of the statement that the Chinese were the first to use the mariner's compass at sea. It shows that they were well acquainted with the properties of the needle already."—*N.-C. Herald*, June 5th, 1891.

Astrology.—By T'ai Tsung's orders "an eminent scholar drew up a report upon the popular manuals of astrology, which were denounced as pernicious and delusive. In pursuance of the delightful Chinese plan of giving reasons for every official decree, it is explained that, according to the astrologers, all persons born at the same day and hour should have a similar fate, which experience proves not to be the case; while many of those who are actually overtaken by the same destiny—as, for instance, the soldiers who perished in a great historical massacre—were certainly not all born under the same constellations (*De Mailla*, vi. 94)."—*Simcox*, ii. 132–3.

Astronomy.—"The Sui astronomers argued, 1200 years ago:—'If the Heavens are like a globe, then the going out and coming in of the Heavens must necessarily cause them to travel in the midst of the water.' It is evident they were dissatisfied with Ptolemaic theories." "The astronomical chapter in the Sui dynasty's history says:—'The whole circuit of the heavens is 365¼ degrees. If divided in the centre, half hangs over the earth, and half encircles the earth below. Hence of the 28 groups of stars, half are visible and half concealed, the heavens revolving like a cart-wheel.'" "The observers of the Sui dynasty . . . remarked:—'The body of a comet possesses no inherent brightness; it derives its brightness from the sun, hence when seen in the evening, it points east, and when seen in the morning it points west.' The only question is what do the Chinese mean by 'pointing.' Possibly exactly the reverse of what we mean."—*Ch. Rev.*, xxi. 54–7.

"The sun is removed from the equator 24 degrees inside and out. If it is far from it it is cold, and if near, hot. The sun in the vernal and autumn equinoxes is removed from the zenith 36 degrees. The degree of the sun's removal from the centre of the earth is the same in the four seasons. The reason that some seasons are hot and some cold is due to the atmosphere ascending and the temperature descending, so that far from the sun it is cold, and near, hot."—*Sui shu T'ien wên chih, Tzŭ shih ching hua, c.* 2, p. 5*a*.

T'ai Tsung "fostered learning, and tried to restore astronomy to its place as a practical science."—*Giles, Bio. Dic.*, p. 462.

"Despite their childish popular views of an eclipse, the Chinese must have known how to calculate them approximately, for on the first day of the third moon of the year A.D. 714 the *T'ai Shih* reported to the Emperor that 'the expected partial eclipse of the sun had not come off.'"—*Ch. Rev.*, xiii. 400.

"Solar *maculæ* were first observed in Europe in the year 807; and . . . in that year the same phenomenon was observed by Chinese astronomers."—*Journ. N.-C.B.R.A.S.*, N.S. xii. 92.

"In the year 633, the T'ang dynasty made an astronomical

instrument called the 渾天儀, which was intended as an improvement upon the observatory (靈臺), introduced by 文王 2,000 years earlier, and upon the 候儀, which appears to have been introduced from India, and perfected by one 斛蘭 of the after-Toba dynasty. The effect of these two was that the divisions of time were unequal (度刻不均), and the equator too rigid a standard (赤道不動), for the correct observation of the moon's courses. The new instrument consisted of three concentric circles; the outermost represented the 六合儀, or divisions of the ecliptic; the second represented the 三辰儀, or sun, moon, and stars, and the third the 四游儀 or four cardinal points. One 李淳風 was the inventor (or introducer) of this instrument, the full name of which was 渾天黃道儀."—*Ch. Rev.*, xiii. 399.

Medicine, etc.—"The kidney rules the marrow. The brain is a sea of marrow and the hair is the flower of the brain."—*Wang Ping chu, Ko chih ching yüan, c.* 11, p. 5*a*.

"The massage doctor taught the cure by massage (*i.e.*, by dispersing or reducing [the disease] and by rest) of the 8 diseases of mankind, viz., diseases of the wind, of cold, of heat, of damp, of hunger, of satiety, of fatigue, and of idleness or listlessness. If [the circulation in] a man's limbs and joints, with the 5 superior and 6 inferior viscera, were stopped, he would fall sick. By the restoration of the circulation, the internal disorder is expelled and external diseases prevented from entering. If a limb were wounded or broken, it could be set right by this method."—*T'ang liu tien, Tzŭ shih ching hua, c.* 116, p. 4*a*.

[It was only in the time of the T'ang that cinnabar became really well known, and it was probably made artificially.]—*Mém. conc. les Ch.*, xi. 306.

[Red honey is stated to have cured a "serious illness" of Princess T'ung Ch'ang in *Tu yang pien, Ko chih ching yüan, c.* 23, *Yin shih lei*, p. 10*a*; vinegar is mentioned as a remedy for a "scale on the heart affecting the eyes" in *Kuang po wu chih, ibid.* p. 9*a*; mule-skin jelly for "diseases of the lungs, liver, and kidneys, as well as consumption of or weakness and soreness of the limbs or body" in *Pên ts'ao kang mu, ibid. c.* 50, *Jih yung ch'i wu lei*, p. 24*b*; tiger's whiskers for toothache in *Yu yang tsa tsu, Tzŭ shih ching hua, c.* 116, *Fang shu pu*, p. 4*b*; and a mixture of powdered bitter ginsêng, gentian, and bear gall as a stimulant to work in *T'ang shu, Kuang shih lei fu, c.* 16, p. 4*b*.]

[The heart was regarded as the seat of vigour, and the kidney of resolution.]—*Pên ts'ao pei yao, c.* 2, p. 1*b*.

[In *Chiu T'ang shu Hsü Ying chuan, Tzŭ shih ching hua, c.* 116, p. 3*b*, Hsü alleges that men of the present time did not understand the pulse so well as those of earlier ages and could not therefore correctly diagnose disease.]

"Wu P'u wrote the *Hua T'o fang* ('The Medical Methods, or Prescriptions, of Hua T'o')," and Wei Sung the *I mên pao chien* ("Precious Mirror of Medicine").—*I hsüeh chien chin lu*, MS. copy (unpaged).

"Sun Ssŭ-miao understood the *Yin* and the *Yang*. He obtained the *Lung kung chin fang* in 30 *chüan*."—*Ch'ien ch'üeh lei shu, Shih lei t'ung pien, c.* 62, p. 7*b*.

[Among other medical works of the period are:—*Ch'ien chin yao fang*, "The Thousand Ounces of Gold Important Prescriptions" [life being worth more than 1,000 ounces of gold], and others by Sun Ssŭ-miao (see *Pi shu yü hua, Tzŭ shih ching hua, c.* 116, p. 4*b*, and *Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu, c.* 10, *Tzŭ pu I chia lei*, p. 6*b*); *Ch'ao shih Chu ping yüan hou lun*, "Chao's Discussions on the Characteristics of Various Diseases," by Ch'ao Yüan-fang (see *ibid.* p. 6*a*); *Wai t'ai pi yao*, "Secret Essentials from the Outer Terrace," by Wang T'ao (see *T'ang shu Wang Kuei chuan, Tzŭ shih ching hua, c.* 116, *Fang shu pu*, p. 3*b*); and revisions of the *Pên ts'ao*, "Herbal," etc., by Yü Chih-ning and Li Chi (see *T'ang shu Yü Chih-ning chuan, ibid.* p. 3*b*).]

Light, heat, etc.—[Red jade from Fu-yü was said to give sufficient light to boil a pot of edibles.]—*De Groot, Rel. Syst.*, i. i. 278.

Gravity.—[The earth and water in Yin and Pin were said to be heavier than in Honan by two-tenths.]—*Yen fan lu, Ko chih ching yüan, c.* 10, p. 1*a*.

Geography.—"We have unfortunately no materials for tracing the period of progress and decay in cartography. After the Han period it seems to have attained a high level under the Sui (589–618) and the first emperors of the T'ang dynasty. . . . According to Neumann, *Asiatische Studien* (Leipzig, 1837), 139 works in 1432 volumes are catalogued under 'Geography' in the literary history of the Sui, while that of the T'ang has 63 authors with 106 works in 1292 volumes. A great part of these related to Central Asia."—*Richthofen, China*, i. 391.

"We have one notice of a survey of the whole of China, during the Tang period, when the study of geography was carried on with the greatest enthusiasm. In 721, a Buddhist priest named I-hang is said to have been commissioned to carry out a triangulation throughout the whole empire. He is stated to have sent his assistants to Tongking, Cochin-China, and Mongolia, to determine the length of the days and nights, and observe those stars which were not visible in Hsi-ngan-fu. His measurements of the gnomon-shadow seem to have extended even to India. In the following century a scholar named Kiatau is said to have constructed a map of China 33 feet long and 30 feet broad, and extending as far as India, Persia, Arabia, and Constantinople. The results of this so-called triangulation are, however, . . . [very] poor."—*Ibid.* i. 390. Richthofen refers for these maps to *Gaubil, Hist. de la dyn. des Thang*, in *Mém. conc. les Ch.*, xvi. 152, and his *Astronomie chinoise*.

"In the first half of the seventh century, when the Tang extended the Chinese power to the westward, we find, for the first time, a new name for Yü-tien, viz. Kiu-sa-tan-na, or Hwan-na, pronounced by the Turkish tribes Khiu-tan and Khutan. The inhabitants are praised for their cleverness, their cheerful and yet gentle disposition, and their politeness in intercourse; they weave cloth, are inventive and industrious, dance and sing, and are all well-to-do. In particular, it is noticed that they have chronicles, and that their written characters, laws and literature come from India. This imitation, it is further said, had modified their character and manners. Their language differed from that of other western nations."—*Richthofen, China*, i. 48.

[Attempts to trace the source of the Ho were continued, but unsuccessfully.]—*Legge, Ch. Class.*, III. i. 134, note.

Philosophy.—Han Yü "advanced a new theory upon the constitution of man's nature, in which he sought to harmonize the conflicting doctrines of Mencius and Sün Tsze, and to prove that human nature is divided into three classes, viz., that in which innate goodness prevails, that which is innately evil, and a third which occupies a middle position, sharing the qualities of the other two. This doctrine was large accepted, until superseded at length by the theories of the schoolmen of the Sung dynasty."—*Mayers, Manual*, p.50.

History and Classical Scholarship.—"History now began to be epitomized (*Schott*, p. 72); the literary examinations were fully organized, the Han-lin installed at their head; the Hiao-king added to the national text-books; and the diffusion and utilization of knowledge crowned the labors of a thousand years. . . . Buddhist monks carried classical works and imperial devotions to bordering lands; and Japan had already the five *King*, the prayers to Buddha, and seventy other works from the 'Central Land' (*Ma-touan-lin, Border Countries*; tr. in *Atsuma Gusa*)."—*Johnson, Or. Rel.—Ch.*, pp. 441–2.

"During the T'ang dynasty a compilation was made under the name of the *Shih san king*, or 'Thirteen Classics.' In this collection three of the commentaries on the *Ch'un-ts'ew* were also admitted to the rank of secondary classics. Of these, the most important and best known is the Tso-chuen, by a scholar named Tso, supposed to have been a disciple of the sage. This is a narrative of events contemporaneous with the *Ch'un-ts'ew*, but so fully developed, and so much superior to the latter, that it has been said, 'In no ancient history of any country have we such a vivid picture of any lengthened period of its annals, as we have from Tso of the 270 years he has embraced in this work.'"—*Wylie, Ch. Researches*, p. 212.

"The classical scholarship of the T'ang dynasty was neither very original nor very profound. It is true that the second Emperor founded a College of Learning, but its members were content to continue the traditions of the Hans, and comparatively little was achieved in the line of independent research."—*Giles, Hist. of Ch. Lit.*, p. 189.

907–960.

Chronology.—"I find in the Kitan history that they had carried off all the astronomical instruments from the Chinese capital (K'ai-fêng Fu) when they raided it in 947, and they had found there a modified calendar introduced by one of the half-Turkish emperors of China in 939. But they seem to have accepted in the end the old system of Tsu Ch'ung-chï (462). . . . As we shall see, the Nüchêns and Mongols both used Tsu's calendar in a modified form for some time."—*Parker, China*, p. 300.

Astronomy.—"The Five Dynasties for the most part continued the arrangements of the collapsed T'ang house. In 956 it is recorded that a Hindoo bonze came 'with some silly yarns about eclipses.'"—*Ibid.* p. 299.

"Among the enormous comets recorded in Chinese history is one in the year A.D. 905 (4th moon of Summer). It appeared every night from the north-west, and extended 'right across the heavens.'"—*Ch. Rev.*, xiv. 223.

[The astronomer Tou Yen predicted between 954–60 the conjunction of the five planets which took place in 967.]—*Ibid.* xv. 183.

Sung Period (960 *to* 1280).—*Table VI.*

Mathematics.—"Mathematics flourished and elaborated a native algebra during this period. Horner, in the year 1819, discovered in England a method for extracting roots to any power and solving equations of all orders. This method was anticipated by the mathematicians of the Sung dynasty. Mathematical studies in China were facilitated by the possession from ancient times of the principle of local value in writing arithmetical quantities."—*Journ. P.O.S.*, ii. 153–4.

"The *Tsïh yuen hae king* is a work on trigonometry by Le Yay, finished in 1248. This is remarkable as being the earliest book containing the *T'een yuen*, a native system of algebra, about which a great deal has been written during the present [Manchu] dynasty."—*Wylie, Ch. Researches*, p. 231.

[A "calculating cord" (*tao*) was used to assist reckoning.]—*Hsiao êrh ya, Ko chih ching yüan, c.* 49, *Jih yung ch'i wu lei*, p. 8*a*.

Chronology.—"When after a period of anarchy the Great Sung dynasty reunited the greater part of China (A.D. 960), the last month of the year was once more changed—that is (apparently) the solstice again began the new year; a new calendar was introduced in 963 [by T'ai Tsu, *v. Giles, Bio. Dic.*, p. 70], and nineteen years later a fresh automatic orrery was invented. . . . In 976, the whole Empire was ordered to hunt for competent astronomers, and a conference of them seems to have resulted in the elaboration of a new globe above mentioned. In 983 there was a change of calendar. During the next century there are numerous mentions made of new clepsydras, astronomical instruments, and further changes in the calendar. A certain Su Sung wrote an illustrated book on these matters, and this book is still in existence; but it appears to me that much of the new mechanical work described therein had already been anticipated. . . . The late Alexander Wylie says that it is 'the oldest work we have on the *Hwăn-t'een* [globe-heavens] system.' But the Mongol history distinctly says that the inventor, in 979, of the then improved orrery was the last man who really understood the same globe system."—*Parker, China*, pp. 299–301.

"Sze-ma Kwang [1019–86] gets the credit of fixing the standard chronology; but . . . Choo He . . . tells us:—'When Kwang first made a chronological scheme, his earliest date was the 1st year of Wei-lëĕ (B.C. 424). Afterwards he extended his dates to the time of Kung and Ho (B.C. 840). After this again, he made his "Examination of Antiquity," beginning with the period of "highest antiquity," but he could give no dates of years earlier than that time of Kung and Ho. It was Shaou K'ang-tsëĕ who pushed the calculations up to the 1st year of Yaou.'"—*Legge, Ch. Class.*, III. i. Prol. p. 83, note.

"The philosopher Shaou [died A.D. 1077], in his *Yüan hui yün shih*, adopted the number 360 as an arbitrary standard, the circumference of the heavens being the basis of his calculations. That being once fixed [at 360°], it became comparatively an easy matter to deal with the other fractional quantities. [It must be observed that the phrase *t'ien chou*, circuit or circumference of the heavens, here changes its meaning; and the value assigned to it, in its former sense, of 365·2575, now to be reckoned in days, is as necessary to astronomical calculations as ever.]—*Gaubil, Le Chou-king*, p. 7, n. 4, quot. *Legge, Ch. Class.*, III. i. 22, note; and see MANCHU PERIOD.

[In 1220 Yeh-lü Ch'u-ts'ai reformed the calendar.]—*Giles, Bio. Dic.*, p. 929.

[The following extract referring to the chronology of the Mongols before they had established their supremacy over the whole of China is introduced as a link with the extracts given under the Mongol Period.] The Mongols being "ignorant themselves, free from priggish Chinese conceit, and anxious to avail themselves of talent and light wherever found, were naturally active in the matter of correct calendars. The Nüchêns, when in 1123 they took the same Chinese capital the Kitans had taken two centuries before, carried off the Sung instruments to Peking, where they suffered much from exposure and rough handling. Moreover, having been manufactured in 1050 for the south, they were not adapted to the meridian of Peking. When the Nüchêns in turn had to fly before the Mongols back to the capital they had once plundered, two clepsydras were the only things they had time to move, and even these were destroyed when the Mongols took the place (modern K'ai-fêng Fu) in 1234. As I have stated, the Nüchêns made use of the system of 462, as slightly modified or perfected by a certain Chao Chï-wei; and this was what the Mongols used at first too, as again corrected by Genghiz and Ogdai Khan's able minister, the celebrated Kitan statesman and author Yelü Ch'u-ts'ai. But in 1267, when Kublai was firmly seated on the throne, a Persian named Djamar ud' Din brought a number of instruments from West Asia, and introduced a second calendar called *Wan-nien* (Myriad Years), which, however, never came into general use. There was a Fulin man, and therefore either a Syrian or a 'Frank,' named Aisie or Isaiah, who also acted as astronomer at the Mongol Court."—*Parker, China*, p. 301.

Mechanics.—[Some mechanical skill was shown by the construction of a "measure mile drum carriage" or taxicab, drawn by an animal. See the quotations given by *Giles, Adv. Sin.*, pp. 223–7, and *cf.* ARTS.]

Astronomy.—[In 976 the Emperor's interest in astronomical and chronological matters was shown by the order to all the department magistrates, under penalty of death, to send to Court all persons versed in those sciences.]—*Hsü t'ung tien ch'i yao, c.* 20, *Hsing*, p. 2*a*.

"The *Sin e seang fă yaou* was written by Soo Sung at the close of the eleventh century. The author had constructed a large celestial globe, with machinery to represent the mechanism of the heavens and illustrate the seasons, the whole set in motion by water power. The work named was written specially to explain the theory of these movements."—*Wylie, Ch. Researches*, p. 230.

In "979 a new orrery, revolving of its own motion without human aid, was invented by the chief astronomer Chang Ssŭ-hsün."—*Ch. Rev.*, xv. 183.

In "1074 one Shên Kua completed certain astronomical instruments," evidently an orrery, sun-dial, and graduated clepsydra."—*Ibid.* xv. 53.

"One hundred and thirty-six years subsequent to Sü Ang's discovery [see REST. OF UNITY], a certain Yao Shun-fu for the first time found that there was even in totality 'an error of floating superfluity,' which I suppose refers to the nimbus or contact."—*Parker, China*, p. 299.

"The sun at the winter solstice is on the outside of the ecliptic. When the sun removes further from the north pole it is *hsiao han*, 'small cold,' 23rd solar term; then the day is long and the night short. In the vernal and autumnal equinoxes the day and night communicate equally, as spring is mild and autumn cool, so then the days and nights are equal in length."—*Sung shih T'ien wên chih, Tzŭ shih ching hua, c.* 2, p. 5*a*.

Geography.—[Chu Hsi's theory of the world is that given *supra* (*v.* LATER FEUDAL PERIOD). Another calculation made its distance from the sun 81,394 *li*, and a third 216,781½ *li*.]—*Williams, Midd. King.*, ii. 142.

"It is in the thirteenth century that we hear for the first time in the Chinese records intelligible accounts of Kipchaks, Alans or Azes, Bulgars, and Russians."—*Parker, China*, p. 123.

Archæology.—"At this period much attention was paid to antiquarian research; bronze tripods, vases, etc., with ancient inscriptions were eagerly sought after and large collections made, to be broken up afterwards when the falling dynasty became weak and impecunious."—*Journ. N.-C.B.R.A.S.*, N.S. viii. 140-1.

Chemistry.—"The theory of the interaction of the five elements has . . . been credited to" Wang Chi, a scholar of the Sung dynasty."—*Giles, Bio. Dic.*, p. 811.

Magnetism.—"About the year 1068, Shên kwa, a very observant and scientific author, wrote of the magnetic needle as pointing to the south but with eastern variation. He speaks of it as employed by professors of *Feng shui*, but not of its use at sea. . . . What Shên kwa says exactly is that the needle is made magnetic by rubbing it with loadstone and it points then to the south but with easterly variation which is constant. He kept a needle in his house and noted these peculiarities himself. It is as difficult, he adds, to know the reason of its polarity as it is to know why the branches of the cypress bend to the west."—*Journ. P.O.S.*, ii. 152.

"The twelfth century witnessed the use of the mariner's compass at sea. The oldest recorded instance is in the year 1122, when a Chinese ambassador going with his suite to Corea in eight vessels kept a diary in which he mentions the use of the compass to know the direction of the ship's course. It was a needle floating in water that was used."—*Ibid.* ii. 151. *Cf.* previous Periods.

Botany.—"When the apricot was brought to the north, it was transformed into the *hsing*, plum, so the northerners knew it not, for the change was caused by the climate."—*P'i ya, Ko chih ching yüan, c.* 74, p. 2*b*.

[A passage in *Tung p'o shih ch'ang p'u hsü, ibid. c.* 68, p. 8*a*, indicates that some plants were supposed to grow without earth.]

Medicine, etc.—"Medicine and the art of healing generally came in for a considerable share of attention at the hands of the Sungs, and many voluminous works on therapeutics have come down to us wholly or in part from this period. Inoculation for small-pox has been known to the Chinese at least since the early years of this dynasty, if not earlier. It was also under the Sungs that the first work on acupuncture was published. It is attributed to the court physician of the day, who, by command of the Emperor, constructed two brass figures of a man and woman, in order the better to illustrate the principles of his art."—*Giles, Historic China*, p. 85.

[The circulation of the vital fluid is referred to and illustrated

in a medical work named *Su wên.*]—*Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu*, c. 10, p. 8*a*.

[The value of a due proportion between working and resting, and eating and drinking were insisted upon by "an aged doctor," and regarded as superior to taking medicine.]—*Pi shu yü hua, Tzŭ shih ching hua*, c. 116, p. 4*b*.

"As a therapeutic agent arsenic came into use about the twelfth century. Long anterior to this, it was—next to cinnabar—the most important of the agents that were employed to transmute the baser metals into gold, and to discover a 'longevity medicine.' Its anti-periodic properties were discovered at an early day; subsequently its other qualities became gradually known."—*Journ. N.-C.B.R.A.S.*, N.S. ix. 178.

"Under the Sung Dynasty the Chinese had three hundred and sixty-five kinds of drugs and one hundred and thirteen kinds of formulæ. But they use rough decoctions, and make tisanes from their drugs; they never make extracts, nor use minute and accurate weights to dole them out."—*Little* (*Mrs. A.*), *Int. Ch.*, p. 266.

"The *pa* bean and pellet (or dung) beetle, ground into powder and rubbed on the wounded place would enable the barb of the arrow to be extracted."—*Ch'ün sui lu, Ko chih ching yüan*, c. 41, *Wu pei lei*, p. 21*a*.

"Hsü Chêng-shu was versed in the medical art. He said: 'The worms in the 5 superior viscera move upwards, but only those in the lungs move downwards. These are difficult to cure, but they may be got rid of with powder made from otter's claws, and the treatment should be administered on the 2nd or 6th day of the month, for on these 2 days the worms in the lungs move downwards."—*Hsi huan ts'ung yü, Tzŭ shih ching hua*, c. 116, p. 4*b*.

"Liu Wan-so set forth the principles of prescriptions. . . . He frequently used cooling medicine, for he followed the climate of the north."—*Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu*, c. 10, p. 12*b*.

[Ho Lao discarded the use of medicine powder. Mugwort was used for cauterizing. Chang Chi-shan was a skilled acupuncturist. This method is frequently mentioned. In some cases the back of the head was pierced. Ch'ên Tzŭ-ming classified the herbal into 8 kinds comprising 260 reasoned processes, to which were attached prescriptions for healing female ailments.]—*Tzŭ shih ching hua*, c. 116, pp. 3*a*, 4*a*, 4*b*; *Pên ts'ao pei yao*, c. 1, p. 10*b*; *Ko chih ching yüan*, c. 11, *Shên t'i lei*, p. 4.

[The practice of inoculation was introduced in 1014.]—*Lockhart, Medical Miss. in China*, p. 226.

A poem by Su tung-p'o is "considered as descriptive of the operation for breaking up and dissolving the cataract. The instrument is compared to the awn or beard of wheat, which is not a bad simile for a cataract needle. It is said that the interior light of the eye checks the candle of heaven, just as a lighted taper in the day hinders vision, and that the pearl within the eye contracts a misty haze. . . . It appears that the operator was careful not to wound any of the blood-vessels, lest the aërial principle which circulates with the blood should escape."—*Lay, Chinese As They Are*, pp. 228–9.

[For names and descriptions of medical works issued during the period see *Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu*, c. 10, *Tzŭ pu I chia lei*, pp. 11*b*, 8*a*, 10*b*; 5*a*; *Sung shih Kao Jo-na chuan, Tzŭ shih ching hua*, c. 116, p. 4*a*; etc.]

"*Medical jurisprudence* has long been an object of study in China. The standard, and the first work on that science was published about 1249 A.D., three centuries before the publication *De Relationibus Medicarum* at Palermo, by Fortunatus Fidelis, the earliest European writer on legal medicine. It is styled *Si-yuen luh* (洗冤錄), and is frequently republished for the use of coroners; but the additions of more than six centuries have been of little value, nor do the Chinese possess any other work on the subject. Although it partakes of the medical superstitions of the land, it is not without merit; it displays considerable research, and it compares not unfavourably with the early attempts of our own writers. Examination of the cadaver never having been allowed, the directions which are given touching enquiries respecting the extinction of human life are more curious than instructive."—*Journ. N.-C.B.R.A.S.*, N. S. ix. 176.

Philosophy.—"The Sung dynasty . . . introduced a Tauist cosmogony into the Confucian orthodoxy, and sought to replace the physical aspects of the Han philosophy by ethical and metaphysical substitutes. A succession of eminent teachers of orthodoxy appeared during the 11th and 12th centuries who gave to the period in which they lived the distinction of being the most philosophical which China has ever known."—*Journ. P.O.S.*, ii. 153.

"Later on, as tranquility prevailed, philosophical and economical disputes and discussions caused great disturbances. Wang-an-shih [1021–86], an innovator of socialistic tendencies, and of great ability, attacked many of the prevailing dogmas of Confucius, and raised a storm of criticism. A materialistic school of philosophy, professing to be based on Confucianism, emerged from the struggle, and the Sung dynasty is as famous for its philosophers as the T'ang for its poets."—*Oxenham, Atlas*, Pref. p. iii.

"The second [period of Chinese Philosophy] began with Chow leen ke, or Chow tsze, who commenced his labours about A.D. 1034: and ended with Choo he or Choo tsze, who died in A.D. 1200." "Choo he . . . is the fashioner of Chinese mental life as it now exists; and is, in virtue of the immense practical effect of his labours, fairly entitled to be considered one of the greatest men that history makes known to us. [He was an able man of affairs, and rose to high official posts.] That a man who lived such a life, and who [had] a mind unusually candid, clear and powerful, should have written one of the best histories of the nation, need not surprise us. . . . In 37 years, he published about 25 separate works. Two of these were historical. . . . The most of the others were commentaries and introductions to the Sacred books which had descended from the first literary epoch; annotated editions of the works of his predecessors in the second epoch; and sketches of the history of philosophy." "[For] a period of six hundred years, his views of philosophy, morality and politics have been supreme in China. At this day, his commentaries on the Yih king and the Four Books are learnt by heart by millions of Chinese, with the text of these works. The Public Service Examinations cannot be passed unless this be done."—*Meadows, Ch. and their Reb.*, pp. 329, 335–7.

"According to Choo-hi, the decrees of Heaven make what is called Nature. 'That which is divided is clear and distinct'; so the first point is to distinguish what we mean by Nature. Nature consists of humanity, justice, propriety, and wisdom. Humanity includes the ideas of gentleness and peace; justice those of fear, force, firmness and resolution; propriety (or the Rites) only include the conception of an external manifestation, which instructs and enlightens, and an external production, which excites and animates. Wisdom consists in seeking, collecting, constructing and forming, without material action or result. Nature is fate, but—Yang Koui-Shan used to say—human passions are not nature. . . . The nature of heaven and earth is also that of man; there is one rule for all, from which there is no escape even by death. Man dies, but he is not entirely destroyed: he possesses no special property entirely peculiar to himself." "We are probably justified in believing that behind the Emersonian sound of the above phrases there is a kernel of hard, rational, and scientific positivism, which has more in common with the scientific side of Spinoza's ethics than with any other European system of philosophy."—*Simcox*, ii. 212–3.

"It took more than a thousand years after the closing of the Yî to fashion in the Confucian school the doctrine of a primary matter. We do not find it fully developed till the era of the Sung dynasty, and in our eleventh and twelfth centuries."—*Legge, Yî king*, Introd. p. 44.

"The years of peace enjoyed by the southern Sung towards the close of the 12th century, when the aggressions of the Kin had ceased and those of the Mongols had not yet begun, were taken up with internal disputes," between the rival schools of "progress" versus "the ancients." Controversies respecting interpretations of the *I Ching* continued. "M. Biot compares the debates upon the *King* carried on at the Imperial court with those of the theologians, who disputed at Constantinople about the interpretation of the Gospels, while the Turks were within a few days' march of the city. . . . The scholars had begun to form parties rather than schools, and were more concerned to effect the ruin of their rivals than to promote the interests of the empire or even to establish those opinions which were the occasion of dispute." "Choo-hi himself was a rather startling and rationalistic commentator," but the reproach of innovation was hurled at him as a party weapon. In 1195 "the people were commanded to adhere to the doctrine of Confucius and not rely upon the authority of commentators."—*Simcox*, ii. 206–8.

"In speculation the method of all these worthies [Chou Lien-hsi, Chang Hêng-Chü, the brothers Ch'êng, and Chu Hsi] is uniform, viz. to seize a first principle and deduce its consequences. . . . Not one of them ever thought of questioning nature by means of a careful induction of particulars. . . . Bound by the yoke of authority and led by a habit of the Oriental mind, they have clung to the *à priori* method even in matters susceptible of easy verification by experiment. Witness that preposterous classification of elements which includes such an organic substance as wood, and omits atmospheric air."—*Journ. P.O.S.*, ii. 130–1.

History.—"In the number and extent of their histories the Chinese stand unrivalled. Their dynastic history alone is a marvel. During the Sung dynasty the *Seventeen Histories*, including so many dynasties, were published in a single work."—*Wylie, Ch. Researches*, p. 217.

[The Sung histories were not considered models of style.]—*Ibid.* p. 217.

"There are double histories, the old and the new, of the Tang dynasty, and also of the five dynasties succeeding, both of which are admitted into the standard collections. The new histories of both these are by Gow-yang Sew, a scholar of established reputation early in the Sung. In the *Sin woo tae she*, or 'New History of the Five Dynasties,' he has departed somewhat from the beaten track, both as to style and arrangement. He omits the memoirs altogether, and divides his work into five sections: 1, imperial records; 2, narratives; 3, researches; 4, genealogical registers; 5, appendix. It was printed by orders from the emperor, after the author's death."—*Ibid.* pp. 217–8.

"The most celebrated [historical] production is the great work of Sze-ma Kwang, entitled *Tsze che t'ung këen* . . . [which] with the various appendices, [comprises] 326 books, [and] embraces a period from the commencement of the fourth century B.C. down to the end of the five dynasties preceding the Sung. . . . [There is also a prefix by Liu Shu dealing with the earliest times.] About a century after the time of Sze-ma Kwang, the *T'ung këen kang mŭh*, which is a reconstruction and condensation of the *T'ung këen*, was drawn up under the direction of the celebrated Choo He."—*Ibid.* p. 218.

"The reader of the Tong-kien of Sse-ma-kwang, his [Sŭ-ma Ch'ien's] descendant (eleventh century), will be surprised to find in this standard history of an Oriental nation, written before the conception of history had dawned upon the Christian mind, a work as severely exclusive of miracle as Tacitus,—a work as secular as Macaulay or Grote, as simple and direct as Herodotus, and as noble as Thucydides."—*Johnson, Or. Rel.—Ch.*, p. 476.

"The *T'ung che* is a historical work belonging to still another class, which has been termed 'separate histories.' The plan is very much the same as that of the dynastic histories, but they are not limited to the stretch of time they embrace, whether it include a great number of dynasties or merely one. The work just named is a history of the empire from Füh-he down to the Tang dynasty. The division of the work is into imperial records, biographies of empresses, registers, compendiums, and narratives. Matters of much interest are found in the compendiums. It was composed in the Sung dynasty by Ch'ing Tseaou, and is in 200 books."—*Wylie, Ch. Researches*, p. 220.

Learning.—"The effect of printing was seen in the increased number of authors on philosophy, the publication of large encyclopædic works and abridged histories, of commentaries on the classics, of writings on the study of the Chinese character, and of illustrated works on ancient bells and vases."—*Journ. P.O.S.*, ii. 151.

During this period "came the engraving of the classics on wooden plates, so that copies could be circulated with cheapness and speed; books were no longer articles of 'vertu,' but open to all; scrolls were superseded by folded sheets; and printing was invented (tenth century). It was natural that this broadening of educational currents should bring an 'Augustan Age' of letters, and especially of *speculative philosophy*."—*Johnson, Or. Rel.—Ch.*, p. 442.

Liao and Kin.

[Yüan So said that it was impossible to cure new sicknesses by the ancient prescriptions, and used new formulæ.]'.—*Chin shih, Tzŭ shih ching hua*, c. 116, p. 4*a*.

[Two medical works—the *Liu mên* and *Erh fa*—by Chang Ts'ung-chêng, are mentioned in *ibid.* p. 4*a*.]

Mongol Period (1280 *to* 1368).—*Table VII.*

Chronology.—"Many learned Mahommedans, from Balkh and Samarcand, accompanied the Western Tartars when they invaded China, A.D. 1278. These men were of infinite service to the state, particularly in imparting to them a knowledge of astronomy, and correcting their calendar."—*Martin, China*, i. 69.

"In 1280 the calendar was revised."—*Giles, Bio. Dic.*, p. 387.

"Hindoo, Syrian, Nestorian, and Arab influence was strong at the Mongol Court. . . . In 1280 an astronomical commission reported to Kublai the result of their labours. They said: 'In the past 1356 years (excluding the changes of the past 174 years) there have been 70 calendars and 13 new methods or schools. We have now decided, counting the fractions day by day, that the time between each solstice, winter and summer, should be $\frac{9}{50}$ of a degree less than the Ta-ming calendar [*i.e.* the modified one of A.D. 462]. In the said calendar each year is 365 days, 24 hundredths and 25 ten-thousandths; these 25 ten-thousandths being the annual superfluity of the present calendar to make junction with the moon.' They went on to say, in connection with the sun's orbit and the moon's 'separation,' that three-tenths of a day would have to be added to the Ta-ming numbers. There are other matters . . . which seem to refer to right and left ascension, azimuth distances, and so on. . . . Anyhow, each degree was to be henceforth divided into exactly 30 parts, and sunrise, sunset, etc., were to be calculated from Peking instead of K'ai-fêng: 62 and 38 'quarters,' or hundredths of a day, respectively, were to be the standard for longest and shortest days and nights."—*Parker, China*, p. 302.

"Another thing decided about this time was that 'in 24 hours the moon gets 12 degrees ahead, and catches up the sun in 29·53 days."—*Ibid.* p. 302.

"The real cycle of the Mongols, which was also that of the Chinese [*v. supra*], runs: 1. Rat; 2. Ox; 3. Tiger; 4. Hare; 5. Dragon; 6. Serpent; 7. Horse; 8. Sheep; 9. Ape; 10. Cock; 11. Dog; 12. Swine. But as such a cycle is too short to avoid confusion, it is combined with a coefficient cycle of *ten* epithets in such wise as to produce a 60-year cycle of compound names before the same shall recur. These co-efficient epithets are found in three different forms: (1) From the Elements, Wood, Fire, Earth, Iron, Water, attaching to each a masculine and feminine attribute, so as to make 10 epithets. (2) From the Colours, Blue, Red, White, Yellow, Black, similarly treated. (3) By terms without meaning in Mongol, directly adopted or imitated from the Chinese, *Ga, Yi, Bing, Ting*, etc. . . ." "This Calendar was carried by the Mongols into all their dominions, and it would appear to have long survived them in Persia. . . . The Hindus also had a 60-year cycle, but with them each year had an independent name. The Mongols borrowed their system from the Chinese, who attribute its invention to the Emperor Hwang-ti, and its initiation to the 61st year of his reign, corresponding to B.C. 2637."—*Yule, Marco Polo*, i. 435–7 (2nd ed.).

"Pauthier (pp. 515 *seqq.*) gives some very curious details from the Annals of the Yuen. In the accounts of the year 1328, it appears that no less than 3,123,185 copies [of the almanac] were printed in three different sizes at different prices, besides a separate almanac for the *Hwei-Hwei* or Mahommedans. . . . The price was 1 *tsien* or cash for the cheapest edition, and 1 *liang* or tael of silver for the *édition de luxe*. . . . We may note that in Polo's time one of the principal officers of the Mathematical Board was *Gaisue*, a native of *Folin* or the Byzantine Empire, who was also in charge of the Medical department of the Court."—*Ibid.* i. 448–9 (3rd ed.).

"Under the Yuen dynasty, Kwoh Show-king [died A.D. 1316], on a comparison of ancient and modern observations, fixed the circuit of the heavens at 365°·2575, and the tropical year at 365·2425 days. The accumulation of decimal figures, however, in both of these quantities" [while the degree was made to correspond to a day] "made all calculations founded upon them difficult."—*Gaubil, Le Chou-king*, p. 7, n. 4, quot. *Legge*, III. i. 22, note.

"In the court of the old observatory at Peking, is preserved, with a few other ancient instruments which date from the Mongol era, a very elaborate water-clock, provided with four copper basins embedded in brickwork, and rising in steps one above the other."—*Yule, Marco Polo*, i. 365–6 (2nd ed.).

"At Pekin one of their [Mongol] Emperors had erected in the grounds of the palace a lofty tower of porcelain, at enormous expense, and had arranged an ingenious contrivance at its base for denoting the time. Two statues sounded a bell and struck a drum at every hour."—*Boulger, Short Hist.*, p. 81.

Astrology.—"There are in the city of Cambalac, what with Christians, Saracens and Cathayans, some 5000 astrologers and soothsayers, whom the Great Kaan provides with annual maintenance . . . and they are in the constant exercise of their art in this city. They have a kind of astrolabe on which are inscribed the planetary signs, the hours and critical points of the whole year. And every year these Christian, Saracen and Cathayan astrologers, each sect apart, investigate by means of the astrolabe the course and character of the whole year, according to the inclinations of each of its Moons, in order to discover by the natural course and disposition of the planets, and the other circumstances of the heavens, what shall be the nature of the weather, and what peculiarities shall be produced by each Moon of the year; as for example, under which Moon there shall be thunderstorms and tempests, under which there shall be disease, murrain, wars, disorders and treasons; but always adding that it lies with God to do less or more according to His pleasure. And they write down the results of their examination in certain little pamphlets called *Tacuin*, and these are sold for a groat to all who desire to know what is coming." "And if any one having some great matter in hand . . . desires to know what will be the upshot, he goes to one of these astrologers and says: 'Turn up your books and see what is the present aspect of the heavens, for I am going away on such and such a business.' Then the astrologer will reply that the applicant must also tell the year, month, and hour of his birth; and when he has got that information, he will see how the horoscope of his nativity combines with the indications of the time when the question is put, and then he predicts the result, good or bad, according to the aspect of the heavens." "The Tartars reckon their years by twelves; the sign of the first year being the Lion, of the second the Ox, of the third the Dragon, of the fourth the Dog, and so forth up to the twelfth. . . . And the father of a child always takes care to write these particulars (of the year, month, day, hour and moment of birth) in a book."—*Yule, Marco Polo*, i. 432–4 (2nd ed.).

Astronomy.—"The *Kih seang sin shoo*, by Chaou Yew-k'in, appeared during the Yuen dynasty, and differed in several particulars from the orthodox views of the time. It ascribes the length of the day, not to the distance of the sun, but its altitude, and the heat of the atmosphere to the accumulation of air. The planets are made to circle round the earth in parallels of declination, while they revolve round the pole of the ecliptic in tortuous paths. It ascribes the apparent increase in the size of the sun near the horizon to its nearer approach to the earth than when in the zenith. In other matters also it deviates from the received doctrines."—*Wylie, Ch. Researches*, p. 230

[During the Yüan dynasty only one instance of the occurrence of sunspots is recorded, namely in 1276.]—*Journ. N.-C.B.R.A.S.*, N.S. xii. 91.

Geography.—The discovery of the exact source of the Yellow River "engaged the earnest attention both of the ablest Mongol and the most ambitious Manchu Emperors."—*Parker, China*, p. 9. *Cf. Legge, Ch. Class.*, III. i. 134, note.

"Even the geographical description [by Rashid-eddin] of the different provinces of the empire is tolerably circumstantial and correct, considering the great distances and the imperfection of the available maps."—*Simcox*, ii. 231.

Anatomy.—"Wang Hao-ku said: 'Water rules the three *ching* (經), organs (*lit.*, bloodvessels)—spleen, lungs, and kidneys. There are five superior and six inferior viscera, and twelve *ching*, parts and organs. The upper parts are the head and face; the middle part, the four limbs; and the lower parts, the feet and heels; the outer part, the skin; the middle part, the muscles; and the inner part the tendons. The pulse has differences of measure and distinctions of rising and sinking. To all cellular dropsy purgatives should not be rashly applied; one should examine what *ching* or what viscera is diseased."—*Pên ts'ao pei yao, c.* 2, p. 16*b*.

History.—Among works "on the Constitution is the 'Complete Antiquarian Researches' of Ma Twan-lin (A.D. 1275), in three hundred and forty-eight chapters. It forms a most extensive and profound work, containing researches upon every matter relating to government, and extending through a series of dynasties which held the throne nearly forty centuries."—*Williams, Midd. King.*, i. 681.

"The *Wän hëen t'ung k'aou* [published 1319], by Ma Twan-lin of the Sung, is a work well known to European scholars, from the frequent quotations and extracts made by sinologues. It consists of 348 books, which include a period from the commencement of history to the early part of the thirteenth century, very near the author's time. He has expanded the eight sections of the *T'ung tëen* into nineteen, and added five more, on bibliography, imperial lineage, appointments, uranography, and phenomena. It has been wrongly named a cyclopædia by Europeans."—*Wylie, Ch. Researches*, p. 220.

"Ma-touan-lin (thirteenth century) resigned office for the sake of studies which resulted in his vast cyclopædia, of which it has been said that 'one has but to choose his subject, he can study it in Ma-touan-lin' (*Remusat*, ii. 170)." "Ma-touan-lin called his work, 'Profound Researches in Ancient Monuments.' And its sources demanded critical studies that justified the title. The standard Chinese histories are results of repeated revisals of the older works. Sse-ma-thsian apparently had at his command, in the treasures of the ancestral temple of the House of Tcheou, every form of literary monument, except the modern popular journal (*Plath, Wien. Ak. d. Wissensch.*, Jan., 1870). The literary resources of Ma-touan-lin must have been almost unlimited." "The Chinese, above all these nations [Hindus, Hebrews, etc.] except perhaps the Greek, have been gifted with the 'historic sense.' They have clear consciousness of an objective basis, independent of constructions by fancy, and corresponding to the modern conception of scientific law."—*Johnson, Or. Rel.—Ch.*, p. 479.

"Choo He's doubts about the authenticity of the Books and commentary ascribed to Gan-kwŏ were plainly enough indicated; but his expression of them was not very decided. The suspicion, once given out by such an authority, went on to grow. Under the Yuen dynasty, about the beginning of the 14th century, Woo Ch'ing published his 'Digest of Remarks on the Shang Shoo.' . . . His Work contains none of the Books which were decyphered by Gan-kwŏ. He rejects also the 'Great Speech' which Fuh-săng gave, believing that it was not originally among his Books, and confines himself to the other 28, which he believes are all of the Shoo that we now have."—*Legge, Ch. Class.*, III. i. Prol. p. 36.

"During the Yuen dynasty, Wang Yew-hëŏ published his researches on the *T'ung këen kang mŭh*. In 1359 Seu Chaou-wăn completed a critical examination of the same."—*Wylie, Ch. Researches*, p. 218.

Ming Period (Restoration of Chinese Supremacy) (1368 *to* 1644).—*Table VIII.*

Western science.—"After Ricci's death, Pantoja, Rho, Schaal, and other distinguished Jesuits succeeded to his influence; they rendered considerable service to the Chinese in the manufacture of guns, the calculations of eclipses, and matters of science generally."—*Parker, China*, p. 89. See also *infra, Chronology, Magnetism, Astronomy*, and *Geography*. A French investigator has stated that spectacles were "an ancient discovery of the Chinese," but according to Prof. Hirschberg it is certain that they were introduced from Europe in the fifteenth century.

Mathematics.—"The abacus with its balls and rods . . . came into use by the entire Chinese nation from the beginning of the Ming dynasty."—*Journ. P.O.S.*, ii. 154. *Cf.* however, previous Periods.

"Down to the end of the Ming dynasty, these branches [arithmetic and algebra] made slow progress."—*Williams, Midd. King.*, ii. 67.

Chronology.—[Ricci presented to the Emperor a clock that struck the hours; clocks and watches that merely marked the time were apparently already known. A tower was built to accommodate it.]—*Simcox*, ii. 266.

"In 1613 the President of the Nanking Board of Works, a Christian convert, is said in the Annals to have recommended 'certain strangers from Europe' as qualified to correct the calendar, which had got into such a state that eclipses of the sun and moon were not correctly foretold. This recommendation is reported without note or comment; but in 1629 a similar recommendation by another high officer, the Christian known as Paul in the writings of the missionaries, is followed by the nomination of four Europeans, whose names are given, as members of the Board of Astronomy, in which capacity, the annalist adds, 'they distinguished themselves.'"—*Ibid.* ii. 267.

"The belated Ming historians, writing in 1742 of the period 1368–1644, complacently congratulate themselves that 'in no science have we advanced more than in astronomy.' They count only sixty-two changes of calendar from ancient times up to the reign of Kublai, 'whose calendar we followed in a modified form for 270 years, but always concurrently with the Mussulman calendar, until we began to find eclipses going wrong.' In their opinion the three great standard calendars of history are the one of the eunuch in B.C. 104, that of the priest in A.D. 728, and that of 1281. So far as I can understand the subject, they style the calendar which Kublai published in 1281 th, *Shou-shi*, or 'Time-giver,' and the slightly modified form of it accepted by themselves (to suit Nanking), the *Ta-t'ung*, or 'Universal.' When the capital was in 1420 permanently transferred to Peking, confusion arose once more. But it also appears that the founder (1368–98) in 1382 caused the Mussulman calendar which he found at Peking to be translated and used as well; its use was, however, partly abandoned after his death. This calendar, which was translated with the assistance of an *ulema*, named Masha Ike, is defined as having 'been made by Mahomet of Medina, beginning in 599, the year when his rule began.' (It has been explained by Gabriel Devéria how the Chinese came to retrospectively mistake the year of the Hegira, owing to the fact that a Mahometan lunar year did not coincide even approximately with either a Christian or a Chinese year). The Chinese adaptation of it had no intercalary moon, and the sidereal year consisted of 365 days of 12 months, with one intercalary day in every $4\frac{1}{2}$ years, or 31 in 128 years. At the same time it had a lunar year of 354 days in 12 lunations, each one of either 29 or 30 days, with 11 intercalary days in 30 years, but always in the 12th moon, the solar and lunar years and days coinciding every 1,941 years. The important remark is added that this Mussulman calendar was practically the same in principle as the 'Nine Holdfasts' of the T'ang dynasty, and also as the one made for the Mongols by Djamar ud' Din. It begins with the 'Arabi' year 599, and 360 degrees (each of 60 minutes, each of 60 seconds) make one daily revolution of the heavens, 30 degrees going to a 'mansion.' One daily revolution of the sun is 1,440 minutes, contained in 96 quarters, or 24 hours; beginning at noon, spring equinox, sign Aries. There are seven days to a week, and the solar months are consecutively of 31, 31, 31, 31; 32, 31; 29, 29; 30, 30, 30, 30 days. Eclipses of the sun are considered to take place 'before or after noon of a given day,' *i.e.* the day begins at noon."—*Parker, China*, pp. 302–4.

"It is not easy to say how far the historians of the Ming dynasty, who did not complete their labours until a century after its fall, echoed the opinions of Ricci, Pantoja, des Ursis, Longobardi, Schaal, Torrenz, etc., or of their native friends the Chinese astronomers Paul Zi and Paul Li. Their story is that, whilst no instruments can be absolutely exact, the ancients worked entirely by 'triangulation' (or whatever *kou-ku*, 'the long and short sides of a right-angled triangle' may mean), and 'never got beyond adding or subtracting errors' discovered. The Mongols advanced a step beyond mere arithmetic, and 'calculated the heavens purely,' by which, I suppose, they mean 'algebraically.' Unfortunately Kwoh Shou-king's works have perished, but those of his contemporary, Li K'ien, partly survive, describing the use of Euclid, the telescope, arcs, ascensions, planes,' etc. The defects of the Mussulman calendar (which, however, was better than either the 'Nine Holdfasts' or the 'Myriad Years') arose from the fact that it was written in a strange tongue, and all calculations were made from an 'earth platform' (? unsteady emplacement). It is added that the Mussulman eclipse failed in 1527, but turned out right in 1583. It was found that in about 1,700 years the winter solstice had got three days wrong—apparently in the Mongol-made calendar —'owing to the Mongols having misquoted the Han records.' Paul Zi, having proved one eclipse, secured the appointment of Chief Astronomer. He demonstrated that the chief trouble arose from shiftings of the dynastic capital. In 1292 Kwoh Shou-king at Peking had found the error to be 0·24·25 of a day, but Zi made it 0·24·21. After Zi's death in 1633 fearful squabbles took place between rival astronomers, to cut which short the Emperor in 1643 by decree ordered the European system to be adopted; it was defined as being 'the same as the Mussulman, but more exact.' Previous to this time the Ming calculations had been based upon the incomplete Mongol system, but without the indispensable 'rapid means' (? logarithms). In 1384 the tropical year was found to be 675 seconds short of $365\frac{1}{4}$ days, that is, according to the old decimal system, 365 days, 24 'quarters,' 25 decimals; if we add the 'sidereal error' or annual precession of 1 quarter 50 decimals, we get 365·25·75 for a complete revolution. The longest Pekingese day has $15\frac{1}{4}$ hours *plus* $12\frac{3}{5}$ minutes (61 quarters, 84 decimals), and the shortest $9\frac{1}{2}$ hours *plus* $2\frac{2}{5}$ minutes (38 quarters, 16 decimals)."—*Ibid.* pp. 304–5.

Chemistry.—"Li Shih-chên said: 'Mercury contains poison: if cinnabar be heated and salt and alum added it becomes calomel."—*Pên ts'ao pei yao, c.* 4, p. 15*a*.

Magnetism.—"In the 16th century, the Chinese improved their compass by observing the way in which the Japanese compass was constructed. The Japanese had been taught by the Portuguese how to make it. When a Japanese junk was captured on the Chinese coast, the compass served as a model, and from this time the Chinese made *dry* compasses with the needle resting on a pivot. . . . About 1150, the needle exhibited true eastern variation."—*Journ. P.O.S.*, ii. 152–3. *Cf.* previous Periods.

Astronomy.—"Mahomedan astronomers were employed as well as Chinese."—*Simcox*, ii. 267.

"On the arrival of the Jesuit astronomers in the seventeenth century, a great revolution took place in the native theories; the result of which was the compilation of the *Sin fa swan shoo*, in 100 books, about the year 1634, by an imperial commission consisting of natives and Europeans. It is divided into 11 parts, treating respectively of the elements of the system, standard numbers, calculations, instruments, general operations, sun's course, fixed stars, moon's path, nodes and conjunctions of sun and moon, five planets, and nodes and conjunctions of the five planets. The Ptolemaic theory is still adhered to, but Tycho Brahe's discovery of the variation in the obliquity of the ecliptic is stated, and his numbers adopted for that and other elements, as also his solar and lunar tables."—*Wylie, Ch. Researches*, pp. 230–1.

"One of their [Roman missionaries] chief and most useful works was the correction of some astronomical errors. They were entrusted with this work by a Chinese official, Li Chitsao, or Petu, President of the Tribunal of Rites at Nankin, and the Imperial Observatory was placed under their charge."—*Boulger, Short Hist.*, p. 101.

[During the Ming dynasty only four observations of sunspots seem to have been made.]—*Journ. N.-C.B.R.A.S.*, N.S. xii. 91.

Geography.—"Now [1601] it was that the Chinese had the opportunity for the first time of comparing notes upon the subject of the mysterious Franks and the semi-mythical country of Ta-ts'in, which up to that date had been as much a puzzle to them as Serica and the Seres had been to the denizens of the West."—*Parker, China*, p. 82.

"Up to the time of Ricci's arrival it was not quite understood what country Portugal really was; the very name was not heard in China till 1564; and even now the vague name of 'Western Ocean' men is usually employed by old popular habit to specially designate the Portuguese,—except . . . in 'pidjin English' conversation."—*Ibid.* pp. 84–5.

"It was about this period that the Chinese first heard of the existence of the Dutch."—*Ibid.* pp. 87–8.

"Ricci died in 1610, and was therefore not called on to explain to the Chinese the concrete existence of any European nations except the Franks, the Italians, and the Dutch. But there is a chapter in the Ming history which states that, according to the Western men who arrived between 1573 and 1617, their 'Lord of Heaven' was born in Judæa, or the ancient Ta-ts'in. Ricci is also specifically said to have made for the Chinese a map of Europe, and to have explained to them the division of the world into five great continents. His statements were received with considerable incredulity."—*Ibid.* p. 89.

The Kalmucks, a branch of the Mongols, were styled by the Chinese Eleuths. Regarding the latter "it so happens that there is a hiatus in Chinese history at this time, and the Manchu Emperor Kienlung himself admits that between 1450 and 1650 the Chinese knew little more of the Eleuths than that they often joined other Mongols in raiding the frontiers; they do not even know the names of the Khans. . . . The very name of Russia was to all appearances totally unknown in Peking at that time [1619]." The killing of the Cossack Stepanhoff by the Manchu troops in 1658 is "recorded by the Chinese."—*Ibid.* pp. 126–7.

"The Government of China in the 17th or 18th century was no doubt sincerely unable to understand what there was offensive to European powers in its pretensions."—*Simcox*, ii. 273.

"They never came to think clearly about the existence of antipodes on the other side of the world until the introduction among them in the Ming dynasty of modern European ideas." "The Chinese have only learned them [distinctions between torrid and frigid zones] from Europeans since the discovery by the Portuguese of the sea route to India."—*Journ. P.O.S.*, i. 7.

"The retrogression dating back to the ninth century at latest, seems to have been merely interrupted for a time, even in the most brilliant period of historical scholarship, during the Sung and Yüan dynasties (960–1368), and to have ended, under the Ming, at the lowest point of cartographical knowledge. The Paris Bibliothèque Nationale possesses an atlas of China belonging to this epoch which shows the lamentable condition in which the Chinese then were, as regards the geographical knowledge of their own country, and in fact indicates a total lack of interest in, and understanding of geography. . . . [The upper course of the Hwang-ho is, in part at least, correctly given on this map, but lower down] it divides into two arms, one of which disembogues near Tientsin, the other south of Shantung, whereas only this latter course was in existence at that time. The middle course of the Wei is connected with the Han, right through the high Tsing-ling-shan range; while the Yang-tsze, half way between Nan-king and Lake Po-yang, sends out an arm to the south, which reaches the sea as Tsien-tang, leaving the Tai-hu Lake far to the northward."—*Richthofen, China*, i. 391.

Natural History, Botany, etc.—"It must have required no little ardor in the study of Natural History to produce the works called '*Pên-ts'ao*,' or 'Herbals,'—not less than forty-two of which are known to have been composed since the fourth or fifth century. These are not mere descriptions of plants, but collections of data covering the whole range of life, though with special relation to therapeutic uses (*Schott, Ch. Literat.*, p. 102; *Wylie*, p. 80). An idea of their character may probably be derived from an analysis of the principal work of the kind, dating from the sixteenth century (*Schott; Williams*, i. 288; *Davis*, ch. xx.; *Kidd, China*). Its great divisions are water, fire, earths, plants, animals, men. The inorganic world is distributed into earths, metals, gems (including crystals), stones, and salts; the organic, according to obvious distinctions of place, form, and qualities. Several hundred families are mentioned; classes are formed on something like Linnæan principles, and objects arranged according to such categories as—where they live, what they are good for, what they look like, and on the sexual theory of *Yin* and *Yang*. There are water plants, stone plants, marsh plants, poisonous plants, twining plants; trees are viewed as aromatic, lofty, luxuriant, or flexible; insects, worms, and scaleless creatures are placed together; so are lizards, serpents, fish; then come creatures with shells, which are said to have their bones outside . . .; then the feathered tribes, as of the water, the heath, the mountain, the forest. Finally, come hairy animals and men. A kind of unity is given all these data by constant reference to human, and especially to medical, uses."—*Johnson, Or. Rel.—Ch.*, pp. 90–104. See also *Williams, Midd. King.*, i. 370–9.

Medicine, etc.—"The whole art of medicine, he [Trigault] thinks, would be included in the European science of botany."—*Simcox*, ii. 267.

"Chinese medical writers make little distinction between their Materia Medica and Materia Alimentaria. The *Puntsau* ascribes therapeutic properties to all articles that are used as food. Nearly all portions of animals, the human frame included, are supposed to be efficacious in the treatment of disease. In their preparation they are for the most part subjected merely to ordinary culinary treatment. The exceptions consist of animal substances which are macerated in fermented or distilled liquors. To these they apply the term *chiu*, commonly rendered wine by sinologues. Hence we find in the *Puntsau*, mutton wine, dog wine, deer wine, deer horn wine, tiger bone wine, black snake wine, flowery snake wine, *ki* snake wine and tortoise wine." "Alcohol . . . is seldom used as a pharmaceutic menstruum, their distilled *chiu* being employed as a solvent for articles used as medicines." "Snake wines are used in

palsy. In Kwangsi the fermenting agent is a species of wild grass. . . . This wine is in high esteem as an anthelmintic, and an antidote to malaria. . . . An adder wine is used in paralysis and insanity." "The wine in which tortoise has been macerated is described as useful in chronic bronchitis." "Dog wine is described as very heating and stimulating." "The officinal mutton wine of the Pharmacopœia is in fact made of goat's flesh." "Mutton or goat wine is a great restorer of the constitution, it strengthens the stomach, the kidneys and testes."—*Journ. N.-C.B.R.A.S.*, N.S. vii. 237–8.

The *Pên-ts'ao kang mu* gives the following prescription: "When babies cry at night, kindle some old coffin wood and let the flames shine over them, then they will be quiet immediately."—*De Groot, Rel. Syst.*, i. i. 328.

Mu Tsung "began by imprisoning the vendors of so-called elixirs of immortality."—*Simcox*, ii. 248.

[Medicines were still regarded as efficacious only if taken on auspicious days (*Pên ts'ao pei yao, c.* p. 2*b* ; etc.). Tears were compared to "drops of water on a piece of steamed felt," the fluid secretion of the pulse and of the viscera, moved by sorrow, laughter, coughing, etc. (*Ko chih ching yüan, c.* 12, p. 19*a*).]

"When the pulse is strong and vigorous the face will be azure; the bones strong and vigorous, the face white; the blood strong and vigorous, the face red. In one who drinks wine the liver's action will be weak and his face become azure; when the heart's action is weak the face will be red."—*Ts'ao mu tzŭ, Ko chih ching yüan, c.* ii. p. 12*a*.

[Among medical works written during the period were:—*Wên i lun*, "Discourses on Epidemic Diseases," by Wu Yu-hsing (theory of infection by inhalation); *Chêng chih chun shêng*, "Indispensable Guide to Proved Cases," and others, by Wang K'ên-t'ang; *Shang han lun t'iao pien*, "Discussions on Colds categorically Explained," and others, by Fang Yu-chih; *K'o nio lun shu*, "Discussions and Explanations on Coughs and Fevers," by Lu Chih-i; *P'ing Hu mo hsüeh*, "A Study of the Pulse [made at] P'ing Hu," by Li Shih-chên, whose father also wrote on medicine; *P'u chi fang*, "Prescriptions for Universal Aid," by Chu Shu, Prince of Chou Ting; *Ming i lei an*, "Classified Cases dealt with by Famous Physicians," by Chiang Ch'üan; *Pên ts'ao chi yao*, "Essentials of Medicine," by Wang Lun; and *Pên ts'ao kang mu*, "Materia Medica with Text and Commentary," by Li Tai-chên.]

Philosophy.—"The doctrines of Chu Hi were collected and interpreted, by order of the Emperor Yung Lo, about the beginning of the fifteenth century, by a commission of forty-two scholars, who composed a summary of them under the title of *Sing-li-ta-tsuen*, or 'Natural Philosophy.'"—*De Courcy, l'Emp. du Mil.*, p. 223.

History, etc.—"The Mings signalized the recovery of the empire into native hands by gathering up the whole harvest of the past. An imperial library of three hundred thousand volumes contained histories of all the dynasties (*Zeitsch. d. D.M.G.*, i. 117), and a full consciousness of nationality busily resumed all the stages of literary achievement. It was the age of *collectors* and *commentators*, gifted with that minuteness of detail study which sifts every mass into the atomic state most fit for currency and use. The best science and culture of Europe was welcomed in the Jesuit Fathers. The history of cosmogonic philosophy [*q.v.*] was compiled in the school of Chu-hi. The national code of jurisprudence was presented in full order and detail; and the first great description of the whole Empire published from minute surveys (1587)."—*Johnson, Or. Rel.—Ch.*, p. 443.

[For historical and educational works see *Literature*.]

Manchu Period (1644 *to* ——).—*Table IX.*

"On the whole, it may be said that in all departments of learning the Chinese are unscientific; and that while they have collected a great variety of facts, invented many arts, and brought a few to a high degree of excellence, they have never pursued a single subject in a way calculated to lead them to a right understanding of it, or reached a proper classification of the information they possessed relating to it."—*Williams, Midd. King.*, ii. 134.

"The philosophical calmness and political sagacity of Kanghi led him to tolerate the presence of men whose ethics he could appreciate with an academic pleasure, and whose practical services he recognised as invaluable. He employed them [foreigners] as envoys, geographers, doctors, and astronomers. Their maps brought under his eye the extent and the form of the territories he ruled, their artillery sometimes turned the tide of battle in his favour, their medicines more than once saved him from illness, and perhaps from death."—*Boulger, Short Hist.*, p. 149.

Logic.—"The logic of the Chinese is chiefly confined to that part which we call method, or the art of arranging our thoughts for memory or instruction. The native, like a true lover of hypotheses, constrains every class of phenomena to come within the limits of his system. . . . He has remarked, for example, that the number 5 often occurs in the works of creation, and has received from tradition and philosophy a regard for the number 8; he conceives, therefore, that many of the features of the moral, as well as the physical world, may be grouped under one of these numbers. In every work of science, a logical diagram or two meet the eyes of the reader. . . . The Chinaman describes several circles round a common centre, divides the circumference into 5 or 8 different arcs, and designates them by the terms *wood, water, metal, earth, fire*, or with the eight *kwa* or symbols of the divining-board. Corresponding with these, upon the circumference of larger or lesser circles, are set the names of the different phenomena which belong to the department of science under consideration. These circles appear to be fantastical, puzzling or useless things, till they are regarded in the light of attempts at logical arrangement; and then, however they may fall short of representing truth, they appear to have reason and design in them."—*Lay, Chinese*, pp. 160–1.

Mathematics.—"The knowledge of mathematics, even among learned men, is very small, and the common people study it only as far as their business requires; the cumbersome notation and the little aid such studies give in the examinations doubtless discourage men from pursuing what they seem to have no taste for as a people."—*Williams, Midd. King.*, ii. 67. See also *N. and Q. on C. and J.*, i. 166; iii. 173.

"The notation of the Chinese is based on the decimal principle, but as their figures are not changed in value by position, it is difficult to write out clearly the several steps in solving a problem. . . . Arithmetical calculations are performed with the assistance of an abacus, called a *swanpan*, or 'counting-board,' which is simply a shallow case divided longitudinally by a bar and crossed by several wires; on one side of this bar the wire bears five balls, on the other two. The five balls stand for units, the two balls being each worth five units. When the balls on any wire are taken for units, those next to the right stand for tens, the third for hundreds, and so on; while those on the left denote tenths, hundredths, etc. Simple calculations are done on this machine with accuracy and rapidity, but as it is only a convenient index for the progress and result of a calculation performed in the head, if an error be made the whole must be performed again, since the result only appears when the sum is finished. There are three sorts of figures, partly answering to the English, Roman, and Arabic forms—as *Seven*, VII., and 7 . . .; the complicated form is used for security in drafts and bills, and the abbreviated in common operations, accounts, etc., and in setting down large amounts in a more compact form than can be done by the other characters."—*Williams, Midd. King.*, ii. 65–6. For origin see Later Feudal Period.

"In Chinese commerce the same principle [of local value in arithmetical notation] is in use in writing, but there is this difference. Strokes are used instead of special symbols for 1, 2, 3, 6, 7 and 8. Thus two strokes are two, and three strokes are three. When four is reached the Chinese merchant writes 𝍠 and for five 𠌫. Beyond that he returns to strokes. He writes a short down stroke and places it at right angles to a cross stroke. This is six. He adds a cross stroke to six to make seven 𠄌, two to make eight 三, and a new symbol to make nine 𠄎. This mode of numeration is known as Soochow *Matsï*. The city of Soochow has been for centuries the chief place of trade in China, and it is a trade that has maintained during a long period this mode of writing numbers. The writer of the *matsï* begins with a down stroke, and changes to cross strokes when he comes to six." "The connection of the *matsï* with the common Chinese abacus is very close. The abacus is a picture of the mode of working the *matsï*. . . . The abacus is simply a new instrument intended to help in calculation, and does not contain any new principle." The principle of local value "came from the calculating slips called *ch'eu* 籌, which have been in use from ancient times in China." Several reasons are given for assigning the origin of the principle of local value to the Babylonians.—*Journ. P.O.S.*, i. 162, 167–9.

"Father Ricci [see previous Period] was aided in his translation of Euclid by a native scholar (1608); and another during the present dynasty prepared a supplement on Geometry; while a third was the chief originator of the recent completion of the Euclid by Mr. Wylie. Mr. Wylie's list proves how carefully the later Chinese have preserved their astronomical and mathematical treasures, reviewing them from time to time, and critically reporting their condition, in theory and practice. Of such reports a great Thesaurus was published in the reign of Kien-lung. Elaborate collections of formulæ for calculation have been made down to the present day, when there is no lack of native mathematicians in China."—*Johnson, Or. Rel.—Ch.*, pp. 90–113.

"The Chinese, *i.e.* a few rare scholars in China, have for ages known the chief processes of Algebra. . . . At the beginning of this dynasty, the Jesuits introduced Algebra, according to the then existing state of it in the west. . . . Native Chinese Geometry is based almost entirely on right-angled triangles."—*Ch. Rec.*, ix. 372.

"In the various branches of mensuration and formulæ used to describe the dimensions and weight of bodies, they have reached only a practical mediocrity. With a partial knowledge of trigonometry, and no instruments for ascertaining the heights of objects or their distances from the observer, still their lands are well measured, and the area of lots in towns and cities accurately ascertained."—*Williams, Midd. King.*, ii. 81.

"Some time ago there died, at Peking, the greatest Chinese mathematician of the present century. His name was Li Shan-lan, and he was Professor of mathematics at the T'ung Wên Kuan. . . . He denied the non-existence of a point. A point, [he] said, is an infinitesimally small cube; and in saying so, he only reproduced the theories put into the mouth of the sophistical God of the Northern sea, two thousand years ago, by Chwang-tzŭ."—*Balfour, Leaves*, p. 157.

"The *Tsu-wei-shan Fang Sho Hioh*, or 'Mathematics of the Lagerstræmia Hill Institution,' in thirty-eight books, octavo, 1828, contains a complete course of mathematical instruction in geometry, trigonometry, mensuration, etc., together with a table of natural sines and tangents, and one of logarithmic sines, tangents, secants, etc., for every degree and minute." This compilation derives most of its value from the mathematical writings of the Roman Catholic missionaries.—*Williams, Midd. King.*, ii. 66–7.

"The second part of the great work [*Leŭh leĭh yuen yuen*] entitled *Soo le tsing yun*, is on pure mathematics, treating of the theory and use of numbers, geometry, and mensuration, with a description of the European system of algebra, and tables of the numbers of trigonometry and logarithms."—*Wylie, Ch. Researches*, p. 231.

[For other mathematical works see *Wylie, Notes on Ch. Lit.*, pp. 106–30.]

[Yao Nai, A.D. 1730–1815, was bitterly opposed to the rage for mathematical and scientific studies.]—*Giles, Bio. Dic.*, p. 926.

"Since foreigners have begun to apply western science, the development has been rapid."—*Williams, Midd. King.*, ii. 67.

Chronology.—The Chinese Government "considers the publication of a Calendar of the first importance and utility. It must do everything in its power, not only to point out . . . the distribution of the seasons, but . . . it must mark in the almanac the lucky and unlucky days, the best days for being married, for undertaking a journey, for making their dresses, for buying or building, for presenting petitions to the Emperor, and for many other cases of ordinary life. By this means the Government keeps the people within the limits of humble obedience; it is for this reason that the Emperors of China established the Academy of Astronomy."—*Timkowsky, Russian Mission*, i. 358. See also *Balfour, Waifs and Strays*, pp. 143–8.

In accordance with the standard adopted by the philosopher Shao [see Sung Per.] "the calendar now published by authority determines the circumference of heaven to be 360° (a degree containing 60 minutes, a minute 60 seconds and all the parts below continuing to be reckoned by 60); and the tropical year consists of 365 days, 5 hours, 48 minutes, 45 seconds (365·2421875)."—*Gaubil, Le Chou-king*, p. 7, n. 4, quot. *Legge, Ch. Class.*, III. i. 22, note.

"James Rho (Italian) and Adam Schaal (German) were found living at Si-an Fu when the Manchus came to Peking; they were at once summoned to the Astronomical Board; but, as Alexander Wylie somewhat harshly remarks: 'along with their new formulæ and improved tables, they took advantage of their position to foist upon the Chinese the antiquated system of Ptolemy.' . . . When the youthful K'anghi came to the throne after Schaal's death, he was intelligent enough to perceive the superiority of European methods, and entrusted the correction of the calendar to the Dutchman Verbiest, who was made President of the Board. K'anghi's angry dispute with the Popes about ancestor worship and the proper word for 'God' did not interfere with his zeal for science, and in 1713 he sanctioned the publication of a work embodying the latest astronomical discoveries."—*Parker, China*, pp. 305–6.

Chemistry.—"Their practical skill far outruns their theoretical knowledge. They have rich stores of subtle and brilliant processes; but no minute analysis of elements, and no large generalization of results. These devotees of concrete labors are so absorbed in arts of manipulation, that no fresh speculative movement is possible. Their ideal chemistry remains therefore, to a great extent, in the stage of alchemy; and has been derived, in part, from Arabic and Byzantine sources, though greatly promoted as a native product by the growth of Taoism in the fourth century, B.C."—*Johnson, Or. Rel.—Ch.*, p. 90–104.

"As the result of these researches, pursued with all perseverance but no success in finding the Elixir of Life or the Philosopher's Stone, the Chinese of the . . . present day have a number of exceedingly simple and economical processes by which they obtain tolerably pure mercurial and other preparations, of the greatest service even in their own unskilled hands. Their apparatus is of the very rudest character, and their materials are often of the most unexpected kind, but with these they can manufacture calomel and vermilion of the most beautiful description." "The manufacture of enamels and porcelain formed another field of chemical research, carrying them to the same effective results, produced they knew not how or why. The taste for colouring vessels, walls, scrolls and some few other objects led them to the study of the metals iron and copper, from which they extracted red and blue pigments. The manufacture of fire-works has been also a means of increasing their chemical knowledge. These artists, called *Yen-huo-kia*, learnt the use of iron, camphor and other secret substances, by the addition of which the flame is altered or intensified. It has been long known to these numerous manufacturers that by the addition of a small quantity of arsenic the noise of crackers is rendered much louder and sharper. The preparation of pigments for artists . . . has been a stimulus to the manipulation of minerals. To this day the Chinese white is to be found in the colour-artists' shops all over Europe as the best pigment of that description. The manufacture of ink, that most potent agent, has led to several curious observations."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 140.

"In the making of Gunpowder the Chinese have practised a good deal of chemistry unconsciously. The manufacture of nitrate of potash from the efflorescent salts which are found on the surface of the soil, and on walls and places charged with urine, is carried on on a large scale in China. The properties of sulphur are well known to Chinese writers. It is procurable in large quantities from the sulphur-pits near Tamsui and Kelung in Formosa. . . . The red amorphous sulphur, called Shih-ting-chī, probably produced by the accidental mixture of some fatty substance with the ordinary brimstone of commerce, is fairly described in Chinese works. The composition of Chinese gunpowder, called by them 'fiery medicine,' is not very different, in some cases, from that of English powder. The charcoal of the Willow and the *Cunninghamia Sinensis* or Chinese Pine, is used in the manufacture. The Chinese are aware of the disinfecting and insecticidal powers of sulphur and arsenic. They enter into the composition of pastilles for getting rid of mosquitos, and the good effects of the gases resulting from the burning of crackers as expellers of evil influences are appreciated by the Chinese in some quarters. The alkalies soda and potash are turned to some account, although nitre and soda, or natron, are often confounded together. Carbonate of soda is brought from Mongolia, where the soil is charged with this alkaline substance, and requires no manipulation to render it useful as a means of raising bread. Potash, or pearl ash, obtained by burning the rank herbage of inland districts is also to be met with in China. Tsi-nan-fu in Shantung is, or was, the seat of this rough manufacture. Both of these alkalies are used in Pehchihli to make a coarse soap. . . . Ferrocyanide of potassium, a beautiful yellow salt, is made in Canton and by Cantonese in other parts of China, by burning dry refuse of animal substances, such as horn-parings, to a red heat with pearl ash and a quantity of iron-filings in a covered crucible. The process is kept a profound secret, as far as possible. The importance of this salt, sometimes called yellow prussiate of potash, is its employment along with alum and sulphate of iron to make that beautiful dye Prussian Blue—called 'foreign indigo' by the Chinese."—*Ibid.* vi. 141–2.

[Other substances, with which considerable acquaintance had been formed and which were used in various ways (for details see *ibid.* vi. 142–7) were salt of potash, used as a flux for minerals, sulphate of soda (confounded, however, with the natural nitrates of potash and soda), sulphate of magnesia, or Epsom Salts (the plan of removing the magnesian element from the crude salt was not now practised). The phenomena of deflagration and crackling of salts of potash and soda are so frequently referred to in Chinese works as to lead us to believe that they practised something equivalent to our blow-pipe examinations of substances. The use of fire to distinguish arsenical substances, such as black [metallic] arsenic, white arsenic [arsenious acid] and yellow arsenic [or piment], as by the varying smell of these substances, indicates a step in the direction of practical chemistry), alum (used in sizing paper, making mucilage, purifying drinking water, and many chemical and economical processes; it had apparently supplanted the more effectual carbonate of soda formerly used), etc.]

"Metals have received much attention at the hands of the Chinese who revel in alloys, and love the cheap thunder of gong-metal, and the musical ring of pieces of silver. Copper is regarded by Chinese writers as more friendly to the human constitution than iron, and they prefer the former metal for the making of cooking and washing vessels. Malachite is well known to them, and sulphate of copper, or *Shih-tan*, is described in their works. . . . Steel needles dipped

in a solution of sulphate of copper have been sometimes sold to foreigners as curiosities in the way of well-tempered metallic copper. Although aware of this decomposition of one metal by another, the Chinese have misunderstood it, and they have been led into the assertion that one metal undergoes conversion into the other. Verdigris, a basic acetate of copper, is easily procured by the action of vinegar on plates of copper. Vinegar is the only pure acid substance known to the Chinese. They use it as a solvent, and by sprinkling it upon minerals exposed to the fire they bring about oxidation and solution of these substances. It is curious that they have never learnt to distil acetic acid from their strong but rank vinegar. Verditer, a carbonate of copper, is largely made by the Chinese in Hupeh, and is mixed with rice-starch for some reason best known to themselves. It occurs in small, thin, square, pale-green pieces, and is used in dyeing shagreen cases for pipes and spectacles. There is a process described in a Chinese work by which wood to be placed in water is preserved by previously dressing it with acetate of copper solution. This is something like the Kyanising process, in which corrosive sublimate is similarly employed. Iron, a metal abundantly bestowed upon China, yields oxides, and the sulphate of iron in various forms. The black oxide of iron dissolved in vinegar was formerly employed by the Chinese as an ink. . . . The red sesquioxide of iron is made on a large scale by heating impure sulphate of iron to a great heat. The hotter the fire the better the colour, so the *Pen Ts'au* says. This rouge is used to colour porcelain, and to redden walls of temples and palaces. Sulphate of iron is made in a crude and cheap form by mixing together sulphurous coal and hepatic iron pyrites, and covering the heap with mortar and mud to prevent the access of air. Spontaneous chemical action occurs, and the mass which results is treated with water, and the rough green salt is crystallized out. This is sold at a very cheap rate, and is much used as a dye, after mixture with galls or other substances. . . . A preparation of great beauty, called *Tieh-hwa-fen*, is made by acting upon sheets of iron with vinegar. It resembles the citrate of iron in its appearance."—*Ibid.* vi. 143–4.

"Lead, zinc, antimony and pewter are not carefully distinguished. . . . Argentan, or German silver, called *Peh-t'ung*, is an alloy of copper, arsenic and zinc, largely prepared for use in making tobacco pipes. The use of sal ammoniac as a test for these alloys, showing them to contain copper and to be not silver, is another item of chemistry met with in the *Pen Ts'au*, the manual of the Chinese chemical manufacturer. Acetate of lead is a salt much extolled by Taoist writers as a styptic remedy. A plan of making a salt, supposed to be an acetate, is given in the *Pen Ts'au*, by which an amalgam of fourteen parts of lead with one of mercury is acted upon by vinegar. This must issue in the formation of white lead, a salt made at many places in China, and largely used as a paint and as a face-powder. . . . Mercury, called 'water silver' . . . has had a mysterious attraction for the Chinese alchemists. . . . Cinnabar, the most frequent ore of mercury, is also made artificially on a large scale in Hankow and other places, by fusing a mixture of sulphur (two catties) and mercury (one catty) and subliming it. . . . Vermilion is made in much the same way in Hankow as the cinnabar, which has the same chemical composition. The crystalline sublimate formed on the sides of the vessel is carefully powdered between two stones turned by the hand, a little water being added from time to time. The pasty mass is then carefully levigated by mixture with pure water, decanted and dried upon tiles in the sun. . . . The more patiently and carefully the cinnabar is powdered and washed, the finer is the colour of the resulting vermilion. . . . Æthiops mineral is a common drug used in medicine as an alterative, and made by melting two Chinese ounces of sulphur, and then adding to it half a catty of mercury. The mass is taken out, powdered and sublimed. . . . Calomel is made in large quantities in Hankow. . . . Common salt, mercury and alum, or salt, mercury, sulphate of iron and nitre are rubbed together in certain proportions, and put into an iron platter which is covered over with a roomy earthen dish well luted down. This is exposed to the heat of a strong charcoal fire for four hours, when water is thrown upon the upper pan, and the removal of it shows the calomel condensed in the form of a beautiful white, glistening feathery sublimate upon the inner surface of the upper dish." "Corrosive sublimate, called literally 'white precipitate,' is also made in Hankow by a very complicated way, by fusing together nitre, mercury, borax, salammoniac, orpiment and massicot, and subliming the mass in the same way as the calomel. A very good crystalline preparation is obtained, which is used only externally as a caustic. The lead is added on medical, and not on chemical grounds, as it is supposed to correct the poison of the salt. Red precipitate is made by putting nitre into a small boiler and melting it, alum being afterwards melted and incorporated with it. Some mercury is put into the middle of the mass, and after covering it over with a small dish, the whole is heated for about an hour and a half. The heat is at first gentle, and is then gradually increased. The red precipitate, or red oxide of mercury as it is, is taken out in the form of sublimated scales of a bright brick-red colour. A nitrate of mercury, mixed with the red oxide, is sold under the same names (紅粉 or 三仙丹) as the red precipitate. A Tarbeth mineral, or yellow sulphate of mercury, is also sometimes made by the Chinese." "Urea, called 秋石 *Ts'iu-shih*, is a regular article of manufacture from human urine at Ngan-king fu and Chi-chau fu in Nganhwei province. This substance, mixed with the other constituents of the excretion, is obtained by boiling down urine, sulphate of lime or common salt being added to hasten the crystallization, and to increase the quantity obtained. It is used to soften fresh meat required for immediate use, and is used in medicine."—*Ibid.* vi. 144–7.

Astronomy.—"Adam Schaal was in Peking shortly after the Manchus took possession; his appeal to their clemency was well received, and he was appointed President of the Astronomical Board by the prudent Manchus, who were only too anxious to avail themselves of talent, wherever found."—*Parker, China*, pp. 89–90. *Cf. Chronology.*

"The young Emperor Kanghi gave the first indication of his capacity to judge important matters for himself by deciding after personal examination that the astronomical system of Europe was superior to that of China, and by appointing Father Verbiest to succeed the Abbé Schaal."—*Boulger, Short Hist.*, p. 133. *Cf. Chronology.*

The "symmetrical position of the Great Bear, or 'Northern Bushel,' with reference to the seasons, is essential to the Chinese creed; and hence to this day, maugre the precession of the equinoxes, it retains its position in the estimation of almost all Chinese, learned and ignorant. The seasons still arrange themselves round the dial in exactly the same way, Winter going to the north, Spring to the east, Summer to the south, and Autumn to the west."—*Legge, Ch. Class.*, III. i. Prol. p. 94.

[The Chinese have very little knowledge of astronomy, and what they have is mixed up with crude and puerile superstitions. . . . It is only *astrology* that has kept astronomy from being entirely neglected. The Chinese constructed a calendar, B.C. 2600 [?]; yet they knew nothing of the apparent motion of the heavens till 3000 years later, though they had learnt to calculate eclipses long before that. In spite of the knowledge they must have possessed in order to do this, the people in general have always gone on believing that a dragon eats the sun.]—*Balfour, Waifs and Strays*, p. 143.

"The astronomical ideas of the common Chinese are vague and inaccurate. The knowledge contained in their own scientific books has not been taught, and they still [*cf.* LATER FEUDAL PERIOD] believe the earth to be a plain surface, measuring each way about one thousand five hundred miles; around it the sun, moon, and stars revolve, the first at a distance of four thousand miles. This figure comes so near the earth's radius that it is reasonable to infer, with Chalmers, that it was calculated from the different elevation of the sun in different latitudes."—*Williams, Midd. King.*, ii. 72.

"The European astronomers were received even more favourably on the establishment of the present dynasty than they had been during the Ming, and their influence is apparent in the great thesaurus entitled *Leŭh leĭh yuen yuen*, compiled under the direct superintendence of the Emperor in the first half of the eighteenth century. This is composed of three parts; the first, entitled *Leĭh seang k'aou ching*, on astronomy, has several points of divarication from the great work of the Ming. The obliquity of the ecliptic is given from native observation as 23° 29′ 30″, being two minutes less than Tycho Brahe's statement. In the correction for the sun's velocity, the new work takes account of the minute motion of the perihelion, and the epoch is changed from 1628 to 1683, but the Ptolemaic theory is still retained. In a supplementary portion, however, the elliptic orbits of the planets are suggested, and Kepler's law of equal areas in equal times is stated. The sun's parallax is given as the seconds, instead of three minutes, the old number. The circulation of Mercury, Venus, and Mars about the sun is also named, but the whole are still made to revolve about the earth as a centre."—*Wylie, Ch. Researches*, p. 231.

"The Chinese, in observing eclipses, use a basin of water, as an artificial horizon, in which—if it is kept perfectly still—the sun is seen reflected 'in a manner entirely sufficient for all purposes of ordinary observations.'"—*N. and Q. on C. and J.*, ii. 113.

Geography.—"The passion of the Chinese for registering the physical features of their great empire has been extremely productive; but it does not amount to scientific genius. Their geographical descriptions are here but heaps of well-arranged facts, without reference to large relations, general ideas, or constructive laws (*Schotte*, 49, 50). Yet in no department have they been more serviceable to science than in their careful observation of localities, their minute itineraries, their full descriptions of lands, productions, climates, races (see *Journ. Asiat.*, 1846–7). Their researches on the mountain systems of Central Asia greatly aided Humboldt in his study of that region. The records of the pilgrims, Fa-hian and Hiouen-thsang, are of great interest. Reports of officials and commissions to neighbouring countries are generally models of compact, simple, business-like statement, and reach back for two thousand years."—*Johnson, Or. Rel.—Ch.*, pp. 80–113.

"Tien Ki-shih, a popular essayist of the last century, thus congratulates himself and his readers: 'I felicitate myself that I was born in China, and constantly think how very different it would have been with me if I had been born beyond the seas in some remote part of the earth, where the people, far removed from the converting maxims of the ancient kings, and ignorant of the domestic relations, are clothed with the leaves of plants, eat wood, dwell in the wilderness, and live in the holes of the earth; though born in the world, in such a condition I should not have been different from the beasts of the field. But now, happily, I have been born in the Middle Kingdom. I have a house to live in; have food and drink, and elegant furniture; have clothing and caps, and infinite blessings: truly the highest felicity is mine.'"—*Williams, Midd. King.*, i. 725.

[The name of France does not appear in Chinese history until 1718, when the French were confounded with the Dutch and Portuguese.]—*Parker, China*, p. 99.

"The Chinese at first styled them [Americans] 'New People,' not being able at once to differentiate them from the English. Then the name 'flowery-flag' was invented, and this continues in popular use to our own day."—*Ibid.* p. 104.

"The Chinese, in referring to these events [relating to the country of Sibir in the 15th and 16th centuries], say (but do not explain at what date or on what authority) that the Russians had four great provinces—Ki-yu (Kiev), the 'old tribe'; Moskwa, the 'new tribe'; K'a-shan (Kazan); and Si-pi-r (Siberia), which last was subdivided into four."—*Ibid.* p. 125.

"There is not in the whole of Chinese history one trace of a single definite name to show that they [the Chinese] had any knowledge of what we call Siberia."—*Ibid.* p. 121.

"Manipur, or Kasé, as the Chinese call it" is not mentioned before the Ch'ing dynasty, and was then known only to the Manchus for a short time during the wars with Alompra's successors.—*Ibid.* p. 128.

[The Emperor K'ang Hsi sent officers to trace the Ho to its source, but a large part of its course remains unexplored (*cf.* MONGOL PER., UNITY, and MONARCHY).]—*Legge, Ch. Class.*, III. i. 134, note.

[Klaproth says that a Chinese writer in the second half of the 18th century expressed the opinion that the Central Asian desert was the former bed of a sea which had been bounded by Pi-jan in the north, by Kashgar in the west, and by the northern border of Tibet in the south.]—*Tableaux*, pp. 181–2. See also *Richthofen, China*, i. 25.

"If their astronomical notions are vague, their geographical knowledge is ridiculous. The maps of their own territories are tolerably good, being originally drawn from actual surveys by nine of the Jesuits, between the years 1708–1718, and since that time have been filled up and changed to conform to the alterations and divisions. Their full surveys were engraved on copper at Paris, by order of Louis XIV., on sheets, measuring in all over a hundred square feet, and have formed the basis of all subsequent maps. The Chinese do not teach geography in their schools, even of their own empire. The common people have no knowledge, therefore, of the form and divisions of the globe, and the size and position of the kingdoms of the earth. Their common maps delineate them very erroneously, not even excepting their own possessions in Mongolia and Ili—scattering islands, kingdoms, and continents, as they have heard of their existence, at haphazard in various corners beyond the frontiers. The two Americas and Africa are entirely omitted on most of them, and England, Holland, Portugal, Goa, Luconia, Bokhara, Germany, France, and India, are arranged along the western side, from north to south, in a series of islands and headlands. The southern and eastern sides are similarly garnished by islands, as Japan, Lewchew, Formosa, Siam, Birmah, Java, the Sulu Islands, and others, while Russia occupies the whole of the northern frontier of their Middle Kingdom."—*Williams, Midd. King.*, ii. 80.

"The earth is popularly believed to be square, and the Heavens a kind of shell or covering, studded with stars, and revolving round the earth. . . . The sun is supposed to pass at sunset under the earth, and to come out next morning at the other side, [and] the moon to rise from and set in the ocean. Earthquakes are held to result from explosions of sulphur in the heart of the earth; rain is said to be poured down by the Dragon God who usually resides on the other side of the clouds, and the rainbow is believed to be formed by the breath of an enormous oyster which lives somewhere in the middle of the sea."—*Giles, Ch. Sketches*, p. 100.

"Le Mingche, more generally called 'Le Tsinglae' [a Taoist priest of Canton, who studied astronomy and geography for some years under a European living in the interior, published] . . . a treatise on these sciences in 1820, in 3 volumes, afterwards increased to five. He was also, we believe, chiefly employed in compiling the maps for the Kwang Tung Tung Che, or General Statistical Account of Kwang Tung Province—a large and voluminous work, which was published in 1822, under the direction of Yuen Yuen, formerly . . . governor of Canton." "The map [published by him in 1825 or 1826] . . . evinces, by the rough manner in which it is drawn up, the very partial advances made by the Chinese in the art of chorography. All that they know on the subject has been derived, indeed, from the Catholic Missionaries; but they have followed the instructions of their *barbarian* teachers only so far as they themselves thought proper. They have been taught by them the doctrine of the earth's globular form; the consequent system of spherical projection; the use of latitude and longitude in order to ascertain the exact situation of places, and the method of finding of the same by observation and calculation. These have been adopted by the Chinese, and with very great advantage. But devoid of all neatness of execution, their maps present a rough, unfinished appearance; the coasts are badly described, and afford no guide to the navigator; islands are crowded together . . . or they are entirely omitted. Very little regard is paid to the relative distances of places . . . and the courses of rivers, however small . . . are invariably described by two lines, at some distance from each other, thereby so crowding the map as to leave little room for the names of places, which, in Chinese characters, occupy considerable space. . . . [There are] explanatory and descriptive observations, which fill up the unoccupied corners."—*Ch. Repos.*, i. 33–4.

"The geographical works of Tsinglai are not quite so erroneous as his astronomical, but the uneducated people, notwithstanding his efforts to teach them better, still generally suppose the earth to be an immense extended stationary plain. Their notions of its inhabitants are equally whimsical, and would grace the pages of Sir John Mandeville. In some parts of its surface they imagine the inhabitants to be all dwarfs, who tie themselves together in bunches for fear of being carried away by the eagles; in others they are all women, who conceive by looking at their shadows; and in a third kingdom, all the people have holes in their breasts, through which they thrust a pole, when carrying one another from place to place. Charts for the guidance of the navigator, or instruments to aid him in determining his position at sea, the Chinese are nearly or quite destitute of; they have retrograded rather than advanced in navigation, judging from the accounts of Fa-hian, Ibn Batuta, and other travellers, when their vessels frequented the ports in the Persian Gulf and on the Malabar Coast, and carried on a large trade with the Archipelago. Itineraries are published, containing the distances between places on the principal thoroughfares throughout the provinces, and also lists of the ports, harbors, and islands on the coast, but nothing like sailing directions accompany the latter, nor do maps of the routes illustrate the former. Such knowledge as they have on these points is hidden away in their libraries, as the Latin and Greek classics were in European convents and castles a thousand years ago."—*Williams, Midd. King.*, ii. 80–1.

[For geographies and topographies see *Literature.*]

Natural history.—"Natural history, in its various branches of geology, botany, zoölogy, etc., has received some attention, because the objects which come under it could not escape the notice of all the writers in Chinese literature. As sciences, however, none of them have an existence, and they are studied chiefly for their assistance in furnishing articles for the materia medica of the native physician. To these persons nothing comes amiss, and, like the ingredients of the hubbling, bubbling caldron of Macbeth's witches, the stranger it is the more potent they think a dose will be; in this particular they now act very much as the faculty did in England two centuries ago."—*Williams, Midd. King.*, ii. 134.

Anatomy, Surgery, Medicine, etc.—[The Chinese make no clear distinction between physiology and metaphysics. The same word, *ch'i*, denotes *breath* and *anger*; and they conceive anger as an actual rush of air from the heart to the head, thus, a purely physical phenomenon. So, too, the heart is considered, literally, as the seat of the intellect and of all moral characteristics. They have a fairly correct notion of the physical functions of the heart, and its relation to the blood, and knowing that everything which taints the latter has an injurious effect on the former, they argue that it is the same in the moral nature, and that the inhabitants of Peking, by reason of the foul air they breathe, are the most corrupt people in China.]—*Balfour, Leaves*, pp. 64–7.

"They do not depend upon incantations and charms for relief in case of sickness, but resort to the prescriptions of the physician as the most reasonable and likely way to recover; mixed up, indeed, with many strange practices to assist the efficacy of the doses. These vary in every part of the Empire and show the

power of ignorance to perpetuate and strengthen the strangest superstitions where health and life are involved."—*Williams, Midd. King.*, ii. 118–9.

"The dissection of the human body is never attempted, though some notions of its internal structure are taught in medical works [see *infra*], which are published in many forms." "The Chinese seem to have no idea of the distinction between venous and arterial blood, nor between muscles and nerves, applying the word *kin* to both tendons and nerves. According to these physiologists, the brain is the abode of the *yin* principle in its perfection, and at its base, where there is a reservoir of the marrow, communicates through the spine with the whole body. The larynx goes through the lungs directly to the heart, expanding a little in its course, while the pharynx passes over them to the stomach. The lungs are white, and placed in the thorax; they consist of six lobes or leaves suspended from the spine, four on one side and two on the other; sound proceeds from holes in them, and they rule the various parts of the body. The centre of the thorax (or pit of the stomach) is the seat of the breath; joy and delight emanate from it, and it cannot be injured without danger. The heart lies underneath the lungs, and is the prince of the body; thoughts proceed from it. [It was included as one of the five senses, from which the sense of touch was omitted!] The pericardium comes from and envelops the heart and extends to the kidneys. There are three tubes communicating from the heart to the spleen, liver, and kidneys, but no clear ideas are held as to their office. Like the pharynx, they pass through the diaphragm, which is itself connected with the spine, ribs, and bowels. The liver is on the right side and has seven lobes; the soul resides in it, and schemes emanate from it; the gall-bladder is below and projects upward into it, and when the person is angry it ascends; courage dwells in it; hence the Chinese sometimes procure the gall-bladder of animals, as tigers and bears, and even of men, especially notorious bandits executed for their crimes, and eat the bile contained in them, under the idea that it will impart courage. The spleen lies between the stomach and diaphragm and assists in digestion, and the food passes from it into the stomach, and hence through the pylorus into the large intestines. The omentum overlies the stomach, but its office is unknown, and the mesentery and pancreas are entirely omitted." "The small intestines are connected with the heart, and the urine passes through them into the bladder, separating from the food or fæces at the caput coli, where they divide from the larger intestines. The large intestines are connected with the lungs and lie in the loins, having sixteen convolutions. The kidneys are attached to the spinal marrow, and resemble an egg in shape, and the subtle generative fluid is eliminated by them above to the brain and below to the spermatic cord and sacral extremity; the testes, called *wai shin* [*wai shên*], or 'outside kidneys,' communicate with them. The right kidney, or the passage from it, is called the 'gate of life,' and sends forth the subtle fluid to the spermatic vessels. The bladder lies below the kidneys, and receives the urine from the small intestines at the iliac valve."—*Ibid.* ii. 119–21.

"'Theories are furnished in great variety to account for the nourishment of the body and the functions of the viscera, and upon their harmonious connection with each other and the five metals, colors, tastes, and planets is founded the well-being of the system; with all they hold an intimate relation, and their actions are alike built on the all-pervading functions of the *yin* and *yang*—those universal solvents in Chinese philosophy. The pulse is very carefully studied, and its condition regarded as the index of every condition of the body, even to determining the sex of an unborn infant; great parade is usually made by every practitioner in examining this important symptom."—*Ibid.* ii. 121–2.

"The osteology of the frame is briefly despatched: the pelvis, skull, forearm, and leg are considered as single bones, the processes of the joints being quite dispensed with, and the whole considered merely as a kind of internal framework, on and in which the necessary fleshy parts are upheld, but with which they have not much more connection by muscles and ligaments than the post has with the pile of mud it upholds. The *Tai-i Yuen*, or Medical College at Peking, contains a copper model of a man, about six feet high, on which are given the names of the pulses in different places; it is pierced with many small holes. . . . The irrigation of the body with blood is rather complicated, and authors vary greatly as to the manner in which it is accomplished. Some pictures represent tubes issuing from the fingers and toes, and running up the limbs into the trunk, where they are lost, or reach the heart, lungs, or some other organ as well as they can, wandering over most parts of the body in their course."—*Ibid.* ii. 121. See detailed description in *Lay, Ch. As They Are*, pp. 238–42.

"The Chinese rarely, if ever, amputate. They use strong drawing plaster to extract the ball."—*Scarth, Twelve Years*, p. 144.

"There is a curious practice adopted by the people of Hunan and Hupeh for the cure of certain injuries of a surgical nature. In the case of a severe wound, complicated with loss of blood, fracture of bone, or other injuries of an external kind, particular persons enjoy an hereditary reputation for being able to cure such hurts, and instantaneously staunch bleeding by the use of what they call the *peh sway sen fu* (*pai shui shên fu*). Over a bowl of water, the operator, who is neither priest nor doctor, traces with his finger certain letters, and the water is partly drunk by the patient, and partly spurted out of his mouth upon the affected place by the dispenser of this magic power. Men connected with the timber-trade, and coming from a particular district of Hunan, called *Sen-tsow* (Ch'ên Chou), have a great reputation for success in this. . . . It is customary to give a fee of three thousand cash, more or less, to the operator, but there are some who decline to receive any remuneration." The practice is probably of Buddhist origin. "The water used is always cold, and cold affusions are no strange remedies for such wounds and bruises." "The practice gets mixed up in some localities with Tauism, and its professors use the words *mau san shoh fah* (*Mao shan hsüeh fa*) as their description."—*Ch. Rec.*, i. 114.

"Among the Chinese medicaments in my possession, one is said to be good for broken bones; but whether [to reunite the parts or] only allay the pain, is not stated. [Other methods, however, are used.] When the fracture occurs in the fore-arm (though they seem, strangely enough, to have left the other limbs to take thought for themselves), the operator is directed, in the first instance, to bring the parts into their natural position, then to apply a roller or bandage of cotton, and, lastly, to render the arrangement steady by a belt of bamboo slips . . . [which, being elastic, can] adapt itself to the shape of the limb, while, by two or three folds of it, all disturbance in the adjustment of the parts would, under ordinary circumstances, be quite impossible. . . . The arm . . . is suspended from the neck by a sling." "When the knee-pan [is] displaced . . . a ring, made of bamboo, and furnished with four projecting pieces, is clapped upon the knee, and after being moved so as to effect the reduction, it is bound to the spot by bandages."—*Lay, Ch. As They Are*, pp. 224–5.

"It would seem that dislocations of the spine are not attended with the same fatal effects as with us, but admit of surgical interference. The Chinese suffer little from feverish or nervous irritation after an accident or an operation, so that, if there be breath and blood enough in the body to supply the frugal wants of nature, the patient will live."—*Ibid.* p. 225.

"The Chinese, as if fully persuaded that [displacements of the *vertebræ* might happen without issuing fatally] appear to have invented a back of fir-wood, which, after being well padded with cotton, was bound to the back of the patient by braces, which passed over the shoulders and around the body. Before this . . . was applied, the patient was made to lie down upon his face. An attendant then set his feet upon the shoulders, while the surgeon, by means of a roller or a swathe of cotton, elevated that part of the spine where the injury had taken place, and thus, by a series of pressures [restored the parts to the right position]. . . . After this, the artificial back was braced on, and worn till the parts had recovered their natural tension. [An operation for restoring dislocated ribs to their place—the patient hanging by his hands from a beam—and keeping them there by means of bamboo stays is then described.]"—*Ibid.* pp. 226–9.

"Nine instruments are used for scarification and acupuncture, the peculiar *forte* of the Chinese. . . . Each [has] an appropriate name, and a certain class of diseases to which it belongs. Many directions are given as to the manner in which they are to be used, and it is stated that the user ought to understand the situation of the blood-vessels, lest he should wound an artery. The practice of sticking needles into the flesh, and allowing them to remain a certain time, is, I believe, purely Chinese; [they also use, by way of counter-irritants, the lancet and the *moxa*]."—*Ibid.* p. 229.

"Many of the operations in cases of fracture present a strange mixture of folly and sense, proceeding from their ideas of the internal structure of the human body conflicting with those which common sense and experience teach."—*Williams, Midd. King.*, ii. 124.

[Children were pinched when in convulsions.]—*Giles, Dic.*, 1191.

[The colour of the tongue as an index of sickness was observed by Chang Têng.]—*Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu*, c. 10, p. 20*a*.

"Turning in of the eyelashes is a common ailment, and native practitioners attempt to cure it by everting the lid and fastening it in its place by two slips of bamboo tightly bound on, or by a pair of tweezers, until the loose fold on the edge sloughs off; the eye is, however, more frequently disfigured by this clumsy process than is the trouble remedied. Poultices made of many strange or disgusting substances are applied to injured parts. Dr. Parker mentions the case of a man who, having injured the iris by a fall, was ordered by his native physician to cut a chicken in halves, laying one portion on the eye as a cataplasm and eating the other as an internal cure. Venesection is rarely attempted, but leeches and cupping are employed to remove the blood from a particular spot. Blood-letting is disapproved in fevers, 'for,' says the Chinese reasoner, 'a fever is like a pot-boiling; it is requisite to reduce the fire and not diminish the liquid in the vessel if we wish to cure the patient.'"—*Williams, Midd. King.*, ii. 123–4.

"Dentists employ arsenic in the extraction of teeth. It is inserted between the teeth and the gums, causing the latter [? former] to loosen in their socket."—*Journ. N.-C.B.R.A.S.*, N.S. ix. 179.

"A diseased state of an organ is supposed to be owing to a disagreement of the *yin* and *yang*, the presence of bad humors, or the more powerful agency of evil spirits, and until these agencies are corrected medicines cannot exercise their full efficacy. The surface of the body receives the closest attention, for there is not a square inch without its appropriate name. Plasters and lotions are applied to these places according to the diagnosis of the disease, predicated on the dual theory; and the strolling quacks and regular practitioners both administer the rationale and the dose together—considering, probably, that the medicine would lose half its efficacy upon the organs it was intended to affect if it was not mixed with faith to operate upon the sentient principle lodged there."—*Williams, Midd. King.*, ii. 122.

"The practice of the Chinese is far in advance of their theory, and some of their treatises on dietetics and medical practice contain good advice, the result of experience. Dr. W. Lockhart has translated a native treatise on midwifery, in which the author, confining himself principally to the best modes of treatment in all the stages of parturition, and dwelling briefly on the reasons of things, has greatly improved upon the physiologists. This branch of the profession is almost entirely in the hands of women. Surgical operations are chiefly confined to removing a tooth, puncturing sores and tumors with needles, or trying to reduce dislocations and reunite fractures by pressure or bandaging. Sometimes they successfully execute more difficult cases, as the amputation of a finger, operation for a harelip, and insertion of false teeth. In one case of dentistry four incisor teeth made of ivory were strung upon a piece of catgut and secured in their place by tying the string to the eye-teeth; they were renewed quarterly, and served their purpose tolerably well (*Cf. Remusat, Nouv. Mél. Asiat.*, i. 358–80). The practice of acupuncture has some good results among the bad ones. That of applying cauteries and caustics of various degrees of power is more general, and sometimes entails shocking distress upon the patient. Cases have presented themselves at the hospitals, where small sores, by the application of escharotics, have extended until a large part of the tissue, and even important organs, have been destroyed, the charlatan amusing his suffering patient by promises of ultimate cure. The moxa, or burning the flowers of the amaranthus upon the skin, is attended with less injury."—*Ibid.* ii. 123.

The doctor's questions "are usually few, as it is presumed the pulse reveals everything needful to know. Ink and paper are produced and a prescription is written out, which consists of numerous ingredients, but there are one or two of only prime importance—the rest are servants or adjuvants. They are all taken from the vegetable kingdom, and are mostly simples of little efficacy. The prescription is taken to a druggist to be dispensed; the prescriber seldom makes up the medicine himself, and as large doses are popular . . . so the decoction made from the whole amounts to pints or even quarts, which are swallowed in large portions with the greatest ease; powders, boluses, pills, and electuaries are all used."—*Ibid.* ii. 126.

"Dr. Hobson has given an analysis of 442 medicinal agents enumerated in one of the popular dispensatories; of the whole number, 314 are vegetable, 50 mineral, and 78 animal. The author gives the name of each one, the organ it affects, its properties, and lastly the mode of its exhibition. Medicines are arranged under six heads—tonics, astringents, resolvents, purgatives, alteratives of poisonous humors, and of the blood. Among the agents employed are many strange and repulsive substances, as snake-skins, fossil bones, rhinoceros or hart's horn shavings, silk-worm and human secretions, asbestos, moths, oyster-shells, etc. Calomel, vermilion, red precipitate, minium, arsenic, plumbago, and sulphate of copper are among the metallic medicines used by physicians; Dr. Henderson enumerates thirty-three distinct mineral medicines. . . . Hartshorn is reduced to dust by filing, for exhibition in consumption. Many roots, as rhubarb, gentian, etc., are prepared by paring them into thin laminæ; others are powdered in a mortar with a pestle, or triturated in a narrow iron trough in which a close-fitting wheel is worked. The use of acids and reagents is unknown, for they imply more knowledge of chemistry than the Chinese possess. Vegetable substances, as camphor, myrrh, ginseng, rhubarb, gentian, and a great variety of roots, leaves, seeds, and barks, are generally taken as pills or decoctions."—*Ibid.* ii. 127–8. See also details given in *Lay, Ch. As They Are*, pp. 230–7.

[Camphor was used in medicine, as in former times.]—*Pharmaceutical Journal*, Third Series, iv. 710.

[Glue prepared from stags' horns is believed in as a valuable remedy for consumption.]—*Lay, Chinese*, p. 232.

"We learn from Chinese writings that shad, particularly shad oil, is efficacious in the treatment of consumption, and that seaweed is serviceable in goitre." "Besides shad, several other oleaginous fish are considered as peculiarly adapted to consumptive patients. The barbel is commended in that disease, fattening the patient and imparting glossiness to the skin. The bream is useful in emaciation. The gurnard is extolled as useful in phthisis. The eel is also named as useful in that malady. Anthelmintic properties . . . are attributed to the eel, and the mullet." "They have discovered that various fuci are efficacious in goitre, glandular swellings of a scrofulous character and cutaneous eruptions. Those seaweeds which are known to be richest in iodine are most valued."—*Journ. N.-C.B.R.A.S.*, N.S. vii. 235–6. For descriptions of various other remedies and methods see *Balfour, Leaves*, pp. 68–81; *Scarth, Twelve Years*, pp. 122–3; *Gray, China*, ii. 189–90; *Parker, John Chinaman*, p. 364; *Little* (*Mrs. A.*), *Int. Ch.*, p. 267; *Ch. Rev.*, x. 72, 221; etc.

The Chinese have no real confidence in Western physicians, and look with suspicion on treatment which does not include incense-burning, and other ceremonies for propitiating spirits; also "they have no faith in medicine of any kind which does not make its presence felt quickly and powerfully."—*Giles, Ch. Sketches*, p. 38.

"No museums of morbid or comparative anatomy exist in the country, nor are there any lectures or dissections; and the routine which old custom has sanctioned will go on until modern practice, now rapidly taking its place, wins its way."—*Williams, Midd. King.*, ii. 133.

"Medical treatises are exceedingly numerous and various in their subjects. Medical practice in China . . . stands very low in comparison with European science. . . . The medical art is divided by them into nine branches, relating respectively to the main arteries and blood vessels, their ramifications, fevers, female complaints, cutaneous complaints, cases of acupuncture, eye complaints, throat, mouth, and teeth complaints, and bone diseases. Each of these departments has its literature, while there are also very many works of a general character."—*Wylie, Ch. Researches*, p. 229. See also *Hsi tien fu chih, Sung Yüan hua jên hsing shih lu*, c. 36, *Shih tzŭ*, pp. 39*b*–40*a*; *Ch'in ting ssŭ k'u ch'üan shu chien ming mu lu*, c. 10, *Tzŭ pu I chia lei*, p. 19*b*; p. 21*a*; *I hsüeh chien chin lu, I chih mu lu*, MS. copy (unpaged), etc.

Archæology.—"Twenty years ago the *Chin Shih So* was published, and this work with its profuse illustrations helped to spread the knowledge both of the new-found Han Dynasty sculptures and of the earlier bronze vessels. Rich men and scholars became sensible of the great pleasure to be derived from archæological research. And this has become a real feature of modern Chinese life. Men of means and leisure visit all celebrated monuments to study them for themselves, and take back with them rubbings to preserve at home. The large demand there is in China for rubbings of ancient inscriptions is very remarkable."—*Little* (*Mrs. A.*), *Int. Ch.*, p. 428.

Mechanics.—"The Chinese have made but little progress in investigating the principles and forces of mechanics, but have practically understood most of the common powers in the various applications of which they are capable. The lever, wheel and axle, wedge and pinion, are all known in some form or other, but the modification of the wedge in the screw is not frequent. The sheave-blocks on board their vessels have only one pulley, but they understand the advantages of the windlass, and have adopted the capstan in working vessels, driving piles, raising timber, etc. They have long understood the mode of raising weights by a hooked pulley running on a rope, attached at each end to a cylinder of unequal diameters; by this contrivance, as the rope wound around the larger diameter it ran off the smaller one, raising the weight to the amount of the difference between the circumference of the two cylinders at a very small expense of strength. The graduations of the weighing-beam indicate their acquaintance with the relations between the balance and the weight on the long and short arm of the lever, and this mode of weighing is preferred for gold, pearls, and other valuable things. The overshot water-wheel is used to turn stones for grinding wheat and set in motion pestles to hull rice and press oil from seeds, and the undershot power for raising water. There is a great expenditure of human strength in most of their contrivances; in many, indeed, the object seems to have been rather to give a direction to this strength than to abridge it. For instance, they put a number of slings under a heavy stone and carry it off bodily on poles, in preference to making a low car to roll it away at half the expense of human power."—*Williams, Midd. King.*, ii. 117–8.

"As in every branch of science and art, mechanics in China have remained for centuries in a perfectly stagnant condition.

The tools and appliances which were good enough for those who worked and laboured before our era, still satisfy the requirements of Chinese craftsmen."—*Douglas, Society in China*, p. 137.

In *metaphysics*, "the soul is not contemplated apart from the body, and therefore no distinct attributes are assigned to it. It is supposed to be of a fine and subtil nature, and to ascend to heaven at death; but in what capacity, or with what endowments, is not stated."—*Lay, Chinese*, p. 161.

Philosophy.—"Since the close of the second epoch [of philosophy] there have been hosts of writers in China; but if any have put forth original and divergent views they have not met with acceptance from the people and the government. Those whose labors have obtained currency are esteemed merely as able expositors of the views of Choo tsze."—*Meadows, Ch. and Their Reb.*, p. 337.

"Philosophic Taoism is cultivated now mainly by the literati who do not take office, or by officials who have retired; and as the only criticism of any weight which can be directed against orthodox Confucianism proceeds from this quarter, it is notable that the critics plead always for less, not different government, and undervalue the charms of office instead of competing for it."—*Simcox*, ii. 95.

"The later Taoists, who practise legerdemain and seek for elixirs of immortality, grossly misunderstood the doctrine of their masters; but abstract philosophy is not the *forte* of the Chinese, and it is easy to see how the doctrine, that mind is superior to all the restraints imposed by phenomenal existence, and that the preservation of the body is at once a duty imposed by nature and proof of conformity therewith,—should lend itself to the corrupt reading which has enjoyed a vogue equal in duration if not in extent to that of the established orthodoxy."—*Simcox*, ii. 95.

Political science.—"But it is in the science of government that this race of organizers have done their best work, anticipating the West by many centuries, both in noble definition of public duties, and in practical construction of the political and civil elements. . . . Under the patriarchal system, government is father, teacher, preserver of the people; yet not . . . by divine right of kings to the absolute allegiance of the people. It represents the relation of the whole race to the universe, expressed in principles and laws higher than personal caprice. It originates in the moral needs of men, and in their spontaneous recognition of right. In the old time, it affirms, rulers wrought not by laws, but by example; not by rules, but by instinctive perceptions. They laid down the maxim, even in dealing with rebellion or invasion, that doing justly would conquer an enemy more effectually than force of arms (*Shu ching*, ii. 2). This, of course, means that such was the *aspiration* which, in later times, this peaceable and civil race pursued, affirming its success to have been apparent in the divine and creative past. Through the supposed degeneracy of centuries it has endured, and is still visible in many institutions implying the highest forces of moral culture, amidst the special laws that prove such forces far from available. . . . Works on judicial precedents, reviews of criminal legislation, records of *causes célèbres*, discussions of the theory and practice of government, abound; and the law codes, whatever mixture of good and evil they may contain, are models of direct, practical, unmistakable dealing with the facts, and monuments of sincere effort to deal justly. They consist, it is true, of bald detail, though arranged with the utmost clearness. . . . The Penal Code of the T'sing is a compilation of extreme minuteness and reach, abounding in just distinctions and noble equities. It is but here and there that startling anomalies, in principles and estimates, interrupt the great preponderance of mercy over severity."—*Johnson, Or. Rel.—Ch.*, pp. 93–4.

History.—"Of historical data the pragmatic Chinese possess an unlimited amount; of the science of history, a better conception than most ancient peoples, since they have always carefully registered events in their relation to causes and effects. But this correct basis is disturbed by being obliged to adjust itself to a theory that events proceed from the maintenance or violation of a pre-ordained harmony between earth and heaven, the fixed norm of which is a set of institutions established in the earliest times. Behind all this mixture of history with fable, however, stands a very clear conception of moral sequence, in national penalty and reward, according to unchangeable right. Full responsibility of nations and their governors to forces of moral and spiritual order as supreme is the ideal of historic justice. Of the complexity and variety of human relation and motive the uniformity of the national type allows less perception. Here, as elsewhere, the main aim is to collect details and the passion for calendaring facts has kept historic documents nearer to sober truth than those of any other Oriental nation, with perhaps the exception of the Egyptian."—*Ibid.* p. 90.

"The editors of Yung-ching's Shoo give the names of 115 scholars of the Yuen . . . and Ming . . . dynasties, of whose labours they make use in their annotations; and Choo E-tsun, bringing his researches into the last century, enumerates the titles of more than 350 Works upon the classic, from Choo He downwards. All these Writings have the whole of the Shoo, or as much as their authors acknowledged to be genuine, for their subject. On particular books, especially the two Canons, the Tribute of Yu, and the Great Plan, about 200 works have been published during the same time. All this shows how the Shoo continues to hold its place in the minds of the Chinese. Its very difficulties seem to fascinate the scholars, who for the most part repeat one another sadly; but now and then, we find a commentator who endeavours to shake off the trammels of Choo He, and to look on the ancient document with his own eyes."—*Legge, Ch. Class.*, III. i. Prol. pp. 34–5.

Learning.—Han T'an, A.D. 1636–1704, is "credited with having restored the standard of scholarship at the public examinations, which had sunk since the fall of the Mings."—*Giles, Bio. Dic.*, p. 252.

Mrs. M. E. Talmage says she had never met with a woman at Amoy who could read. "Our teacher says that there are very few, not one in a thousand; that some of the wealthy families have a teacher for their little girls; one, two or at *most* three years. . . . It is said that some of the Mandarins have their daughters taught for a longer period."—*Woman's Work*, ii. 48. See also pp. 103, 104.

"In the region of which Swatow is the seaport, I have never seen nor heard of a native school for girls. When travelling in the country in various directions, to a distance of 50 or more miles from Swatow, during five years, I have made the personal acquaintance of only five heathen women who knew how to read. In the cities, some women belonging to wealthy families, as well as the daughters of some literary men can read; but in the country villages none of the women read. All the Buddhist nuns, and the girls they rear in monasteries, learn to read and write; and some of them are fine scholars. Little girls used as actresses, in plays performed by children, are also taught to read. Apart from the nuns and actresses, taking city and country together, I think the average would be about one woman in a thousand who could read at all."—*Ibid.* ii. 143.

[It is estimated that, in wealthy Canton families, 60 or 70 per cent. of women can read. The Chinese say that more attention is paid to female education in Canton than any other city.]—*Ibid.* ii. 135–40.

LANGUAGE.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

"There can be little doubt that the old idea of Chinese having preserved unchanged the earliest type of human speech is . . . false. On the contrary, there is clear proof in the structure of the language itself that it was once polysyllabic, and that its words were to a great extent formed by the addition of agglutinative elements, some of which may have had the function of cases, etc. A comparison with the cognate languages confirms these conclusions, and also shows that the Chinese word-order is not original, and that the language must consequently have formerly expressed grammatical relations by other means."—*Sweet, Hist. of Lang.*, p. 70.

"The date of the origin of this language, like that of the letters of Western alphabets, is lost in the earliest periods of post-diluvian history, but there can be no doubt that it is the most ancient language now spoken, and along with the Egyptian and cuneiform, among the oldest written languages used by man. . . . During successive eras, the written and spoken language of the Chinese has undergone few alterations, and done much to deepen the broad line of demarkation between them and other branches of the human race. The fact, then, that this is the only living language which has survived the lapse of ages is, doubtless, owing to its ideographic character and its entire absence of sound as an integral factor of any symbol."—*Williams, Midd. King.*, i. 581–2.

"The changes of the spoken language previous to the 2nd or 3rd century of our era, it is impossible to trace; as prior to that period it was preserved only in the memories of the people and communicated either vivâ voce, or to those partially instructed by referring to a character well known of the same sound as one not known, and saying 'Tuh jo mow,' 'Read as such a character,' or this character is pronounced like that."—*Morrison, Dic.*, Introd. p. iii.

"The Chinese themselves say that, in high antiquity, they had words without letters; in the middle ages (*i.e.*, about the time of Confucius) words were communicated by letters in the way which has just now been noticed. In later times the sounds of many characters were forgotten and lost, for the Yun-heo was not known. The Yun-heo is a mode of classing all the words of the same termination together, as we do those of the same initial."—*Ibid.* p. iv.

Ch'ên Ti, 16th century A.D. "maintained *à outrance* that in early ages there was no such thing as pronouncing a word in poetry not according to its ordinary sound, but in accordance with the requirements of rhyme."—*Giles, Bio. Dic.*, p. 103.

"The priority of labial letters over other consonants is rendered probable by the facts of letter change in China. As a rule the order observable in the changes of letters whether initial or final is from lips to throat or from lips to teeth or from teeth to throat, but not from teeth and throat to the lips. Thus, *p* produces *f* or *h*, but *f* and *h* do not change to *p* [see *Edkins, Study of the Chinese Characters*, pp. 184–211]. There are exceptions, but this is the general rule."—*Journ. P.O.S.*, ii. 10.

"The time during which there was the greatest predominance of *p*, *b*, *m* in Chinese roots, was before the formation of the characters, assigned by tradition to about 2500 B.C. For in the phonetic characters the six final consonants *p*, *t*, *k*, *m*, *n*, *ng* are neither of them wanting. Examining the phonetic characters we find that as a rule final *p*, occurring in any phonetic, belongs to all words written with the same phonetic. It follows then that final *p* was certainly in the pronunciation of the inventors of the character. The same is true of the other five final consonants found in Chinese words."—*Ibid.* ii. 12.

"The time for the first appearance of roots would be the labial age when gesture prevailed extensively and in the civilized period when the upgrowth of various arts originated many new words. During the same period the principles and usages of grammar would grow into authoritative shape. All this would happen before the invention of writing. At that time, 2500 B.C., we find . . . the old grammar was fully developed. Let us call 5000 to 4000 B.C. the labial period, 4000 to 3000 B.C. the dental period, and 3000 to 2000 B.C. the guttural period. When the characters were invented the guttural age was not finished, for we find traces in the phonetic characters indicating this fact."—*Ibid.* ii. 50.

"The doctrine of Tones, and of the Syllabic Spelling, were not known in ancient times."—*Liu shu ku*, Preface.

"The successive origination of the tones is historically proved. Their growth can be measured by centuries."—*Edkins, Evol. of the Ch. Lang.*, p. 26.

"The age of the two oldest tones extended from 2500 to 1800 B.C., and of three tones . . . from 1800 B.C. to 300 B.C."—*Journ. P.O.S.*, ii. 50.

"The tones of the oldest period of Chinese History are studied in the book of poetry. A great deal has been written on the rhymes of the *Shih* by native authors, and the evidence which has been brought to bear upon the subject seems to favour the assumption that the tones existed even in the earliest known specimens of the language, but that they were used unconsciously, and with a considerable degree of latitude. Words rhyming in the *Shih* are found in the majority of cases to belong to the same tone-class still, though the exceptions are certainly much more numerous than would have been tolerated in the age, say, of the T'ang or Sung."—*Ch. Rev.*, xxii.

"The slow growth of the Chinese tone system and its tendency to subdivision in localities are very marked."—*Edkins, Evol. of the Ch. Lang.*, p. 27.

"The development of distinctions of tone in such a language as Chinese, by which words that would otherwise be identical in form are kept apart, used to be explained as a compensation for the confusions caused by phonetic decay—that is, that when two words became homonyms, a tone was 'invented' to keep them distinct, and that as confusion increased, more and more distinctions of tone were elaborated to keep pace with the demands of distinctness. The real explanation of this apparent use of word-tones for purposes of differentiation is the exact opposite. It was the development of tone distinctions that led to the carelessness of articulation and the multiplication of what without the tones would be homonyms."—*Sweet, Hist. of Lang.*, p. 94. For the superseded theory see *Journ. P.O.S.*, ii. 27; *Lacouperie, Lang. of Ch.*, p. 137–40; *Early Hist.*, p. 19; *Beginnings of Writing; Rohring, Researches; Dubeaux, Compte Rendu*, pp. 12–14; *Eclaircissements*, pp. 5–6; *Lucien Adam, De l'harmonie, etc.*, pp. 31–76; *L. de Rosmy, De l'origine du langage*, pp. 36–9; *Beaulieu, Mémoire sur l'orig. de la Musique*, pp. 5–8.

"The time when sonants became surds was probably early in the tone period. Surd initials are common in the oldest parts of the Book of History. . . . If they originated in the dental period, as is possible, the surds may be conjectured to have branched off from the sonants at that time."—*Journ. P.O.S.*, ii. 29.

"In the Chinese syllables in the old language vowel endings are rare."—*Ibid.* ii. 29.

"Since the Chinese language was already a medium in which eighteen hundred years before Mencius there were written records to preserve the data of astronomy, the facts of history, and the interpretations of the diviner, we may expect that the letters were at that time fairly well developed." "There would be the nasals *m*, *n*, *ng*." "Coming to *b*, *d* and *g* with *p*, *t*, *k* . . . there is reason for regarding *b*, *d*, *g* as the older. In the modern language *p*, *t*, *k* have been evolved from them. This happened when *b*, *d* and *g* were abandoned by the mandarin dialect. It is probable that it was by a like process at some ancient date that the old *p*, *t* and *k* took the place of *b*, *d* and *g*. We cannot tell when this was because the rhymes of poetry do not help us here. Another reason for assigning priority to *b*, *d*, *g* is that they are more audible, and in primitive times this advantage would be of no little value." "The analogy of Manchu and Mongol would lead to the supposition that the aspirated *p*, *t*, *k* were early introduced among Chinese current sounds." In Chinese, aspirated consonants "occur as a device rather to multiply syllables in a monosyllabic language. . . . In the oldest Chinese records words read with the unaspirated *p*, *t*, *k* are to be aspirated as three to one in the very old Yau-tien, and as two to one in the sixty-four names of the combinations in the Yi-ching." "There would probably also be in existence 2500 B.C. *s*, *r*, *sh*, *zh*. . . . In Chinese evolution the letters *s* and *sh* both proceed from *t*. In 2500 B.C. consequently fewer words would begin with *s* and *sh* than at present." "In regard to *w* and *g* with their aspirates *hw*, *hy*, they are probably letters of an origin later than the primitive age." "The letters *f*, *v*, *l*, *r* are not likely to have had a very early origin." "The vowels *a*, *i*, *o* would naturally be the oldest of all vowels. . . . These primitive vowels were followed by *u*, *ü*. . . . The lesson taught by studying the ancient sounds and the dialects is that the farther we go back the nearer we approach to unity. As the consonants are reduced to labials in the first instance, so the vowels are reduced to *a*."—*Ibid.* ii. 13–16.

"In a language like Chinese, which has no inflections, and uses only a few grammatical form-words, and relies mainly on word-order, it is still more difficult than in English to discriminate the parts of speech. Apart from their grammatical context Chinese words can only be classed as substance-words and phenomenon-words—'dead words' and 'living words,' as the Chinese grammarians respectively call them—and so on. If a substance-word is put before another substance-word—either with or without the particle *ci* [*chih*] between them—it becomes an adjunct-word. Further than this we cannot go in our grammatical analysis of Chinese."—*Sweet, Hist. of Lang.*, p. 49.

[Old Chinese was characterized by extreme elliptical conciseness and concentrated force of expression. These with desire for logical clearness led to great development of untranslateable particles. Non-inflexion and paucity of grammatical word-forms made discrimination of parts of speech difficult. Apart from context words can only be classed as substance-words ("dead") and phenomenon-words ("living"). Nouns and adjectives are strictly speaking only noun- and adjective-equivalents. Any word may be used as a predicate. Vocabulary contained many imitative and "empty" (form-) words. Prepositions were generally phenomenon-words. Order of sentence was from general to special.]—*Ibid.* pp. 34, 42, 49, 50, 55, 61, 69, 70, 79.

[The structure of the language bore definite marks of intellectual power and activity. It combined Roman brevity with Greek love of clearness and moderation of expression, but showed none of the imaginative and poetical qualities reflected in most Aryan languages.]—*Ibid.* p. 143.

"The relative pronoun does not appear in distinct shape in the oldest documents. But we find it in the Song of the Five Sons purporting to belong to 2188 B.C., and in the next chapter in the history."—*Journ. P.O.S.*, ii. 87–8.

[The postposition of the genitive to its noun, the preplacement given to the object, the postposition of the object to the verb, are characteristics of the Book of Poetry. The postposition of the adverb to the verb, contrary to the Chinese habit, is frequently resorted to in the Taoist books. See the *Shih ching*, *passim*.]

Lacouperie considers that there was an intermingling of the language of the conquerors with that of the previous inhabitants. "The phonesis, morphology and sematology of the language bear, also, their testimony to the great influence of the native tongues. . . . In the process of word-making, the usual system of post-placing particles for specifying the conditions in space and time common to the Urgo-Altaic linguistic alliance has been disturbed in Chinese, and most frequently a system of preplacing has been substituted for the older one. And finally, in the department of sematology, we have to indicate, also, as a native influence on the language of the Chinese, the habit of using numeral auxiliaries, or segregation particles, otherwise classifiers, which, if it had not been altogether foreign to the older state of the language, would not have taken the important place it occupies in the modern dialects."—*Languages of Ch.*, p. 16. See also pp. 14–15.

"The vocabularies . . . have come at one pace with the preceding alterations. The loan of words has been extensive on both sides, native and Chinese, and reached to a considerable amount."—*Ibid.* p. 17.

Writing.—"The Chinese receive it as an undoubted fact that in high antiquity knotted cords were made use of to signify the intention of Rulers, and to be, to a certain extent, the signs of ideas. It is said that in the time of Hwang-te, the third from Fuh-he, a Person whom they call Ts'hang-hëĕ, observing the appearance of a certain constellation, the marks on the shell of a tortoise, and the print of a horse's foot, first conceived the idea of forming Letters."—*Morrison, Dic.*, Introd. p. 1. See also *Ch. Rev.*, x. 73; *Williams, Midd. King.*, i. 580; *Wylie, Ch. Researches*, p. 203.

"In the sixth century B.C. the Chinese were . . . in possession of a written language, fully adequate to the most varied expression of human thought, and indeed almost identical with their present script, allowing, among other things, for certain modifications of form brought about by the substitution of paper and a camel's-hair brush for the bamboo tablet and stylus of old. The actual stages by which that point was reached are so far unknown to us. China has her Cadmus in the person of a prehistoric individual named Ts'ang Chieh, who is said to have had four eyes, and to have taken the idea of a written language from the markings of birds' claws upon the sand. Upon the achievement of his task the sky rained grain and evil spirits mourned by night. Previous to this mankind had no other system than rude methods of knotting cords and notching sticks for noting events or communicating with one another at a distance."—*Giles, Hist. of Ch. Lit.*, pp. 5–6.

"As to the origin of the written language of China, invention is altogether out of the question. It seems probable that in prehistoric ages, the Chinese, like other peoples, began to make rude pictures of the sun, moon, and stars, of man himself, of trees, of fire, of rain, and they appear to have followed these up by ideograms of various kinds. How far they went in this direction we can only surmise. There are comparatively few obviously pictorial characters and ideograms to be found even in the script of two thousand years ago; but investigations carried on for many years by Mr. L. C. Hopkins, H.M. Consul, Chefoo, and now approaching completion, point more and more to the fact that the written language will some day be recognised as systematically developed from pictorial symbols. It is, at any rate, certain that at a very early date subsequent to the legendary period of 'knotted cords' and 'notches,' while the picture-symbols were still comparatively few, some mastermind reached at a bound the phonetic principle, from which point the rapid development of a written language such as we now find would be an easy matter."—*Ibid.* p. 6. *Cf. infra.*

"The original hieroglyphics contained no sound, *i.e.*, were not formed of phonetic constituents; the object depicted had a name, but there was no clue to it. It was impossible to do both—depict the object, and give its name in the same character. At first, the number of people using these ideographic symbols being probably small, every one called them by the same name, as soon as he knew what they represented, and began to read them. But when the ideas attempted to be written far exceeded in number the symbols, or, what is more likely, the invention of the limners, recourse was had to the combination of the symbols already understood to express the new idea. This was done in several modes. . . . The same principle would be applied in *reading* every new character, of which the phonetic primitive merely was recognized, although its meaning might not be known. Probably all the characters in the" class of syllabic symbols "were sounded in strict accordance with their phonetic primitives when constructed, but usage has changed some of their sounds, and many characters belonging to other classes, apparently containing the same primitive, are sounded quite differently. . . . This mode of constructing and naming the characters also explains the reason why there are so few sounds compared with the number of characters; the phonetic primitive perpetuated its name in all its progeny."—*Williams, Midd. King.*, i. 606–7.

"More than seven-eighths of the characters have been formed from less than two thousand symbols, and it is difficult to imagine how it could have been used so long and widely without some such method to relieve the memory of the burden of retaining thousands of arbitrary marks. But until the names and meanings of the original symbols are learned, neither the sound nor sense of the compound characters will be more apparent to a Chinese than they are to anyone else; until those are known, their combinations cannot be understood, nor even then the meaning wholly deduced; each character must be learned by itself, just as words in other languages. The sounds given the original symbols doubtless began to vary early after coming into use. Intercommunication between different parts of the country was not so frequent as to prevent local dialects from arising; but however strong the tendency of the spoken monosyllables to coalesce into polysyllables, the intractable symbols kept them apart. . . . If the characters could have coalesced, their names would soon have run together, and been modified as they are in other languages. The classics, dictionaries, and unlimited uses of a written language, maintained the same meaning; but as their sounds must be learned traditionally, endless variations and patois arose. Moreover, as new circumstances and increasing knowledge give rise to new words in all countries, so in China, new scenes and expressions arise requiring to be incorporated into the written language. Originally they were unwritten though well understood sounds; and when first written must be explained, as is the case with foreign words like *tabu*, *ukase*, *vizier*, etc., *ad infin.*, when introduced into English. Different writers might, however, employ different primitives to express the sound, not aware that it had already been written, and hence would arise synonyms; they might use dissimilar radicals, and this as well would increase the modes of writing the sound. But the inconvenience of thus multiplying characters would be soon perceived in the obscurity of the sentence, for if the new character was not in the dictionary, its sound and composition were not enough to explain the meaning. When the language had attained a certain copiousness, the mode of education and the style of literary works compelled scholars to employ such characters only as were sanctioned by good use, or else run the risk of not being understood." "The unwritten sounds, however, could not wait for this slow mode of adoption, but the risk of being misunderstood by using characters phonetically led to descriptive terms, conveying the idea and not the sound. Where alphabetic languages adopt a technic for a new thing, the Chinese make a new phrase."—*Ibid.* i. 607–8.

"The primitive form of the signs became effaced as the art of writing was propagated; the strokes indicating the outlines were altered; then, to give more regularity to the writing, the strokes were made stiffer, and more uniform. The characters thus ceased to be images and became conventional signs. The number of primitive signs appears at first to have been limited; for, in writing, it must have been found embarrassing to depict a multitude of very different objects; but, the barrier of the image once passed, and the elements of the characters rendered more regular and easy to trace, the groups increased rapidly." "This must have taken place in the first centuries of the Chinese monarchy, for the most ancient inscriptions known to us, such as the monument of Yu and the inscriptions on Mount Tai Shan in the province of Shantung, offer but few real images, though one may without difficulty recognise in the characters they contain, the altered outlines of these last images."—*Klaproth, Mém. rel. à l'Asie*, ii. 97.

"During the reign of Ching Wang [Ch'êng Wang], the second of the Dynasty Chow, . . . a Person named Paou-she formed a work called *Luh-shoo* [see following Period], the contents of which he taught to his pupils. He is considered the Father of Letters, and his work has been a standard to which all future ages have referred. It is there affirmed that originally $\frac{9}{10}$ of the characters were hieroglyphic; but that, being abbreviated for the sake of convenience, or added to, for the sake of appearance, the true and original form was gradually lost. . . . The character is said to be derived from the following 6 sources: (1) Resemblance to the object. . . . (2) Pointing out some property. . . . (3) Combination of ideas. . . . (4) Sound of the thing spoken of. . . . (5) Contraries, by inverting and reversing the character. . . . (6) Borrowed, supposed, or arbitrary characters."—*Morrison, Dic.*, Introd. pp. i. ii.

"The first mention of the *lu shu* '6 kinds of writing' is in the classical work *Chêu li* attributed to Cheu Kung 1100 B.C. The 5th of the 6 accomplishments taught to princes is stated to be *lu shu*."—*Edkins, Study of the Ch. Char.*, p. 151.

"There is no evidence to show that Chinese, though doubtless springing from a pictorial germ, was ever practically a hieroglyphic language."—*Giles, Dic.*, p. 280, No. 2724.

"Premising that the original symbols were ideographic, the necessities of the case compelled their contraction as much as possible, and soon resulted in arbitrary signs for all common uses. Their symbols varied, indeed, at different times and in different States; it was not until a genuine literature appeared and its readers multiplied that the variants were dropped and uniformity sought. . . . It is apparent that the number of pictures which could be made . . . would bear no proportion to the wants and uses of a language, and therefore recourse must soon be had to more complicated symbols, to combining those already understood, or to the adoption of arbitrary or phonetic signs. All these modes have been more or less employed."—*Williams, Midd. King.*, i. 583.

"In the preface to the Shioŏ Wăn [see MONARCHY] the oldest extant dictionary of the Chinese, we are told that 'when Ts'ang Kĕĕ first made characters (*shoo*), they were, according to their classes, resemblances of the objects, and therefore called *wăn* (delineations); that afterwards, when the forms and their sounds (or names) were mutually increased, they were called *tsze* (begetters); and that, as set forth on bamboo or silk, they were called *shoo* (writings).'"—*Legge, Ch. Class.*, III. i. Prol. p. 1.

[*Edkins* (*Journ. R.A.S.*, xviii. 7) says: "It is perfectly possible that the art of writing may have been communicated to China from Mesopotamia . . . by the same route which afterwards gave to India the Devanagari alphabet. But when ocean navigation first reached China, alphabets were unknown, and therefore Chinese writing is ideographic and phonetic only."]

"The stories current, and which are endorsed by statements in the later semi-classical books, about the invention of the characters by Ts'ang-kĕĕ, in the time of Hwang-te, are of no value . . . but the original immigrants, I believe, brought with them the art of ideographic writing or engraving. It was rude and imperfect, but it was sufficient for the recording of simple observations of the stars in their courses, and the surface of the earth, and for the orders to be issued by the government of the time. As early as the beginning of the Shang dynasty, we find E Yin presenting a written memorial to his sovereign [see following extract]."—*Legge., Ch. Class.*, III. i. p. 192.

"He, that is, E Yin, then made the following writing" (*Shu ching*, Pt. IV. Bk. V. Pt. i.). "This is the first time that we read in the Shoo of any communication addressed otherwise than by word of mouth. Ch'in Leih suggests that perhaps the presenting written or engraved memorials commenced at this time. We are not to think of E Yin as using pencils, ink, and paper. His memorial was on one or more slips of wood or bamboo, lightly engraved, or described perhaps with some colouring matter on the plain surface. Lin Che-k'e observes that down to the Han dynasty the memorials were all upon such slips, and were presented tied up in black bags."—*Ibid.* III. i. 200, note. The authenticity of the above passage in the Shu ching has, however, been doubted.

"The style of these Parts [the Canons of Yao and Shun in the *Shu Ching*] is distinguished, in several paragraphs, from that of the Books of Hea, Shang and Chow. The exclamations 'Alas!' 'Ah!' and 'Oh!' in particular, are expressed by characters which we do not find elsewhere used in the same way."—*Ibid.* III. i. Prol. pp. 49–50.

[The *Shu ching*, if not written from reign to reign, must have been based on documents dating from the times it describes.]—*Mém. conc. les Ch.*, i. pp. 28–9.

"The phonetic characters appear to belong to the same era as the hieroglyphic [*cf. supra*]. They are found together among the earliest remains of Chinese literature. According to the uniform national tradition, they must therefore be dated about B.C. 2700. The phonetic characters are nearly nine-tenths of the whole number. The phonetic element often differs in initial, tone, or final vowel, from the compounds that it assists to form, but there is one part in which it is remarkably free from variation—the final consonant."—*Trans. C.B.R.A.S.*, 1853, p. 51.

"When the phonetic, according to the modern pronunciation of the southern provinces, ends in M, the compounds do so too, and in a few instances the same phonetic is found in words in the short tone, with the final *R*. . . . A phonetic in N final forms compounds also in N, and in the short tone in T. Phonetics in NG form compounds with this final, but words in the short tone with phonetic elements of this kind are wanting. When long-tone phonetics with vowel finals appear in the short-tone characters as their phonetic element, there are traces of a preference for particular consonant endings, shown by particular vowels. Thus áu, á, è, ú prefer k."—*Ibid.* p. 53.

"The number of cases where the long and short-tone phonetics intrude into each other's territory, I have found to diminish rapidly when the ancient pronunciation could be ascertained. But, more than this, there is within these limits a careful separation kept between the different members of two groups of phonetics, viz., those ending with the letters K, T, P, and NG, N, MK. . . . In seeking to explain why these six sets of phonetics do not intermingle except as already shown, no hypothesis presents itself so probable as that they were distinguished by final consonants. Consequently, no hesitation has been felt in adopting from the modern pronunciation of the southern provinces the finals M, P, &c., as belonging to the primitive form of language. If, *e.g.*, the finals P, T, and K did not exist in the short tone, how could such words as 亟 kik, 及 kip, and 吉 kit be so isolated as the compounds they form prove them to have been? A modern speaker of Mandarin, and who has the short tone in his dialect, will say that they are identical in sound. So also with 弗 fut and 福 fuk, 妾 tsiep, and 節 tsiet."—*Ibid.* pp. 53–4.

"If it be asked how do we know that there was a difference existing at all at that ancient period between long and short tones, it may be answered that the number of phonetics common to these two classes of characters is very small; so few are they that we are obliged to hypothecate a natural distinction between the classes, . . . a distinct preference being observable for phonetics now in the short tone, it is fair to conclude that they were so when the characters were invented and that this was the ground of the preference."—*Ibid.* p. 54.

"The second source [of] information on ancient Chinese sounds is the rhymes of the Shi Kĭng. [These show] the same sixfold division of final consonants." "Words that rhyme are in the same tone in each case, words in M and K are found to have rhymes with the same final, the character 心 never takes a word in N to rhyme with it, as it naturally would do according to modern Mandarin pronunciation in which all words in M change to N." "Since the words pronounced in the south at the present day with the six finals NG, N, M, K, T, P, do not rhyme with each other in the Shĭ King, it may be concluded that in the northern parts of China during [and before] the Chéu dynasty the same distinction of finals existed as that still prevailing in the south, and that the modern Mandarin pronunciation is an innovation."—*Ibid.* p. 55.

"Chinese writing is certainly at least as old as the historical constitution of the family, and probably older, because it takes us back to the time when genealogies were traced through the mother habitually, and not merely in the exceptional case of a heaven-born hero; *hsing*, the character for 'surname,' is compounded of two signs for 'woman' and 'birth,' and the eight most ancient surnames are said to be written with that symbol."—*Simcox*, ii. 21. See following Period.

[There are traces of more than one original centre of development of the written language. In this way two sets of characters representing the same thing may have helped in the formation of the vernacular languages.]

"Whereas some of the descendants of the . . . petty princes adopted a part of the personal appellation of their particular ancestor, the founder of their house, a great many more took their names from the locality in which the family settled, altering the character or otherwise in one of the ways above described" [*i.e.*, by the addition or omission of the portion of the character signifying "district"].—*Giles, Historic China*, pp. 361–2.

"The tabooing of proper names is said to have begun under [the] rule [of the Shang dynasty]."—*Lacouperie, West. Orig.*, p. 30.

"The proper names of the living ruler were tabooed for the time being." Lacouperie thinks this due to the influence of the pre-Chinese population.—*Ibid.* pp. 74, 79.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

"In the Odes of 800 B.C. there are three tones. . . . In the Chinese development of language it was the nasals, sonants, and vowels that were most important. . . . It was only in words with vowel endings that the rising tone was at first used. All the words ending in *m*, *n*, *ng*, were then heard in the even tone, and this state of things continued down to the time of the poet Ch'ü-yuen, about 300 B.C. . . . Before the Odes were written, if we judge by the evidence before us, no single word ending with *ng*, *n*, or *m*, had left the even tone. The same is true down to the time when the departing tone with vowel finals first appeared."—*Journ. P.O.S.*, ii. 25. See also *Trans. C.B.R.A.S.*, 1853, p. 53.

300 B.C. "The even tone was changed for the departing tone."—*Journ. P.O.S.*, ii. 7.

"The age of four tones existed from 300 B.C. to A.D. 1000."—*Ibid.* ii. 50.

[For the foreign languages of non-Chinese tribes, which had an influence on Chinese through "idioms proper to the linguistic formation," see *Lacouperie, Languages*, pp. 17–18; *Legge, Ch. Class.*, V. 464; *Li chi*, iii. iii. 14; *Legge*, i. 290–30; etc.]

[Lacouperie argues (*Languages*, pp. 21–33) that "the gradual absorption by the Chinese of the aboriginal tribes interspersed among them, and their progressive extension on a larger area, made itself felt by the introduction of foreign words here and there into the general language, as well as the appearance of provincialisms and local pronunciations of some words of their old stock." This fact led to an attempt in 820 B.C. by Hsüan Wang, to "ensure for ever the intelligibility of his written communications and orders to the various parts of his dominion, whatsoever might be the local variations of speech in words or in sounds," by a "partial recast and simplification of the characters of writing, in order to give a predominant and extensive position to the silent ideographs, suggestive of meaning, which hitherto were not much used coupled in one and the same groups of signs indicative of sound by syllabic spelling or otherwise." The effect produced, however, was not to keep the general language on the same level nor prevent the introduction of foreign words: some other means had to be found "to make the central government aware of the new words gradually introduced. The records of the time are silent on the subject. We only know that the Sacred books were explained in the various states by special men sent for the purpose; and we also hear of the complaints made against the independence shown by these states individually, in their customs, as in their words." Collectors of provincialisms were appointed who made an annual circuit of the empire in the 8th moon to "enquire for the . . . forms of speech (or words) used in various regions." Parts of the *Erh-ya* may have been "made by means of help derived from them." The *Erh-ya* "is said to be a dictionary of the Classics," but contains "regional words borrowed from other [than Chinese] stocks of vocables," which "could be expressed in Chinese writing only by the use of homonyms as phonetic exponents." "There are no less than 928 words, or about one-fifth of the general stock, which do not appear anywhere else than in the *Erh-ya*."]

"According to the *Wu King Wên tze*, the 5 *Kings*, or Canonical books, contain only 3,335 different word-characters. They are *Yi King*, *Shu King*, *Shi King*, *Li Ki* and *Tchun Tsiu*. Adding to them the *Sze Chu* or 4 books, namely the *Ta hioh*, *Tchung yung*, *Lun yu*, and *Mêng tze*, the total of words reaches only 4,754. [In] the great collection of the 13 *Kings*, *Shi San King*, which besides the preceding includes the *I-li*, *Tchou-li*, *Hiao King*, *Ko liang*, *Kung-Yang* and the *Erh-ya*, the great total is 6,544 different words, including those which appear exclusively in the latter."—*Ibid.* p. 24, note.

[We find some ancient proverbs quoted in the *Shih ching*, all of great simplicity, and connected with the habits of a country life. For example:—"Do not teach a monkey to climb trees" (II. vii. IX. 6); "Do not add mud to one in the mire" (*ibid.*); "There is no wise man who is not [also] stupid" (III. iii. II. 1); "He who would hold anything hot must [first] dip his hand into water" (III. iii. III. 5); "Virtue is as light as a hair, but few are able to lift it" (III. iii. VI. 6). The equivalent of the English saying "Walls have ears" is found in II. v. III. 8: "Our sovereign should not lightly utter his words, Lest an ear be laid close to the wall."]

[Family names date back 3,000 years (*Williams*). Possibly like the Roman gens the number of surnames in China was once coextensive with the number of feudal states, and the clan and its belongings alone made use of the surname while the people were treated as slaves and only admitted into the clan as an act of grace.]—*Ch. Rev.*, viii. 70.

"It was under the Chows, a thousand years before Christ, that the people of China began to possess family names. Previous to that time there appear to have been tribal or clan names, but these were not in ordinary use among the individual members of each clan, who were known by their personal appellations only, bestowed on them in childhood by their parents. Gradually, it became customary to tack on to this personal appellation a surname, adopted generally from the name of the place where the family lived, sometimes from the personal appellation or official title of a famous ancestor. By the time of Confucius, the use of surnames had become definitely established for all classes."—*Giles, Historic China*, pp. 10–11.

Writing.—"About 800 years before the Christian era, in the reign of Seuen-Wang, the Seal Character was first written [replacing the *ku-wên*]. The 大篆文 Ta-chuen-wăn, or Letters having a representation of the object, was formed by a person named Chou [or Shih Chou, the historiographer Chou]. It was the design of these Characters to carry the hieroglyphic system as far as possible, and, as they say, to represent the straight lines of the dragon, the crooked windings of the worm, the footsteps of birds, the marks on shell fish, the figures of plants and trees and insects and swords and spears; hence the Letter appeared as if flying or even crawling."—*Morrison, Dic.*, Introd. p. ii.

"It is pretty certain that eight centuries before Christ, elaborate symbols of the kind, approximately those of modern times, were traced upon tablets of bamboo with a sharp-pointed metal stylus, and there are now in Peking ten irregular shaped blocks of stone, called 'stone-drums' bearing inscriptions in the same form of character as that employed under the Chow dynasty, to which period they may without exaggeration be referred. We have also plenty of inscriptions said to be copied from vases or bells dating from the pre-historic dynasties, but many of these are evidently spurious and the rest doubtful. Of the bamboo tablets in use among the Chows, not one is known to be in existence now, and on paper, which was not invented until several centuries later, there are probably no manuscript remains more than six or seven hundred years old."—*Giles, Historic China*, pp. 12–13. See also *Bio. Dic.*, pp. 650–1; *Klaproth, Mém. rel. à l'Asie*, ii; *Williams, Midd. King.*, i. 594; *Wylie, Ch. Researches*, pp. 203–4. The character at this time was still called *ming*, *wén*, or *shu*.

"About 500 years later, one Le-sze [227 B.C.] reduced the number of strokes and formed the Leaou-chuen-won [or lesser seal character]. The moderns profess that these characters, in later years, were obtained from the hieroglyphics engraven on ancient metal vases, and hence called Chung-ting-wan, or the letters of bells and tripods." "When Che-hwang-te . . . ordered all books to be burnt, those metal vases were, it is said, the means of preserving the ancient characters. However there does not seem any necessity to have recourse to those vessels, as it cannot be supposed that the order of the Emperor was carried into full effect."—*Morrison, Dic.*, Introd. p. ii.

"In these two latter styles much of the pictorial had disappeared. . . . With the spread of literature, however, and the gradual adoption of silk for writing on in place of bamboo tablets, the seal characters with their curved lines were found to be too cumbersome."—*Wylie, Ch. Researches*, pp. 203–4.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

"It is from this period of Ch'in Shih Huang Ti that the use of the term *tzŭ* or 'character' dates, and the change in name from *wên* or *shu* is said to have been brought about by the modes of writing invented by Li Ssŭ and Ch'êng Mao. Hitherto, all inscriptions and engravings had been mainly pictorial or symbolic, expressing, as their chief office, only objects or ideas, but now sounds also began to receive attention."—*Watters, Essays*, p. 27.

"In the Han poetry departing tone words with vowel finals began early to rhyme with each other. The Tai-yuen-king of Yang-hiufang shews this and also the collection in six volumes of Han and Wei poetry published in the seventeenth century by Mei-ting-tsu. In the same work words now in the rising and departing tone with consonant finals are all found rhyming with words in the rising and even tone respectively. . . . From this fact we learn that just as in the previous age when the rising tone was forming the vowel finals moved first to be followed subsequently in the Han dynasty by the consonants, so it was with the departing tone. First in the Han dynasty the vowel finals moved and after the age of the Three Kingdoms, A.D. 300, the consonant finals followed. Thus it was that in the 5th century when the discovery of the tones was made, the number was stated to be four. The poetry of the Three Kingdoms enables us to decide that the departing tone, Sir Th. Wade's fourth tone, was not completed till the fourth century."—*Journ. P.O.S.*, ii. 25–6. See following Period.

"When the N.W. state of Ts'in, the most powerful principality of the Chinese Confederation, conquered the Chinese parts and some others of the Flowery Land in the third century B.C., it brought along with its sway a strong current of labialization all over the country. The pronunciation was carried from the teeth to the lips. The capital was then in Shensi and remained there during the first Han dynasty. The same phonetic influence, with perhaps less energy than in the beginning, was continued until the transfer of the capital in Honan, with the establishment of the Eastern Han dynasty (A.D. 25)."—*Lacouperie, Languages*, pp. 34–5.

"According to some, the modern hair-pencil, employed by the Chinese as a pen, was invented about this time, to be used for writing on silk; while the characters themselves underwent certain modifications and orthographical improvements."—*Giles, Historic China*, p. 33.

"Under the Thsin and the Han, or in the last three centuries B.C., images disappear altogether in the characters *Ta tchouan* and *Siaou tchouan*, then in use; at this period Chinese writing was already, in the main, the same as what is used at the present day."—*Klaproth, Mém. rel. à l'Asie*, ii.

"In the Han dynasty were laid the foundations of the Chinese calligraphy, which was perfected in the fourth century in the hands of Wang Hi chi. Since that time, there has been no important change in Chinese penmanship."—*Journ. P.O.S.*, ii. 149.

"The Seal Character, as the Chuen-tsze is now called by Europeans, was, in the dynasty Han, found extremely inconvenient, and, according to some, the Government ordered it to be modified to what is now called the Le tsze, or Le character, a form not very dissimilar from the present Written Character, and so called from the Le-jin, or Writers of Public Contracts, having framed it. Others again affirm that it was formed by a Person named Ching-mŏ, when confined in prison."—*Morrison, Dic.*, Introd. pp. ii–iii. See also *Bastian, Sprachv. Stud.*, p. 10, note; *Pauthier*, p. 287.

"During the two dynasties which immediately preceded the Han, certain officials—the 'light carriage envoys'—were sent periodically to visit the various states subject or tributary to China. Their duty was to observe and note the different ways of speech, and manners, and popular sayings, and ballads of the towns and districts through which they passed. When they returned to court they made reports which were put on record." This led to the compilation of Yang Hsiung's *Fang Yen*, from which we learn the dialectical varieties existing in the first century B.C.—*Watters, Essays*, pp. 31–2.

Apprehensive that the original form of the characters would be lost, "Heu-shin [許 愼 Hsü Shên], an officer of government, during the dynasty Han (about A.D. 100) had formed the well-known work called Shwŏ-wăn [a dictionary of the lesser seal character], in which he endeavours to trace and to preserve the derivation and meaning of the characters."—*Morrison, Dic.*, Introd. p. iii. See also *Watters, Essays*, pp. 33–5.

"In the dictionary *Shwo wên*, A.D. 200 [? 100], the first elaborate attempt was made to explain the formation of the Chinese characters. Shuchung, the author of that work, described about 10,000 characters according to the nature of their symbolism as ideographic or phonetic." "This book was written before the Hindoo Buddhists taught the Chinese to spell, so that the author had no method for preparing the sounds of words as they were pronounced in his own time." "To analyse sounds, and divide vowels from consonants has always been a problem which the Chinese have failed to comprehend. Down to the present [19th] century their best writers on the changes of sounds have never made use of the alphabet or divided words into vowels and consonants." "One great advantage of the *Shwo wên* is that it selected the best established forms of the character, suggested an explanation of them, and fixed them according to a system. In the forms of the characters as preserved on old bells, vases, cups and tablets, there is the most remarkable variety. This variety the author reduced to a certain unity. There now exist in the country only a portion of those forms that must have been familiar to this author. He lived at the closing part of an eminently critical and learned time [Han dyn.], during which the ancient texts were published with comments, and made the foundation of a government system of examinations. Although we meet hereafter with considerable diversity in the forms of character, we may look upon those given in the *Shwo wên* as the collective result of the learning of the Han dynasty in this department." "The Han dynasty scholars, meditating on the classical phrase *lu shu*, '6 principles of writing,' and on the various modes of formation discoverable in the character, placed pictures of ideas and objects first. Then came a want. Pictures could not be for ever multiplied. They might be turned round. Two might be joined to make a third. Hence came a large accession of new signs. Afterwards the phonetic principle and that of borrowing were introduced, and these were the most fruitful of all principles in forming new characters. The philology of the Han period could proceed no farther that this."—*Edkins, Study of the Ch. Char.*, p. 151. The *Shuo wên* classified the characters under 540 radicals.

"The *hing shoo* or running-hand is an elegant form of manuscript, especially suited to the hair pencil, which was already in general use at the time of its introduction during the Eastern Han dynasty (A.D. 56–220). The invention is ascribed to Lew Tih-shing."—*Wylie, Ch. Researches*, p. 204.

"About the same time [A.D. 100], for the convenience of Government, recourse was had to what is called Tsaou-tsze, 'Grass character,'—a free, running hand, now in general use, where saving of time is an object. Government does not, however, permit of human documents to be written in any other than the Kae-shoo form. The Person who first wrote the Tsaou-tsze was She-yew or Chang Pi-ying."—*Morrison, Dic.*, Introd. p. iii.

"The introduction of this running hand having brought great confusion into national education, and among the numerous class of the literati, the Emperor Hiao-ho-ti (A.D. 89) gave orders to return to the cultivation and exclusive study of the ancient characters. It was then that Hiù chin composed his *Shuo Wên*, an 'Explanation of the ancient characters' in 14 books. If the use of the *thsao* [*ts'ao*] character, or running hand, had continued, there would have taken place in China, by a natural process, one of those intellectual revolutions to which nations are sometimes subject, without knowing it, and of which history does not always make mention. After the adoption of running hand, to the giving up of the ancient writing, which still preserved numerous traces of its *figurative* origin, there would have been only one step to take before arriving at alphabetical writings. This decisive step was not taken by the Chinese in the first century of our era, and probably it never will be."—*Pauthier, Ch. Mod.*, p. 282.

"But the most important work of its kind, and, I think, that which is unique in antiquity, is the vocalization of regional words compiled by Yang-hiung (B.C. 53–A.D. 18). The whole title is *Yeo hien she tche tsiüeh tai yü shi pieh kwoh fang yen*, generally simplified into *Fang yen*, and may be translated, 'The language of former ages from the envoys in light chariots with regional words from various States explained.' This title would show that the author has used the lists, or at least some of the lists, made by the envoys mentioned."—*Lacouperie, Languages*, p. 24.

"It is nothing less than a comparative vocabulary," but with additions of later times.—*Ibid.* p. 25.

"Yang-Hiung was enabled by his efforts to include in his vocabulary words from over 44 regions, many of which were Chinese only in name, and others not Chinese at all, though within the area of China proper."—*Ibid.* p. 25.

"Much attention was paid to local words about the time of this author. A countryman of his, Yen Kiün p'ing, of Shuh (Szetchuen) had collected more than 1,000 words used in dialects," and several other scholars laboured on the same subject.—*Ibid.* pp. 24–5.

[Buddhism introduced 26,430 new terms, chiefly technical and belonging to works of that religion.]—*Wylie, Ch. Researches*, p. 201. For the influence of Buddhism on the language see *Watters, Essays*, pp. 379–496. Buddhist missionaries also introduced the *fan-ch'ieh*, system of "spelling," by which the sound of a character is ascertained from the initial and final of two others: see *ibid.* p. 37. A similar system is said by some to have been used earlier by the Chinese.

"Here is an instance of how surnames were introduced. One 莊 光 under the Founder of the after Han dynasty, changed his surname to 嚴 because 莊 was the name 諱 of the Emperor 明."—*Ch. Rev.*, xii. 442.

"Either one or all of the characters composing an emperor's name are altered by the addition or omission of certain component parts; as if, for instance, we were to write an Albart chain, because Albert is the name of the heir-apparent. Similarly, a child will never utter or write its father's name; and the names of Confucius and Mencius are forbidden to all alike."—*Giles, Ch. Sketches*, p. 1.

Period of Disruption (221 *to* 589).—*Table IV.*

"During this short but troubled period [220–65], the cultivation of the language steadily advanced. Up to this time, we are told, there had been little care given to the spoken words or the cultivation of characters. But now these matters also began to be thought of importance." Characters were classified according to their sounds.—*Watters, Essays*, p. 38.

"The tones include rising and falling inflections and monotones. In the fifth century after Christ there were but four. They were called from their quality even, rising, departing, entering. This was several centuries before mandarin was in existence. In choosing names for the four tones the makers of the first tables of sounds selected the words even, rising, departing, and entering because these words exemplified the tones of which they were the names."—*Journ. P.O.S.*, ii. 24.

In the Wei and the Chin dynasties "many words in the second and fourth tones changed to the third and many of the first changed to other tones."—*Trans. C.B.R.A.S.*, 1853, p. 53.

[The consonant finals moved after 300. The departing (4th) tone was not completed till the 4th century.]—*Journ. P.O.S.*, ii. 25–6.

"The conscious discrimination of the tones and their codification were not arrived at till the latter part of the 5th century A.D. Chou Yu [Yung, see *infra*] and Shên Yo are the names usually associated with their discovery; but it is more probable that they were first observed by the Indian Missionaries, who had commenced before that time to flock into China, and were then busy translating the Buddhist canon into the Chinese language. Shên Yo resided at the Court of Liang Wu-ti, the great patron of the Indian strangers, and it may well be doubted, says Dr. Edkins, if he arrived at the discovery unassisted. 'Accustomed to the unrivalled accuracy in phonetic analysis of the Sanscrit alphabet, the Indians would readily distinguish a new phenomenon like this, while to a native

speaker who had never known articulate sounds, to be without it, it would almost necessarily be undetected' (*Edkins, Ch. Buddhism*, p. 113). The tones were not altogether new phenomena to the Indians, for they had already studied the accents and quantities in the language of the Vedus, and these were the elements out of which the Chinese tones undoubtedly grew."—*Ch. Rev.*, xxii. 447.

"The Four Tones were first noticed by a Person named Chow-yung, and first published to the world by Shin-yŏ. The last work referred to [Tan-tsĭh], says that 'the distinction of the four tones took place during the dynasties Tse and Leang'; about the close of the 5th century. It is said that Leang Woo-te, His Majesty Woo-te, of the dynasty Leang, would not believe that there was really any such distinction as that of the four Shing, and often conversed on the subject. He one day asked Chow-shêng what the four tones were. The courtly scholar replied. . . . 'You, Sire, are Heaven's son, holy wise; these four words contain' (illustrate, or are instances of) 'the four Shing.' The compliment, no doubt, had such weight as to carry with it full conviction to His Majesty's mind, of the existence of the Four Tones. There is no argument that can stand against flattery."—*Morrison, Dic.*, Introd. p. vi.

"Knowledge [of the tones] was popularised chiefly through the introduction, during the Sui and T'ang dynasties, of poetry into the curriculum of the candidates for office. This entailed the necessity for a standard dictionary which was supplied in the *Ch'ie yün* of Lu fa-yen, published in 601."—*Ch. Rev.*, xxii. 447.

"The 'market languages' of Ch'ang An were of various kinds, such as *hu lu*, 'calabash,' talk, *so tzŭ*, 'chain,' talk, *niu*, 'knot,' talk, *lien*, 'collected,' talk, and *san chê*, 'three folds,' talk."—*Hsi ching tsa chi, Yüan chien lei han, c.* 357, *Ch'an yeh pu*, p. 4*a*.

Writing.—"The next modification of the character was to what is called Kae-shoo. It is considered the most perfect and beautiful form of the character, and was first written by 王次仲 Wang t'hsze-chung [王羲之 Wang Hsi-chih, A.D. 321–79] during the dynasty Tsin. . . . In this, as well as the Le-shoo, the original form is nearly lost."—*Morrison, Dic.*, Introd. p. iii.

This style was "gradually formed by the improvements in good writing. It is the usual form of Chinese characters, and no man can claim a literary name among his countrymen if he cannot write neatly and correctly in this style."—*Williams, Midd. King.*, i. 597.

"The old forms were now only seen on seals or on ornamental scrolls."—*Giles, Historic China*, p. 52. See also *Bio. Dic.*, p. 822; *Simcox*, ii. 130.

"The best mode of arranging the characters so as to find them easily, has been a subject of considerable trouble to Chinese lexicographers, and the various methods they have adopted renders it difficult to consult their dictionaries without considerable previous knowledge of the language. In some, those having the same sound are grouped together, so that it is necessary to know what a character is called before it can be found; and this arrangement has been followed in vocabularies designed principally for the use of the common people." "An improvement on this plan of arrangement was made by adopting a mode of expressing the sounds of Chinese characters introduced by the Buddhists, in the *Yŭh Pien*, published A.D. 543, and ever since used in all dictionaries. This takes the initial of the sound of one character and the final of another, and combines them to indicate the sound of the given character; as from *li*-en and y-*ing* to form *ling*. There are thirty-six characters chosen for the initial consonants, and thirty-eight for the final sounds, but the student is perplexed by the different characters chosen in different works to represent them." "The unfitness of either of these modes of arrangement to find an unknown character, led to another classification according to their composition, by selecting the most prominent parts of each character as its key, or radical, and grouping those together in which the same key occurred. This plan was adopted subsequently to that of arranging the characters according to the sounds, about A.D. 543, when their number was put at five hundred and forty-two; they were afterwards reduced to three hundred and sixty, and towards the close of the Ming dynasty finally fixed at two hundred and fourteen in the *Tsz'Lui* [see MING PERIOD]. For further particulars see following Period.—*Williams, Midd. King.*, i. 589. See also *Biot, Essai*, p. 242; *Wylie, Ch. Researches*, p. 215.

"The Imperial Dictionary, by order of the Emperor Kang-he, contains the following quotation, from a work called Tan-tsĭh: 'The Literati, in the time of Han . . . understood Letters, but were unacquainted with the Mother Characters; the Literati on the left of the Great River (*i.e.*, the North of Yang-tsze-Keang) knew the four tones, but were unacquainted with the seven sounds. Information respecting the seven sounds originated in the Western regions; in which system, 36 characters are constituted Mothers; longitudinally are the four tones and transversely the seven sounds.' It is added in the above work that 'In the Western regions, the books of the Po-lo-mun can combine all sounds by 14 letters.' This system is further spoken of as being derived from the country Fan, from whence sprung the Religion of Fŭh, and which place is commonly said to be some part of Tsang, which is Tibet. The introduction of the 36 initial sounds is attributed to Shin k'he, a priest of Fŭh, and it is said the system was much employed 'to give currency to the books of Fŭh in China.' I shall quote one more testimony, which shows the period in which it became prevalent, as well as from whence it originated. 'The Syllabic Spelling entered China from the West, and prevailed extensively under the dynasties Tse and Leang,' answering nearly to A.D. 500."—*Morrison, Dic.*, Introd. p. v. See also *Biot, Essai*, App. I., pp. 597–8.

"The Ts'hêĕ-yun, or system of Syllabic Spelling, adapted to Chinese Monosyllables, and which has been fully proved to have originated in a modification of some foreign system (in all probability the Shanscrit) is at this day very partially and ill understood in China. The 36 initials of the Series are redundant more than one-third. . . . One writer "complains that the fashionable rage of many persons for those foreign distinctions of sound, unknown to their fathers, and not suited to the genius of the Chinese language called off people's attention from the plain, tangible, and useful study of letters, to a visionary pursuit of abstruse, evanescent, and useless distinctions of sound."—*Morrison, Dic.*, Introd. p. vi.

"Chinese despatch forms, registers, ledgers, and office forms generally owe their origin chiefly to 蘇綽 of the Western Wei dynasty."—*Ch. Rev.*, xiv. 222.

[The variants of the common characters were exceedingly numerous before the invention of printing (in the Sui dynasty), which gave to the forms a greater degree of certainty than they had in ancient times. See extract under MANCHU PERIOD.]

From the Restoration of Unity to the End of the Five Dynasties (589 *to* 960).—*Table V.*

"Evidence of the continuous decline of the labials in language may be found in Chinese. Thus in modern dictionaries the initial letters *m, p, f* occupy a space only half of that occupied by *h* and *k* and *ng*, and not much more than one-fourth of the space occupied by words commencing with *t, s, n, j, ch*. Since the front and point of the tongue are both engaged in forming the initials *t, s, n, j, ch*, we may divide the words in this case into two great groups. Each of them has nearly twice as many words as the labial initials. So in the use of the finals *k, t, p* which had existed in the language till the seventh century, there were then, as the Dictionary Kwang-yün shows, twice as many words with final *t* as with final *p*, and three times as many with final *k* as with final *p*. Words with final *m* were as 32, while *n* and *ng* were as 84 and 80 respectively, that is to say, words with final *m* were scarcely one-third as many as words with *n* or *ng*. Thus 1200 years ago the lip letters *p, b, m*, had lost a great part of their share in the Chinese vocabulary and since that time they have lost much more. Hence it may be concluded that there has been an immense migration of letters which has destroyed the predominance of labials existing in the first period of the Chinese language, and that it was by change of *p* to *t* and *k* and of *m* to *n* and *ng* that the tongue and throat letters have obtained their present great prevalence in the vocabulary."—*Journ. P.O.S.*, ii. 11–12.

[The *Ssŭ shêng ch'ieh yün* of Lu Fa-yen, published in 601, ed. by Kuo Chih-hsüan in 677, was the first dictionary with the characters arranged under 206 finals according to the four tones.]—*Watters, Essays*, p. 47.

"The first dictionary composed by the Chinese on the tonic system is the *Thang yun*, which appeared under the Thang dynasty, in the period Y-fong (A.D. 676–9)." [This was a republication of Lu Fa-yen's work, which set a precedent for later dictionaries.] "Under the same dynasty was published the *Koung yun*. Before this period, the decomposition by tonic elements had been applied to the terms of the laws, under the Souï dynasty, in the period *Jin-cheou* (601–5). See the new edition of the *Than-thse, kw.* iii. fol. 20."—*Biot, Essai*, App. I. 597–8.

"We now read for the first time of *tzŭ mu*, letters, alphabet, or, in the narrowest use of the term, characters employed as initials." . . . An Indian monk also "taught the use of the tones and the art of analyzing and compounding the sounds of human speech."—*Watters, Essays*, p. 52.

By an imperial order of 744, the Classics were reproduced in the vulgar form of writing. "Plays also began to be performed in a style but little removed from that of everyday conversation. These, however, tended to make the dialect in which they were composed fashionable and permanent. Hence we find it stated that with them arose the *Kuan-hua* or standard language of the country; which thus became the language of the empire, having been previously only the dialect of Kiangnan (*T'ang shu*, ch. lvii.; *Legge, Ch. Class.*, III. Prol. p. 31)."—*Ibid.* p. 54.

"Passing over the poetry of the intervening dynasties, which would offer similar illustrations, that of the T'ang dynasty may be adduced, as belonging to a period far on in the Christian era. The . . . verses [quoted] of the poet Sú are given as containing rhymes in M. The short-tone finals do not occur in the rhymes, being excluded by the laws of poetry that then came into use. They might be easily exemplified from the poetry of the Han dynasty."—*Trans. C.B.R.A.S.*, 1853, p. 55.

[The results of investigations by Edkins (*ibid.* p. 82) show (i) a new spelling for several of the vowel terminations as pronounced in the T'ang dynasty, and of the vowels connecting the initial and final of Chinese words. (ii) When dialects have two forms of pronunciation, the colloquial sounds are probably older than those of the reading. (iii) The comparison of the orthography of the southern dialects and the Corean and Japanese transcriptions, renders it probable that so early as the T'ang dynasty, the formation of Mandarin in the northern provinces has begun, but that only T among the old consonant finals had disappeared. (iv) The Japanese and Corean orthography, agreeing much better with the colloquial than the reading forms of the south-eastern dialects, it follows that the reading sounds must be more recent than the T'ang dynasty, the period to which that orthography, as at present accessible to us, may with the greatest probability be referred. A table appended to this paper shows that, since the T'ang period, one initial (NG) has been lost, and that the same sound has, in other cases, been added as an initial. Of medials, three (í, á, ú), have been lost, and four (i, ó, á, ú), added. Of finals, k, p, t, have been lost and none added. The changes are as follows:—

Initials.—ng to y, m to w, g to k', k, d to t', t, b to p', p, v to f, z to s, j(zh) to sh, ch', dz to ts', ts, dj to ch', ch, h to h', ni to r, j.

Medials.—i to u, o to á, iá to u, ó to u, ö to a, ú to a, ú to u.

Finals.—m to n, í to ï, é to á, á to ó, ò to ú.]

"A Chinese collection of epigrams, dating from the ninth century, gives a facetious list of *Incongruous Conditions*, among which we find a poor Parsi, a sick Physician, a fat Bride, a Teacher who does not know his letters, and *a butcher who reads the Scriptures* (of Buddhism)."—*Yule, Marco Polo*, i. 162, note.

Sung Period (960 *to* 1280).—*Table VI.*

In this Period "the language is supposed to have reached its acme, to have become complete in all its formal and material equipment, having everything needful to make it an effective instrument for expressing the national mind."—*Watters, Essays*, p. 54. Printing "led to great results" (*ibid.* p. 54).

"The four tones remained undisturbed from the fifth century till about the 11th when the even tone on account of the change from sonant to surd which then took place was divided into two parts. . . . Intonation began to play the part which had hitherto been played by surd and sonant. China became weary of sonants and abandoned them for ever. Aspirates and surds took their place and they were pronounced in a new tone. The additional muscular force which makes voice was exchanged for that which produced an intonation. A little later the entering tone lost its finals *k, t*, and *p*. They do not appear in the Basclipa transcription made in Marco Polo's time. The cause was that the muscular force required to close the mouth barriers was felt to be too great an exertion. The brigade of words which belonged to this tone became scattered, some joining one of the new tones and some another. This was a relief to the tone-forming muscles in the walls of the larynx which objected to the extra work caused by the bisection of the even tone."—*Journ. P.O.S.*, ii. 26. See also *Edkins, Evol. of Ch. Lang.*, p. 26; *Wylie, Ch. Researches*, p. 198.

"The age of five tones commenced about A.D. 1000 and has continued till the present time."—*Journ. P.O.S.*, ii. 50.

"The new grammar, that of the mandarin language and the dialects, has been developed during the thousand years that have passed since the T'ang dynasty. It is very remarkable how little trace of the mandarin grammar we can find before A.D. 1000. . . . Native scholars have searched industriously for examples of colloquial speech in the writings of the historians but have found none earlier than the 6th century. . . . Chau Yi, a critic of immense learning, vouches for there not being a sentence of modern colloquial speech in any of the early histories [*v. Chao Yi, Chi Yü Tsung K'ao*] yet in criminal cases at the present time the testimony of witnesses is not seldom given in its original colloquial form, in memorials laid before the throne. We may then conclude that the creating genius of the language only began in the fifth century to formulate the modern colloquial idiom. Its variety of word groups linked by agglutination are new but they are made chiefly after old models. Many hundreds of new groups of old words have been added to the already rich treasure of fixed phrases existing in the book language."—*Journ. P.O.S.*, ii. 51–2.

"The voiced consonants have [since] about A.D. 1000 been abandoned in favour of the unvoiced in the whole country north of the Yang-tsze-kiang. At the same time that 平 *bing* became *p'ing* with an aspirate 同 *doong* also became *toong* with an aspirate. This was the rule in the even tone or *p'ing shêng*. In the other tones the unvoiced shut consonant without aspiration was uniformly adopted. *Doong*, to move, is never *t'ung* with an aspiration because it has the departing tone. It is heard *toong*."—*Ibid.* ii. 54.

"I should tell you that in this city [Tyunju = possibly, Yung-chun] they have a peculiar dialect. [For . . . throughout all Manzi they employ one language and one kind of writing only], but yet there are local differences of dialect, as you might say of Genoese, Milanese, Florentines, and Neapolitans, who though they speak different dialects can understand one another."—*Yule, Marco Polo*, i. 186 (2nd ed.).

"Ch'ên Shun (A.D. 1151–1216) is said to have been the first to use the term 性理 in the sense of philosophical speculation."—*Giles, Bio. Dic.*, p. 101.

Writing.—"The sixth style [of writing] is called *Sung shu*, and was introduced under the Sung dynasty in the tenth century, soon after printing on wooden blocks was invented. It differs from the third style [*k'ai shu*], merely in a certain squareness and angularity of stroke, which transcribers for the press only are obliged to learn." Of the "six forms of writing the pattern style and running hand are the only two which the people learn to any great extent, although many acquire the knowledge of some words in the seal character, and the running hand of every person, especially those engaged in business, approached more or less to the plant character." "Besides these styles, there are fanciful ones, called 'tadpole characters,' in imitation of various objects."—*Williams, Midd. King.*, i. 597–8.

"Tai T'ung, the author of the *Lu shu ku*, divides the characters into 479 classes. Among these he distributes them further according to the 6 principles of formation. He arranges them in the following order:—1. *Chi shi*, symbols of ideas, acts, members and positions in space. They are such as a stroke for one, 2 strokes for two, the sign 丄 for 'above' and 丅 for 'below.' 2. *Siang hing*, pictures of objects. The sun, the moon, vapour, mountains, fire, water, a sheep, a fish, are represented by outline pictures. 3. *Hwei yi*, suggestion. Thus in 从 one man is seen following another. This is used as a symbol for the verb 'to follow' with the sound *t'ung*. Three men placed together represent *chung*, 'many' as in the lower part of 衆. Two fires, one above the other 炎 represent *yen*, 'burning' 'bright.'"—*Edkins, Study of the Ch. Char.*, p. 151.

[Ssŭ-ma Kuang's *Lei pien* arranges the characters under 544 radicals.]

"The oldest phonetic dictionary which has come down to us is the *Kuang yün* edition of 1008, but we have reason to believe that, in its phonetic part at least, it was little more than a reproduction of the *Ch'ie-yün*. [The *Kuang yün* distributed the characters under the four tones.] Many are the rhyming dictionaries published since, but after the reduction of the rhyming finals from 206 to 107 made in the *P'ing-shui-yün-lu* of 1252 (which does not affect the tones) the arrangement has scarcely been altered."—*Ch. Rev.*, xxii. 447.

"In 1269 written Mongol characters were introduced."—*Giles, Bio. Dic.*, pp. 58, 387.

[Wu Yü (12th cent.) was the first to distinguish in a methodical manner between the old and the modern pronunciations of characters.]—*Watters, Essays*, p. 70. See also p. 72.

"The surnames of the people were collected together to the number of 438 in all; and although the list was admittedly not complete, the great majority of those names which were omitted, once perhaps in common use, have altogether disappeared. It is comparatively rare now-a-days to meet with a person whose family name is not to be found within the limits of this small collection."—*Giles, Historic China*, pp. 84–5.

LIAO.

"The Khitan had two national scripts, the 'small characters' (*hsiao tzŭ*) and the 'large characters' (*ta tzŭ*)."—*Bushell, Inscr. in the Juchên and Allied Scripts, Cong. des Or.*, Paris, 1897.

Mongol Period (1280 *to* 1368).—*Table VII.*

"The orders of the Great Kaan are stated to have been published habitually in six languages, viz., Mongol, Uighúr, Arabic, Persian, Tanqutan (Si-Hia), and Chinese."—*Yule, Marco Polo*, i. 29, note.

[In the *Liu shu ku* an attempt is made to trace the origin and

development of writing and its connection with speech.]—*Watters, Essays*, pp. 73–4.

"You must know that throughout all Manzi they employ one speech and one kind of writing only, but yet there are local differences of dialect."—*Marco Polo, Yule*, ii. 236. This statement of Polo referring to the Fu-kien dialect and the unity of the written language throughout China, gives no indication of knowledge of its peculiar principles, nor of the extent of difference in the spoken dialects. Mendoza makes a similar reference. As to the so-called "dialects" see MANCHU PERIOD. —*Ibid.* ii. 243, note 6.

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

"You shall find very few in this kingdom but can both write and read, yet have they not the alphabet of letters as we have, but all that they do write is by figures, and they are long in learning of it, and with great difficulty, for that almost every word hath his character. . . . They do use more than six thousand characters, different the one from the other, and they do write them very swiftly (as it hath been seen many times at the Philippinas, by many Chinos that are there and come thither daily); it is a kind of language that is better understood in writing than in speaking (as the Hebrew tongue) by reason of the certain distinction of points that is in every character differing one from the other, which in speaking cannot be distinguished so easily. Their order of writing is clean contrary unto ours, for that they do begin their lines from above downwards . . . likewise they begin their lines at the right hand and write towards the left. . . . They keep the very same order in their printing. . . . In that kingdom they do speak many languages, the one differing from the other; yet generally in writing they do understand one the other, and in speaking not. The occasion is for that one figure or character unto them all doth signify one thing, although in the pronouncing there is difference in the vowels. And in this order do communicate with them the Japones, Lechios, those of Sumatra, and those of the kingdom of Quachinchina and other borderers unto them; whereas in their speech or language, there is no more understanding than there is between Greeks and Tuscans."—*Mendoza, Hist.*, i. 121–2.

"The dialect of Peking became the court dialect since A.D. 1411 under the Ming dynasty, when, during the reign of Yung-loh the court was transferred there."—*Lacouperie, Languages*, p. 34.

"In the *Lüh shoo pùn é*, which appeared early in the Ming dynasty, the number of radicals is reduced to 360; in the *Ching yùn wuy pëen*, published about the beginning of the seventeenth century, there are 239, and a supplementary class of characters at the end, not referable to any radicals; the *Tszé wuy*, which was published at a later period of the same dynasty, contains only 214."—*Wylie*, pp. 204–5.

Tung Ch'i-Ch'ang (A.D. 1555–1636) was the "inventor of the style of writing known as 董字."—*Giles, Bio. Dic.*, p. 790.

[It was now first taught in a methodical manner that characters have from age to age undergone changes of sound.] —*Watters, Essays*, pp. 83–5, 90.

Manchu Period (1644 *to* —).—*Table IX.*

"Chinese . . . has remained in the monosyllabic stage."—*Chavée, Les Langues et les Races*, p. 14.

"The Chinese of books written in the high style, and of imperial rescripts is still that of remote antiquity. As for spoken Chinese, one can hardly believe that it has not undergone some changes. The most considerable must have affected the pronunciation, and some turns of phrase; for (apart from the fact that China has nearly always been without neighbours, to a certain extent, on account of the barbarism of the surrounding nations, that, besides, it has never experienced those great barbarian invasions which transformed the languages of Spain, Gaul, Germany, etc.) its words being so few in number, and, as it were, chained to the characters used in writing them; it was almost impossible to institute different or introduce new ones. Let us add that most ceremonial and polite phrases, being formulas of etiquette, consecrated either by law or custom, to change them would have been at Court, an offence, and in the ordinary intercourse of life, a ridiculous eccentricity. As for the pronunciation, it appears, by the rhymes of the most ancient verses, that it has changed in the case of many words—but they are tolerably few in number; and in this respect there is less difference between the ancient and modern poets than between those of Regnier [latter half of 16th cent.] and Rousseau [J. B. 1670–1741, not J. J.] Petrarch [1304–1374] and Metastasio [1698–1768]. Plays are acted which are more than 1,000 years old; and they are understood all over China, as among us the earlier tragedies of the great Corneille.—*Mém. conc. les Ch.*, viii. 142–3.

"The new language . . . often uses two words where one would suffice. In the old language the orthoepy was distinct and the style laconic. In modern speech words are often clipped and incomplete, but there is more expansiveness of phrase to balance this loss."—*Journ. P.O.S.*, ii. 21.

"The Mandshu conquest, and the establishment of their sway all over China, did not change this state of affairs [resulting from the dialect of Peking becoming the court dialect] otherwise than in this way, that it has helped greatly to corrupt the former language, and that it is this rapidly decaying form of speech which has now the lead over the other Chinese dialects. *Ki, tsi, tchi*, are now all *tchi*; *si, hi*, are now a medial sound usually transcribed *hsi*, and so forth."—*Lacouperie, Languages*, p. 34.

"At the present day, if we wish for etymological accuracies, we find them most perfect in Canton and Corea; that is, the best representative of the language spoken under the two divisions of the Han dynasties is now to be found in the descendants of emigrants to the south; whilst the Coreans, cut off for many centuries by Tartars from intercourse with literary China, have rigidly preserved, in or according to their ancient form, the early Han pronunciation of the Chinese words they borrowed 2,000 years ago. The rough nomads who swarmed into North China not only mixed their blood with that of the Chinese, but debased the language; hence we find that the 'mandarin' forms of speech, in their relation to old theoretical Chinese, bear much the same relation to the coast dialects that French does to Spanish, Portuguese, or Italian, which, though not so fashionable, are all of them nearer old Latin than the French can claim to be."—*Parker, China*, pp. 25–6.

"Mr. Edkins, who has given more attention to the sounds of the Chinese language than almost anyone else, tells us that there has been a considerable secular transformation going on in the pronunciation from ancient to modern times; many relics of the older language being still preserved in the local dialects. The Mandarin or general dialect of China, which is that of the official class everywhere, is also the common language, with slight modifications, of several of the northern and western provinces. This is marked by the almost entire absence of consonantal terminations, *n*, *ng*, and *rh* being the only ones admitted. The provincial dialects of the south, however, have largely preserved the finals *k*, *m*, *p*, and *t*, and in one or other of them nearly all the letters of our alphabet may be found, either as initials or finals. It would be almost impossible to give even an approximation to the number of words in any of the dialects, made up with these syllables."—*Wylie, Ch. Researches*, pp. 196–7.

"The Chinese monosyllable has formative laws from which it never departs. It always begins with a *noise* (consonant) and ends with a *sound* (vowel); only this final vowel may be strengthened in two ways—(1) by one or two vowels preceding it (a, ia, oua, ioua; ë, ië, iouë, etc.)—(2) by a dento-nasal (an, en) or gutturo-nasal (ang, eng, ing, oung) assonance. Hence such words as these: ta, te, ti, to, tou, tan, tang, kia, koua, kian, kouan, kiang, kouang. The inhabitants of the Celestial Empire thus possess 36 ways (not a single one more or less) of ending their monosyllables—*i.e.*, . . . their words. To begin these same words they have 24 initial consonants, among which are found, besides p, t, k, and their aspirates, the sibilants f, s, ch, j, w, to which we must join the [guttural] German ch, the nasals m, n, n', ng, the compound explosives, such as ts, tch (the Italian *c*), ttch, and the liquid l. But you will not find either our B, our D, or our G. Further, the consonant which most especially expresses movement, the most energetic and expressive oral gesture of the Indo-European and Syro-Aryan languages, the vibrant consonant R, is wanting in the speech of the Chinese. . . . Theoretically, if we cared to multiply the 24 initial consonants in Chinese by the 36 terminations, we should have a product of 864 possible words; but Chinese has not realized all these combinations, and from the point of view of syllabic constitution, it only possesses the small number of 450 words. However, it has five ways of inflecting or accenting these monosyllables, and though all words do not receive the five accents, there is here a powerful means of individualising and consequently multiplying the spoken vocables. And now, since these words can be grouped, and can either define more precisely, or modify, one another's situations, one may conceive the ways in which the Celestial lexicon might have, and has, in fact, developed."—*Chavée, Les Langues, etc.*, p.

"The want of the *mediae* in Chinese (b, d, g) is, according to Lepsius, not an original deficit, but a phonetic loss (*Lautverlust*)."—*Bastian, Sprachvergl. Stud.*, p. 77.

"Complicated vowel-combinations [occur in] Chinese, where the short sounds i and u or y and w are contracted with a following accented vowel, under the influence of the accent to a diphthongal unity."—*Ibid.*, p. 112. This writer demonstrates the relationship between Chinese and Burmese.

"We have in China the upper and lower series of letters and tones in the old middle dialect, and of tones only in Fukien and Canton. These are separated by an interval of a second in city dialects and by a wider interval in country places where enunciation is more emphatic." "This double pitch sometimes becomes triple when a particular intonation is set very low, whether as monotone or inflection." "The question when the upper and lower series commenced is historically very much the same with the question when the distinction between voiced and unvoiced consonants, or sonants and surds began. It is necessary to bear in mind that the difference between voiced and unvoiced does not affect the quality of a vowel. In the Tang dynasty the difference in pitch which we now find uniformly maintained from Shanghai to Canton must have certainly existed, and we may assume that it existed long before that time, the mandarin pronunciation in which the sonants have disappeared being then entirely unknown. The surds present all the appearance of having been intruders [see illustrations]. . . . For very many surd initials a corresponding sonant is easily found. The sonant has been the mother form from which the surd has been evolved. We see this in mandarin where what were once sonants are all now surds. Hence the sonants being primitive and the surds derived we may conclude there was in the primitive state of the language no difference of pitch in pronouncing the initial consonants. When the surds were evolved the double pitch would be originated at the same time in order to give them more distinctness."—*Journ. P.O.S.*, ii. 23–4.

"In modern Chinese *m* as a final has been replaced by *ng* and by *n*."—*Ibid.* ii. 31.

"Within 1,000 or 1,200 years we have the upgrowth of the Mandarin language. The voiced shut consonants have been changed for the unvoiced and for aspirates. Many words have changed *m* for *w* and *p* for *f*, but such changes as from *p* to *t* and to *g*, do not occur. . . . The farther we go back in the history of the language, the more striking and revolutionary are the letter changes. Slight transitions satisfy modern speakers. In ancient times it was not so."—*Ibid.* ii. 34.

"We may conclude that labial initials and finals met with in Chinese words are relics of primitive times, while the other letters are of later origin and have been evolved from the labials. Gutturals have been formed by evolution from labials or from tooth letters. The letters which the tongue makes by approaching the palate were formerly evolved from tooth letters, but more recently from gutturals."—*Ibid.* ii. 36.

"The Chinese language having gone through a very long history the number of variations in letters is remarkably great. In Canton many words that should have initial *h*, or *k* with the aspirate, take *f*. In Shensi *f* is heard for *sh* in very many words. In Fuchow final *k* is employed instead of final *t* and *p*, which are quite lost. In Amoy final *t* is found for final *p* in some words. Yet in others the Amoy dialect has retained the ancient final *p* when in the Kwang yüan dictionary of the 7th century *p* has been changed to *t*. In Fuchow the final letters *m* and *n* are exchanged uniformly for *ng*. These examples are sufficient to show that in the caprices of dialects the most useful distinctions of sound may be recklessly sacrificed to save exertion. In Fuchow the final letters *t, p, n, m* are resigned without a sigh in order that the muscles may not be at the trouble of enunciating them. The consequence of this improvidence is that Chinese from a distance listen to the dialect as an unknown tongue. It should be added that variations are caused by *mountain ranges* which shut a people in and greatly diminish intercourse. In these circumstances accidental variations are easily exaggerated into differences so important that the brogue of a valley becomes almost another language." "The *honorific principle* has given occasion to the appearance of numberless words. It seeks to use a large variety of special phrases to honour kings and aristocratic persons." "The causes of variation are: (1) Imitation of sporadic novelties; (2) Emphasis on special sense; (3) weariness of constant repetition; (4) rest sought in change; (5) limitation of the attention; (6) effect of fashion; (7) fancied cacophony; (8) civilization making new words; (9) honorific principle; (10) compensation; (11) phonetic decay resulting from the law of least exertion; (12) the shape of the mouth changing for one letter often affects its neighbour." "But local variations gradually disappear and the mandarin speech is always gaining in territorial extent upon the tract occupied by provincial dialects."—*Ibid.* ii. 55–9.

"This [*viz.*, that Chinese is sufficient for itself and need not borrow any foreign words, as stated on p. 148 of the text] is to be understood of Chinese properly so called, for since the Tartars have been masters of China, several Tartar words have been *chinoisés*. But, apart from the fact that they are only found (written) in books connected with business, and are only used in conversation, they are scarcely correct except at Peking and in the neighbourhood. At an early time, the sect of Foë and others imported Indian and Tibetan words into the Chinese language. The Literates complained of this; and thanks to their firmness, good taste has restricted such words to the books of these sects. Speaking of new words, here is a fact which deserves to be known beyond seas. The reigning Emperor works every day, trying to perfect the Tartar-Manchu language of his ancestors. He makes, and causes to be made, new words of every kind. They are, for the most part, drawn from Manchu, by means of analogy, extension, derivation, and a few others are formed from Chinese words. Almost all are sonorous, expressive, and well formed. Who will venture to say that it was not so in antiquity? In that case, we must not be surprised if some of the ancient languages are more regular than all those spoken at this day in Europe. The literates and grandees examine the new lists of words to be presented to the Emperor for approval. Those admitted by H.M. are published in the tribunals, people use them, they are printed, their use spreads, and the Tartar language is enriched. . . . No glossary is needed to understand the proclamations, edicts, and laws of the Emperors, from the most ancient times."—*Mém. conc. les. Ch.*, viii. pp. 206–7. It is not clear whether the Emperor introduced new words in part by reviving obsolete ones. If not, the last instance would appear to contradict the rest.

"The languages of the West are inflected—organic; and hence include a living principle of development and increase. But the Chinese language has not reached this inflected state. It is either all alphabet or no alphabet; every root is a word and every word is a root. It is a mass of primitive sounds representing ideas, lying like boulders on the shores of human speech whose forms have no doubt been rounded by the wear of ages; yet whose relations to each other have not essentially changed beyond that which the force of the laws of thought have compelled in them. It is, in fact, a language in its most primitive or its radical state, and being so, has, as we should naturally then expect, no trace of the formal elements of grammar, every word existing in its simplest form, with no inflection, no declension, and no arbitrary distinction of the various parts of speech. We should also expect its sounds to be few in number, its characters few and ideographic, used in different senses, and, according to our own grammatical system, as different parts of speech. This is indeed the case; in the Classics there are no formal elements of grammar. A Chinese commentator usually speculates on the power of a word from the sense of the passage and its general scope, and rarely appeals to its grammatical structure for the support of his view. Also we find, again and again, instances in which the meaning and power of a character depend on a change of tone. Now as there must be some means to determine the powers of words, and thus fix the sense of a passage, the difficulty of the Chinese language consists in this indefiniteness arising from its lack of inflection. But as inflection is impossible in such a language, from the very necessity of the case, the position and collocation of words assume the places and function which inflection holds in more matured languages. The relation of Chinese symbols, then, to each other, their nature and powers as parts of speech, their sense as *media* of thought—in a word, the whole of Chinese primitive speech—depends on position."—*Ch. Rev.*, i. 110–6.

"All the cases of nouns may be indicated by position, and the oblique cases also by certain particles. . . . Moods and tenses of verbs are generally indicated by the general construction of a sentence, though particles also are sometimes used. . . . Pronouns are sparingly used, unless the sense or the rhythm actually requires them. The first person is often replaced by a term of humiliation, as *yu*, the stupid one; while a term of exaltation is used to replace the second person. When the pronoun *yu*, I, has to be written or printed, it is often put in smaller type than the other characters, as a mark of humility; just the reverse of our English practice."—*Wylie, Ch. Researches*, p. 208.

"Chinese possesses a grammar, in which all the parts of speech are nearly as well defined as in that of any other language; but depending as it does so much on the value of position among the members of a sentence, it is less flexible than that of inflected tongues. Polysyllabic nouns are formed in various ways."—*Ibid.* p. 198.

"A good summary of the principles of Chinese grammar is given by Rémusat, who says that generally, 'In every Chinese sentence, in which nothing is understood, the elements of which it is composed are arranged in the following order: the subject, the verb, the complement direct, and the complement indirect.' 'Modifying expressions precede those to which they belong; thus, the adjective is placed before the substantive, subject, or complement; the substantive governed before the verb that governs it; the adverb before the verb, the proposition incidental, circumstantial, or hypothetical, before the principal preposition, to which it attaches itself by a conjunction expressed or understood.' 'The relative position of words and phrases thus determined, supplies the place often of every other

mark intended to denote their mutual dependence, their character whether adjective or adverbial, positive, conditional, or circumstantial.' 'If the subject be understood, it is because it is a personal pronoun, or that it is expressed above, and that the same substantive that is omitted is found in the preceding sentence, and in the same quality of subject, and not in any other.' 'If the verb be wanting, it is because it is the substantive verb, or some other easily supplied, or one which has already found place in the preceding sentences, with a subject or complement not the same.' 'If several substantives follow each other, either they are in construction with each other, or they form an enumeration, or they are synonyms which explain and determine each other.' 'If several verbs succeed each other, which are not synonyms and are not employed as auxiliaries, the first ones should be taken as adverbs or verbal nouns, the subjects of those which follow; or these latter as verbal nouns, the complements of those which precede.'"

"Chinese grammarians divide all words into *shih tsz'* and *hü tsz'*, *i.e.*, essential words and particles. The former are subdivided into *sz' tsz'* and *hwoh tsz'*, *i.e.*, nouns and verbs; the latter into initials or introductory words, conjunctions, exclamations, finals, transitive particles, etc. . . . The rules above cited are applicable to the written language . . . the changes in the phraseology of the colloquial do not effect its grammar, however, which is formed upon the same rules."—*Williams, Midd. King.* i. 617–8.

"Although the characters are, when isolated, somewhat indefinite, there are many ways of limiting their meaning in sentences. Nouns are often made by suffixing formative particles . . . the suffix, in these cases, simply materializing the word. Gender is formed by distinctive particles, prefixed or suffixed by appropriate words for each gender, or by denoting one gender always by a dissyllabic compound. . . . Number is formed by prefixing a numeral . . . by suffixing a formative . . . by repeating the word . . . and lastly, by the scope of the passage. The nominative, accusative, and vocative cases are commonly known by their position; the genitive, dative, and ablative are formed by appropriate prepositions, expressed or understood. The vocative is common in light reading and historical studies." "Adjectives precede nouns, by which position they are usually determined. Comparisons are made in many ways. . . . The position of an adjective determines its comparison. . . . The comparison of ideas is made by placing the two sentences parallel to each other. . . . The proper use of antithesis and parallelism is considered one of the highest attainments in composition. The numerals are thirteen in number, with the addition of the character 零 *ling* to denote a cipher. All amounts are written just as they are to be read." "The Chinese, like the ancient Greeks, enumerate only up to a myriad, expressing sums higher than that by stating how many myriads there are. . . . Pronouns are few in number, and their use is avoided whenever the sense is clear without them. The personal pronouns are three, *wo*, *ni*, and *ta*, but other pronouns can all be readily expressed by adjectives, by collocation, and by participial phrases. The classifiers sometimes partake of the nature of adjective pronouns, but usually are mere distributive or numerical adjectives." "Verbs, or 'living characters,' constitute the most important part of speech in the estimation of Chinese grammarians, and the *shun tuh*, or easy flow of expression, in their use, is carefully studied. The dissyllabic compounds, called *clam-shell words*, are usually verbs, and are made in many ways; by uniting two similar words . . . by doubling the verb . . . by prefixing a formative denoting action . . . by suffixing a modifying word." "The various accidents of voice, mood, tense, number, and person, can all be expressed by corresponding particles, but the genius of the language disfavors their frequent use. The passive voice is formed by prefixing particles indicative of agency before the active verb. . . . The imperative, potential, and subjunctive moods are formed by particles or adjuncts, but the indicative and infinitive are not designated, nor are the number and person of verbs usually distinguished. The number of auxiliaries, particles, adjuncts, and suffixes of various kinds, employed to express what in other languages is denoted by inflections, is really very moderate; and a nice discrimination exhibited in their use indicates the finished scholar."—*Ibid.* i. 618–20.

"The greatest defect in the Chinese language is the indistinct manner in which time is expressed; not that there is any want of terms to denote its varieties, but the terseness of expression admired by Chinese writers leads them to discard every unessential word, and especially those relating to time. This defect is more noted by the foreigner than the native, who has no knowledge of the precision of time expressed by inflection in other languages. Adverbs, prepositions, conjunctions, and interjections are not distinguished by native grammarians; the former are classed with adjectives, and the others are collectively called *hü tsz'*—'empty words.'" "No distinction is made between proper and common names, and as every word can be employed as a name it becomes a source of confusion to the translator; in some books a single line drawn on the side of characters denotes the names of persons, and a double line the names of places; important words are denoted by commencing a new line with them, raised one or two characters above the other columns, which answers to capitalizing them. In most books an entire absence of all marks of punctuation, and divisions into sentences and paragraphs, causes needless doubt in the mind of the reader."—*Ibid.* i. 621. See also *Watters, Essays*, pp. 128–51.

"That a close analogy exists between the oral and written *media* of communication cannot be denied; and yet it is equally true that their respective peculiarities are too distinctly marked to admit of the identification of one with the other. It is difficult indeed to believe that people ever spoke in the curt and sententious style of the books, and we have no evidence to prove a closer approximation of the two forms in any preceding age than we find at the present day. Be this as it may, it is easily demonstrable that in the oral medium as we now find it we have to do with a polysyllabic language (pp. 195–6). . . . The number of syllables in the language is, as might be expected, variously estimated by different authorities. . . . Even admitting that a perfectly accurate estimate could be made, it would doubtless be found that the numbers vary considerably for different parts of the Empire."—*Wylie, Ch. Researches*, pp. 195–6. See also *Williams, Midd. King.*, i. 617; *Johnson, Or. Rel.—Ch.*, pp. 8–10.

"The monosyllabic sound of the primitive once imparted to the ideophonous compound, explains the existence of so many characters having the same sound [*cf. supra*]. When these various characters were presented to the eye of the scholar, no trouble was felt in recognizing their sense and sound, but confusion was experienced in speaking. This has been obviated in two ways. One is by repeating a word, or joining two of similar meanings but of different sounds, to convey a single idea; or else by adding a classifying word to express its nature. Both these modes do in fact form a real dissyllable, and it would appear so in an alphabetical language. The first sort of these *hien hioh sz'*, or 'clam-shell words,' as they are called, are not unfrequent in books, far more common in conversation, and render the spoken more diffuse than the written language—more so, perhaps, than is the case in other tongues. Similar combinations of three, four, and more characters occur, especially where a foreign article or term is translated, but the genius of the language is against the use of polysyllables." "The other way of avoiding the confusion of homophonous monosyllables, which, notwithstanding the 'clam-shell words,' and the extensive use of classifiers, are still liable to misapprehension, is by accurately marking its right *shing* or tone. . . . At Canton there are eight arranged in an upper and lower series of four each; at Peking there are only four, at Nanking five, and at Swatow seven. The Chinese printers sometimes mark the *shing* on certain ambiguous characters by a semicircle put on one corner; but this is rarely done, as every one who can read is supposed to know how to speak, and consequently to be familiar with the right tone. These four tones are called *ping*, *shang*, *kü* and *jih*, meaning, respectively, the *even*, *ascending*, *departing*, and *entering* tone. They are applied to every word, and have nothing to do either with accent or emphasis; in asking or answering, entreating or refusing, railing or flattering, soothing or recriminating, they remain ever the same."—*Williams, Midd. King.*, i. 609–10.

"The four tones recognized in the *Kuang-yü*, and no more, are admitted into the *P'ei-wén-yün-fu*, the standard of appeal of to-day, and the distribution of the words among these 4 classes is practically the same also. The spoken language in the meantime has not been at a standstill, and hence the modern tones exhibit a considerable discrepancy when compared with the theoretical tones indicated in the dictionaries."—*Ch. Rev.*, xxii. 447.

"The gradual growth of the tones is an historical fact which we see still at work in the present time. . . . It has been demonstrated to be a fact in Chinese by a native scholar, Twan-yu-tsai, of the last century, whose views have proved to be substantially correct."—*Lacouperie, Languages*, p. 140.

"The most recent change among the tones is the abandonment of the short in the Peking dialect, where the words of that class are distributed among the other three classes, leaving only four tones now in that region."—*Wylie*, p. 198.

"Setting aside the numerous tone distinctions in the south, at least one tone has been gained by the dialects of Central China, while in the N. one tone was gained and another one lost. The addition was caused by the differentiation of the *p'ing* tone into an upper and lower series; the loss, by the absorption, in the Northern dialects, of the *ju shêng* words in the other three tone classes. These changes were so general that they could not be overlooked by lexicographers, and they were more or less adopted in works of a more local character, such as the *Chung-yuan-yin-yün* of 1324, and *Wu-fang-yuan-yin* of 1700, or the *Li-shih-yin-chien* of 1806. But they continued to be ignored in those authoritative works which were intended to furnish a standard for the whole Empire." I cannot convince myself that the distinction of the upper and lower series of even tones is in any way indicated in the phonetic tables in K'anghsi. The 36 initials or consonants there employed are those selected by the Indian monks and others in the 7th and 8th centuries. They are arranged in the order of the Sanscrit letters and apparently have nothing to do with the marking of tones. It is a pure coincidence, not accidental indeed, but more probably causal that the words beginning with sonants are now for the most part found in the lower series." "It is hard to conceive, and yet harder to define, what relation subsists between the articulation of a word and its tone. The only cases of general changes which fall within the range of critical investigation are those already referred to. Whereas the division of the *p'ing shêng* into 2 series has been shown to stand in a definite relation to the nature of the initial consonant, no such relation could be detected by Mr. Parker, who has gone into the matter, as regards the distribution of the *ju shêng* words among the remaining tone-classes. The latter phenomenon may be appropriately described as a *migration* of tones, though the principle governing it remains for the present unknown." "We have seen that the tones recognized in the modern rhyming dictionaries are theoretically the same as they were 1,000 years ago. How these tones may have sounded in reality can only be guessed."—*Ch. Rev.*, xxii. 447. See also *Trans. C.B.R.A.S.*, 1853, p. 53.

"The most searching inquiry and careful reflection point to the following conclusions. 1. That the Pekinese dialect, whether colloquial or otherwise, has but 4 tones, which are never modified, except inasmuch as they change slightly, in a rhythmical sense, according as the words are grouped; but these changes are not positive, still less indispensable, least of all recognized systematically by the natives. The modifications are *instinctive*. 2. The dialect of Hankow has in practice 4 tones, though 5 are counted; 2 being identical. Tone inflection in this dialect, as in Pekinese, is practically non-existent. 3. In Foo-chow there are 7 tones in practice, and, in fact, only 7 generally speaking, in theory; even the recollection of the eighth having almost passed away, since it has become identical with another tone. Both tonic, consonant, and vowel inflection are, in this dialect, positive, rigid, indispensable and all-pervading, not only to their fullest extent, in conversation, but also to a great extent in reading aloud from books or papers. 4. In Cantonese there are 8 tones positively and systematically recognized by name in vocabularies, and a 9th is universally recognized, so that it may safely be stated roundly that there are 9 *bona fide* tones in the dialect. In reading aloud from books these never modify, except perhaps in reading from vulgar song-books or popular romances. In conversation, there is no consonant or vowel inflection whatever, but the tones are modified, *not as in Foochow from one genuine tone to the other*, but into a series of *new* tones, numbering relatively, nine, but actually and positively, only three. These 18 Cantonese *nominal* tones, are thus reduced in practice, setting aside all consideration of the consonant, nasal or vowel terminations of the words, to 12. Hence we have in the 4 dialects under discussion, respectively 4 tones for Pekinese, 4 for Hankow, 7 for Foochow, or 27 in all. But some of the tones or voice cadences in one dialect actually resemble those in another, although in name they differ widely.—*Journ. N.-C.B.R.A.S.*, N.S. xii. 44–5. See also *Wylie*, p. 198.

"In the Shanghai dialect, which I adduce, not because of its individual importance, but because I have had the opportunity of studying it closely, there are the following indications of change now in course of accomplishment. Large classes of initials are pronounced sometimes as hardmutes and sibilants, P.K.S., the form at which they are aiming, and sometimes as B.G.Z., their past form. The first and second of the old four tones have subdivided into two, the others remain as they were. The second tone is gradually resigning the contents of one of its subdivisions to the third tone, so that it will become one again. K, the last of the old finals in the short tone, is gradually disappearing. When all these changes are effected the dialect will become five-tone Mandarin."—*Journ. R.A.S.*, xv. p. 71, note.

"Gützlaff thus divides the syllables of the language among the four tones; first tone, 533; second, 501; third, 519; fourth, 221."—*Ibid.* p. 198.

"Not only do tones vary in adjacent districts and towns, but the natives of certain cities profess to determine by his tones alone from which particular quarter of the city a speaker comes, for his speech bewrayeth him."—*Smith, Proverbs*, p. 12.

"Besides the aspirates and tones, accent is also to be taken into account, as modifying the utterance of a word; particular members of a sentence, according to the dialect, being subject to this modification."—*Wylie, Ch. Researches*, p. 198.

In "Chinese, where the written character unites the mass of the people in one language, a dialect has been usually regarded by those who have written on the subject, as extending to variations in the idiom, and not restricted to differences in pronunciation and local expressions. According to this definition, there are only four or five dialects (which would in fact be as many languages if they were not united by the written character), but an endless variety of patois or local pronunciations. The Chinese have published books to illustrate the Court, Changchau or Amoy, the Canton and Fuhchau dialects. The differences in the idioms and pronunciation are such as to render persons speaking them mutually unintelligible, but do not affect the style of writing, whose idioms are founded upon the usage of the best writers, and remain unchanged."—*Williams, Midd. King.*, i. 612–3.

"A language may acquire the predominance, through being the property of a learned caste, and therefore may be assumed to be understood by all belonging to that caste, as the Mandarin dialect of the officials scattered over the whole of China."—*Bastian, Sprachvergl. Stud.*, p. 49.

"The court language, the *kwan hwa*, or mandarin dialect, is rather the proper language of the country—*the Chinese language*—than a dialect. It is studied and spoken by all educated men, and no one can make any pretence to learning or accomplishments who cannot converse in it in whatever part of the Empire he may be born. It is the common language throughout the north-eastern provinces, especially Honan, Shantung, and Nganhwui, though presenting more or less variations even in them from the standard of the court and capital. This speech is characterized by its soft and mellifluous tones, the absence of all harsh, consonantal endings, and the prevalence of liquids and labials. In parts of the provinces where it is spoken, as the eastern portions of Chehkiang and Kiangsu, gutturals are common, and the initials softened or changed."—*Ibid.* i. 613. See also *Irisson, Études*, pp. 27–50. *Cf.* REST. OF UNITY.

"The Chinese dialects are only a more or less locally altered and corrupted Kwan-hwa, something like the French of some towns in Flanders and Germany, of the negroes in our (West Indian) Islands, and the uneducated people of Paris. However, though all the Chinese dialects come from the same source, they differ widely from one another, not only in different provinces but even in villages of the coast and of the plain. How far do these differences go? In what do they consist? It would be both difficult and useless to go into these details. All I can say is that the difficulty of pronunciation changes the greater part of the words to such a point as to make them no longer recognizable; that many have very different meanings in different places; and that, in general, the ignorance, caprices and eccentricities of the populace made these words very hard to be understood."—*Mém. conc. les Ch.*, viii. 161.

"The vernacular or spoken language of Amoy is not a mere colloquial dialect or *patois*, it is a *distinct language*—one of the many and widely differing spoken languages which divide among them the soil of China. For these spoken languages are not *dialects* of one language, but cognate languages, bearing to each other a relation similar to that between Hebrew, Arabic, and Syriac, or between English, Dutch, German, and Danish. The so-called 'written language' is indeed uniform throughout the whole country, but that is rather a *notation* than a language. And this written language, as read aloud from books, is not *spoken* in any place whatever, under any form of pronunciation. The most learned men never employ it as a means of ordinary oral communication even among themselves. It is, in fact, a *dead language*, related to the various spoken languages of China, somewhat as Latin is to the languages of Southern Europe." There were dialects, properly so called, of the vernacular languages. Thus there were several cognate languages sprung from one common stock—the ancient form of the Chinese language as spoken some 3,000 years ago—with numerous subordinate dialects.—*Rev. C. Douglas, Ch.-Eng. Dic. Cf.* Parker's Introd. to *Giles' Ch. Dic.*

"The local patois of a place is called *tu tan*, or *hiang tan*, *i.e.*, local or village brogue, and there is an interpreter of it attached to almost every officer's court for the purpose of translating the peculiar phrases of witnesses and others brought before him. The term *dialect* cannot, strictly, in its previous definition, be applied to the *tu tan*, though it is usually so called; it is a patois or brogue." "None of the provincial patois differ so much from the *kwan hwa*, and afford so many peculiarities, as those spoken in the province of Fuhkien and eastern portions of Kwangtung. All of them are nasal, and, compared with those spoken elsewhere, harsh and rough. They have a large number of unwritten sounds."—*Williams, Midd. King.*, i. 614–5. For description of the various dialects see *ibid.* i. 133, 136–7, 138; *N. and Q. on C. and J.*, i. 65–7; *Bastian, Sprachvergl. Studien*, p. 6; etc.

"The extent to which the dialects are used has not been ascertained, nor the degree of modification each undergoes in those parts where it is spoken; for villagers within a few miles, although able to understand each other perfectly, still give

different sounds to a few characters, and have a few local phrases, enough to distinguish their several inhabitants, while towns one or two hundred miles apart are still more unlike."—*Williams, Midd. King.*, i. 615–6.

"Since the time of K'anghsi, efforts have been made to substitute the standard language for the local dialects."—*Watters, Essays*, p. 98.

Pigeon-English "has so long been in use as the medium of traffic and household talk that it now bids fair to become an unwritten patois, of which neither the Chinese nor the English will own the parentage. The term *pigeon*, a corruption from *business*, shows, in its transformation, some of the influences which our words must undergo as they pass through the Chinese characters. The foreigners who first settled at Canton had no time nor facilities for learning the dialect, and the traders with whom they bargained soon picked up more foreign words than the former did native. The shopmen ere long formed vocabularies of foreign words obtained from their customers, and wrote the sounds as nearly as possible ; these were committed to memory and formed into sentences according to the idioms of their own language, and disregarding all our inflections, in which they had no instruction. Thus the two parties gradually came to understand each other enough for all practical ends ; the foreigners were rather pleased to talk 'broken China,' as it was not inaptly called, and habit soon made it natural to a newcomer to talk it to the natives, and it obviated all necessity for studying Chinese. The body of the jargon is English, the few Chinese, Portuguese, and Malay words therein imparting a raciness which, with the novelty of the expressions, has of late attracted much attention to this new language."—*Williams, Midd. King.*, i. 624–5.

"The personal names of the Chinese are written contrariwise to our own, the *sing*, or surname, coming first, then the *ming*, or given name, and then the complimentary title ; as Liang Wăn-tai sieu-săng, where *Liang*, or 'Millet,' is the family name, *Wăn-tai*, or 'Terrace of Letters,' the given name, and *siensăng*, Mr. (*i.e.*, Master), or 'Teacher.' A few of the surnames are double, as *Sz'ma Tsien*, where Sz'ma is the family name and Tsien the official title." "In Canton and its vicinity the names of people are abbreviated in conversation to one character, and an *A* prefixed to it ;—as *Tsinteh*, called *A-teh* or *A-tsin*. In Amoy the *A* is placed after, as *Chin-a* ; in the northern provinces no such usage is known. Some families, perhaps in imitation of the imperial precedent, distinguish their members from others in the clan by adopting a constant character for the first one in the *ming*, or given name ; thus a family of brothers will be named Lin Tung-pei, Lin Tung-fung, Lin Tung-peh ; where the word *Tung* distinguishes this sept of the clan Lin from all others. There are no characters exclusively appropriated to proper names or different sexes . . . all being chosen out of the language with reference to their meanings."—*Ibid.* i. 798.

"When a man marries he adopts a third name, called *tsz'* or 'style,' by which he is usually known through life ; this is either entirely new or combined from previous names. When a girl is married her family name becomes her given name, and the given name is disused, her husband's name becoming her family name. Thus *Wa Salah* married to *Wei Sanwei* drops the *Salah*, and is called *Wei Wa shi*, *i.e.*, Mrs. Wei [born of the clan] Wa, though her husband or near relatives sometimes retain it as a trivial address. A man is frequently known by another compellation, called *pieh tsz'*, or 'second style,' which the public do not presume to employ. When a young man is successful in attaining a degree, or enters an office, he takes a title called *kwan ming*, or 'official name,' by which he is known to government. The members or heads of licensed mercantile companies each have an official name, which is entered in their permit, from whence it is called among foreigners their *chop name*. . . . Besides these various names, old men of fifty, shopkeepers, and others take a *hao*, or 'designation' ; tradesmen use it on their signboards as the name of their shop, and not unfrequently receive it as their personal appellation. . . . The names taken by shopkeepers allude to trade or its prospects, such as *Mutual Advantage*, *Obedient Profit*, *Extensive Harmony*, *Rising Goodness*, *Great Completeness*, etc. ; the names of the partners as such are not employed to form the firm. Besides this use of the *hao* it is also employed as a brand upon goods."—*Ibid.* i. 799–800.

"When a Chinese becomes a 'mandarin,' he adopts an official 'Christian' name, and T'ing-fang, or 'hall fragrance,' is accordingly the bureaucratic designation of Ng Choy : the idea is that of a statesman, the sweet-smelling savour of whose reputation 'fills the court.'"—*Parker, John Chinaman*, p. 215.

"When a man dies he receives another and last, though not necessarily a new name in the hall of ancestors ; upon emperors and empresses are bestowed new ones, as *Benevolent*, *Pious*, *Discreet*, etc., by which they are worshipped and referred to in history, as that designation which is most likely to be permanent."—*Williams, Midd. King.*, i. 800.

"Nearly every one of the provinces has an ancient and purely territorial name, in addition to its present practical or descriptive appellation : this ancient or literary name is used in official documents quite as often as the modern one."—*Parker, China*, p. 161.

"In some Chinese villages, the people have all one surname, and this may sometimes, in sparsely peopled regions, lead to awkward consequences, as persons of the same surname are never allowed to intermarry. It happens occasionally, in very exceptional circumstances, that such a clan will agree to divide, half of the people [taking] a new surname, so that marriages may be contracted. But . . . the children [of those who take the new name] to the fifth generation can never become . . . [literary graduates]. In Gou-tshan [Kwang-tung ?] there are four or five different surnames."—*Woman's Work*, iii. 52.

"A community so ancient, vast, and social as the Chinese, so fond of finalities in speech and belief, and so apt to bring every experience to literary form and popular function, naturally possesses a prodigious number of *proverbs* ; embodying in them an impalpable inmost life, which can only in this way find true expression. A nation's proverbs are the ripe fruit of its character and history, its true confession of faith, its alphabet of manners, its outlet into cosmopolitan life. Not till adopted into the universal brotherhood of the Proverbs do the maxims of the wise wear their immortal crowns. Yet the recognized sages are seldom the proverb-makers in an original sense ; these are commonly unknown ; they live only in their winged words, and pass into the circulation of the popular heart, to which they supplied these mystic unappropriated vivacities. A shy literature is the proverb ; its tracts hid in the infinite meshes of social magnetism and construction, by no human wit to be unravelled. In the sea of uniformity into which all Chinese individuality is speedily absorbed, we should hardly expect variety in the experience set forth by this form of expression, where the tides of ages would be apt to roll the pebbles into common shape and break off fresh fragments from the same old rocks. But precisely here, nature justifies herself in her Chinese children by a remarkable diversity."—*Johnson, Or. Rel.—Ch.*, p. 461. For collections of proverbs see *Smith, Ch. Proverbs* ; *Doolittle, Ch. Dic.* ; 明心寶鑑, *Ming Hsin Pao Chien*, trans. *Plath, Bay. Ak. d. Wiss.*, July, 1863 ; *Davis, Chinese*, ii. 166–71 ; *Williams, Midd. King.*, i. 720–3 ; *Ch. Rev.*, Nov. and Dec., 1874 ; *Nevius, Collection of Pearls* ; *Rochet, Sentences Mantchoux* ; *Wollheim, Litt. Sämmtl. Völk. des Orients*, ii. 663–4.

Writing.—"The Chinese write in vertical columns, following from right to left, and it is customary in the better class of works to raise the name of the dynasty a character above the other columns ; even should it occur anywhere in the middle of a column, that column is abruptly broken off, and the imperial character carried up to commence another, while the sense of the passage is continuous, as if there were no break. The title or functions of the Emperor are raised two characters above the other columns, and the titles of the imperial ancestors are raised three characters. In inscriptions and documents, the mention of an Emperor is frequently preceded by a blank of two characters' length, as may be seen in the famous Nestorian inscription at Se-gan."—*Wylie, Ch. Researches*, p. 207.

"The Chinese class the forms of the Character variously. Some affirm that there are 5 classes, others 6, and others again say 8. The 5 classes are thus : 1, Koo-wun ; 2, Ta-chuen—both out of use ; 3, Seaou-chuen, used on seals, the colours of the army, &c. ; 4, Pà-fun, something like the Le-shoo, used on stone tablets ; 5, Le-shoo ; and the present Kae-shoo, used in Deeds of Property, Reports to his Majesty, Public and Private Documents." "Those who arrange the Character under 6 classes eall them : 1, Koo-wun ; 2, Ko-tsze ; 3, Chuen-wun ; 4, Le-shoo ; 5, Mew-chuen ; and 6, Chung-shoo, a character which has the appearance of crawling insects." "The Pa-te, or 8 forms, are called : 1, Ta-chuen ; 2, Seaou-chuen ; 3, Kih-foo ; 4, Chung-shoo ; 5, Moo-yin ; 6, Shoo-shoo, 暑書 ; 7, Shoo-shoo, 发書 ; 8, Le-shoo ; several of these have fallen into disuse."—*Morrison, Dic.*, Introd. p. iii. See also *Williams, Midd. King.*, i. 597 ; *Wylie, Ch. Researches*, p. 203.

"The total number in the six classes [of characters : see *supra*] is twenty-four thousand two hundred and thirty-five, being many less than are found in Kanghi's Dictionary, which amount to forty-four thousand four hundred and forty-nine ; but in the larger sum are included the obsolete and synonymous characters, which, if deducted, would reduce it to nearly the same number. It is probable that the total of really different characters in the language sanctioned by good usage, does not vary greatly from twenty-five thousand, though authors have stated them at from fifty-four thousand four hundred and nine, as Magaillans does, up to two hundred and sixty thousand eight hundred and ninety-nine, as Montucci. The Chinese editor of the large lexicon on which Dr. Morrison founded his Dictionary, gives it as his opinion that there are fifty thousand characters, including synonyms and different forms ; and taking in every variety of tones given to the words, and sounds for which no characters exist, that there are five thousand different words. But even the sum of twenty-five thousand different characters contains thousands of unusual ones which are seldom met with, and which, as is the case with old words in English, are not often learned."—*Ibid.* i. 588–9.

[The *hsing shu*, *ts'ao shu*, and *k'ai shu* are in general use at the present day.]—*Wylie, Ch. Researches*, p. 204. See also p. 203.

"The term Ching-tsze, the proper Character or plain hand, is used in contradistinction from Tsaou-tsze, the running hand. Kaeshoo, the plain written hand, is sometimes used in contradistinction from Sung-pan, a stiff character, commonly used in printed books. It derives its name from the dynasty Sung. There is yet one form, the Hing-tsze, a free hand, holding a middle place between the plain and running hands."—*Morrison, Dic.*, Introd. p. iii. *Cf.* previous Periods.

"Great pains are taken by the Chinese to secure the correct and graceful form of their characters, and the most minute rules are laid down for their formation, both as to the order of sequence and proportions, which are carefully enforced by the teachers. All the characters in the language are reckoned to be made up of the eight elementary parts contained in the character 永 *yüng*, signifying eternal, *i.e.*, a dot, horizontal line, perpendicular line, hook, spike, sweep, stroke, and dash. There is a small native work containing ninety-two short rules for writing, illustrated by examples." (*v. Trans. R.A.S.*, vol. i).—*Wylie*, p. 204.

"The two principal dictionaries that have been published during the present dynasty, *Ching tszé t'ung* and *K'ang he tszé tëen* (which latter forms the basis of Medhurst's *Chinese and English Dictionary*), have both adopted the number [of radicals : 214] fixed by the *Tszé wuy* [*v.* previous Period]. These are divided into 17 classes, according to the number of their strokes."—*Ibid.* pp. 204–5.

The prevalence of monosyllables has been referred to. "Another peculiarity of the written language is the capability of some of the characters assuming the *rôle* of different parts of speech, according to the positions they occupy in a sentence. . . . In classical books we find a character undergoing an analogous change of meaning even without any alteration in the pronunciation."—*Wylie, Ch. Researches*, p. 207.

The arrangement for finding characters finally adopted in the Ming Period "is now in general use from the adoption of the abridged dictionary, the *Kanghi Tsz' Tien* ; though this number could have been advantageously reduced, as has been shown by Gonçalves, its universal adoption, more than anything else, renders it the best system. All characters found under the same radical are placed consecutively, according to the number of strokes necessary to write them, but no regularity is observed in placing those having the same number of strokes. The term *primitive* has been technically applied to the remaining part of the character, which, though perhaps no older than the radical, is conveniently denoted by this word. The characters selected for the radicals are all common ones, and among the most ancient in the language." "The number of characters found under each of these radicals in Kanghi's Dictionary varies from five up to one thousand three hundred and fifty-four. The radical is not uniformly placed, but its usual position is on the left of the primitive. Some occur on the top, others on the bottom ; some inclose the primitive, and many have no fixed place, making it evident that no uniform plan was adopted in the original construction. They must be thoroughly learned before the dictionary can be used, and some practice had before a character can be quickly found. The groups occurring under a majority of the radicals are more or less natural in their general meaning. . . . Some of the radicals are interchanged, and characters having the same meaning sometimes occur under two or three different ones—variations which seem to have arisen from the little importance of a choice out of two or three similar radicals. Thus the same word *tsien*, 'a small cup,' is written under the three radicals *gem*, *porcelain*, and *horn*, originally, no doubt, referring to the material for making it. This interchange of radicals adds greatly to the number of duplicate forms, which are still further increased by a similar interchange of primitives having the same sound. These two changes very seldom occur in the same character, but there are numerous instances of synonymous forms under almost every radical, arising from an interchange of primitives, and also under analogous radicals caused by their reciprocal use. Thus from both these causes, there are, under the radical *ma*, 'a horse,' one hundred and eighteen duplicate forms, leaving two hundred and ninety-three different words ; of the two hundred and four characters under *niu*, 'an ox,' thirty-nine are synonymous forms ; and so under other radicals. These characters do not differ in meaning more than *favor* and *favour* or *lady* and *ladye* ; they are mere variations in the form of writing, and though apparently adding greatly to the number of characters, do not seriously increase the difficulty of learning the language." "Variants of other descriptions frequently occur in books, which needlessly add to the labor of learning the language. Ancient forms are sometimes adopted by pedantic writers to show their learning, while ignorant and careless writers use abridged or vulgar forms, because they either do not know the correct form, or are heedless in using it."—*Williams, Midd. King.*, i. 589–93.

"The invention of printing [in the 6th cent.] and the compilation of dictionaries have given to the form of modern characters a greater degree of certainty than they had in ancient times. The variants of most of the common ones were exceedingly numerous before this period ; Callery gives forty-two different modes of writing *pao*, 'precious' ; and forty-one for writing *tsun*, 'honorable' ; showing the absence of an acknowledged standard, and the slight intercourse between learned men."—*Ibid.* i. 589.

[For some similarities between Chinese characters and Egyptian hieroglyphics see *Kidd, China*, pp. 95–8.]

DISTRIBUTION.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

Commerce.—"The exchange of commodities—the practice of commerce on a small scale—was, moreover, early developed among them [early Chinese]. It was long, indeed, before they had anything worthy of the name of a city ; but fairs were established at convenient places, to which the people resorted from the farms and hamlets about, to barter their various wares."—*Legge, Ch. Class.*, iii. Prol. p. 191.

"In purely mythical and semi-historical times there are traditions of islanders bringing tribute from the south, and tattooed tribes from part of Yüeh (modern Wenchow) carrying swords, shields, and fish-skin boxes for sale or barter. The so-called 'tribute' of ancient times seems to have practically meant trade, for each province was supposed to bring to the metropolis the superfluity of that which it produced easiest and best, receiving bounties or presents in return."—*Parker, China*, pp. 41–2.

"Shih Ku said : 'In ancient times there were no markets ; they sold goods at the well-side when they gathered there to draw water.'"—*K'ang Hsi Tzŭ tien, Yin chi chung, Shih pu*, p. 50*a*.

Shên Nung "caused markets to be held at midday, thus bringing together all the people, and assembling in one place all their wares. They made their exchanges and retired, every one having got what he wanted."—*I ching*, App. III. Sect. II. ch. 2, 14 ; *Legge*, p. 383.

Means of Conveyance.—"In the north of China, more particularly in the provinces of Shansi or Shensi, wagons appear to have been long used by a nomadic people in their migrations. Wheel carriages were first introduced by the Emperor Tay-yu, who was the founder of the Hia dynasty, 2205 B.C. At this early period, however, they were not, it appears, drawn by horses, but by men. Their use was in a great measure restricted to royal and noble families. The cars in which the Emperor of this dynasty rode were invariably drawn by twenty men."—*Gray, China*, ii. 177.

"I [Yü] mounted my four conveyances (carts, boats, sledges, and spiked shoes)." His "dragon-chariot," apparently drawn by horses, is mentioned in *Pao P'u Tzŭ, Yüan chien lei han*, *c.* 325, *Ch'iao i pu*, p. 9*a*.—*Legge*, III. i. 77.

[Provision-carriers are mentioned in the *Shu ching*, Pt. iv. Bk. ii. ch. iii. 6.]

"They [Huang Ti, Yao, and Shun] hollowed out trees to form canoes; they cut others long and thin to make oars. Thus arose the benefit of canoes, and oars for the help of those who had no means of intercourse with others. They could now reach the most distant parts, and all under heaven were benefited."—*I ching*, App. III. Sect. II. ch. 2, 16; *Legge*, p. 384. *Cf.* IMPLEMENTS.

"Yao set up a post at cross-roads on which people might write any complaints against their rulers: there was also a flag standing under which they might make novel suggestions. This seems to show that writing of some sort was in vogue even thus early."—*Ch. Rev.*, xii. 444.

[The state of manners and customs in each feudal State were communicated to the suzerain of the central kingdom by means of the ballads commonly sung by the people which were periodically transmitted by the nobles to their suzerain.]—*Legge*, III. i. 81, note.

[Laws were made known by being "solemnly and periodically proclaimed in each vassal kingdom."]—*Parker, Anc. Ch. Simpl.*, p. 110.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Commerce and Trade.—["Trafficking to a distance with carts and oxen" is mentioned in the *Shu ching*, Pt. V. Bk. X. 6.]

[The market as a place for exchange of goods, benefiting both the buyer and seller, is mentioned in *Kuan Tzŭ, Yüan chien lei han, c.* 357, *Ch'an yeh pu*, p. 3*b*.]

"The system of post houses and hotels at stated distances, by which mediæval travellers were so much impressed, dates from the Chow Li; there was a post house at the distance of every ten and an inn at every thirty li, and a market-place with hostelry at every fifty li."—*Simcox*, ii. 63.

[The care of the highways was regarded as of equal importance with that of the watercourses and the markets.]—*Simcox*, ii. 63; *Chou li*, ii. 128, etc. For the hours at which markets were held see *Fêng su chih, Yüan chien lei han, c.* 357, *Ch'an yeh pu*, p. 1*b*.

"The merchants and dealers collected and spread abroad for sale their merchandise of gold and cloth."—*Chou li kuan chu* (*Gingell*), p. 50.

"It was only in Confucius' time—the period of the Rival States under the nominal hegemony of the kings—that the idea of accumulating profit seems to have energetically possessed men's minds. One statesman (Kwan Chung) invented a kind of *lupanar* where trading visitors from neighbouring states were encouraged by 'Babylonian women' to leave their gains behind them; thus this enterprising state sold its goods at a profit, and got the money back in part. As the historian says: 'Roguery and violence now began to take precedence of right and justice: greed for the possession of riches replaced modesty and humility in men's minds: huge fortunes were made by some callous ones, whilst others were starving before their eyes.'"—*Parker, China*, p. 42.

"There is a story about the eccentric philosopher Chwang-tsz, stating that he preferred the dung-beetle's dung-roll to a piece of storax. This being so, and storax being elsewhere stated to have come from Syria, it seems that indirect intercourse with the west of Asia must have begun as early as the fourth century B.C., when Chwang-tsz flourished."—*Ch. Rev.*, xv. 373.

"Cotton would seem . . . to have been first imported into China from Turkestan."—*Ch. Rev.*, xv. 189.

"In the Cheu dynasty . . . we have proof of the flourishing state of the iron trade."—*Journ. P.O.S.*, i. 2.

So soon as Persia "had fallen before the Macedonian troops under Alexander the Great, 325 B.C., the silken stuffs of China were exposed for sale in all the marts of Greece."—*Gray, China*, ii. 218.

[Shanghai is mentioned as existing in 249 B.C., and was celebrated as the seat of an extensive cotton manufacturing industry.]

Means of Conveyance.—"This mode of conveying letters [by carrier-pigeons] is not by any means new to the Chinese. To them it was . . . well known in ancient times."—*Gray, China*, ii. 189.

"The Chow Li, besides contemplating a uniform scale of proportion for wheeled vehicles and prohibiting 'furious driving,' also provides for the regulation of traffic at crowded crossings, whether by land or water; boats and carriages were only allowed to pass in a prescribed order, which policemen stationed at the critical spots were instructed to enforce (*S.B.*, xxvii. 339.)"—*Simcox*, ii. 63–4.

"Persons without regular occupation went round from place to place and carried on a calling (acted as porters, or coolies)."—*Chou li kuan chu* (*Gingell*), p. 50.

[See also *Richthofen*, i. 379.]

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

"The founder of this active dynasty [Sui] . . . to evince his hatred as a legislator for huckstering . . . 'forbade merchants to wear silk or ride in carriages, piling upon them taxes and charges of all kinds, in order to humiliate and make them miserable.' His wife and son after his death somewhat alleviated these burdens as the Empire gradually settled down into a better financial condition; but the sons of 'merchants were still unable to occupy any official post,'—an incidental statement of the historian which leads us to infer that traders were under a social tabu."—*Parker, China*, pp. 42–3. *Cf.* REG. OF LABOUR.

"The cuttings, which were necessary for drainage and useful for irrigation, served also to provide water-ways for trade, and so to prevent the exclusive dependence on agriculture which has a cramping effect on natural development."—*Simcox*, ii. 10.

"While the course of the rivers is such as to facilitate and promote inland traffic, the conformation of the coast is the reverse of favourable to foreign commerce. Harbours are few and bad, the mouths of the rivers are silted up with sand; there is but one bay of any importance, and none of those gulfs and indentations which invite and almost compel the dwellers on the coast to carry on their traffic by help of short cuts across the water. The inferiority of their neighbours on the north and south prevented any equality of intercourse, either political or commercial; while the industrial instincts of the people found ample satisfaction in the production of native articles of use and luxury, which each province could exchange as far as needful with other parts of the empire."—*Ibid.* ii. 10.

"It is the glory of their Han emperor—Wuti—to have established a secure commerce with the opposite border of the continent in the second century B.C.; with one hand suppressing predatory tribes, and with the other protecting the regular movements of trading caravans to more distant lands. This adventurous spirit, so rare in Asiatic monarchs, was rewarded by the arrival of one of his generals, if not at the Caspian Sea, yet near the Persian Gulf, whence the vine, true symbol of *social unity*, was carried to China; whose exchange for the gift came some centuries later, when the silk-worm, symbol of *productive labor*, was brought to Constantinople by Nestorian monks. From the date at which Ma-tuan-lin begins his notices of Indian relations, religious and commercial,—not far from the Christian era,—two, and probably three, great lines of traffic were fully organized across the continent. One high road is described by Ptolemy as coasting the desert on the south from Bactria to the Western sea; another led from Samarcand to the northern provinces of China. In nine months the caravans crossed from sea to sea; and the Romans met these returning land-galleons at the fairs of Armenian and Persian towns."—*Johnson, Or. Rel.—Ch.*, pp. 119–21. See also *Wên hsien t'ung k'ao hsiang chieh, c.* 6, *Shih ti k'ao*, p. 2*b*; *Journ. R.A.S.*, vi. 457; *Ch. Rev.*, xiii. 52; and for details of the routes, *Parker, China*, pp. 57–8.

"There is an old Chinese legend about foreign envoys having been sent back to Annam in 'South-pointing carriages,' from which story some persons have rashly inferred that in 110 B.C. the use of the magnetic compass was known. What we may fairly conclude is that in those times there was already an overland commerce with the South. When in or about 134 B.C., a Chinese agent was visiting the modern Canton, he noticed some strange produce which was stated to have come from modern Yün Nan. On his way back to the imperial capital the agent questioned some traders in modern Sz Ch'wan about this produce, and discovered that there was a regular junk trade between Yün Nan, Kwei Chou, and Canton. When in 112 B.C. the generals of the Emperor marched upon Southern Yüeh in several columns by way of Hu Nan and Kiang Si, they took advantage of this discovery to ship troops also from Sz Ch'wan and Kwei Chou, in both cases by means of the divergent head-waters of the Western River. . . . In 196 B.C. the King of South Yüeh had already complained to the Emperor that his trade in cattle, iron, and utensils was being interfered with by the King of Ch'ang-sha (Hu Nan); so that it is evident the trade route by the Canton North River and the Hu Nan Siang River had also been used long before this."—*Parker, China*, p. 58.

"All silk and iron went by land, until the Parthian cupidity, two centuries later, drove it to the sea route. The Chinese enumerate over fifty kinds of produce imported by them from Ta Ts'in."—*Ibid.* pp. 59–60.

"The overland route from Rangoon and one of the three Burma roads to China by the Irrawaddy, Mekong, or Salween (*viâ* Bhamo, Esmok, Kiang-hung, or the Kunlŏn Ferry), was open to the 'tribute' of Antoninus."—*Ibid.* p. 60.

For the reasons which led to caravans being sent to Ta-ouan and Ou-sun (Ili and Ferghana) see POLITICAL. The caravans were "sent to explore alternative routes; those to the north of the desert were rendered insecure by the Huns and other barbarians, while to the south food and water were lacking, so that half the members of a single expedition perished." "The number of caravans sent, notwithstanding these difficulties, varied from five to ten in a year, the longest journey occupying nine years. Embassies were exchanged, and the Emperor of China was particularly anxious to obtain horses of a rare breed from Ta-ouan. But the Western kingdoms had apparently as much trade as they wanted, and believed the Hans to be too far off to be dangerous, so even food was refused to the Chinese caravans. . . . The Huns were near and formidable, so traders protected by the Huns were secure, while 'those of the Hans, on the contrary, only obtained food, baggage animals and admission to the bazaars by producing their wares' (*Nouv. Journ. Asiat.*, 1828, ii. 438)."—*Simcox*, ii. 109.

"The Phœnicians, Carthaginians, and Syrians were already old hands at conducting sea trade when China under the Han dynasty first found herself with an unbroken line of coast. . . . I am disposed to think that trade went on between the Syrian merchants and the natives exactly as it does now, and probably at most of the same places, between Canton and the coasts of India. . . . It is distinctly stated by native historians that the Chinese obtained from Ta-ts'in glassware of all kinds, asbestos, woven fabrics, and embroideries, drugs, dyes, metals, and gems."—*Parker, China*, pp. 46–8. See also *ibid.* for Pliny's statements regarding the Seres.

The Hiung-nu "were driven away by the Chinese from the southern group of roads, *viâ* Hami, at a comparatively early date; but, during the greater part of the time—to use the words of Chinese historians—'the Han dynasty had the sagacity to keep them in good temper by permitting a regular border trade.'"—*Ibid.* pp. 117–8.

[For the contempt with which traders were regarded by the government see *ibid.* p. 44 and REG. OF LABOUR.]

[The principal articles of trade were grain, salt, iron, horses, carts, silk, copper, and gems.]—*Ibid.* p. 44. See also *Journ. P.O.S.*, i. 2.

[Kao Tsu's popularity was great because he promoted commerce.]—*Boulger, Short Hist.*, p. 11.

"Frontier 'fairs' and even clandestine trade are also specifically mentioned as early as 140 B.C. The nomads used to bring horses and beasts for sale; more especially the '300 mile a day' or 'blood-sweating' horses of Kokand were highly prized. Horses, pearls, sables, and excellent wood for making arms are mentioned amongst the earliest products of North Corea, which then extended far into Manchuria; the same thing, *plus* flax or hemp, of the Tunguses bordering thereon; the buckthorn arrows with petrified resin or lapis-lazuli tips brought by the latter were known by report even in Confucius' time (550–480 B.C.). In the eastern part of the Corean peninsula iron was the sole currency: both the Japanese and the other Corean states used to purchase their iron there." Chang Ch'ien saw "Chinese goods in Bactria, and . . . ascertained that they came through India. . . . Yün Nan produce came to Canton by river: this led by degrees to the conquest of both regions, and to the better knowledge of several new trade routes; but to this day the hoped-for southern line of posts extending from Canton to Bactria has never been achieved. In the negotiations which preceded the conquest of Canton (110 B.C.), the King of South Yüeh complained that he was not allowed to import iron, agricultural implements, or female animals. His return presents include such things as rhinoceros horns and peacocks, which probably came to Canton by sea in the way of trade. From all this we may gather a tolerably accurate notion of what the ancient land commerce of China must have been."—*Parker, China*, pp. 44–6.

[By the year 115 B.C. a regular intercourse with the thirty-six states of the Western regions had become established through the efforts of Chang Ch'ien for which he was ennobled as Marquis.]—*Giles, Bio. Dic.*, p. 12.

"In the first century of our era, at least, a brisk trade in silk had already grown up between China and Rome. The Parthians tried to monopolise it, and the Romans, in order to escape Parthian cupidity, had recourse to the sea route, with which official China had no opportunity of acquainting herself before the second century. The one link, and that an important one, between the land and sea routes was forged by such travellers as the Buddhist priest Fah Hien, who reached Turkestan by way of the Pamirs, and groped their way home through India, and thence by sea along the Java and Malay coasts."—*Parker, China*, pp. 48–9. See also *Simcox*, ii. 117; *Del Mar, Mono. on Hist. of Money*, p. 4.

"The extraordinary market value of silk at this time [A.D. 220] was not owing to its scarcity in China, but to the great difficulty which the merchants of Persia and India experienced in procuring it from there in sufficient quantities. Between the merchants of Persia and India on the one hand, and those of China, on the other, imperfect and irregular communications were kept up in the face of very formidable obstacles."—*Gray, China*, ii. 219.

[Markets are mentioned, as at Ch'ang An.]—*K'ang Hsi Tzŭ tien, Yin chi chung, Shih pu*, p. 50*a*.

Hoo Wei mentions "the burdensome system of transporting the revenue in kind which has prevailed in China since the time of the Han dynasty. It was a consequence of the change from the feudal system to the centralized government,—an evil in itself, but less than other evils."—*Legge, Ch. Class.*, III. i. 144, note.

[Important prisoners were conveyed in a prison-van resembling a cage and securely fastened.]—*Shih chi Chang Erh Ch'ên Yu chuan, Tzu shih ching hua, c.* 55, p. 37*b*. *Cf.* Laws.

Period of Disruption (221 *to* 589).—*Table IV.*

North China being now, and for four centuries to come, politically cut off from the southern coast, "it is not surprising . . . to find that the northern Tobas have nothing new to say about the South Seas, whilst the southern dynasties at Nanking are correspondingly ignorant of events along the desert routes. But these southern dynasties kept up their relations with Ceylon, India, and Indo-China, and there is every reason to believe that a brisk trade went on without interruption as before. Up to the time of Mahomet, it seems that colonists sent out from India had managed or financed the entire ocean trade with the Far East, if they did not also in most cases directly rule the coast peoples of Java, the Malay Peninsula, and Indo-China. Profound international peace appears to have reigned, so far as Chinese trade was concerned. There were no attempts made by junk-masters to conquer the natives, nor by dark-skinned rulers to harass or practise extortion upon the traders. There is one specific mention in A.D. 226 of a Ta-ts'in [Syrian] merchant coming to the court of the Emperor of Wu (at Nanking, but later at Wu-ch'ang opposite Hankow), who gave him some black dwarfs to take back as curiosities; otherwise nothing new is said of that country except in connection with the trade of India. . . . The single important point [in the various historical accounts], and that upon which to lay stress, is this: both Roman and Chinese accounts make it perfectly clear that land and sea trade in silk, iron, glass, textile fabrics, and many other articles existed between the Red Sea ports (Petra, etc.) and the Indo-Chinese ports (Rangoon, etc.), and also between Mesopotamia and Si-an Fu, during the first five or six centuries of the Christian era; but so far it does not appear that the question of customs duties, transit charges, or tonnage dues ever came to the front prominently, if at all, in China."—*Parker, China*, pp. 49–50.

"Cosmas tells us in the sixth century that the Chinese brought their silks and sandal-wood to Ceylon, where they were met by traders from the west (*Knight, Commerc. Interc. with China*). Here was, perhaps, initiated the extensive commerce carried on by the Arabs with China for many centuries, not only by sea, but across Persia and Thibet; and it has become more than probable that many of the inventions supposed to have been introduced by them, such as paper and the mariner's compass, were brought from the Pacific shores (*Draper, Intell. Develop. of Europe*)."—*Johnson, Or. Rel.—Ch.*, p. 122.

"The superior safety and quickness of the land traffic is alleged by Cosmas as a reason why there was so much silk in Persia, and the quantity exported is proved to have been considerable, by its reaching the empire of Justinian in quantities sufficient to suggest the thought of acclimatizing the precious worm."—*Simcox*, ii, 130.

"It is stated that Alexander Cosmas, himself a trader in Arabia and India (530–50), says in his *Topography* that there was a maritime trade thence with Tzinistan, a place bordered by the Eastern Ocean."—*Parker, China*, p. 61.

"The routes followed by the Chinese Buddhist pilgrims are not to be ignored when we attempt to decide what the ancient sea and land trade routes were." See details and further information concerning the iron and silk trade in *ibid.* pp. 60–4.

"There is no doubt that 1600 years ago, a great postal highway extending from Peking to Kashgar existed—probably the longest road in the world." (Sven Hedin.)—*Standard*, Dec. 8, 1902.

[For early voyages of Europeans to China, see *Martin, Hist.; Appleton, Cycl.*, v. 110; etc.]

[Markets were held. See *P'ei wên yün fu, c.* 34*a*, p. 146*a*; etc.]

Means of Conveyance. In a campaign undertaken by Chu-ko Liang in A.D. 231 "he made use of the famous device of 'wooden oxen and running horses' as a means of transport. What the device was, nobody now knows."—*Giles, Bio. Dic.*, p. 181.

[A carriage which registered the distance travelled was in use. See *Giles, Ad. Sin.*, No. 7.]

From the Restoration of Unity to the end of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

"A general impetus was given to foreign travel and foreign commerce; and while the court was filled every year by strangers coming peaceably from regions that Han-Wu-ti had vainly endeavoured to subdue by force of arms, colonies of traders established themselves in the southern ports, as well as along the continental trade routes."—*Simcox*, ii. 139.

"The Chinese in the eighth and ninth centuries made much more silk than before for foreign countries. The spread of the silk manufacture in Western regions did not put an end to the demand for the silk goods of China or for the unwoven silk. Neither Europe nor Western Asia could manufacture enough of their own silk to meet the demands of the market. The historian Robertson says of this period that the silk of China was purchased in Shensi, the westernmost province of that empire, and conveyed thence by caravan in a march of eighty or a hundred days to the banks of the Oxus, where it was embarked and carried down the stream of that river to the Caspian. After a dangerous voyage across that sea and ascending the River Cyrus as far as it is navigable, it was conducted by a short land carriage of five days to the river Phasis which falls into the Black Sea. Thence it was taken by ship to Constantinople. While such was the activity of trade by land there would naturally be a corresponding expansion of sea-borne traffic from the seaports of China to India and farther west. The three centuries of the Tang dynasty at the same time gave opportunity to home commerce to grow in proportion. Trade flourishes when an empire is at peace."—*Edkins, Chinese Currency*, p. 1. See also *Richthofen*, i. 529.

"Towards the end of the fifth century the Turks appear on the Chinese frontiers, in order to purchase silk and wadding in exchange for articles of their own production. The Turks were workers in iron, and the district of Liang Chou, in or near which they are first heard of, was, as we have seen, precisely the most ancient iron-producing place mentioned in Chinese history. Tea now appears for the first time as an article of commerce, and from that day to this Turkestan, Siberia, Tibet, and finally Europe, have regarded this as the main staple of their trade with China."—*Parker, China*, pp. 52–3.

"The Arabs are first heard of by the Chinese in A.D. 628, under the name of Tajik, or Tazi, and in connection with a revolt of Persia against her overbearing task-masters the Turks. As Mahomet was not yet dead, and means of communication were not more rapid then than they had been 600 years earlier, we have here a good instance of the speed at which news of political changes in Europe might reach China. The name Fu-lin now also apppears for the first time, and the people of that country (which I take to be Fereng, or 'Frank') are baldly stated to be 'also called Ta-ts'in.' The energetic but crazy Emperor of the Sui dynasty, whom I have already characterised as a sort of Caligula, is stated to have unsuccessfully attempted to open communications with Fu-lin."—*Ibid.* p. 51. See also *Johnson, Or. Rel.—Ch.*, pp. 122–3; *Renaudot, Mahom. Travellers, etc.*, p. 21.

"These two [Fah-hien and Hüan-chwang] are by no means the only priests who made important journeys. . . . The fact that hundreds of Nestorian, Hindoo, and Chinese priests and bonzes were able to move freely, by land and by sea, all over Asia proves, though it may not throw specific light upon commerce that trade routes were frequented then along exactly the same lines as they had been before, and as they are now."—*Parker, China*, pp. 62–3. For the routes followed see *ibid.* pp. 61–2.

"In the early part of the T'ang dynasty . . . large numbers of Persian traders are stated to have come by sea and spread themselves over the Empire. Owing to the anarchy which ushered out the ruling house (end of the ninth century), they and other foreigners at last confined their trading operations to Canton. Besides the accounts already mentioned . . . there are the often quoted narratives of the Arabs Wahab and Abu Seïd (850–77), which testify once more to an active sea trade all along the Indian Ocean, the Persians being apparently ahead of the Arabs in numbers and energy."—*Ibid.* p. 64.

"When Hsü Shên was promoted to be Governor of Ling Nan, the foreigners came yearly with pearls, tortoise shell, and rhinoceros' horn by sea. Shên did not exact other duties after they had paid the usual taxes, so the merchants and traders greatly increased."—*K'ung t'ieh, Yüan chien lei han, c.* 357, *Ch'an yeh pu*, p. 20*a*.

"They import into China ivory, incense, ingots of copper, shells of sea-tortoises, and rhinoceros horn."—*Reinaud, Rel. des Voy.*, i. 33–4.

"The inhabitants of China make belts of rhinoceros horn, the price of which, in China, is as high as two or three thousand dinars, and even more, according to the beauty of the markings. All these horns are bought in the states of Rohmy, with cowries, which are the money of the country."—*Ibid.* i. 29–30.

[Fairs held every 3 days are mentioned in *Nan pu hsin shu, P'ei wên yün fu, c.* 6, p. 144*a*.]

"In the middle of the seventh century we . . . first hear of tithes being levied in kind, upon imports of spices, camphor, and precious woods, by an officer appointed specially to oversee the foreign trade: one of these functionaries is stated to have been on duty at Canton in A.D. 763, just five years after the Arabs and Persians had made a filibustering attack upon and then pillaged and burnt some warehouses in that city, as recounted in the history of the T'ang dynasty."—*Parker, China*, p. 52.

"Each district in China has its tolls and markets."—*Reinaud, Rel. des Voy.*, ii. 19.

"The market of Fêng Tu was eight *li* in area, and had twelve entrances. In it there were 120 hongs and 3,000 shops."—*Ta ts'ung tse chi, P'ei wên yün fu, c.* 34*a*, p. 149*a*.

"About the year A.D. 700 a market for strangers was opened at Canton, and an imperial commission appointed to levy duties."—*Simcox*, ii. 139–40.

"Another indication of the range of Chinese influence is given by the Chinese Version of the Yenisei inscriptions (*Acad.*, Jan. 20, 1894) which shows the monuments (bearing other inscriptions in an unknown alphabet) to have been erected to princes of a Turk dynasty, circ. A.D. 730."—*Simcox*, ii. 140, note.

"During the eighth century several Arab missions came to China by way of Tokhara, the north branch of the South Road, the Purun-ki River, Si-ning, and Liang-chou. . . ." They "would seem to have worked their way from Si-ning down to the head waters of the Yang-tsze."—*Parker, China*, pp. 65–6.

"The Nestorian stone with Syriac and Chinese inscriptions, dated A.D. 781, . . . gratefully acknowledges the toleration shown to Christian travellers by the monarchs of the T'ang dynasty. At this time there were over 4,000 foreign families in Si-an Fu." "It is further testimony to the fact that Syrians if not also Europeans, had for many centuries followed the great road from Mesopotamia to China."—*Parker, China*, pp. 52–3, 72–3.

"Foreign trade continued to exist on sufferance, but so far as the Chinese were concerned it was limited by the attitude of the Government to a moderate exportation of staple commodities, paid for in foreign coin or precious metals. What China had to sell was much more important to the Western nations than anything else she or her rulers could be prevailed upon to buy; and so long as the trade dealt with surplus manufactures, like silk, or natural products, like musk or rhubarb, and did not endanger the local food supply, it was not interfered with. In A.D. 794 complaints were made that trade was leaving Canton for Cochin China, but the traders' schemes for recovering or pursuing it were discouraged by the Government, which opined that there must have been intolerable extortions used to drive it away, or a want of natural inducements to bring it, and quoted the Shoo: 'Do not prize strange commodities too much, and persons will come from remote parts.'"—*Simcox*, ii. 140.

"Arab geographers and travellers of the 9th century show what a development had been reached by foreign commerce under this modified freedom. The Jewish merchants described by Ibn Khordadbeh . . . had their representatives at Canton; and the four trade routes, enumerated by Sir Henry Yule (*Cathay*, ii. 559), enabled all the great commercial communities to try their hand at the China trade. The first of these routes led from the Mediterranean over the Isthmus, of Suez and onwards by sea; another reached the Indian sea viâ Antioch, Bagdad and Bussora and the Persian Gulf; a third followed the coast of Africa by land from Tangiers to Egypt and thence by Damascus to Bagdad, while the fourth led south of the Caspian Sea and north of the Central Asian desert to the gates of the Great Wall. The Chinese traders either met the Western merchants at Ceylon, or themselves came as far as the mouth of the Euphrates."—*Ibid.* ii. 140.

[Mention of a western religion (Manichæism or Nestorianism) in the tri-lingual stone inscription discovered by Russians at the old Ouigour capital, and dating from 830, is another link connecting "Syria and Persia . . . through Tokhara, with China and Mongolia."]—*Parker, China*, pp. 72–3.

"The reports of the Arab merchant Suleiman upon the condition of trade in the Far East during the ninth century, and the comments of the Arab geographer Abu Seïd, who wrote about one century after this again, confirm what the Chinese say, and make it quite certain that a lively international traffic then pervaded the whole of the Indian Ocean. Even the Chinese accounts speak of foreign ships at Canton having a capacity of 1,000 *bharams*—an Indian word having the meaning of 'a quarter of a ton.'"—*Ibid.* p. 52.

"In the period *K'ai Ch'êng* [836–41] the price of things was cheap. The people sold fish and meat in the village markets, and the natives there bought them with half a cubit of raw silk from Hu. If [the buyer] was a scholar or official he bought them with copies of verses written by Lo T'ien [a famous poet]."—*Fêng nien lu, Ko chih ching yüan, c.* 27, p. 15*b*.

[In 877, the Arab trade was interrupted by internal troubles in China, which co-operated with the decline of the Arab power to break off the growing intercourse between South China and the Western nations by way of the Indian seas. The journey was too long to be undertaken without the assurance of a peaceful market, while the supply of merchandise itself must have fallen short for the time, as the rebel armies are accused of the supreme barbarism of cutting down the mulberry trees.]—*Simcox*, ii. 142.

The trade "relations [of Palembang] with China are stated to date from the period T'ien-yu of the T'ang dynasty (A.D. 904–907)."—*Hirth, Ancient Porcelain*, p. 57.

Means of Conveyance.—"The institution of the 'Peking Gazette,' the oldest periodical in the world," was due to Hsüan Tsung.—*Boulger, Short Hist.*, p. 32.

"The *Ching Pao*, i.e., '*Metropolitan Reporter*,' usually called the *Peking Gazette*, is compiled from the papers presented before the General Council, and constitutes the principal source of information available to the people for ascertaining what is going on in the Empire. Every morning ample extracts from the papers decided upon or examined by the Emperor, including his own orders and rescripts, are placarded upon boards in a court of the palace, and form the materials for the annals of government and the history of the Empire. Couriers are despatched to all parts of the land, carrying copies of these papers to the high provincial officers; certain persons are also permitted to print these documents, but always without note or change, and circulate them at their own charges to their customers. This is the *Peking Gazette*, and such the mode of its compilation. It is simply a record of official acts, promotions, decrees, and sentences, without any editorial comments or explanations; and as such of great value in understanding the policy of government. It is very generally read and discussed by educated people in cities, and tends to keep them more acquainted with the character and proceedings of their rulers than ever the Romans were of their sovereigns and Senate. In the provinces thousands of persons find employment by copying and abridging the *Gazette* for readers who cannot afford to purchase the complete edition."—*Williams, Midd. King.*, i. 420.

"All correspondence between the Emperor of China and the governors of towns, as well as the eunuchs, is carried on by means of post-mules, which . . . follow certain fixed routes." Ibn Wahab about 915 travelled from Peking to Khanfu by government post-mules.—*Reinaud, Rel. des Voy.*, i. 88, 118. The posts and rest-houses are mentioned in *T'ung tien, Ko chih ching yüan, I lei*, p. 16*a*.

"The *chien-yu*, or Shoulder-Cart . . . is mentioned in the T'ang Annals as used by the mourning officials at the death of the Emperor Wen-tung in A.D. 840."—*Ch. Rev.*, xix. 58.

[Chartered ships provided with carrier-pigeons trading between Canton and Colombo are mentioned in a work of the T'ang dynasty. See *Hirth.*]

[Stones 10 cubits in height were set up inscribed with lists of diseases and their appropriate remedies.]—*Reinaud, Rel. des Voy.*, i. 46.

907–960.

"During the period of anarchy which intervened between the collapse of the T'ang dynasty and the rise of the Sung—that is, during the greater part of the tenth century—Canton seems to have lost its place as the main centre of foreign trade."—*Parker, China*, p. 53.

"There is no mention of the Arabs during the Five Dynasty anarchy . . .; but there is evidence of friendliness between Khotan and the Ouigours, and of a brisk trade along the southern branch of the south road. During the whole period of the Tungusic Kitan and Nüchên reigns in North China (900–1200), the Arabs only found their way once or twice to the north. In 924 the founder of the Kitan dynasty was on the Orkhon, trying to persuade the Kan-chou Ouigours to come back to their old *habitat* there. An Arab mission promptly turned up on the Orkhon, and applied to him for a marriage alliance. It is not likely that it arrived from the north-west by the Uliassutai Road: probably it came by way of the Great High Road to the West from Si-an Fu, which then ran through Ouigour territory."—*Ibid.* p. 66.

Sung Period (960 *to* 1280).—*Table VI.*

"Our notices of intercourse between China and the countries of the West are at their scantiest during the first two centuries of the Sung dynasty. After A.D. 1077, 'tribute' was brought almost yearly from Khotan, and commercial and other intercourse with Corea was closer than usual, till private commerce was put a stop to towards the close of the 11th century, at the instigation of Su-tung-po. Under the year 1200, we are told that 'no commerce was allowed but what was carried on by Government capital.'"—*Simcox*, ii. 215.

"During the northern Sung dynasty (from 960 to its flight south in 1127) there was a 'barbarian hotel' or caravanserai at Si-an Fu, inside of the south gate of the city. Nothing whatever of the Nestorians is heard during this period; but there are still existing some records at K'ai-fêng Fu of the Jews there, who, in the opinion of Father Tobar, used probably to come to China as merchants."—*Parker, China*, p. 67.

"In 985 the sea traders [who had made Canton the centre of foreign trade] were prohibited from exercising their calling. The explanation probably is that petty local dynasties ruled all over South China, at Canton amongst other places; and until the Sung dynasty had settled the question of respective political spheres with the Kitans in the north, it could not give attention to such remote districts as Canton. Hence there are more frequent allusions to the land trade between Tangut and Corea than to the junk-borne commerce of the South Seas. The result was [Canton having lost its monopoly in 999] a partial transfer of sea trade to Hangchow and (modern) Ningpo, to which places customs inspectors were, at the request of the foreign spokesmen, appointed in A.D. 1000; efforts were also made to obtain a similar appointment for Ts'üan-chow (Marco Polo's Zaitun), and this was granted in A.D. 1087; but I observe in the Sung history a statement in the year 1114 to the effect that the Hoppo of Canton was then still obliged to send to Court annual presents of pearls and ivory. The learned German sinologist, . . . Dr. Frederick Hirth, succeeded a few years ago in obtaining a very rare Chinese work, *Upon Foreigners*, composed by an imperial scion of the ruling Sung house, who actually occupied this last post towards the end of the twelfth century."—*Ibid.* p. 53.

"Trade between Loochoo and Japan clearly went on, and there are full descriptions of Sumatra, Java, and Borneo, which places the Zaitun junks reached with the north-east monsoon in six weeks. But I see no real evidence that Manila had yet been discovered, as suggested by Hirth. The junks usually waited until the following spring for a favourable breeze to take them on to Ceylon, the Malabar coast, and the Arabian and African ports, amongst which Berbera, Shehr or Shaher, and Djafar can be specifically identified from the Chinese characters used. There is ample evidence from standard Chinese history, as well as from Dr. Hirth's rare book, that Zanzibar was included in the usual voyages, and there are also descriptions of Cambay, Guzerat, Malwa, Bagdad, Basra, and other places in the Persian Gulf. It is to be noticed that one Chinese author (A.D. 1000) identifies the 'sea-trading barbarians' at Canton with the '*Hien* sectarians' of the Ta-ts'in monastery at Si-an Fu. At one time it was thought that Nestorians were referred to when these two words were used; but quite recently . . . the late Gabriel Devéria has proved them to have been Persian Mazdeans and Manichæans."—*Ibid.* pp. 67–8.

"Nearly thirty Arab missions are mentioned between 968 and 1116 as arriving by sea. . . . In 1017 half the duties 'charged on foreign trades' were specially remitted as a favour to the Arabs."—*Parker, China*, p. 67.

"After the partition of the Empire [1127] the Southern Sung were cut off from most of their northern and southern tributaries. The eastern provinces of Yünnan and Sz'chuen seem to have been in direct communication with India."—*Simcox*, ii. 215.

[Shanghai was a place of some importance in the 11th century. It had been an important seat of trade for many centuries before the incursion of foreigners.]

"As piracies at Swatow, off Fuh Kien, Canton, and the Lei-chou peninsula are frequently noticed in the standard histories, it is probable that the whole coast was in a disturbed state at this time; but in the year 1141 it is recorded that 'rules governing sea-going junks' were drawn up. In 1132 the Fuh Kien customs officer was abolished. [About 1150 the terminus of the western trade is placed at Hang-chow (Khan-fu), the Yang-tzŭ naturally being more important for the inland trade than the Canton River (*Edrisi*). In 1154 Wênchow oranges are mentioned at the Sung court at Hang-chow (*Parker*, p. 145).] In 1156 the taxing stations in all the provinces were closed up, in order to facilitate trade. In 1157 the Hoppo of Canton was directed to scrutinise the doings of foreign traders pretending to bring tribute. In 1166 the two maritime customs stations of Chêh Kiang were closed. [In 1180 trade was sanctioned with the Tibetan frontier tribes (*ibid.* p. 219).] In 1173 and and 1182 foreign traders were restricted in their dealings with bullion; and in 1199 Japanese and Corean traders were limited in some way in their copper 'cash' operations. In 1204 Canfu was first garrisoned with marines; and in 1205 eighty-one Cantonese sub-stations (? *likin*) were abolished. In 1211 Kwang Si cattle taxes were stopped. And so on. . . . The great centre of Arab trade in the Far East was Sarbaza,

or the modern Palembang in Sumatra, between which place and the coasts of Fuh Kien Chinese junks plied regularly with the two monsoons, carrying their cargoes of porcelain, silk, camphor, rhubarb, iron, sugar, and precious metals to barter at Palembang for scents, gems, ivory, coral, fine swords, prints, textile fabrics, and other objects from Syria, Arabia, and India. Cochin-China—probably 'Faifo,' near the modern Tourane—joined in this trade as a sort of half-way house, but levied the heavy charge of 20 per cent. upon all imports. It is specifically stated that there was no foreign trade with the northern part of the peninsula, *i.e.*, what we now call Tonquin. After Palembang the most important trade centres were Lambri (Acheen), and ports in Java, Borneo, and perhaps Manila. That there was an active trade with North China is also evident, for in 1130, when the Nüchên Tartars had driven the native Chinese Sung dynasty across the Yang-tsze, 'Fuh Kien, Canton, and Chê Kiang trading junks were forbidden to go to Shan Tung lest the Nüchêns might make use of them as guides.' In 1173 the export of silver and silk 'to the north' was forbidden, and in 1178 it was made a capital offence to export tea thither 'on ox or horseback.' In 1192 the Ya-chou custom-house was abolished—evidently referring to Tibetan teas."—*Parker*, *China*, pp. 53–5.

"It appears that Ch'üan-chou-fu [in Fukien] was at this author's [Chao Ju-kua's] time [13th cent.] the starting-point for commercial enterprise in China, navigation existing between it and the N.W. coast of Borneo."—*Hirth*, *Anc. Porc.*, pp. 48, 51–2.

Siam from about A.D. 1200 to 1853 "always recognised China as a nominal suzerain, for reasons of trade policy."—*Parker*, *China*, pp. 128–9.

[Soon after 1200, if not earlier, porcelain was shipped to Cochin China and Cambodja, where it was exchanged for local products.]—*Hirth*, *Anc. Por.*, p. 55.

"In the account of Shê-p'o, or Java, the journey to those ports was made with the setting in of the north-east monsoon from Ch'üan-chou-fu within a little more than a month, we read that 'the Foreign merchants import imitation gold and silver, and gold and silver vessels, silks, damasks, a kind of medicine from Szechuen, orris root, cinnabar, green and white alum, borax, arsenic, lacquered ware, iron tripods, and green and white porcelain, in exchange of the pepper produced in this foreign country, and the merchant ships assembled there derive much profit from this trade."—*Ibid.* pp. 55–6.

"The most important place in the history of far-eastern trade in this epoch is, however, doubtlessly, the country described under the name of San-fo-ch'i (the present Palembang in Sumatra). As to Java, journeys were made to this port from Ch'üan-chou-fu in the beginning of the winter season, junks passing the Straits of Lingas on the way. The accounts furnished by Chao Ju-kua of this country, the greater part of which has been taken over into the *Sung-shih* (see the portion of that work translated by Groeneveldt), leave no doubt that it was the principal link in the commercial relations between Western and Eastern Asia all through the early part of the middle ages. All the produce of China and the countries south of it, such as Annam and the Malayan Islands, were stapled up there for sale to the Arab traders, who in their turn imported the products of Europe, Western Asia, India, and Africa for re-exportation to China and the other countries of the Far East. Chao Ju-kua mentions as indigenous products of San-fo-ch'i: tortoise-shell, gum camphor, certain incenses, laka wood, cloves, sandalwood and cardamoms. Besides these, he says, the Arabs bring from the West: pearls, gum olibanum, rosewater, becho nut flowers, castoreum, myrrh, aloë, asa fœtida, putchuk, liquid storax, ivory, corals, cats' eyes, amber, foreign cloths and foreign sword-blades. These were bought up by the 'Foreign (Chinese?) Traders,' who exchanged them against: gold, silver, porcelain, silk piece goods, sugar, iron, samshoo, ginger and galangal, rhubarb and camphor."—*Ibid.* pp. 56–7.

With Lambri, in Sumatra (40 days), and Coilam, in Malabar (a month further, after the intervening winter), a similar trade was carried on. "The 'hills of Lambri furnish cats' eyes, red glass, camphor, blue and red pearls, and in the country cardamoms, tree bark, coarse and fine incense is produced; the 'Foreign Merchants' import, in exchange of these products: sandalwood, cloves, camphor (!), gold, silver, porcelain, horses, elephants and silk stuffs.'"—*Ibid.* pp. 57–8.

"Chinese junks came to Malabar [Nan-p'i] in exceptional cases. . . . 'The products of the country are brought to San-fo-ch'i, and the following goods are returned in barter against them: lotus flower tanks, silks, porcelain, camphor, rhubarb, cloves, camphor-drops, sandal wood, cardamoms and eagle-wood.'"—*Ibid.* p. 59.

"Chao Ju-kua's work places us in the position to trace the export trade in porcelain even as far as the coast of Zanzibar; for this must be the country described by him under the name of *Ts'êng po*. . . . Porcelain . . . was brought to Guzerate as part of the country of Nan-p'i by way of San-fo-ch'i in Sumatra, and was thence sent south to the Arab colony in Zanzibar."—*Ibid.* pp. 59–60.

Probably "all these céladons [*Lung-ch'üan yao*]" took "their way from Lung-ch'üan by river to Zaitun (Ch'üan-chou-fu, or thereabout), whence they were brought to Borneo, Java, Sumatra, India and Arabia."—*Ibid.* p. 66.

"The Japanese timber junks arriving at Ch'üan-chou-fu are sure not to have left that port without return cargoes, and since porcelain, especially green porcelain, was among the staple articles of the latter, we may conclude that shipments were made of it to Japan."—*Ibid.* p. 67.

[For the routes followed by the céladons from Lung-ch'üan to Quinsai, Zaitun, and the coast markets see *ibid.* pp. 39–41.]

"The conquests of Genghiz Khan once more opened freely the great trade routes of the West."—*Parker*, *China*, p. 69.

"In 1254–5 the King of Little Armenia sent his brother to Gayuk Khan with presents."—*Ibid.* p. 69. See the route followed (pp. 69–70).

"On the whole . . . the Great Northern High Road, which may be called the main road, manifestly seems preferable to those running both north and south of it for waggons, cattle, and foot travellers alike."—*Ibid.* p. 70.

"The weight of evidence points to their [Chinese bottles found in Egypt and Asia Minor] having been taken to Egypt and Arabia by the Arabs who traded at Canton and Hangchau down to the end of the Sung dynasty in 1278."—*Williams*, *Midd. King.*, ii. 27–8.

"Marco Polo's description of Yün Nan and Burma is simply that of the chief trading road of to-day by way of Momein and Bhamo (the Irrawaddy). He never went to the more southerly Shan States, nor to Siam; and consequently he does not mention the only two other peninsular trade routes (one by way of the Kunlôn Ferry (Salween), and the other *viâ* Kêng-hung (Mekong). Nothing has essentially changed from that day to this, and as many as 5,000 Chinese mules from Yün Nan may be seen any day during the autumn trading season picketed amongst their burdens in the vacant fields around Bhamo. The other two routes are also in full vogue for the Moulmein and Siamese trade."—*Parker*, *China*, pp. 70–1.

"There is no doubt that Marco Polo's Zaitun was to all intents one of the places immediately north or south of Amoy, and it almost certainly included, in a trader's sense, both Chang-chou and Ts'üan-chou. These are still the great emigration and trade ports for the southern ocean, and both of them lie near the European 'open port' in Amoy Bay." Zaitun "almost certainly stands for the coast town of Haitêng, which, though not made an official 'city' until 1564, must have long borne that name; just as Shanghai was not made an official city till 1291, Kan-p'u not until the Ming dynasty, and Hankow not until 1899."—*Ibid.* p. 71.

"Almost every single one of these [35] names [Ciampa, Java, Lochae, etc. (see pp. 71–2)] is mentioned either in the Chinese history of Kublai's relations with the Indian Ocean, or in the Ming history of the eunuch's voyages to the West two centuries later. Where the names are not specifically mentioned by the Chinese, it is generally because they had apparently changed, or for other sufficient reasons; in most cases discrepancies are satisfactorily explained."—*Ibid.* pp. 71–2.

Means of conveyance.—"Whilst foreign vessels were conveying cotton to the ports of Kwang-tung and Fo-kien, beasts of burden were carrying it in equal quantities over the western provinces of China to Shansi and Shensi."—*Gray*, *China*, ii. 142.

[Junks as well as foreign ships are frequently mentioned.]—*Ch. Rev.*, xvii. 51.

[For the "measure-mile-drum chariot" (so-called taxi-cab) see *Giles*, *Adv. Sin.*, No. 7, and *cf. supra* and KNOWLEDGE.]

[The imperfect state of communication in the interior is indicated by the inability of the rural proprietors to pay taxes in coin.]—*Journ. Asiat.*, Ser. III. vi. 307–8.

Mongol Period (1280 *to* 1368).—*Table VII.*

"Sir Henry Yule (*Cathay*, ii. 288) understands Pegolotti's account of his merchant's itinerary as bringing him down the great canal to Hang-chow, and thence back to Peking; but the expressions used do not seem naturally to indicate such a journey, and, in fact, it seems as if the line of overland traffic had led normally to Mongolia, Peking, and the districts north of the Yellow River, while maritime trade had stopped short in Southern China. Pegolotti speaks of the capital city (Cambalec) as the resort of merchants, in which there is a vast amount of trade; and the absence of any special description of the greatest sea port then known seems to indicate Peking as the real goal of the journey. It is difficult to see what a European traveller had to gain by going from one end of China to another, in the interval between selling the goods he brought and buying those he meant to take away, both of which it was his interest to do in the market nearest to the frontier, Si-ngan-fu for instance. To go to Hang-chow *viâ* Central Asia and Peking would be as expensive as to go to Peking *viâ* the Indian Ocean and the sandy mouth of the Hoang-ho."—*Simcox*, ii. 234.

"The Mongol generals of the thirteenth century, who generally used the northernmost road, past Issyk Kul, as being in a most suitable climate for their men and beasts, never travelled by any of the more southerly roads, except on one or two occasions over parts of those traversed by Fahhien and Hüan-Chwang. The reason is plain: there was no pasture for the animals, and no sufficient space for their huge wagons."—*Parker*, *China*, p. 63.

"It was in Southern China that the chief interruption of foreign traffic took place towards the close of the Sung Dynasty, but it was regularly restored in 1292."—*Simcox*, ii. 234.

[Marco Polo says that Chinese ships carried "cloths of silk and gold and sendals" to Malabar.]—*Yule*, *Marco Polo*, ii. 325 (1st ed.).

From the Annals of Kuangtung it seems that "foreign trade was interdicted by the Emperor *Chih Ta* in 1312, and the edict rescinded in 1314 by *Yen Yu*, also of the Yuan dynasty, who opened the three ports of Chüan Chaw (Chin Chew), Canton, and Ch'ing Yuan to foreign commerce."—*Ch. Rev.*, xii. 513.

"In 1323 a Chinese minister denounced the trade in precious stones, which dealers were compelled to purchase from the court at ten times their real value, and the pearl fishery at Canton, to which many lives were sacrificed every year."—*Simcox*, ii. 230.

[For the journeys of John of Plano Carpini (1245–7), Rubruquis (1254), Friar Odoric (1286–1331), the Arab traveller Ibn Batuta (1339–47), and the trade routes described therein see *Parker*, *China*, pp. 72–4. From 1336–71 various missions indicated intercourse with Western countries (*ibid.* p. 74).]

"Commercial intercourse at this time between Italy and China was sufficiently frequent for Odoric to feel assured that his traveller's tales would be confirmed in Venice by many who knew from personal experience of their truth. The overland traffic was not less important than that by sea, and Florentine, Venetian, and Genoese traders were to be met with upon both routes. An employee of the great Florentine house of Bardi, Pegolotti by name, compiled about this time (1340) a practical commercial guide and vocabulary (*Cathay*, ii. 279 ff.), in which, along with other interesting and instructive matter, he describes the journey for 'such as will go from Azov to Cathay, and come back with goods,' and the comparative advantages of land and water carriage: where are the best markets, and what goods it is most profitable to lay in here or there in relation to the cost of transit. At Azov the Genoese and Venetians were the 'most favoured nations,' and paid only 4 per cent. duty on wine and hides, while other traders paid 5 per cent."—*Simcox*, ii. 233.

"Pegolotti gives in detail the payments exacted from traders between the gulf of Iskenderan and Tabriz for caravanserais, and baths, guards, watchmen, duties and licences, and he advises the merchant to give presents to the custom-house officials and their servants, in consequence of which they will undervalue the goods. The road from Tana (Azov) to Cathay is described as perfectly safe, but the lord of the land inherits the property of travellers who die within his borders, unless they have a natural heir in the same company. The first part of the road is the most dangerous, but no serious disturbances are anticipated: for the traveller is informed that, though he need not do so unless he likes, he may if he pleases, take a woman of the country with him, and will find his comfort increased by so doing. With a party of sixty 'you will go as safely as if you were in your own house.' The cost of the journey for a merchant with interpreter, servants, pack animals, and goods to the value of 25,000 gold florins, is estimated at 300 to 400 florins; the cost of the journey depends on the number of pack animals employed, but these will average about forty-five florins each." Silk was expected to form the chief article of traffic.—*Ibid.* ii. 233.

"The activity of the postal department in Kubla's day may be estimated from the circumstance, parenthically recorded by Marco, that a gravelled bridle road had to be kept for the couriers by the side of the paved highways, which in the low-lying parts of Southern China were necessary to avoid mud and bog."—*Ibid.* ii. 222.

"The accounts given by Marco Polo of this same ocean trade [between China and Sumatra: *cf.* SUNG PER.] as it existed when he visited the South Seas [circ. 1292] were at first received in Europe with incredulity, but almost every place named by him, whether it be in Africa, Arabia, India, Sumatra, or Java, can be identified with trade marts mentioned either in Mongol history or in the above-cited work [*Upon Foreigners*] of the Sung dynasty, or else in the history of the Ming dynasty. . . . The late Colonel Yule has treated this subject so exhaustively in his immortal work on Ser Marco Polo that it is quite superfluous to cite further evidence, unless it be to demonstrate the accuracy or inaccuracy of insignificant points in detail. Full accounts have also been published, by various gentlemen competent to examine the Chinese originals, of the voyages of Chêng Ho and other Chinese eunuchs, despatched early in the fifteenth century by the emperors reigning at Nanking and Peking upon various diplomatic and commercial missions to most of the countries in the Indian Ocean between the Red Sea, the Persian Gulf, and Singapore."—*Parker*, *China*, p. 55.

[Chinese rhubarb, produced in Shansi, Shensi, Honan and Ssŭch'uan, was till recently "almost all exported by Kiakhta and Russia. Ginger from Southern Shensi was carried all over the region of Cathay"; as also cinnamon and cloves (or cassia-buds).]—*Yule*, *Marco Polo*, ii. 19, 35; i. 197, note.

[Musk was a great article of trade in Sinju (Si-Ning-fu in W. Kansu, where the musk-deer was abundant.]—*Ibid.* i. 242.

[The grain tribute junks used to go by sea from Liu Chia Ho, near Shanghai, to Tientsin, reaching it in a fortnight.]—*Ch. Rev.*, xvii. 115.

[The opening of the Grand Canal enabled the rice supply from the provinces to reach the capital with expedition and safety.]—*Simcox*, ii. 224.

Means of Conveyance.—[Odoric describes the roads and post-houses, at intervals of 25 to 45 miles, where relays of horses were kept for the use of government messengers. There were also foot-runners, who stayed at small forts, at intervals of 3 miles, and hand on their despatches to other runners at the end of each lap, great distances being thus quickly covered.]—*Simcox*, ii. 232. See also *Yule*, *Marco Polo*, i. 419–24 (2nd ed.); *Cathay*, i. 137–8.

Yesun Timur (Tai Ting Ti: 1324–28) "forbade Central Asian priests to use the courier-horses, a practice which had caused much injury to the administration and hardship to the people."—*Giles*, *Bio. Dic.*, p. 943.

Marco Polo says that he once saw, at "Sinju" (I-chin-hien on the Yang-tsze) 15,000 vessels at one time. He was also told by Kublai Khan's collector of customs, "that there passed up stream 200,000 vessels in the year."—*Yule*, *Marco Polo*, ii. 133 (1st ed.).

"The vessels which ply on this river [the Yang-tsze] are decked [some with water-tight compartments]. They have but one mast, but they are of great burthen, for . . . they carry (reckoning by our weight) from 4,000 up to 12,000 cantars each."—*Ibid.* ii. 133 (1st ed.). 12,000 cantars = over 500 tons.

"Public carriages, long covered vehicles, fitted with curtains, were used for driving about in. The use of them is said to have been less than in former times owing to the neglect of the roads."—*Ibid.* ii. 206, 211, note (3rd ed.).

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

Pinto "recognises as one chief cause of the great wealth and commerce of China, the multiplicity of rivers and artificial waterways, to the construction of which ancient kings, great lords, and the people themselves, have in all time contributed, so as to render the whole country navigable, and enable all parts to communicate and exchange the produce of their labour."—*Simcox*, ii. 263.

"This enterprise of leading in this river [the Yun ho into the Grand Canal] seems to have been the work of Sung Li, who lived under Hungwu, the first Emperor of the Ming dynasty, about 1375. In his time a part of the canal in Shantung became so impassable that the coasting passage by sea began to be most used. This was the very thing the canal had been intended to prevent."—*Davis*, *Sketches*, i. 245. Sung accordingly concentrated the waters of the Yun ho and neighbouring streams to feed the canal as at the present day.

The Hui T'ung Ho "was opened by the Ming dynasty, and the rice conveyed thence by the inner routes."—*Ch. Rev.*, xvii. 115.

Hung Wu "simplified the transit of salt, that essential article of life, to provinces where its production was scanty."—*Boulger*, *Short Hist.*, p. 85.

"In the early decades of the Ming Dynasty" foreign trade at Canton "was tolerated, though strictly regulated."—*Simcox*, ii. 234.

"At the beginning of the 15th century 120 houses were built for foreigners, but 'ships bringing tribute' were required to land their goods and wait till harvest was over before attempting to dispose of them."—*Ibid.* ii. 234.

"There was no material change in the attitude of the Chinese Government towards such foreign traders as reached the empire, during the period of comparative isolation. The freedom of trade, enjoyed by Arabs and Italians under the Tang and Sung Dynasties, was not refused by China; it was only not claimed, on account of obstacles quite outside the reach of her influence. The commercial colonies of Mahomedans and Jews already settled in China were practically cut off from their countrymen and co-religionists, and were regarded as naturalized Chinese."—*Ibid.* ii. 260–1.

"The first Portuguese comers in 1517 were kindly received, though expelled soon after for good reasons. Occupying Macao, their commerce was developed through the seventeenth century, till they succumbed to Spain."—*Johnson, Or. Rel.—Ch.*, pp. 127–8.

"In 1409 three horse-fairs were established on the frontiers; but everything except tea and horses were treated as contraband. Peculation followed as a natural consequence from the attempt to keep the trade in the hands of officials."—*Simcox*, ii. 240.

On the accession of the Ming dynasty the Nutche Tatars, representatives of the old Liao dynasty, "were almost crushed for harbouring the banished Mongols, but they had since thriven by the trade in ginseng, horsehair, and furs."—*Ibid.* ii. 248.

"The embassy sent to the court of China in 1419 by Shah Rukh, the son of Timour, who was meditating the reconquest of China when he died, may have had a genuine political purpose, but the border Tatar tribes were certainly innocent of any desire except that of finding an advantageous market for their wares. A writer quoted by M. Rémusat (*Hist. de la ville de Khotan*, p. 104) observes, under head of the year 1424, 'All the barbarians are very curious about the stuffs and merchandise of China, so that the markets were constantly filled with merchants who came to make exchanges under pretext of bringing tribute.' The writer goes on to explain that it was attempted to repress this disorder; but the so-called tribute-bearers, who received free quarters and maintenance, always contrived to leave stragglers behind them to dispose of their unsold goods."—*Ibid.* ii. 241.

"The Castilian envoy, Clavijo, who was then at Samarcand, has left it on record that a caravan of 800 camels, laden with silk, musk, rhubarb, and gems, came from 'Cambalu in Cathay' in 1404. The son of Tamerlane sent numerous missions to China, as recorded in the Ming annals, and amongst the many return Chinese envoys there was one who visited Hami, Turfan, Sairam, Otrar, Tashkend, Samarcand, Kesch, Bokhara, Herat, Termed, and Badakshan."—*Parker, China*, pp. 74–5.

"A Persian trader in a work cited by Dr. Bretschneider upon *Tchin* or *Khata* trading, and dated about 1500, mentions a mission to China sent by Tamerlane's grandson about the year 1449, but the Turkish translation of this Persian work does not enable us to identify the names of places along his route. The Ming history says that missions came from Samarcand in 1430, 1437, 1445, 1446 and 1449."—*Ibid.* p. 75.

[For the trade routes followed by the Ming eunuchs see *ibid.* pp. 75–6.]

"In Ceylon, we read in the records bearing on the traffic at Chêng Ho's time, green porcelain was an article of import together with musk, silk, copper cash and camphor. Aden and the Red Sea were visited in the same period." During the reign of Hsüan Tê Chinese vessels took musk, porcelain, and silk piece goods to the ports of Arabia, and returned with "cargoes consisting of all sorts of precious stones, giraffes, lions, ostriches and the like."—*Hirth, Anc. Porc.*, pp. 63–4.

The "tendency to extend the native navigation has certainly never been greater than it was under the ambitious Ming Emperor Yung-lo, whose celebrated delegate, the eunuch Chêng Ho, successfully carried Chinese arms as far as Ceylon. The expeditions of his successor Hsüan-tê (A.D. 1426 to 1436) were of a more peaceful character, though not less enterprising as regards distance. 'In the 6th month of the year 1430,' we read in the *Ming-shih* (extract translated by *Groeneveldt, Mal. Archip.*, p. 44), 'the Emperor considered that he had been on the throne so long now, but that those of the barbarians, who lived a little far away, had not yet appeared at court and brought tribute; upon this Chêng Ho and Wang Ching-hung again got orders to go to Hormus and sixteen other countries. From this voyage they came back safely.'" "This great expedition, which it appears from all we know about it bore an entirely peaceful, if not commercial, character, brought Chinese junks to several of the ports of India, the south coast of Arabia, and even as far as Djiddah on the eastern coast of the Red Sea, the sea-port of Mecca. The trip to Djiddah (Mecca, *T'ien-fang*) was made in company with a fleet of Indian ships starting just at that time for the Red Sea."—*Ibid.* pp. 61–2.

"To what extent commercial enterprise was rife among the Chinese in those days may be gathered from the fact that 'a number of Chinese emigrants had settled down in Ispahan (*Yi-ssŭ-pa-han*), where they established shops, the goods they sold being drawn by way of Samarkand (*Sa-ma-êrh-han*).' The fact is mentioned in connection with a tribute mission from Ispahan having arrived in China under Yung-lo (A.D. 1403–25)." See *Yüan-chien-lei-han*, *c.* 337, p. 25. *Ibid.* pp. 62–3, note.

"The episode [the temporary closing of the Chinese frontier in the Hami region in 1488] has its importance; it is the second link, if the difficulties with the Tartar horse-fairs are reckoned as the first, in the chain of causes which led in the 16th cent. to the full development of that policy of exclusiveness, which we have learnt to regard as characteristically Chinese."—*Simcox*, ii. 245.

In 1517 St. John's Island (Shang-ch'uan, S.W. of Macao) was "the entrepôt of trade between Canton and Malacca." During the ensuing hostilities between China and Portugal, trade was "temporarily transferred to the coast town of Tien-peh (Tin-pák, west of St. John's), but now (1534–7) the Portuguese were allowed by some official who had been judiciously bribed to occupy Macao as a commercial depôt; and from that day to this they have never been ousted from it."—*Parker, China*, pp. 82–4.

"For some years after this the severest possible restrictions were placed upon Chinese leaving their country for purposes of trade, but in 1567 the Governor of Fuh Kien obtained their removal; in any case trade at Macao went on without a break. . . ." The "trade was limited to twenty-five ships a year. In 1667 a mission was sent from Goa to complain about obstructions to trade. . . . The trade of the place has now [1901] dwindled into insignificance."—*Ibid.* pp. 84–5.

"A trade also sprang up [1522] between the two peoples [Chinese and Japanese] who share in an equal degree the commercial instinct, but as the Chinese Government only admitted Japanese goods when brought by the ambassador, who was sent every ten years from Japan, this trade could only be carried on by smuggling. A regular system was adopted to secure the greatest success and profit. The Japanese landed their goods on some island off the coast, whence the Chinese removed them at a safe and convenient moment to the mainland. The average value of the cargo of one of the small junks which carried on this trade is said to have been four thousand pounds of our money, so that it may be inferred that the profits were considerable."—*Boulger, Short Hist.*, pp. 95–6.

"They do sell none of their silk there by the yard, neither any other kind of websterie, though it be linen; but by the weight, wherein there is least deceit."—*Mendoza*, i. 15.

"In their buying and selling they are very subtle, in such sort that they will [divide] a hair. Such merchants as do keep shops (of whom in every city there is a great number) they have a table or sign hanging at their door, whereon is written all such merchandise as is within to be sold. That which is commonly sold in their shops is cloth of gold and silver, cloth of tissue, silks of divers sorts and excellent colours; others there be of poorer sort that selleth serges, pieces of cotton, linen and fustian of all colours; yet both . . . very good cheap, for that there is great abundance and many workmen that do make it. The apothecary that selleth simples hath the like table; there be also shops full of earthen vessels of divers making, red, green, yellow, and gilt; it is so good cheap that for four rials of plate they give fifty pieces."—*Ibid.* i. 32–3.

"In 1559 complaints are made of the inroads of Japanese pirates. In 1403 Japan had paid tribute to Yung-lo, but this soon ceased, and in the interval there had been little intercourse, friendly or otherwise, between the two nations. Friendly powers not calling themselves tributary were only allowed to send embassies once in ten years, and such a privilege naturally soon fell into disuse. But while Tatar and European traders were trying to force their way uninvited and unwelcome into the markets of China, native trade had made an outlet for itself in this not less dangerous direction. And the greed and bad faith of the traders was considered to have provoked the attacks subsequently made by the Japanese on the coasts of the empire."—*Simcox*, ii. 247.

The horse fairs, forbidden in 1547, but permitted at intervals after 1551, "were abolished as giving a pretext for Tatar inroads. The Chronicles of the time are very meagre, and . . . their scantiness only makes the prominence given to this Tatar market-question the more significant." In 1571, Yenta's request to be allowed to pay tribute and bring horses for sale was agreed to.—*Ibid.* ii. 246–8.

"In the sixteenth century the Portuguese found Arab merchants quietly settled in the chief cities of China, in full freedom of traffic."—*Johnson, Or. Rel.—Ch.*, p. 126.

Gaspar da Cruz "speaks of all the foreign traffic in Canton, putting together that of the Portuguese and all that came from Siam, as insignificant when compared with the local and national trade."—*Simcox*, ii. 263.

"In a few years it [Macao] became of so much importance that it was the annual resort of five or six hundred Portuguese merchants, and the Portuguese, by paying a yearly rent of 500 taels, secured the practical monopoly of the trade of the Canton river, which was then and long afterwards the only vent for the external trade of China. . . . Next after the Portuguese came the Spaniards, who, instead of establishing themselves on the mainland, made their headquarters in the group of the Philippine Islands, which they still hold. Chinese traders also visited that archipelago, and Chinese settlers formed the bulk of its prosperous colonists."—*Boulger, Short Hist.*, p. 100.

"In the year 1576 the Chinese, in their pursuit of certain Japanese and Chinese pirates who had been hovering about Formosa, came across some more Franks in Manila, where there had already been large settlements of Fuh Kien traders long before the Spaniards ever appeared in those seas. A Mexican priest who had lived there, writing in 1638, said their junks came from Ocho (Foochow), Chincheo (Ts'üan-chow), and Amoy, and always went back in ballast, carrying only silver. They paid a duty of 3 per cent. upon all imports, and there were no exports; the group was nominally annexed in 1565. In 1575 two Spanish Augustines had visited Foochow and Canton on a political mission from Manila. The Chinese may well be excused for having confused the Portuguese with the Spaniards during the negotiations which took place at Manila relative to the treatment of Fuh Kien merchants there, for in 1580 Philip II. annexed Portugal, which remained for over half a century one realm with Spain." The Chinese have always used, and still use, the old native name of Luzon for Manila. After the massacre of Chinese there in 1603, "junks and traders soon began to arrive again, as if nothing had happened," but a limit upon their numbers and a poll-tax of eight dollars were imposed.—*Parker, China*, pp. 85–6.

[In the reign of Mu Tsung (1567–72) the grain-transport route was reopened.]—*Giles, Bio. Dic.*, p. 187.

"Just after the Chinese and Japanese pirates had been driven out of Kilung (whence the latter fled to Borneo), some Chinese fishing boats drifted to Formosa, and then traders began to settle there. The Dutch were not long in discovering this promising commerce. In 1603–4 they succeeded, with the connivance of certain Chinese traders, in effecting a landing in the Pescadores, whence they were ejected in 1624." Ten years later they founded settlements in Taiwan (South Formosa), but were ultimately driven out in 1662 by Koxinga.—*Parker, China*, pp. 87–8.

[In 1637 five English ships are stated to have arrived at Canton from Sumatra, and opened hostilities, owing to the Portuguese having influenced the local authorities to obstruct English trade; but "they surrendered the fort they had taken on being allowed to dispose of their cargoes."]—*Ibid.* p. 90.

"Neither the English nor the Dutch had any success in their attempts to open an overland route."—*Simcox*, ii. 272.

"The Russians or Cossacks pushed on to Lake Baikal, and received in 1638 their first tea through the agency of . . . Altyn Khan (p. 126)."—*Parker, China*, p. 127.

"Even the pagodas help to promote traffic, for fairs and markets are free on religious festivals; and the temples, erected on the river banks to profit by the consequent concourse, enable the people to do their business and their devotion under one."—*Simcox*, ii. 263.

[Horse, tea, and wood markets are mentioned in *Wên hsien t'ung k'ao hsiang chieh*, *c.* 6, *Shih ti k'ao*, pp. 4*b*, 5*b*.]

Means of Conveyance.—"It is a curious question . . . how far the Tatar clamour for official horse-markets was due to a falling off in the natural Chinese demand for them for use, or how far the use of horses was deliberately discouraged because the trade in them brought their aggressive breeders within the frontier. Other causes may have co-operated. Semedo remarks upon the substitution of litters for carriages about 1546—the time when the latter came into use in Spain and Italy; and the Jesuits tell us that the palanquin was thought more dignified than the saddle. . . . The horse had never been generally used for agriculture, and the abuses connected with the official studs may have tended to discredit their use by private persons. But all these causes together seem scarcely sufficient to account for so considerable a change of old and widespread custom, as is involved in the disuse of wheeled carriages for pleasure and ceremony in a country with high roads." "The fact seems to me that the horse was never really naturalized in China . . . it grew more and more difficult to keep them alive. They died fast and did not breed, so that the numbers required for use had to be kept up by importation from Tatary, Corea, and other less closely cultivated lands."—*Simcox*, ii. 257–8.

"For some time . . . the horse trade with Tatary was not conducted on a purely commercial footing; while nominally paying tribute in horses, the Tatars were virtually receiving it in tea and silk; and while utilizing the horse fairs to obtain a footing in China, they had not the smallest desire to keep the empire efficiently supplied with the animals they claimed the right to sell. It was said that when the Yuen had to retreat before the founder of the Ming Dynasty, they actually had not horses enough for use in their flight; and if this was the case with the Mongols, who had made the care of their steeds an oppression to the people, much more would the number naturally decline under a pacific native dynasty."—*Simcox*, ii. 258. The decline, however, is attributed in the *Wên hsien t'ung kao hsiang chieh*, *c.* 6, *Shih ti k'ao*, p. 4*a*, to the change in the monetary system.

"Whether expedient or not, the change [disuse of horses] was almost a matter of necessity: the present enormous population of China could not be maintained at all, to say nothing of maintained at its present standard of modest comfort, were it not for the extreme economy in the use of the national foodstuffs, rendered possible by the scarcity of large graminivorous live-stock."—*Simcox*, ii. 259.

"The disuse of horses and wheeled carriages in the 16th century, which has generally been attributed to the increase of population and the neglect of the roads, may have begun with a reaction" against the oppression of the Emperor's horses being maintained at the public expense.—*Ibid.* ii. 222.

[The stage-houses, boats, beasts, etc., employed in distribution are referred to in *Ferguson, Lett. fr. Port. Capt.*, p. 127, and the beacon-towers in *Yule, Cathay*, i. 138–9, note. See also *Simcox*, ii. 222.]

"No one sails the sea from north to south; it is prohibited by the king, in order that the country may not become known."—*Ibid.* p. 119. See also *Mendoza*, Bk. III, vii, 92–6 (Hakluyt Soc. Ed.).

"Some cities there be, whose streets be navigable . . . as Venice in Italy; which is the occasion that they are better served and provided, for that their barks and boats do enter laden with all kinds of victuals hard to their doors."—*Mendoza*, i. 27.

"The highways throughout all this kingdom are the best and gallantest paved that hath been discovered; they are very plain, yea unto the mountains, and they are cut by force of labour and pickaxes, and maintained with brick and stone, the which by report of them which hath seen it, is one of the worthiest things that is in all the realm. There are many mighty bridges, and of a wonderful making, and some wrought upon boats . . . but in special upon such rivers as are broad and deep."—*Ibid.* i. 27.

"[The Chinese] have amongst them many coaches and waggons that go with sails."—*Ibid.* i. 34.

"The regular official chair (*ta tsiang*) which must be regarded as the pattern from which daring civilians took their designs for the spring mountain chair, as well as the venetianed ladies chair was certainly in full swing early during the Ming dynasty. We read in the *T'u-shu-chi-ch'eng*, however, that high officials did *not* ride in sedans under Hung Wu and Yung Lo (A.D. 1368–1425): this custom was not adopted until the time of Hsuan-te (A.D. 1426–1436) when the chair was forbidden to the people: only mandarins of the third grade and above were allowed to use it. Lower officials had to ride on horse-back, as the very lowest grades do at the present day."—*Ch. Rev.*, xix. 58.

[Boats were used to carry Tung Yüan vegetables to Lin P'ing and Ch'ang An.]—*Tung ch'êng tsa chi*, *chüan hsia*, p. 35*b*.

[Complainants obtained access to officials to communicate their cases by beating a drum placed at the Yamên gate.]—*T'ung tien ch'i yao*, *c.* 20, *Hsing*, p. 11*b*.

Manchu Period (1644 *to* —).—*Table IX.*

Home Trade.—"Fairs and markets appear to exist all over China, and in the . . . gazetteers of the various prefectures, lists with the names of the places and dates at which they are held will be found. They appear to have taken their origin by accident and to have been established by authority when attaining sufficient importance to attract attention. The country people coming into the market towns would in time come in such numbers that . . . the regulation of the assemblage [became necessary]; a few notables would address a petition to the district magistrate, a proclamation would be issued, and from that moment the chance resort of a few villages would become an acknowledged market or *shih*. The *hsü*, or fairs, owe their origin more to previous consideration; the want of a market place for the interchange of commodities being felt, the notables would in consultation fix on a convenient site, and building a market hall would apply to the District Magistrate to hold a market there on certain fixed days, and obtain the right to do so by the usual and inevitable proclamation rendered necessary by the prohibition by law of all unauthorized assemblages." "Besides these regular markets, annual or six-monthly fairs either general or special are common in all parts of the empire, more especially in the North, the dates at which they are held being generally that of some great religious festival."—*N. and Q. on C. and J.*, iii. 109–10.

"As a rule . . . all Chinese towns and villages where fairs are held—and especially those of Kwang-tung—are provided with excellent accommodation for dealers in agricultural and other produce, and their markets are almost invariably covered with tiled roofs supported by lofty pillars of brick. In this respect, the towns and villages of China are in advance of the majority of those of Great Britain. . . . The live stock which changed owners, consisted of buffaloes, cows, pigs, goats, ducks, geese, fowls, dogs, and cats: in addition to which large quantities of grain, vegetables, and seeds of every description, as well as agricultural implements, were exposed for sale." Large horse fairs were held at Lama-miao and Peking.—*Gray, China*, ii. 190–1.

At each of the 25 principal silk-towns in Kuangtung "there is a market at which silk is sold in its raw state. These

markets are covered . . . and inclosed with high walls. They are divided into compartments, like the stalls in a stable."—*Ibid.* ii. 229.

"On visiting Tang-yang, Hang-chow, Hoo-chow and Soo-chow, I observed that the looms in which the fabrics were made were arranged on one side of the shop, while on the other stood the counter at which the fabrics were sold."—*Ibid.* ii. 229.

[De Courcy gives the following as the principal centres of home trade: *In the North*: (Chihli) Peking, Tien-tsin, Tung-chow, Pao-ting. (Shantung) Tsi-li, Lin-tsing. (Shansi) Tai-yuen; (Honan) Kai-fung. (Shensi) Si-ngan, Hang-chung. (Kansuh and Barkul) Si-ning, Ning-hia, Kiao-kwan, Hami. (Manchuria) Kin-chow, Pétuné, Tsitsihar. (Mongolia) Mai-matsin, Uliasutai. (Koko-nor) Si-ning. (Ili) Hwi-yuen, Kuche, Oksu, Kashgar, Yarkand, Khoten. *Centre*: (Kiangsu) Nan-king, Soo-chow, Chin-kiang, Shanghai. (Nganhwui) Vow-hou (? Wu-hu). (Kiangsi) Nan-chang, Kan-chow, Nan-ngan, Yao-chiu. (Chekiang) Hangchow, Ningpo, Chao-king, Cha-pu. (Fuh-kien) Foo-chow, Tsiuen-chow, Chang-chow. (Hupeh) Hon-keou (Hankow). (Hunan) Yo-chow, Chang-cha. (Sze-chuen) Ching-tu. *South*: (Kwang-tung) Canton, Shao-king, Nan-kiung, Chao-chow. (Kwangsi) Wu-chow. (Yunnan) Yun-nan.]—*l'Emp. du Mil.*, p. 471.

"The chief native trade of Foochow is in timber; huge rafts are brought down and guided under the bridge with surprising cleverness, by very few hands for such cumbersome contrivances." "The timber junks go to sea from Foochow with wood lashed on each side and piled up, making the vessel look three times as broad in the beam as she really is. Some of the timber brought down to Foochow is very finely scented, [exuding] a rich, gummy oil. . . . The Chinese set great value on this wood [seemingly a kind of pine], which they use for coffins, giving as much as a thousand dollars for a single coffin."—*Scarth, Twelve Years*, p. 43.

"Nearly the entire maritime commerce of China is in the hands of the Ch'iu Chew men."—*Martin, China*, i. 33.

"Its [Chinkiang's] position renders it the key of the country, in respect to the transport of produce, taxes and provisions for Peking, inasmuch as when the river and canal are both blockaded, the supplies for the north and south are to a great extent intercepted."—*Williams, Midd. King.*, i. 104.

"The native trade [of Shanghai] has gradually passed from the unwieldy and unsafe junks which used to throng the Hwang-pu east of the city, into steamers and foreign craft, and is now confined, so far as the vessels are concerned, to the inland and coast traffic in coarse, cheap articles."—*Ibid.* i. 107.

At Kiukiang "there is a large native trade in porcelain from the Kiang Si potteries, but not much of it is exported to foreign countries."—*Parker, China*, p. 150.

"Kingteh chin stands on the river Chang in a plain flanked by high mountains, about forty miles north-east from Jau-chau through which its ware is distributed over the Empire."—*Williams, Midd. King.*, i. 113.

"The favorable situation of Wuchang, the provincial capital [of Hupeh] has drawn to it most of the trade, which has caused in the course of years the settlement of Hanyang and Hankow on the northern bank of the Yangtsz' and River Han. The number of vessels gathered here in former years from the other cities on these two streams was enormous, and gave rise to exaggerated ideas of the value of the trade. The introduction of steamers has destroyed much of this native commerce."—*Ibid.* i. 143.

"In the long years of its early and peaceful trade up to 1850, this region [around Wuchang and Hankow] had gathered probably more people on a given area than could be found elsewhere in the world."—*Ibid.* i. 144.

The position of Si-ngan, the capital of Shensi "has always assured for it the control of trade between the central and western provinces and Central Asia."—*Ibid.* i. 150.

"Water communication exists between Hangchau and Yüyau, south-east through Shauhing, and thence to Ningpo, by means of which goods find their way to and from the capital. A good road also runs between the two former cities."—*Ibid.* i. 119.

"It is a mistake to suppose there is no organized book-trade. . . . There is now lying on our tables a very comprehensive list of new editions of standard works lately published at a large book-shop in Wu-chang Fu, with the price of each work attached; and Mr. Wylie, in his 'Notes on Chinese Literature,' devotes five entire pages to the enumeration of . . . catalogues of ancient and modern works."—*Giles, Ch. Sketches*, p. 26.

Foreign Trade.—"Trade with the East India Company nominally began in 1680, and all privileges continued until 1783, when there were certain modifications. In 1834 exclusive rights entirely ceased. . . . The merchants [at Canton] passed a confined, ceremonious, and reserved existence, entirely in the hands of their *fiadors* and *compradores* on the one hand, and of the Chinese co-hong on the other. . . . British trade was . . . the largest of all; lead (for packing tea) and woollens were the chief imports (no specie, no cotton fabrics) from England, opium from India, and the usual 'Straits' produce picked up from the Dutch colonies visited by our ships *en route*. Tea and silk were the main exports then as now. The British tea consumption in 1795 was 14,000,000 lbs. a year, more than one half of which total was smuggled by foreign ships from Canton, operating in the English Channel."—*Parker, China*, pp. 130–1.

"In Koxinga's time the English are believed to have had dealings at Amoy; this is not unlikely, for they were certainly there in 1730, when their trade was stopped; at all events, the East India Company established, and for a few years kept up a factory at the Chusan Islands near Ningpo somewhere towards the end of the seventeenth century. It is certain that already . . . in 1684 a foothold had been obtained at Canton; indeed the Chinese state that in 1685 foreign commerce had been officially authorised at Macao, Chang-chou (Zaitun), Ningpo, and some place near Shanghai. There were several other attempts made during the eighteenth century to trade at Ningpo and Tientsin; but practically all legitimate foreign commerce, English and otherwise, was confined to Canton until the first war with England broke out in 1840, in consequence of a misunderstanding in connection with the opium trade, and about the price to be paid for opium surrendered by us. Up to the year 1765 the import of opium, which was at first regarded in the light of a medicinal drug, had never exceeded 200 chests; but in 1796 it was entirely prohibited, on account of the rapidly increasing number of smokers. . . . By 1820 the import of opium had steadily risen to 4,000 chests, and the Chinese Government began to feel justly alarmed, both at the enormous drain of silver from the country, and at the prospect of debauching the population. In 1821 the opium hulks were driven away to the Ling-ting Islands, and in 1838 severely repressive measures were begun."—*Ibid.* pp. 90–1.

"After their expulsion from Formosa the Dutch are not so much heard of in the China seas as other European nations."—*Ibid.* p. 88.

"Chinese traders . . . managed to thrive under the strict and discriminating rule of the Hollanders. And so things went on, their Canton factory . . . in full swing, until the Dutch treaty of 1863 was concluded. . . . But even after this the Dutch held aloof, and probably they would never have sent a Minister to Peking at all, had they not desired to obtain a liberal supply of coolies for Sumatra."—*Ibid.* pp. 88–9.

"In 1689 a caravan trade was opened by them [the Russians] to the capital. . . . Down to the close of the eighteenth century, boundary disputes have interfered with the natural relations of trade between these two great empires."—*Johnson, Or. Rel.—Ch.*, p. 127.

From 1689 to 1855 "the Russians remained on very quiet and inoffensive terms with China, trading only at Kiachta [tea] and Tarbagatai."—*Parker, China*, p. 127.

"At this time also the question of the residence of Europeans and of the relations with them was complicated by the increasing activity of foreign traders at Canton and generally along the southern coasts of China. Kanghi was well disposed towards the French and other priests at Pekin, but he was not inclined to favour the European traders; and his view was strengthened by the priests declaring that they had nothing in common with the Dutch or the English, not even religion. Thus the very influence obtained by some Europeans at Pekin tended to retard the promotion of trade with China and the free intercourse of Europeans with that country." In 1718 K'ang Hsi "interdicted the export of rice to the Philippines and the despatch of any Chinese junk to those islands, thus breaking off all intercourse with the outside world."—*Boulger, Short Hist.*, p. 150.

"Ismaloff returned to his master with the most roseate account of his reception and of the opening in China for Russian trade. A large and rich caravan was accordingly fitted out by Peter to proceed to Pekin; but when it arrived it found a very different state of affairs from what Ismaloff had pictured. Kanghi lay on his death-bed, the anti-foreign ministers were supreme, declaring that 'trade was a matter of little consequence, and regarded by them with contempt,' and the Russians were ignominiously sent back to Siberia with the final declaration that such intercourse as was unavoidable must be restricted to the frontier."—*Ibid.* p. 151.

[There was a certain amount of French trade at Canton in 1785.]—*Parker, China*, p. 100.

"The United States sent their pioneer trading ship to China in 1785; they were first introduced by the French into the mysteries of the co-hong or 'joint-stock' system at Canton; but in those days foreign traders were only allowed to reside there during the trading season. For some reason this rule was not enforced so strictly with the Americans."—*Ibid.* p. 104.

"America cannot complain of her relations with the Central Kingdom. Our earliest trade to her ports was in the fur of the sea-otter; opened by the discoveries of Captain Cook, it became at once one of the most lucrative fields of traffic then known. Owing to the failure of furs in Siberia, this peltry of the Pacific coast, and especially fox-skins, brought such incredible prices in Canton, that in 1792 there were twenty-one vessels, mostly Bostonian, trading on that coast for cargoes, to be exchanged in China for cottons and teas."—*Johnson, Or. Rel.—Ch.*, p. 128.

[According to Henchman, as early as 1799 and 1800, there was a flourishing import trade at Canton in cotton from India which nearly doubled after the abolition of the E. India Company's monopoly, but was languishing in 1847.]—*Ch. Repos.*, xvi. 134.

"From 1805 to 1809 the coast from Shantung to Tongking was infested with pirates, who fought pitched battles with the Imperial navy and almost stopped trade."—*Giles, Bio. Dic.*, p. 126.

"Up to the year 1834 trade with China had, by the Royal charter, remained the monopoly of the East India Company; but when the charter was renewed in that year for a further period of twenty years, it was shorn of the last of its commercial privileges, and an immediate change became perceptible in the situation at Canton, which was the principal seat of the foreign trade. The withdrawal of the monopoly was dictated solely by English, and not Chinese considerations. Far from facilitating trade with the Chinese, it tended to hinder and prevent its developing, for the Chinese officials had no objection to foreigners coming to Canton, and buying or selling articles of commerce, so long as they derived personal profit from the trade, and so long as the laws of the Empire were not disputed or violated. . . . Had the monopoly been renewed things would have been left in precisely the same position as when intercourse was first established, and trade might have continued within its old restricted limits. But the abolition of the monopoly and the opening of the trade created quite a new situation." In Lord Palmerston's instructions to Lord Napier it is stated that "In addition to the duty of protecting and fostering the trade at Canton, it will be one of your principal objects to ascertain whether it may not be practicable to extend that trade to other parts of the Chinese dominions." "Lord Napier's task was not less diplomatic than commercial," and he was in every way possible strongly opposed by the Chinese officials, who founded a grievance upon the fact that as much as "£20,000,000 sterling had been exported from China in the previous eleven years, and as the Chinese of course made no allowance for the equivalent value imported into their country, this total seemed in their eyes an incredibly large sum to be lost from the national treasure." Disputes respecting trade and other matters eventually culminated in the first war with England, which caused the opening of the ports of Canton, Shanghai, Ningpo, Amoy, and Foochow to foreign trade."—*Boulger, Short Hist.*, pp. 204–29.

"After the first war, which secured, besides, the cession of Hongkong to Great Britain, the chief points of international friction were usually found to be in connection with the contested claim of British traders to reside within the walls of Canton. In 1856 the Viceroy Yeh categorically refused to admit the English, on the pretext that Governor Bonham had formally abandoned the claim in 1849. These strained relations led gradually" to the second war and the opening of "a number of new coast ports (Newchwang, Tientsin, Chefoo, Swatow) to foreign trade, besides certain places on the River Yang-tsze (Hankow, Kewkiang, Chinkiang), two markets in the islands of Formosa (T'aiwan, Tamsui), and Hainan (Hoihow): this last, however, was not actually opened until 1876." . . . "Most of the other European powers hastened to secure to themselves by separate treaty the same commercial . . . advantages as those obtained by England and France."—*Parker, China*, pp. 92–3.

"The Treaty of Nanking (1842) opened four new ports, and abrogated all . . . restrictive rules about residence [enforced against the old Factories]. Then . . . by the Tientsin treaties nine, and by the Chefoo Convention again four, additional ports were thrown open to foreign trade."—*Ibid.* p. 131.

In 1851, shortly after the accession of Hsien Fêng, "the Chinese were attracted in large numbers by the discovery of gold in California and Australia to emigrate from China, and they showed themselves well capable by their trade organisation and close union of obtaining full justice for themselves and an ample recognition of all their rights in foreign countries."—*Boulger, Short Hist.*, p. 250.

"Within the last twelve years [from 1860], the export of China silk has increased enormously, and probably might be still augmented. It must be noted, however, that since the empire has been so much disturbed by civil war, much of the silk which would otherwise have been taken for native consumption, has been available for foreign export."—*Scarth, Twelve Years*, p. 13.

"The amount of silk goods exported has never regained its value previous to 1854, in consequence of the destruction of skilled workmen and manufactories during the Tai-ping rebellion, and raw silk still forms the bulk of the export. The finest silk comes from Chehkiang province, and is known as *tsatli*, *tay-saam*, and *yuenhwa* in commerce; the centre of the culture is at Hü-chau, a prefecture in the northwest of that province. The mulberry grows everywhere, and none of the provinces are without some silk, but Kwangtung, Sz'chuen, and Chehkiang furnish the best and most." "In 1854 the price of the best raw silk was about $330 a bale, and the export over fifty-one thousand bales; in 1860, the same sort was $550, and the export nearly eighty thousand bales; this increase in price was owing chiefly to disease in the trees in Europe, though the ravages of war in both Chehkiang and Kwangtung had destroyed much property in this branch."—*Williams, Midd. King.*, ii. 34–5.

"In 1860 free communication with Peking was conceded to Russia, together with a large portion of Manchuria."—*Johnson, Or. Rel.—Ch.*, p. 127.

Shanghai, "the most northern of the five ports opened to foreign commerce, is, perhaps, the most important of the whole five. I have undoubted authority for asserting, that the number of Chinese junks of more than 100 tons burthen, that enter this port weekly, exceeds a thousand. . . . Many British, American, and other merchants, have visited Shang-Hae since it became an open port; many cargoes of manufactures have been disposed of there; and already a considerable export trade on foreign account has commenced." A temporarily successful effort was made by the Canton merchants to prevent the northern trade leaving their port.—*Davidson, Trade and Travel*, pp. 277–8.

"In the year 1864 the British or direct trade had already reached 101,000,000 taels, and the total, including other countries and coast trade, was 260,000,000 taels: at that date the whole trade of Japan, America and other foreign countries only amounted in all to 10 per cent. of the British trade, including, of course, British colonies."—*Parker, China*, p. 131, where a table showing the silver value of Direct Foreign Trade in 1880 and 1899 at 19 and 32 ports respectively is given. In that period the foreign trade had nearly trebled itself.

[A treaty was concluded with Belgium in 1865.]—*Ibid.* p. 106.

[The first treaty with Japan was concluded in 1871.]—*Ibid.* p. 107.

[Trade was in a very depressed condition for some years after 1870, but this was due to the abnormal prosperity of European trade in general, which had stimulated over-production of tea and silk, whereas Shanghai was the only outlet for these goods, and became congested. Illegal taxes were levied upon foreign goods *in transitu*, in addition to the legal and recognized inland dues.]—*Balfour, Waifs and Strays*, pp. 88–97.

"The Danes had a 'hong' in the old factory days at Canton: they, the French, and the Swedes depended for their profits largely upon their success in smuggling tea about the English coast. They concluded a treaty in 1863. Their interests were chiefly in connection with the Telegraph Conventions."—*Parker, China*, p. 109.

"In 1876 Kiungchow, in the island of Hainan, was made a treaty port, or rather the fact of its having been included in the treaty of Tientsin was practically accepted and recognised. In the following year four new ports were added to the list. One, Pakhoi, was intended to increase trade intercourse with Southern China. Two of the three others, Ichang and Wuhu, were selected as being favourably situated for commerce on the Yangtse and its affluents, while Wenchow was chosen for the benefit of the trade on the coast. Mr. Colborne Baber, who had been a member of the Yuman commission, was despatched to Szchuen, to take up his residence at Chungking for the purpose of facilitating trade with that great province."—*Boulger, Short Hist.*, p. 339.

"The main staples of trade remain very much what they were before what may be called the Treaty-port period. But it must be noticed that an enormous business is now done in many new commodities of which scarcely anything was heard in 1880, still less in pre-legation times; for instance, a gigantic and ever-increasing importation of kerosene oil from America, Russia, and Sumatra, which in 1897 had already exceeded 100,000,000 gallons; and cheap flour for South China from America. These two imports alone have created as great a social revolution in China as did the advent of tea and the introduction of gas into England. Mules may be seen by the thousand in distant Bhamo carrying kerosene oil through the passes into Yün Nan; peasants may be met every evening in Arcadian Hainan carrying home a neat pound-bag of beautiful white flour. . . . An immense trade is done in old English horse-shoes, which are considered the best iron in the world for making small household articles, such as brackets, hooks, and bolts. I have seen steamer after steamer disgorge this paying and useful 'ballast' at Shanghai. Another revelation is the commercial capacity of the Bombay yarn. . . . The trade

in arms and ammunition has enormously expanded, chiefly in the hands of the Germans."—*Parker, China*, pp. 135–6.

"The importation of miscellaneous articles of luxury has of late years increased to such an extent as to vie in aggregate amount with the totals of regulation staples. Thus all Chinamen who can afford it now like to have tumblers and bottles, foreign stockings, soap, lamps, cigars, preserved milk, sweets, and umbrellas; not to mention watches, musical-boxes, and toys. The women are fond of American and European scents, good mirrors, fine white sugar for powdering the face, needles, and finger-rings. Then there is a curious though weighty import which is also an export. It actually pays better to export enormous quantities of coarse Chinese sugar to the foreign country of Hongkong, and re-import it thence, after refinement, as foreign sugar, paying one export, one import, and one half or coast duty, plus two freights, than to refine it in China where labour is cheapest, or to import real foreign sugar. No more eloquent comment on the suicidal and imbecile financial policy of the mandarins could be made."—*Ibid.* pp. 136–7.

"American flour is so far only wanted in South China, where there is no wheat to speak of."—*Ibid.* p. 144.

[For recent shiftings of trade see *ibid.* p. 137.]

"Amoy still carries on the old native 'Zaitun' trade with the 'Straits,' the Indo-Chinese peninsular, the Dutch and Spanish (now American) islands, and (now) Australia, to which places large numbers of emigrants proceed annually (when allowed)."—*Ibid.* p. 143.

[The principal articles of import were:—opium (points of entrance: Pakhoi, Hoihow, Canton, Swatow, Formosa, Amoy, Foochow, Wuhu, Wênchow, Chinkiang, Tientsin, Chefoo), cotton goods (Formosa, Amoy, Foochow, Wênchow, Ningpo, Chungking, Ichang, Wuhu, Chinkiang, Newchuang, Tientsin, Chefoo), Indian yarn (Pakhoi, Chungking, Chinkiang, Newchuang), Japanese yarn (Newchuang, Tientsin, Chefoo), kerosene (Hoihow, Amoy, Foochow, Ningpo, Chungking; by native junks from Hankow, Wuhu, Chinkiang, Tientsin), American flour (all ports south of Shanghai), rice (Swatow), beancake and beans (Amoy, Swatow), tin (Ningpo), musk (Chungking, Hankow), raw cotton (Chungking, Newchuang), silkpiece-goods, and American ginseng (Chungking), sugar, and native tobacco (Chinkiang), Russian seaweed (Newchuang), railway materials (Tientsin), native opium (Tientsin, from Ho Nan).]—*Ibid.* pp. 139–60.

[The principal articles of export were:—tea (points of exit: Amoy, Canton, Foochow, Ichang, Hankow, Kiukiang, Wênchow, Formosa, Chungking, to Tibet, Kalgan), silk (Canton, Chefoo, Chungking, Wuhu), sugar (Pakhoi, Hoihow, Canton, Swatow, Formosa, Amoy, Ningpo), hides, etc. (Tientsin, Hankow, Ichang, Hoihow, Pakhoi), tobacco (Swatow, Amoy, Canton, Hankow, Kiukiang, Chinkiang), camel's wool, coal, and groundnuts (Tientsin), straw-braid (Tientsin, Chefoo), beancake (Newchuang, Chefoo), wild silk (Newchuang), vermicelli (Chefoo), matting (Canton), native opium (Chungking, Hankow), pigs, eggs, and poultry (Hoihow), aniseed, cassia, and indigo (Pakhoi), camphor (Formosa), native stores (Amoy), poles, mushrooms, and edible bamboo shoots (Foochow), bitter oranges (Wenchow, for Mongolia), raw cotton (Ningpo), white wax, and drugs (Chungking), paper (Foochow, Kiukiang), mats (Kiukiang), rice, feathers, and wheat (Wuhu).]—*Ibid.* pp. 139–60.

"The manufacture of sulphur is . . . forbidden by treaty, though its exportation goes on in small quantities, the contractors taking on themselves all risk of seizure."—*Williams, Midd. King.*, i. 139–140.

"Corea . . . as a vassal state, was opened to foreign ships only in 1882."—*Parker, China*, p. 157.

"In 1670 the importation [of tea] into England was 79 pounds; in 1685 it was 12,070 pounds; most of it came from Batavia and sold for a long time between £10 and £5 a pound weight. In 1657 Mr. Garney opened a shop in London to sell the infusion. . . . In 1725 only 375,000 pounds were consumed in Great Britain. The actual quantity now [1883] in the United Kingdom is 126,000,000 pounds. . . . The importation into the United States is worth $18,000,000 to $19,000,000 say 60,000,000 pounds. Russia takes more good tea than any other nation and pays more for it, because the former overland trade to Siberia could not afford to transport poor tea."—*Williams, Midd. King.*, ii. 51.

"The trade in cotton goods more than quadrupled itself between 1880 and 1899." Cotton yarn was sent from India, but "China is now beginning to import large quantities . . . from Japan too. There is an immense import of native raw cotton, native yarn, and native coarse cloth into Sz Ch'wan, and much cotton also comes into Yün Nan from the Shan states and Burmah."—*Parker, China*, pp. 133–4.

"In Yün Nan and Sz Ch'wan there seems to be an unlimited demand for cotton, and it was so also during the Burmese wars of last century."—*Ibid.* p. 160.

"Haiphong now [on the establishment of the French protectorate over Tonquin] became an important centre of trade, and economical development quickly followed all over Tonquin. . . . One of the political results has been that several new treaty 'ports' have opened to the French the inland trade of Kwang Si and Yün Nan. Lungchow (now being connected with Langson, in Tonquin, by railway) was opened to trade on the 1st June, 1889; Mêngtsz was also thrown open in August of the same year; and Hokow (opposite Lao-kai on the Franco-Chinese frontier) in June, 1895. . . . As a matter of fact the trade,—so far as it is not throttled by unwise fiscal measures,—is chiefly between the Chinese of Yün Nan and the merchants of Hongkong."—*Ibid.* pp. 101–2.

"By the Gérard Convention of 1895 Esmok was opened to Tonquin trade, and a like privilege was secured to the British-protected Shan States by the Burma Convention of 1896. This last place (Esmok) is the spot where British and French interests unite. The French took advantage of the novel situation created in the first instance by Germany at Kiao-chou to claim 'compensation' in the shape of the old pirate haunt of Kwang-chou Wan (Bay), and proceeded to add to it *in petto* an as yet undefined *Hinterland*."—*Ibid.* p. 102.

"Nepaul is tributary to China, and sends trading missions."—*Ibid.* p. 128.

[Ya-chou, in Ssŭ Ch'uan, was the great entrepôt of the tea trade with the Tibetan tribes.]—*Ibid.* p. 219.

"As to Tibet, which receives from Sz Ch'wan endless human caravans of tea by way of Ta-tsien-lu and Kwan Hien, I presume it . . . needs no Chinese salt. In any case plentiful supplies for the northern frontier can be obtained from Mien-chu city."—*Ibid.* p. 219.

"The tea trade with Russia still thrives; but that with Europe has been killed by the much more carefully grown and prepared tea of Ceylon and India."—*Little (Mrs. A.), Int. Ch.*, p. 434.

"At present there seems to be no long-distance caravan trade along the direct roads between Tibet and Lob nor across the Kunlun Mountains. . . . The southern branch of the South Road has always been used for the Khotan jadestone import trade, which is a very ancient one. . . . There were continuous disputes with Kokand as to the right of the latter to tax the Kashmir trade crossing the Sarikol region; but China supplied Kokand with tea and drugs, and was thus always able to put pressure upon the Usbeg power by stopping this important trade."—*Parker, China*, pp. 76–7.

"The ordinary Tibetan tribute route, over which thousands of men and animals habitually travel to Peking in huge caravans, was that taken by the Abbé Huc in 1834–5." See the route described: *ibid.* pp. 77–8.

"The Nepaul 'tribute' (trading) mission, which still periodically visits China, invariably takes the post road, *viâ* Shigatsz and Lhassa, to Ta-tsien Lu. The road from Yün Nan to Tibet, though practicable, is too rough for troops, and is therefore deliberately abandoned by the Manchus, as it was 2,000 years ago by Han Wu Ti."—*Ibid.* p. 78. For the routes followed by modern Chinese Mussulmans to Mecca see pp. 78–9.

"If we now pass on to Mongolia, we shall find that the trade of the north-west concentrates at or near Baotu, at the north-east corner of the Yellow River bend, whence the ancient high-road through Kwei-hwa Ch'êng (Tenduc) permits of easy travel to Dolonor (Lama Miao) and Kalgan. From Kwei-hua runs also the high-road to Uliassutai and the northernmost route to the Far West. These roads are of great commercial importance in connection with the foreign trade of Tientsin."—*Ibid.* p. 79.

"As to the roads into Manchuria, recent researches prove absolutely that the mediæval Chinese envoys to the Nüchêns followed the present high-road round from Peking, through Shan-hai Kwan, Mukden, Kirin or Changchun, to Alchuk and Sansing. So with the modern Corean road from Sŏul, or P'ing-yang, by way of I-chou, whence either *viâ* Mukden and the Manchu road, or *viâ* the Fêng-hwang road and Kin-chou, where the latter joins the former: these were the roads of ancient times. The Kitan roads I have been over, for the most part, myself; they are simply the high-roads from Peking through the various passes of the Great Wall, and to this day the caravans of laden camels or mules, the droves of horses, the herds and flocks driven in for sale may be seen coming through in the winter season exactly as they came 2,000 years ago. The present Kalgan and Kiachta road used by the Russians was not the one preferred by them in the seventeenth century. They used to go from Tsuruhaitu on the River Argun, across the River Hailar and the Hingnan Range, down the Yall Valley to the Nonni; whence south-west through the steppes and mountainous borderland of south-east Mongolia to the Hi-fêng K'ou (pass) in the Great Wall. Between Tsitsihar on the Nonni and Peking, travellers crossed Cholin-u-ye and Mokhoi to the rivers Toro and Shara Muren, with its tributary the Loha."—*Ibid.* pp. 79–80.

"The same thing may be said of the Tonquin frontier; the roads have always been the present ones; the only novelty being that the Red River route from Yün Nan past Lao-kai to Hanoi never existed in practice, even if known in theory, as a continuous road, until twenty-five years ago, when Jean Dupuis effectively discovered it. Even Haïphong had no existence as a port. The Annamese formerly discouraged trade with China, when and for the same reasons the Japanese did: first, on account of pirate complications; secondly, from the dread of opium importations."—*Ibid.* p. 80.

"The total result of these laborious inquiries into trade routes is, after all, a simple conclusion. With one or two exceptions, the beaten tracks are exactly the same now as they were 2,000 years ago, both by land and by sea. The marts, with similar rare exceptions, are either the old marts, or are near them, or have a special traceable reason for their modified existence. . . . Cheap freights for heavy commodities in huge ships have displaced certain exchanges; as, for instance, iron, which from being an export is now an import: thousands of tons of old horseshoes go out as ballast, at low freights. The great novelty . . . has been opium."—*Ibid.* pp. 80–1.

Means of Conveyance.—"The enormous fleet of grain junks carrying rice to the capital is supplemented by a still greater number of vessels which take the food up to Tungchau. Formerly the coast trade increased the shipping at Tientsin to thousands of jumks, including all which lined the river for about sixty miles. This native trade has diminished since 1861, inasmuch as steamers are gradually ousting the native vessels, no one caring to risk insurance on freight in junks."—*Williams, Midd. King.*, i. 85. See also *Parker, China*, p. 146; *Gray, China*, ii. 244.

"The basin of the Tsientang River measures nearly half of the province; by means of rafts and boats the people transport themselves and their produce for about 300 miles to its headwaters."—*Williams, Midd. King.*, i. 114.

"These plains [of Honan] are traversed by wheelbarrows [on which sails are sometimes hoisted] and carts, whose drivers and trundlers form a vast body of stalwart men constantly going about in their employment from one city to another."—*Ibid.* i. 99. See also i. 748; *N. and Q. on C. and J.*, i. 29.

"Horses and mules are much used in the saddle for travelling, where the distances are very long. For a journey of five-hundred miles they have to travel at the rate of from twenty to twenty-five English miles *per diem*; and so admirable is their training and management, that they perform this work, in the saddle, or as beasts of burden, with apparent ease. Horses and asses are also sometimes used in this way by ladies in travelling, and women in going to market."—*Gray, China*, ii. 178.

"In the north, the Chinese use a horse litter, consisting of a light frame, resembling a sedan chair, and fixed upon two strong poles. The framework is covered with cloth, and has a door on each side. The litter is borne by two mules, one between the poles in front, and the other behind."—*Ibid.* ii. 178.

[Asses, oxen, and camels, carts, wagons (also used as omnibuses), and wheelbarrows, are mentioned in *ibid.* ii. 150, 176–8, 215.]

"Military officers are supposed to ride on horseback, and not sit in sedans, but in these degenerate days this rule is honoured more in the breach than the observance."—*Parker, China*, p. 248.

"Few carts or wagons are used with animals in the southern and eastern provinces where boats are at all available, human strength supplying the means of transportation; the implements of husbandry and the grain taken from the fields both being carried on the back of the labourer. It is not an uncommon sight about Canton to see a ploughman, when he has done his work, turn his buffalo loose and shoulder his plough, harrow, and hoe, with the harness, and carry them all home. It is when one crosses the Yangtsz' on his way north that pack animals are met transporting goods and food in great droves; here, too, people on carts and wheelbarrows fill the roads. On the Great Plain a sail is raised on the latter when a fair wind will help the man to trundle it over a level way."—*Williams, Midd. King.*, ii. 7–8. See also *De Guignes, Voyages*, ii. 195.

"So powerfully has the food question impressed itself on the Chinese mind that, even in parts of the empire where water communication is not easily accessible, the Chinese refuse to make broad roads, for fear of encroaching on the surface of the bread-producing earth." This causes burdens to be borne by men which would otherwise be transported or drawn by animals.—*Gray, China*, ii. 171.

"Sedan-chairs take the place of carriages in China; and persons of all classes are carried in them on men's shoulders both to near and to distant parts of the country. In some parts of the empire—at Nankin, in particular—I observed that many persons, generally women, rode not in sedan-chairs, but in baskets. At Eching, a city on the banks of the Yang-tsze, I noticed a lady, apparently going on a visit to a neighbouring town or village, walking in front of a man-servant who was carrying two baskets, in one of which was a child, and in the other the lady's luggage. The streets of all cities south of the Yang-tsze are so narrow, indeed, as to render traffic by horses quite impracticable. In consequence packages of every kind are borne by porters on their backs."—*Gray, China*, ii. 171–2. See also *Williams, Midd. King.*, i. 748.

[For descriptions of vehicles, boats, etc., see IMPLEMENTS.]

[The *nien* was a kind of Bath-chair, for old people.]—*Giles, Dic.*, No. 8310.

"What with the Grand Canal, the River Wei (from Wei-hwei Fu), and the canals connecting the various Yellow River beds, Shan Tung has unrivalled facilities for distribution."—*Parker, China*, p. 222.

In Ssŭ Ch'uan "the water-ways are few, shut in, unconnected by canals, and easily controlled. There is really only one great exit eastwards from Sz Ch'wan, as there is only one from Kwang Si."—*Ibid.* p. 219.

[On all the high roads there are coolie-stations where relays of porters can be procured. They usually carry loads suspended at each end of a bamboo, balanced on their shoulders.]—*De Courcy, L'Emp. du Mil.*, pp. 216–7. *Cf. Williams, Midd. King.*, i. 748.

"There is every reason to believe that these Circulating Libraries, (which are found in every 'Hoo-tung' in Peking as well as in Canton) are of considerable antiquity. . . . The books lent are Romances and Historical Novels, works of Fancy and Fiction."—*N. and Q. on C. and J.*, i. 18. *Cf.* ACCESS. INST.

"Books are hawked about the streets, circulating libraries are carried from house to house upon movable stands, and booksellers' shops are frequent in large towns."—*Williams Midd. King.*, i. 602.

"The great number of craftsmen who ply their vocations in the street, as well as the more numerous class of hucksters who supply food as they go from house to house, furnish much to amuse and interest. Each of them has a peculiar call. The barber twangs a sort of tweezers like a long tuning-fork, the peddler twirls a hand-drum with clappers strung on each side, the refuse-buyer strikes a little gong, the fruiterer claps two bamboo sticks, and the fortune-teller tinkles a gong-bell; these, with the various calls and cries of beggars, cadgers, chapmen, etc., fill the streets with a concert of strange sounds."—*Ibid.* ii. 59.

"New medicines, pills, powders, and salves are advertised and puffed by flaunting placards on the walls of the streets, some of them most disgustingly obscene; but the Chinese do not puff new nostrums by publishing a long list of recommendations from patients."—*Ibid.* ii. 128.

"There is no doubt that its extension and the apparent inability of the authorities to grapple with it [famine of 1876] may be traced to the want of means of communication, which rendered it almost impossible to convey the needful succour into the famine districts. The evil being so obvious, it was hoped that the Chinese would be disposed to take a step forward on their own initiative in the great and needful work of the introduction of railways and other mechanical appliances. The Viceroy of the Two Kiang gave his assent to the construction of a short line between Shanghai and the port of Woosung," but official opposition caused its removal shortly afterwards.—*Boulger, Short Hist.*, pp. 338–9.

"Since that date a telegraph line has been laid between Peking and Shanghai, forming the final connecting link between the capitals of the British and Chinese empires, and an attempt is now being made by a body of Chinese merchants to establish themselves permanently and transact their own business in London without the assistance of foreigners."—*Giles, Historic China*, p. 121. Of late years telegraph lines and railways have been extended to most of the provinces.

"The orders of the Court are usually transmitted in manuscript, except when some grand event or state ceremony requires a general proclamation, in which cases the document is printed on yellow paper and published in both the Chinese and Manchu languages, encircled with a border of dragons. . . . Standing laws and local regulations are often superbly carved on tablets of black marble, and placed in the streets to be 'held in everlasting remembrance,' so that no one can plead ignorance; a custom which recalls the mode of publishing the Twelve Tables at Rome. . . . The usual mode of publishing the commands of government is to print the document in large characters, and post copies at the door of the offices and in the streets in public places, with the seal of the officer attached to authenticate them. The sheets on which they are printed being common bamboo paper, and having no protection from the weather, are, however, soon destroyed; the people read them as they are thus exposed, and copy them if they wish, but it is not uncommon, too, for the magistrates to print important edicts in pamphlet form for circulation. These placards are written in an official style, differing from common writing as much as that does in English, but not involved or obscure."—*Ibid.* i. 468–9.

[Couriers ran to and fro from the capital with memorials and decrees, and from province to province with important despatches.]—*Ch. Rev.*, x. 72.

"There is, of course, no government postal system, but the passage boats convey letters and distribute them to their respective addresses; there are no fixed uniform rates, though custom has established certain rates which are adhered to by regular correspondents, casual writers usually paying more; the carriage of a letter may be either prepaid or not, according to option; well-known residents often adopt the former course or pay a fixed sum per annum to the boats plying to the places with which they are in constant correspondence, which entitles them to send and receive all letters free of charge; the cost for short distances is less than one penny postage, but greater as the distance increases; from places whence there are no boats running direct to Canton, two postages have to be paid; the first . . . is prepaid; the second is paid on delivery. If more than one transhipment is necessary, letters are seldom sent except by the hands of a friend. The system works well; letters are as punctually and safely delivered as with ourselves; large sums of money are transmitted by the same means; the money is weighed to the master of the boat, who gives a receipt, and for a trifling percentage is bound to pay a like sum . . . to the party to whom the remittance is being made. Treasure is secured and concealed in the planking of the boat, and loss by theft is unknown, except [by pirates,] which rarely happens. The same system is adopted between Hongkong and Canton; [there are perhaps 200] shops in Canton, exhibiting the times of departure of the Hongkong steamers; these shops are private post-offices; and the letters collected there are transmitted to Hongkong by a special courier for [fifty cash, or less,] for which they are distributed to their respective addresses."—*N. and Q. on C. and J.*, i. 30. See also *Giles, Ch. Sketches*, pp. 59–62.

"There is a separate service [for the government post establishment] in some of the provinces, but [it] is often attended by one of the others, generally the military."—*Meadows, Ch. and their Rebellions*, p. 13.

"The carrier [-pigeon] is of great service to merchants, by whom it is employed in conveying intelligence to the producing districts, of the arrivals of cargoes, and the ruling prices of the markets; merchants at Hongkong use them in conveying news of the arrival of the English, French, or American mails to their partners in trade at Canton. To defend the pigeon during its flight from attacks on the part of falcons or hawks, a whistle is attached to its tail, and the shrill noise of this contrivance, as its bearer flies through the air, terrifies the birds of prey."—*Gray, China*, ii. 188–9.

"Burnes was told of the continued existence of both post and fire beacons between Yarkand and Pekin. The distance is more than five months' journey, as usually travelled, but an express went in thirty-five days, and under very great emergency in fifteen."—*Yule, Cathay*, i. 139, note.

[Signal fires are used to convey intelligence of warlike movements, victories, defeats, etc.]—*Ch. Rev.*, xiv. 50.

"Over the thoroughfares slender towers are erected, where notice of a fire is given and the watches of the night announced by striking a gong."—*Williams, Midd. King.*, i. 742.

"The vernacular newspapers of Hongkong and Shanghai have been the true pioneers of the native Press. That work has borne fruit in a remarkably short time."—*China Mail*, Nov., 1898.

[The *Shun pao*, a Chinese daily paper, edited by a European at Shanghai, had in 1875 a circulation of 4,000 and was in great demand. Being a purely commercial speculation, it was not regarded with suspicion; no articles of a proselytizing character were admitted, and, while disseminating information as to Western manners and customs, science, etc., it was thought necessary, as a concession to popular taste to include occasional paragraphs about marvels and portents.]—*Giles, Ch. Sketches* pp. 168–72. Many native newspapers, owned and managed by Chinese, have appeared within recent years.

[In Sz Ch'uan the hydrogen gas produced from the Artesian wells, and used as fuel, is distributed in long pipes.]—*Parker, China*, p. 218.

EXCHANGE.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

Barter and Money.—"The primitive mode of commercial exchange in China, as in all other countries, was barter, the interchange of certain products of the earth, such as wheat and rice, or of men's manual labor, as silk, arms, etc., by means of which the necessary and much desired articles were obtained. It is, however, remarkable that while all other nations, in Europe as well as in Asia, have had a primitive currency recalling the lowest state of civilisation, the hunting and pastoral state,—when by means of furs and cattle exchange was effected—no trace of the same phenomenon is to be found either in Chinese history or language. The earliest record of money shows that the 'blackhaired people' in the remotest times stood already on the third step of the ladder of civilisation, and that a subject of 'the Son of Heaven' was either a husbandman or a merchant. . . . But at the same time that among the common people, who earned their livelihood by cultivating the soil and feeding silkworms, barter was prevalent, there seems also to have existed a kind of coined metallic money, current among the travelling merchants, the circulation of which was however very limited, as it was not used by the people who lived by the produce of agriculture." "Ma-twan-lin alludes to that ancient money in the beginning of his 'examination,' and the same subject is treated of historically and rather economically by two Chinese scholars, who lived in the middle of the 11th century of the Christian era. . . . Besides, many old Chinese and Japanese mint-books show us drawings of those ancient coins, most of which, however, are covered with characters, in an old and nearly illegible writing-manner."—*Vissering, On Ch. Currency*, pp. 1–2. See also *Edkins, Ch. Currency*, p. 16.

"I [Yü] urged them further to exchange what they had for what they had not, and to dispose of their accumulated stores."—*Shu ching*, Pt. II. Bk. IV. Ch. I. i; *Legge, Ch. Class.*, III. i. 78.

"Cowries and gems" are mentioned in the *Shu ching*, Pt. IV. Bk. VII. Pt. ii. 14, and "Ying-tă says that 'anciently they used the shell as money.' The text is a proof that such a medium of exchange was known in the Shang dynasty."—*Ibid.* III. i. 240, note. See also *Vissering, On Ch. Currency*, pp. 3–4; *Simcox*, ii. 58; and *Biot, Perny*, p. 217. The shells are said by Giles to have been those of the pearl-oyster.

"During the Hia and Chang dynasties, in addition to the cowries, three metals began to be used, viz., gold, silver, and copper. The last-named of these was beaten into the form of a knife-blade. The top part was pierced with a hole to allow of them being easily strung on a cord. Yü, who reigned about 2205 B.C., re-established the custom of weighing the substances exchanged, which was originally due to the celebrated Houang tij."—*Biot*, epit. by *Perny, Append. du Dic. Fr.-Lat.-Ch.*, p. 218. For the origin of money see *Vissering*, pp. 9–10.

[Besides the above metals, silk, grass-cloth, salt, swords, tortoise-shells, and other things were bartered for grain.]—*Edkins, Ch. Currency*, p. 10.

"From the form of the primitive species . . . it will easily be seen that money took its origin in barter. The Romans derived their *pecunia* from *pecus* and on their first coins engraved the figure of an ox or a sheep, the Chinese did very much the same thing when, instead of their knives and articles of clothing, they gave to a weighed quantity of different kinds of metal the shape of articles of clothing and of knives which henceforth served for money."—*Vissering*, p. 9.

Weights and Measures.—"The duty of regularising weights and measures throughout their dominion is laid upon the emperors of China by the highest authority to which they are content to appeal—the example of the ancient monarchs, as recorded in the Scriptures. Of Shun the Sage, when Regent of the Empire in B.C. 2287, it is said in the Book, 'he made of one fashion the pipes and the rule; the bushel and the balances'; and what Shun did the theory of the Chinese Constitution require his successors to do."—*Report on Weights and Measures of China*, p. 3.

"The length of the *ch'ih* has varied in different dynasties, and not a little during the same dynasty."—*Williams, Ch. Commercial Guide*, p. 283.

"The Emperor Shun, about B.C. 2284, divided it [the *ch'ih*] into 10 *ts'un* and 100 *fën*, which was maintained during the three following dynasties."—*Ibid.* p. 283. But *v.* following extracts.

"In the Hsia dynasty 10 *ts'un*, inches, in the Shang 12·5841 in. (? English) (Rondot), and in the Yin dynasty, 9 *ts'un*, made one *ch'ih*, foot."—*Ts'ai Yung tu tuan, Ko chih ching yüan*, *c.* 49, *Jih Tung ch'i wu lei*, p. 4*a*.

"It is not possible that the *le* of Yu could have been equal to the *le* now; but scholars have not been able to determine its measurement."—*Legge, Ch. Class.*, III. i. 148, note.

"The standard Stone and the equalizing Quarter were in the imperial treasuries," which "contained the standard measures of capacity and length as well."—*Ibid.* iii. i. 160, and note.

"The standard is variously stated to have been obtained (a) from the grains of millet; (b) from the keynote of the ancient musical scale."—*Report on the Weights and Measures of China*, p. 2.

"The Ancients said: 'The *lü*, standard tubes, were used for innumerable purposes. Measuring and weighing were effected by means of wooden measures.'"—*T'ung k'ao, Shih lei t'ung pien*, *c.* 75, *Ch'üan hêng pu*, p. 12*b*.

"The *ch'üan* was a weight; in shape it was like a pendulum."—*Po ya, Shih lei t'ung pien*, *c.* 75, *Ch'üan hêng pu*, p. 12*b*.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Money and Barter.—"A coinage of round money, with a square hole in the centre—the prototypes of the modern cash" took place in the reign of king Ch'êng (1114–1079 B.C.).—*Legge, Ch. Class.*, III. ii. 544, note.

"Nor did the finance ministers in very early times limit money to silver or to copper. Pearls and jade, tortoise shell and cowries, bundles of silk and grass-cloth, served as money in China's ancient markets. About B.C. 800 an old poem says 'A simple looking lad, you were carrying cloth to exchange it for silk.'"—*Edkins, Ch. Currency*, p. 4.

[For skins of animals used in barter in 7th cent. B.C. see *Lacouperie, Paper Money and Leather Coinage in China*, pp. 6–7.]

[Up to the time of the Ch'in dynasty, cowries were current as money in China, nor did such a currency even then immediately cease. The *Shih ching*, II. iii. II. 3, says (line 4); "He gives us a hundred sets of cowries" (*p'êng*). According to Chu Hsi and many others, 5 shells constituted a *p'êng* or set; but Ying-ta gives a different account. The shells, he says, were of five classes, according to their size, the largest measuring 4·8 in., and those of the 4th class 1·2 in. Two shells of each of these 4 classes constituted a set, the very smallest not being reckoned (*Legge, Ch. Class.*, IV. ii. 280, note).]

"Traditions current in the 7th century B.C. claim for Yu and Tang the casting of metallic money for the relief of the people; but metal was bartered by weight before any approach was made to a currency. The annals of the first Han (206 B.C.—25 A.D.) give an account of the monetary arrangements of the 11th century B.C., which, though not very intelligible, is probably founded on authentic materials. According to this, gold was moulded in cubes weighing 1 *kin*, and bronze money was round or 'tongue-like,' and its weight estimated in *tchus*. M. Terrien de la Couperie estimates the *tchu* at 4·06 grains, and the *kin* or gold unit at 1,950 grains, *i.e.* one-fourth of the *hwan*, the royal standard of 7,800 grains (about 505 gram.), which is identifiable with the light Babylonion talent (*Catalogue of Ch. Coins*, etc.). M. Biot, the only other writer who has dealt with the subject, estimated the *kin* at one-third of the *hwan*."—*Simcox*, ii. 57–8.

"The oldest existing money is certainly in the form of rings, without any inscription, and no other is known to have been used till the introduction, early in the 7th century, of metal knives as a currency. Large bronze knives of regular weight, with a rude inscription, were also circulated by traders in S. Shantung, serving, like the earliest pi-tchau or spade-money, both for use and exchange. 'Hoes and riches,' 'hoes and cloth,' are general terms for wealth."—*Ibid.* ii. 58.

"The *hwan* [coins or metal in which fines were paid] was equal to six *leang*, *i.e.*, six Chinese ounces. Some uncertainty attaches, however, to this estimate. Këang Shing inclines to the view that 100 *hwan* were equal only to 3 *kin*, or Chinese pounds."—*Legge, Ch. Class.*, III. ii. 605, note.

"About the middle of the 7th century the old ring money of Chow began to be inscribed and became a coinage, but this use for metal is still only third or fourth in importance. About the same time one feudal prince, in giving a present of metal to another, stipulated that it was not to be used for making weapons; and accordingly the recipient cast three bells with it: a more respectful way of using it than for tools. In the next century a prince of Tsin refused to accept a ransom paid in coin, and demanded silk. Several bean-shaped coins, called metallic cowries, were issued about 600 B.C., and a little later we have large knife coins issued by traders' monetary unions, and bearing the inscription: 'Returnable-reviving currency of all travelling traders of Tei and Kwang-tching' (Shensi). Another knife-coin issued by the same class is singular in having a well-executed figure, as well as characters, inscribed on it; a lad bearing a flag appears as a sort of rebus for the word 'to travel.'"—*Simcox*, ii. 58–9.

"The sea-traders of the Indian Ocean had introduced, about 675, the western system of stamping the actual currency, which in China happened to consist of small bronze implements of daily use. . . . Some seventy-five years later, . . . [in] the state of Ts'u, small ingots of bronze, bean-shaped, like the old Lydian coins, and stamped, were issued by Sun Shuh-ngao, for his prince Ts'u Tchwang Wang. . . . They are known . . . [as] Metallic cawries (*Ho pei tsien*). . . . [They must have come from the S.W.—from India.] In later times [the Hindu traders] established monetary unions for the issue with joint names of coins between themselves and inland Chinese cities."—*Lacouperie, W. Orig.*, pp. 148, 89.

"In 554 B.C. a large copper money was issued, as appears from the text of a remonstrance addressed to the king describing the practice of his predecessors, who issued two sizes of coins, called the Mother and the Son, of different sizes, according to the needs of the people. Subsequently a prince of Tsoo attempted to give the value of the large coins to the small ones, with the result that merchants deserted his markets (*Journ. As.*, 3me série, iii. p. 434)."—*Simcox*, ii. 58.

"It is recorded that in 524 B.C. the emperor was desirous of having 'large money' cast, and was dissuaded from doing so by his council, so currency questions were evidently discussed at an early period."—*Ibid.* ii. 157, note. See also *Edkins, Ch. Currency*, pp. 16–17.

"But those old forms of the medium of exchange soon proved to be very inconvenient, and the right principle, that money, whose destination it is to roll about the world, should be round of form, soon became a firm conviction with the Chinese; hence it is recorded that in the reign of the *Tseu* dynasty . . . money was made, which was round of shape and had a square hole in its centre. This convenient form once adopted, is, as it were, petrified in Chinese society. If, at different times, weight and quality vary, with a few exceptions . . . the form has remained unaltered during nearly 30 centuries."—*Vissering*, pp. 11–12.

"Other forms of coin were called weight-money, or 'riding-money,' from the resemblance of its shape to a saddle; and pu-money, in use from the 6th to the 3rd century B.C., but confined to the triangle bounded on the west and south by the Yellow River. The name is translated 'extended,' and the coin has been taken to represent a cloth or garment; it consisted of a piece of flat, inscribed metal, not unlike a spade with indentation at the bottom, and was more of a mere coin than either spades, knives, or the rings, which were a survival from the time when metal for general use was cast in that shape for convenience in porterage or storing. Down to the 4th century unwrought metal continued to be used for purposes of exchange, but in the 5th small spade and pu-money, of no intrinsic use, were also circulated. The knife-money, as it approaches to a token, has less and less blade, in proportion to the round perforated handle by which it could be strung; but the modern cash is descended from the still older ring-money, not from a knife with completely atrophied blade."—*Simcox*, ii. 59.

"In 523 a king of Chow issued coins of four times the customary weight; but they were not accepted by the people, so the old type of flat rings was reverted to. Spade-money was in use for at least three hundred years from the 7th to the 4th century, and for half that time it was the common currency. The spades had hollow handles so as to be useable, and, being really intended more for tools than coins, were only roughly inscribed. The knife-money was confined to the Shantung peninsula and its neighbourhood. About the middle of the 5th century we hear of three Boards of Finance being established in Yueh by the help of the king of Tsoo, for the currency of gems, gold, and coins and silk; coins, *i.e.* metal, and silk being bracketed together as utilities, apart from such merely precious things as gold and gems."—*Ibid.* ii. 59.

"In 423 a prince of Wei is said to have stimulated the use of metallic currency by State purchases, which shows that the mass of the people still did not feel the need of a currency for every-day affairs. Many coins bear the names of two towns—doubtless those that had a common market; and the relative position of towns in the larger monetary unions indicates the lines of old trade routes. Ping-chow, in the State of Tsin, was the centre of four monetary unions. Coins were issued by such unions from 580 to 380 B.C.; but towards the close of the 'Warring States' period, trade as well as everything else suffered."—*Ibid.* ii. 59.

"Hwan, prince of Tse, the first of the 'presiding States,' attempted to regulate the weight of the metallic currency, and had spade money cast from native mines; he also issued knife-coins of practical shape and size, bearing the important inscription, 'returnable-reviving currency of Tse,' and on the reverse '30 units' and 'yuen'—a ring, doubtless an allusion to the old metal rings. Other early inscriptions are 'exchangeable,' 'return,' 'work,' 'sprout,' 'star,' 'family,' and 'currency of Tsih-moh city.' Two things are very remarkable. Coins of all kinds were issued during the feudal period by individual merchants, trading firms, guilds and private families, as well as by cities. And the legends of all seem to show that, like the first issues of paper money many centuries later, the coin was put forward rather as a bond—something returnable, a promise to pay value to such an amount—than as a mere medium of exchange for universal currency."—*Ibid.* ii. 51.

"Ho I-sun, under the dynasty of Yuan, says that it appears from one of the poems in the *Shih Ching*, Book of Poetry, . . . as explained by Chêng Ssŭ-nung, alluding to a man holding a sheet of linen in his hand and exchanging it for silk, that the people of the Chou dynasty . . . had made for the first time a kind of circulating medium by means of pieces of linen stuff, about two feet in length, with certain characters imprinted upon them by the government. This is the origin or commencement of the paper currency of China."—*Journ. P.O.S.*, ii. 265.

"Silks of a certain length and breadth, called a *p'i*, were also a unit of value, but as copper *cash* was by far more convenient, being easier spread than cloth, better strung together than silks, and more profitable than the gold coins, it soon was preferred and generally used."—*Vissering*, p. 20.

Measures.—The *ch'ih* of this period is calculated by M. Rondot to have been equal to 8·04739 in. The ancient books also give it the value of 8·189 in., 8·8978 in., and 8·9765 in.—*Williams, Ch. Commercial Guide*, p. 283. See also *Ko chih ching yüan*, *c.* 49, *Jih yung ch'i wu lei*, p. 4*a* ; *Journ. R.A.S.*, xviii. 20.

"It is known that four measures were used in Ts'e,—the 豆, 區, 釜, and 鍾, and that a *chung* was = 10 *foo*, or six 石 and four *tow*. 10,000 *chung* would thus = 64,000 stone." Four *shêng* (升) made one *tou* (*Tso chuan*).—*Legge, Ch. Class.*, ii. Prol. p. 29, note. About 539 B.C. the three measures of the Ch'ên family had each been raised by one unit (*Parker, Anc. Ch. Simpl.*, p. 313).

"Pan Ku says the *yuen* was 30 mow. A *mow* is 240 *pu* of 4 English feet each." "The *mei* was 100 *pu*. The *pu* was 6 *ch'i*, or 48 English inches, or 4 English feet. Twelve *mei* made a *yuen*."—*Journ. P.O.S.*, ii. 208, note.

"Anciently, according to the cubit of *Kâu*, eight cubits formed a pace. One hundred ancient *li* were equal to 121 of the present day [Han], sixty paces, four cubits, two inches and two-tenths."—*Li chi*, iii. v. 21 ; *Legge*, i. 246.

"One hundred ancient *mâu* were equal to 146 of the present day and thirty paces."—*Ibid.* iii. v. 21 ; *Legge*, i. 246.

"At the equinox [in the second month of autumn] they make uniform the measures of length and capacity ; equalise the steelyards and their weights ; rectify the weights of 30 and 120 catties ; and adjust the pecks and bushels."—*Ibid.* iv. iii. ii. 16 ; *Legge*, i. 289.

"The [thickness of the] silk spun by the silkworm made a *hu* (忽) ; 10 *hu* a *miao* (秒) ; 10 *miao* a *hao* (毫) ; 10 *hao* a *li* (釐) ; 10 *li* a *fên* (分)—this was the beginning of measurement."—*Sun Tzŭ Suan shu, Shih lei t'ung pien*, *c.* 75, *Ch'üan hêng pu*, p. 13*a*.

"Ten pieces of horse's hair made a *fên*."—*T'ung kua yen*, *ibid.* p. 13*a*.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

Money.—"Now, when the *Ts'ins* had united the empire, there were two different sorts of currency. The gold coin called *yi* was the first sort and had a weight and value, as a note observes, of 20 ounces or taels. 'The copper coins were in substance equal to those of the *Tsen* dynasty ; the design was "half an ounce" and their weight was according to that design. But pearls, gems, tortoise shells, silver, tin and what further is connected with these, were used as implements, toys, and precious articles, hoarded up in treasuries, but they were no (more) money.'"—*Vissering*, pp. 28–9. See also *Biot*, in *Perny, Append. du Dic.*, p. 218.

"The currency is stated to have consisted in pounds of unminted gold, and half-ounces of some kind of copper coinage. Silver, pewter, jewels, cowries, and tortoise-shell all had their fluctuating market values, but were not legal currency."—*Parker, China*, p. 42.

"The *History of Cereals and Money* (a part of the history of the Han dynasty) says that the Ch'in dynasty had generalized the whole monetary system which was then in existence in the empire into two classes : precious stones, tortoise-shells and other kinds of shells ; silver and tin were applied to the use of making implements and for ornamentation and were not allowed to be used as money."—*Journ. P.O.S.*, ii. 298–9.

"In Mencius' time (B.C. 372–289) the *yi* also was a current unit of value. . . . Legge reckons it at a value of 24 taels, but from Ma-twan-lin we learn it was only 20."—*Vissering*, p. 28.

"The introduction of paper currency in China is very closely connected with the ancient history of printing. Those native authors who have referred to early passages which speak of the employment of seals by officers to give a money value to certain articles as the real commencement of paper currency have done quite right. Grass cloth, silk, and paper all admit of an impression being made on them with ink or with vermilion. . . . Among the more important of the improvements introduced and additions made to the Chow legislation by the founder of the Ch'in dynasty was the extensive use of seals. . . . From that time it gradually became a fixed idea with the Chinese that they must have a seal impressed on every writing as a proof of property or genuineness."—*Edkins, Ch. Currency*, pp. 6–7.

"The first iron money was made by the rebel Kung-sun Shu, who died A.D. 36."—*Journ. Asiat.*, i. 261.

"Books tell us that the Han dynasty monarchs were the first to direct characters to be inscribed upon their coins. This practice commenced about B.C. 200 and was never afterwards neglected."—*Edkins, Ch. Currency*, p. 4. This refers to coins as distinguished from the old knife-, ring-, and spade-money. *Cf.* previous Period.

[Coinages, various kinds—"leaf coins" (as thin as elm leaves), gold coins of different size, coins of 4 *tsu*, with the design "half an ounce," 3 coins of mixed tin and silver, with designs of a dragon, a horse, and a tortoise respectively, copper coins, coins of 3 and 5 *tsu*, cloth money, skin money, coins of "white metal," reversion to the Chou coins, and to tortoise shells, cowries and copper *pu*, silk, cloth, rice, etc., coins of the "four outlets,"—succeeded one another until the end of the Period. For details see *Vissering*, pp. 29–59 ; *Perny*, p. 218 ; *Simcox*, ii. 115–6 ; *Journ Asiat.*, i. 258, 259 ; and *cf. Revenue and Finance.*]

"In 190 A.D., coins were cast like those of Wu, only without the rim, which used to be chipped off."—*Simcox*, ii. 156.

"Commercial accounts were written on paper for convenience, and merchants and shopkeepers provided themselves with seals for stamping."—*Edkins, Ch. Currency*, p. 1.

Measures.—"The second inscription [of the eight surviving from the time of the Ch'in dynasty], by Tsin-chi-hwang-ti himself, speaks of his ordering the measures and standards of length and capacity to be made uniform. It is dated the 26th year of his reign."—*Simcox*, ii. 101.

"During the Han, about the time of Christ, the *ch'ih* measured 9 *ts'un* [9·1734 in.], and each *ts'un* had 10 *fên*."—*Williams, Ch. Commercial Guide*, p. 283. Edkins (*Journ. R.A.S.*, xviii. 20) says 9·8 inches, (but that in A.D. 76 it was 9·125 in.) and Rondot, 11·17707 inches.

"The measures of length consisted of the *fên*, tenth, *ts'un*, inch, *ch'ih*, foot, *chang*, 10 feet, and *yin*, 100 feet, which were derived from the length of the musical pipe. It was measured by the size of a millet seed taken from the ear, so than 90 *fên* represented the length of the musical pipe. That is to say, one millet seed represented one *fên*, 10 *fên* made one *ts'un*, 10 *ts'un* made one *ch'ih*, 10 *ch'ih* made one *chang*, 10 *chang* made one *yin*." —*Lü li chih, Ko chih ching yüan*, *c.* 49, *Jih yung ch'i wu lei*, p. 3*b*.

"In the time of Wang Mang [who reduced the size of the *hu* and *ch'ih*], Lui Hsin made a copper peck (*hu*) and cubit (*ch'ih*)."—*Han chih, Shih lei t'ung pien*, *c.* 75, *Ch'üan hêng pu*, p. 13*a*. See also p. 14*a*. Ts'ai Yung made the *yo*, copper cubit, a measure of 1,200 grains of millet (*T'ung k'ao*, *ibid.* p. 13*b*).

"Two *yo* made one *ko* (合) ; 10 *ko*, one *shêng* (升) ; 10 *shêng*, one *tou* (斗) ; 10 *tou*, one *hu* (斛)."—*Han chih*, *ibid.* p. 13*b*. See also p. 14*a*. The *shêng* and *tou* were larger than in earlier times (*Ko chih ching yüan*, *c.* 49, p. 3*a*).

"In the Han dynasty 6 *ch'ih* made a *pu* ; 100 *pu* made a *mu* ; 100 *mu* made a 夫 *fu* ; and 3 *fu* made a 屋 *wu* ; but their various values, depending as they did, on the length of the *ch'ih*, are to be estimated by that."—*Williams, Ch. Commercial Guide*, p. 288.

"An apartment was measured by *chi* (几, a small table) ; a hall by *yen* (筵, a mat of 9 cubits) ; a palace by *hsün* (尋, a measure of 8 feet) ; a wilderness by *pu* (步, a pace of 2 跬 *k'uai* steps of 2·5 feet each) ; a road by *kuei* (軌, a track). The Commentary says : 'A measure of 5 feet was called *chi* ; of 6 feet, *pu* ; of 7 feet, *kuei* ; and of 8 feet, *hsün*.'"—*Han lü li chih, Shih lei t'ung pien*, *c.* 75, *Ch'üan hêng pu*, p. 13*a*.

"Six *su* (grains of millet) make one *kuei* (圭) ; 10 *kuei* one *ch'ao* (抄) ; 10 *ch'ao*, one *ts'o* (撮) ; 10 *ts'o* one *shao* (勺) ; 10 *shao*, one *ho* (合)."—*Sun Tzŭ Suan Shu*, *ibid.* p. 13*b*.

"24 *shu* (100 grains of millet) made one *liang*, tael ; 16 *liang*, one *chin*, catty ; 30 *chin*, one *chün*, ¼ of picul ; and 4 *chün*, one *shih*, picul or stone."—*Ko chih ching yüan*, *c.* 49, p. 7*a*.

Period of Disruption (221 *to* 589).—*Table IV.*

Money.—"As *Tsao-li* [Chao lieh] had seized on the land of *So* [*Ssŭ ch'uan*], he caused coins to be cast of a nominal value of 100." For the reasons see p. 62. They were "made and engraved as the 5 *tsu* pieces" [but with the *wu* on the right and the *tsu* on the left.]—*Ma-tuan-lin*, *Vissering*, p. 62.

[Much counterfeiting took place during this long period of unrest, money being even replaced by barter, when the abuse became too great. The "large coins," grain, and silk (nominal value of 500 and 1,000) were introduced in 236 and 238 respectively. *Ch'ih-tseu* coins, having a raised edge of red copper, were much appreciated, but abolished owing to counterfeiting. In 386 money seems to have been little in use, and barter was resorted to for a period of 80 years. The next coins were the 5 *tsu*, made from metal taken by the people to the mint. But it was only under the Sung, about 420, that order began to be re-established in the monetary system. *Cash* weighing 2·60 gram. were introduced. Then Fei Ti increased the confusion by authorizing free coinage, the right being withdrawn in 494. In 523 iron coins were cast, but it ceased to be used in 557. Coinages of 4, 5, and 2 *tsu* were made by several emperors, but excessive counterfeiting continued. At the beginning of the Liang dynasty (502) money was so scarce it was only employed in the capital and its immediate vicinity. For details see *Vissering*, pp. 63–83.]

"The effect of Tartar control was to favour barter, and keep back the onward advance of monetary conveniences."—*Edkins, Ch. Currency*, p. 2.

"The Mei-ling mountains on the north of Canton province at that time separated the belt of country which traded by weight from the belt of country which traded with the help only of copper coins."—*Ibid.* p. 2.

"It is noticeable here that silver began to be a currency in South China first and at a time when China sent her prefects regularly to rule in Cochin-Chinese and Cambodian cities. Gold in ancient China was much used on account of its great abundance. But silver began to enter China because it is produced abundantly in Burma and because it was a circulating medium in India and further west. The silver which circulated by weight in Canton in A.D. 500 would be partly Burmese and partly what Arabian merchants and others brought from distant ports. The Arabian trade would certainly have a share in the introduction of silver by weight into the commerce of China in its southern provinces. We find many proofs of the activity of the Arab merchants from the Han dynasty downwards. This is probably another instance of it."—*Ibid.* p. 2.

"In the period 520–27 the plan was suggested to supersede the copper money by iron money, in order to put an end to the speculations of some cunning traders who, taking advantage of the circulation of so many various sorts of copper money nearly equal in value, sought to make profit by continually exchanging one sort for another. But now there arose another difficulty. Everyone could easily get iron, and as the government itself could not resist the temptation to make large profits by the casting of money, false coining was greatly promoted ; so that, when that iron money had been in use about ten years the 'circulating mass of it was like a mountain.' The prices of all commodities rose rapidly. Henceforth exchange was effected by cart-loads of money without caring for the number (of the coins), and who quarrelled for a single string of 1000 pieces? Travelling merchants and rascals (imposed upon the people, and) with the purpose of gaining profit, they made their way through the mountain-passes into the East, where they brought them in the market at 80 per cent. The name was Eastern money. In *Kiang-Ying* [the ancient name of the district of *Kiang-ling* in Hunan] they were worth 70 per cent., (and there) they were called Western money. In the capital they had still a value of 90 per cent., and were called there great money (or long money). In the first year of the period *Ta-Tung* (527) the emperor decreed that they should be in general circulation at the full amount of 100 per cent. He dictated this to his subjects, but they did not obey. A hundred of these copper coins fell lower and lower, till at the close of that period the worth of a hundred had come down to 35 (or 35 per cent.) [Ma-tuan-lin]."—*Vissering*, pp. 83–4.

"Owing to excessive depreciation, a memorial presented to the Emperor by the minister *Yang-K'an* led to the re-introduction, in the year 529, of the 5 *tsu* pieces. An attempt to obtain permission to introduce 3 *tsu* pieces, however, does not appear to have been successful."—*Ibid.* pp. 87–91.

"As to the currency during" the reign of the Northern Ch'i dynasty, "the money of the *Wei's* continued to be used, but as it was not in sufficient quantities existant to meet the general want, several functionaries began to make their own money which generally was named after the district where it was circulating. The effect of this unwholesome condition was that all sorts of bad money arose. For this reason, after having drawn back all copper money as much as possible, the emperor caused it to be cast into 5 *tsu* pieces, and to prevent the use of false money in the markets there was a balance placed at the entrance of every market-place, in the capitals as well as in the provinces and principalities, and every private person who used scales in the market, was obliged to have them verified by the government standard balance. Assizement thus took place." "A hundred copper pieces of 5 *tsu* were to have a weight of 1 pound 4 ounces and 20 *tsu* (*i.e.*, 500 *tsu*) in order to be employed as a medium of exchange in the market ; and money greatly adulterated might not be used. One great advantage of this measure was, according to the Chinese chronicles, that every individual could now make money, if he liked ; for provided his pieces had the standard weight and quality they were current in the market." Notwithstanding these measures much counterfeiting took place.—*Ibid.* pp. 92–3.

"What follows on the monetary institutions of the Northern *Tsi*-dynasty, is of little interest. Equally uninteresting is the subsequent history of the Northern *Tseu* dynasty. The only fact worth mentioning is, that under that dynasty the gold and silver coins current among the barbarous tribes of the far West were made use of in the provinces of China, west of the *Hoang-ho*, and that the public functionaries did not prevent it." The coinage was of silver, with a man on horseback on the obverse and the face of a man on the reverse.—*Ibid.* pp. 93-4.

"We silently pass the introduction of all sorts of coins bearing such grand inscriptions as 'the eternal money circulating throughout all countries,' and 'the money of the five elements, spreading in great abundance' ; their feeble metallic value was the cause that their little course was soon run."—*Ibid.* p. 96.

"In the beginning of the reign of the *Ts'au* dynasty that ruled the empire after the confusions occasioned by the fall of the *Liang* dynasty, the iron money did not circulate any longer. The new princes reverted for a short time to the old 5 *tsu* pieces which, measured against the still circulating goose-eye coins [p. 76] had a relative value of 1 to 10. Another ruler of the same dynasty again committed the folly to introduce pieces of the weight of 6 *tsu* and a nominal value of fifty 5 *tsu* pieces. But soon the relative value was changed, so that they circulated together with the 5 *tsu* pieces at the same rate. . . . When shortly afterwards the emperor died, the 6 *tsu* pieces were done away with for good, and the 5 *tsu* pieces continued to circulate till the end of the *Ts'au* dynasty."—*Ibid.* p. 84.

Measures.—[Hsün Hsü in 273 found that the *ch'ih* from the Hou Han to the Wei was 4 *fên* and more longer than the one in use. He made a new *ch'ih* by comparing the measurements of the ancient implements.]—*Shih lei t'ung pien*, *c.* 75, *Ch'üan hêng pu*, p. 13*b*.

[The Chin *ch'ih* was 9·125 inches.]—*Journ. R.A.S.*, xviii. 20.

"The *tou* and *hu* of successive dynasties were of different sizes. In the Explanation of the Chronicle of Tso, it says : 'In the Wei and Ch'i dynasties the weight of the *tou* was equal to two, and in the Chou and Sui dynasties, to three of that of ancient times.'"—*Tan ch'ien tsung lu, Ko chih ching yüan*, *c.* 49, *Jih yung ch'i wu lei*, p. 3*a*.

From the Restoration of Unity to the end of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

Money.—"Of little importance to our subject is also the history of the *Suy* dynasty. . . . Two efforts to prevent the circulation of bad money are found in Ma-twan-lin's 'Examination,' Vol. 30" (examination on entering and leaving the market, and lists of legal money exhibited in lodging-houses and shops). "In the 18th year (598) (the emperor) ordered *Liang*, prince of *Han*, to build five money-founderies in *Hing-tseu*. Also in *Kiang-nan* there circulated too little money among the people. *Kwang*, prince of *Tsin*, then proposed to his Majesty to have money cast also in *Ngo-tseu* [a principality on the *Yang-tsze-kiang*, prov. of *Hu-pe*], where at some places in the 'White-hempen mountains' copper ore was found. His Majesty then ordered to build there ten money-foundries. Further, he ordered *Siu*, prince of *So*, to build five money-foundries in the province of *Yik-tseu* [a province in *Sse-ts'uen* ; its old name was *So*]. Now, as at that time the money increased (in quantity), and as there came an abundance of bad money in circulation, he ordered the officials charged with this (duty) to exercise a strict control over the ready money in the inns and shops of the whole empire, and to break all that was

no state-money, and to confiscate the copper obtained in that way; and those who carried on their trade in the capital with bad money, and were detected in the act by the functionaries, were put to death." "So, for a great number of years, false coining diminished a little. But after the period *Ta-ye* (605–617)," there was again excessive counterfeiting. "Some cut little pieces of iron from their ploughshares, or they cut up clothes and paste-board to make money thereof, and promiscuously they employed all this. (The consequence was) that money was cheap and merchandise (goods) dear, and this lasted till the end of the dynasty (618)."—*Vissering*, pp. 96–8. See also *Journ. Asiat.*, i. 259; *Ch. Repos.*, xx. 293.

"On the accession of the Tâ'ng [T'ang], about 620 A.D., the government created a new copper coinage on which were the characters *K'ai Yüan T'ung Pao*. The weight was the tenth of an ounce. The new office established exclusively for the direction of money affairs was fixed in the ancient town of Lŏ Yâng, now Hô nân foù [Ho-nan fu], the capital of the province. But, either with the object of facilitating the issue of the coins or to prevent their being counterfeited, sub-bureaux, having the right of coining money, were established in each province. In spite of the peace which the Empire enjoyed under the Tâ'ng, this abuse of counterfeiting continued in a most lamentable manner. To the old kind of coin the government added a new one a little more substantial than the *kaĭ yuên* [k'ai yüan]. In consequence of the immense progress which Buddhism made in China at this time, copper coins became daily scarcer, because, out of devotion to the new religion, they were destroyed and used for the purpose of casting statues or idols of Foŭ [Fo]. The monetary system continued very much the same until the year 807. At that time banks of deposit or assignment were organized."—*Biot*, epit. *Perny*, *Append. du Dic. Fr.-Lat.-Ch.*, p. 219. See *Vissering*, pp. 103–17 for details, and *Cf. Journ. Asiat.*, i. 259, 260, and following extracts.

"The total number of money-foundries was 99, distributed among the provinces. Every foundry was worked by 30 men. Yearly, in every foundry, there were fabricated 3300 strings of 1000 *cash* (1 string worth six shillings). The cost of each string was 750 cash, so that the profit of the state amounted to 33 per cent. In the whole empire 327,000 strings of copper money were fabricated a year."—*Vissering*, p. 118.

"A piece of silk was equal in value to 100 lbs. of cleaned rice; the size of the pieces is not given, but then as now it would be the length woven on the loom in common use, and may have varied little in 1,000 years. The equivalence . . . is certain, but the estimate of the price in copper money involves a good deal of guess work. M. Biot's calculations would make both worth about 3*s.* 3*d.*, which is intrinsically probable enough."—*Simcox*, ii. 164.

"By a decree of 734 A.D., it was forbidden to measure silk by feet and inches, or grain by spoonfuls or handfuls, as mediums of exchange. This was repealed, and at the end of the century, stones for grinding rice were received as 'money of an intrinsic value,' and exchanged at the rate of one for ten copper cash."—*Ibid.* ii. 161, note.

"It was to the Chinese merchants and statesmen particularly of the ninth century that the credit is due in the first instance of employing paper money in the form of drafts payable at certain cities."—*Edkins, Ch. Currency*, p. 1.

"The convenience of a paper currency made itself felt much sooner in China than in any other country because of the early use of engraved seals, the immense internal trade, and the commercial instinct of the people."—*Ibid.* p. 3.

"At the time of the Emperor Hsien Tsung of the T'ang dynasty (806 A.D.), there was made a form of money called *Fei ch'ien*, which can be translated as 'Flying cash.' The government ordered merchants from all parts of the country to come to the capital to receive from them this note currency, and in return they were required to pay the value in actual cash, so that they had the facility of travelling without being burdened with actual cash and were able to draw at any time the sum specified in the note."—*Journ. P.O.S.*, ii. 266. See also *Lacouperie, Paper Money and Leather Coinage of China*, 1–2, and *T'ang Shu, Shih Huo Chih, Ko Chih ching yüan*, xxxv. 21; *Yüan chien lei han*, ccclxii. 24.

"However, three years had scarcely elapsed before government was obliged to suppress this paper money, which indeed never came into vogue in the provinces."—*Ch. Repos.*, xx. 293.

"No further mention is made at that time of the paper money and it disappears altogether, to return in a more developed form 150 years later."—*Lacouperie, Paper Money and Leather Coinage of China*, pp. 2–3.

"It is the institution of that flying coinage which has given rise to the erroneous saying, so often repeated, even by high Chinese officials in Europe, that the bill of exchange was invented in their country in A.D. 806."—*Ibid.* p. 3.

"Long before the establishment by Lombard Jews of banks in Italy (A.D. 808) the money-changers of China were affording their customers all the help and convenience which belong to the banking system; and 300 years before the establishment at Stockholm of the first bank which issued notes in Europe, paper currency was passing freely through all the provinces of the Empire."—*Douglas, Soc. in Ch.*, p. 142.

"In the text of the old history of the T'ang dynasty, it is said that an imperial decree was proclaimed in the 6th month of the 3rd year of *Yüan Ho* (808 A.D.), in the reign of the Emperor Hsien Tsung, to the effect that, in all silver mines of the realm, there is always found a certain quantity of copper mingled with the silver ores. This copper may be supplied for coinage purposes, but silver having no practical value for the immediate use of the people, it was ordered that in those provinces lying on the north of the Mei-ling pass (Wu-ling), the mining in search of silver should be prohibited, but, referring to the book *T'ung tien*, we find that, at the commencement of the Liang dynasty (907 A.D.), the capital (Nanking) as well as Su-chou (San wu), Hu-pei (Hsing Ying), Hu-nan (Chiang-Hsiang), Ssu-ch'uan (Liang-yih), alone had the use of cash, and, in all the other provinces, the people carried on their commerce by means of cereals and silk, and in those provinces lying on the south, including Kwang si and Canton, Chiao chou and Kuang chou, the medium of exchange was exclusively gold and silver, and it is also found in the petition addressed by Han Yu, of the T'ang dynasty, that in Wu-ling, sales and purchases were effected only in silver. The address of Yuan Chên also refers to the fact that, south of the Ling mountains, gold and silver are used as money, but, outside of the province Pa, salt and silk are used as the circulating medium in commercial traffic and in Chien Wu Hsi mercury, vermilion and raw silk are used, and a sort of silk bonnet is also sometimes made to supply the deficiency of a circulating medium in the market."—*Journ. P.O.S.*, ii. 299–300.

"Yuen Chen, another great statesman, mentioned at about the same time that salt and pieces of silk were used as money in Szechuan. Cinnabar and quicksilver, he added, were used as money in Kuangsi, as also pieces of cloth and silk. At that time any valuable article which had a known price in the market could be bartered like coins elsewhere. It was in this way that silver came into extensive use. It was of a fixed value according to weight and the silver mines of Burma made it very convenient when the influence of the Chinese Government extended to that region."—*Edkins, Ch. Currency*, p. 2.

"In the book *Jih Chi Lu*, it is said that, before the dynasties of T'ang and Sung, the only medium of exchange that had been current between the government and people was copper cash, and silver had never come into use."—*Journ. P.O.S.*, ii. 298.

"Exchange in China is effected by means of pieces of copper, and there is no other coinage."—*Reinaud, Rel. des Voy.*, i. 33. *Cf. Renaudot*, p. 20.

"A little while after the short-lived apparition of paper-money, in the year 809 the quantity of money circulating in the capital was uncommonly slight, trade was dead, and the money still in circulation was no more in demand. Private persons tried to circulate silver money by working the silver mines in the *Wu-ling* mountains, but this was soon prohibited by government."—*Vissering*, p. 121.

[In 817 and the following years regulations were issued prohibiting the possession of more than a certain amount of money, but these proving ineffectual, a decree was issued in 829 ordering that figures of Buddha and temple ornaments should be inlaid with other substances and copper used only for mirrors, gongs, and a few other articles. The state of the currency at the close of the dynasty was a strong contrast to the bright promises of its beginning.]—*Vissering*, pp. 122–5.

"A thousand years ago the people in central China kept their accounts in copper cash, which at that time would in the market procure a much larger amount of clothing and provisions than now, and the inconvenience of copper on account of its relative weight would not be so much felt. They did not then change cash into silver in totalling up their daily and annual entries, because the change from copper to silver as a standard of weight had not yet been made."—*Edkins, Ch. Currency*, pp. 2–3.

Measures.—[A wooden cubit measure is referred to in *T'ung k'ao, Shih lei t'ung pien, c.* 75, *Ch'üan hêng pu*, p. 13*a*, and *Pai shih lei pien, Ko chi ching yüan, c.* 49, *Jih yung ch'i wu lei*, p. 5*a*, as having been made in 590.]

"The T'ang restored the decimal arrangement" [in the relations of the *ch'ih* and *ts'un*].—*Williams, Ch. Commercial Guide*, p. 283.

"M. Rondot calculates the long and short *ch'ih* of this [T'ang] dynasty to have been equal to 12·58415 in. and 10·05924 in. respectively."—*Ibid.* p. 283.

"At the present time 6 *ch'ih* 4 *ts'un* of the Chou made 1 *pu*."—*Yen fan lu, Ko chih ching yüan, c.* 49, *Jih yung ch'i wu lei*, p. 6*a*.

"In the 9th year [721] of the *K'ai Yüan* reign an imperial order was issued that the measure of capacity should be 10 *shêng* (pints) to one *tou* (bushel). [A measure of] one *tou* 3 *shêng* [capacity] was called a 'large *tou*.'"—*Ibid.* p. 3*a*.

[Copper was used as it was supposed not to be expanded or contracted by heat or cold.]—*Ibid.* p. 2*b*.

"In the time of the emperor T'ai Tsung of the T'ang dynasty, Chang Wên, the officer in charge of the standard, cast 360 copper *lü* [standard measures] and 2 copper *ho* [standard pecks]."—*T'ung K'ao, Shih lei t'ung pien, c.* 75, *Ch'üan hêng pu*, p. 12*a*.

907–960.

"In these times of commotion and bloodshed, the monetary history is confined to the abolishment of the existing and the introduction of all sorts of restrictive measures, which were as thoughtless and tyrannical as those" already described. In 938 a proclamation was issued permitting the people to cast money according to the amount of copper possessed. The inscription on this money was *T'ien Fu Yüan Pao*, read in a circle, beginning from the top to the left. In all the provinces the people were allowed to re-open the disused copper foundries for the purpose of melting copper ore. In 940, however, owing to the regulations having been infringed by the adulteration of the money with lead and tin, an imperial decree enacted that henceforth money should be cast by the state only.—*Vissering*, pp. 126–7. *Cf. Perny*, p. 219.

"When under the Later *Tseu* dynasty (951–60) there was again a great want of money, Buddhism was once more laid under requisition. But this time it was ordered that all persons throughout the kingdom should sacrifice to their country their Buddha figures, and what copper vessels, utensils, etc., they might be possessed of."—*Vissering*, p. 128. The money most in vogue bore the title *T'ang Kuei T'ung Pao* (*Perny*, p. 219).

"Before the bills of exchange were brought in circulation, the Chinese seem to have had another sort of paper currency, in some respects resembling our dock-warrants and bills of lading, bills conferring authority to receive a certain amount of government products, as salt, alum, tea, iron, etc. These were transposed from hand to hand like money, and had great credit with the people, as the lands and manufactories belonging to the state yielded a large quantity of productions; especially in the encampments where that last sort of bills was made use of to pay the purveyors who in their turn transferred them to their creditors. And so they circulated till at last they fell into the hands of a merchant who was in want of the articles the bill authorized him to receive, and consequently realized them at the government granaries. (From some vague allusions it also appears that the government discounted those bills and paid them in money, at places where no commodities were stored up.) When, however, besides these produce-receipts, there came other bills which could be exchanged for real money, and which did represent not only a certain sum and often a fractional sum as the produce-receipts, but were to be had of any amount and for even sums, they were generally preferred when payments were made, and it was not long before merchants and traders refused to accept the produce-receipts and compelled the government to shut in some encampments the offices for the issue of these notes. We read however that, in the time when the paper money was depreciated, those offices were opened again."—*Vissering*, pp. 169–70.

"In the time of the Later Chou [dynasty] there was an iron cubit [measure] which T'ai Tsu had ordered Su Ch'o to make."—*T'ung K'ao, Shih lei t'ung pien, c.* 75, *Ch'üan hêng pu*, p. 13*a*. And see p. 14*a*.

Sung Period (960 *to* 1280).—*Table VI.*

Money.—"The monetary system was completely re-organized. A new sort of copper money was made, bearing the legend of 'current treasure from the beginning of the *Sung* dynasty,' *Sung Yüan T'ung Pao*. The decrees by which people were forbidden to possess more than a certain amount of copper money were annulled, and in different parts of the country copper-foundries were built, bearing such promising names as 'The Eternal Prosperity,' 'The Eternal Peace,' 'The Long Repose,' 'The Flourishing Country,' 'The Treasures-producing Mint,' and iron foundries styled 'Beneficial to the People,' 'To the support of all,' etc. The two most remarkable events, however, recorded in the history of the money were (1) the introduction of the double standard, and (2) the issue of paper money."—*Vissering*, pp. 133–4.

"The first Emperor of the Sung dynasty (960 A.D.) established a bureau called *Pien ch'ien wu*, a sort of exchange bureau, and permitted the merchants to deposit cash at the *Tso ts'ang k'u*, and the receipts given for the sums thus deposited were used as a bill of exchange payable in various local currencies." "In the first year of Jen Tsung of the Sung dynasty, *Chiao tzŭ*, a kind of bond note of exchange was established in the province of Ih. When Chang Yung was appointed governor of that province, the people of Shu complained of the iron cash then in use being too heavy and being therefore very inconvenient to handle in their commercial transactions. It was decided that, every three years, there should be one period, and in sixty-five years twenty-two periods for exchanging cash into paper currency, which was called *Chiao tzŭ*. At first, the whole of the operation of exchange was entrusted to the care of wealthy tradesmen of the country, but as they gradually became poor after some number of years, many complaints were addressed to the government. The director of the general-transport bureau, Chang, petitioned the government to the effect that it would be far better to establish *Chiao tzŭ wu* (an exchange bureau of the government) than to trust the operation to private hands, in order that the amount to be so exchanged might be regulated and, at the same time, he recommended prohibiting the fabrication of paper currency by private establishments. The Emperor having approved the plan, gave the order for the bureau to be established at Ih Chou." "The amount of the capital to be employed for that purpose was fixed at 1,256,300 strings."—*Journ. P.O.S.*, ii. 266–7. See also *Vissering*, pp. 167, 171–2.

"When the Sŏng became masters of the whole of China, i.e., about the year 976, they issued first the coinage inscribed *Taĭ pĭn tŏng paò* [*T'ai p'ing t'ung pao*], and then another which bore as its inscription the years of the sovereign's reign with the addition of the characters *Tâng paò* [*Tang pao*], a custom which has been maintained from that time to the present day. . . . In Su-tchuen [Ssŭ Ch'uan] iron money continued to be chiefly used. The situation was such that it was necessary to tolerate this iron money. The average weight of these iron coins which circulated in the empire at that time was 3 gram. 242. In order to facilitate commerce the dynasty caused a considerable quantity of coins to be cast at regular intervals. About the year 970, the deficit in the public treasury caused a return to the plan adopted under the Tâng [T'ang], that is to say, to the *fei ch'ien*. A deposit bank was again established in which merchants could deposit their money and receive in exchange notes payable in the principal towns. These new notes were called *pien ch'ien*, i.e., 'convenient money.' This easy method of circulation proved a great success. . . . The cash of this period were inscribed with the date and the two characters *yüan pao*."—*Biot*, epit. *Perny, Append. du Dic. Fr.-Lat.-Ch.*, pp. 219–20.

"Great sums of money were required to provide for the large army which was maintained in the field all along the western frontier of China to resist the warlike Tartar tribes. Forges and foundries were accordingly erected at those places in the mountains where considerable quantities of metal were found. As, however, the mountains contained much iron and hardly any copper permission was obtained from the Central Board of Administration to cast iron money. Copper coins were also cast in Ssŭ Ch'uan and large iron ones in Shansi, but the casting of the latter was soon discontinued." ". . . There were circulating together: (1) large copper pieces of a metallic worth of 3 and a nominal value of 10 small copper coins. (2) small copper coins which generally commanded *agio*, when circulating together with small iron money. (3) small iron money which had no constant value." "As such a condition proved to be untenable, various measures were suggested to bring about a change." The most sensible advice was that "given by a committee appointed by the emperor to make an enquiry respecting the advantages and disadvantages arising from the use of the double standard. . . . The report of this committee suggests: (1) to fix a better ratio between the value of large and small copper money, and (2) to determine the relative value of copper and iron money." Moreover, the Emperor was advised to cease the building of state foundries on such a large scale. "The emperor consented to all this and made use of the advice given. The government went even further by estimating the relative value of the large and small currency of both copper and iron as 2 to 1. False coining was entirely discontinued, and the manifold complaints of suffered wrong, made since a long time, were not heard any more."—*Ibid.* pp. 137–42.

"It was principally in the western provinces of *Sse-ts'uen*, *Sen-si*, and in the eastern tea-districts of *Fu-kien*, that this iron money was employed in large quantities. . . . The relative worth of the two metals was about as 1 to 3·5. . . . The magistrates of the districts where iron money circulated perpetually complained that the money was so heavy that it was not possible to make use of it. . . . The weight of this iron money was likewise the cause that paper money was frequently used in those districts."—*Ibid.* pp. 134–6.

"By the year 997, there were 1,700,000 taels' worth of this paper (*pien ch'ien*) in circulation and in the year 1021, this sum had been increased by more than 1,300,000 taels."—*Ch. Repos.*, xx. 293.

"Since the period *T'ien-Sing* (1023–1032) the *Kiao-tsze* were limited to a fixed amount of 1,256,340 strings."—*Vissering*, p. 172.

"In the 2nd year (1069) it was ordered that in the district *Lu-tseu* [same as Lu-an fu, Shansi] a bank for the issue of *Kiao-tsze* should be established, because in the province of *Ho-tung* the transfer of iron money to the government as well as to private persons involved so much trouble and cost."—*Vissering*, p. 172.

[For the vicissitudes of the bills of exchange, salt receipts, etc., see *ibid.* pp. 172–7.]

"The measure which at length was resorted to [to reduce the congestion of iron money] and which solved the question in some degree at least, was to regulate the circulation of iron and copper money in such a way, that in some parts of the empire only copper money and in others again only iron money should be employed, by which the speculations on the relative value of the two metals, if not entirely, at any rate was prevented in the main." "Ma-twan-lin has . . . two . . . passages bearing upon this reform, and the fact that a period of more than a century has elapsed between the events he communicates (1075–1191) may serve as another evidence that the regulation, by which certain districts were bound down to the use of a certain sort of money, was the measure which was attended with the best results in the given circumstances."—*Ibid.* pp. 142–5.

"According to a statement given by Ma-twan-lin . . . it appears that about the middle of the 11th century more than 5½ million strings of money were fabricated a year in the whole empire; of these about 900,000 were iron money." A large proportion of the iron money, however, was counterfeit. "A second statement of about the year 1130 shows that since that time . . . less money, only 4 million strings, was cast in the empire."—*Ibid.* p. 149.

"Owing to the war the foundries in the Western provinces had produced hardly any money, and accordingly they had been shut up for awhile, for, though they had no work to do, the great number of officials retained their offices, and for this reason the cost of fabrication was so heavy that the government paid 2400 cash for the fabrication of one string of 1000 cash. Another reason why there was less money circulating, though not stated, must have been the gradually increasing issue of paper money."—*Ibid.* pp. 149–50.

[For Wang An-shih's system (1068) of state advances for the cultivation of fields, and the suspension of restrictions on the export of money abroad see *ibid.* pp. 150–3, and *Cf. Finance.*]

"Under the emperor Kautsung in A.D. 1131, it was attempted to make a military establishment at Wuchau, but as the requisite funds did not come in without great difficulty, the officers charged with the matter proposed to the Board of Revenue, to issue *kwan tsz'* or *due bills*, with which they could pay the sutlers of the troops; and which should be redeemable at a special office. Abuses soon crept into the details of this plan, and the people began to murmur. Later, and under the same reign, similar due bills to these were put into circulation in other provinces. During the reign of this same monarch, the Board of Revenue issued a new sort of paper money called *hwui tsz'* or *exchanges*; these were, at first, payable only in the province of Chehkiang and thereabouts, but they soon extended to all parts of the empire. . . . The *hwui tsz'* first issued were worth a string of a thousand cash ($1·33 nearly); but under the reign of Hiau-tsung in 1163, they were issued of the value of 500, 300, and 200 cash each. In five years, *i.e.*, up to the 7th month of the year 1166, there had already been sent out more than 28,000,000 taels' worth of these notes; and by the eleventh month of this year, this sum had been increased 15,600,000 taels. During the further sway of the Sung dynasty, the number of the *hwui tsz'* was constantly on the increase; and besides this description of note, there were some of the *kiau tsz'* still extant, and notes of private individuals current in the provinces; so that the country was inundated with paper notes, which were daily depreciated in value, in spite of all the modifications and changes the government adopted to augment their circulation."—*Ch. Repos.*, xx. 293–4.

[For details respecting the further history of the *hui tzŭ* see *ibid.* pp. 188–207. A *hui tzŭ* bank was established at Kiang Chou in 1167. The notes had ceased to circulate by 1195–1225.]

"The government continued to cast pieces of 2 *cash* and to take care as much as possible that the money remained in the country, but no law could stop the outflow, and the cunning merchants knew how to keep up their prosperous, though illegal, trade."—*Ibid.* p. 155.

"Ma-twan-lin's last fragment dates from the year 1210. . . . At that time money was cast, which had a metallic worth of 3 and a nominal value of 5 *cash*."—*Ibid.* p. 155.

A coin called, "little peace-money" was afterwards instituted and "circulated for a long time. It seems to have been good, but nothing interesting is communicated beyond its institution."—*Ibid.* p. 155, note.

"It is said . . . that in the first year of Chung t'ung (1260), in the reign of the first emperor (Kublai Khan), the note currency *Chiao ch'ao* was fabricated for the first time, silk being taken as the standard. For every 50 taels of silver, 1,000 taels' worth of silk notes was exchangeable, and the prices of all commodities were calculated on the base of silk. In the 10th month of the same year, the notes called *Chung t'ung yüan pao ch'ao* were made. The notes were of three kinds, viz.: those bearing the denomination of simply *Wên* (cash), composed of four kinds of notes of the value of 10, 20, 30, and 50 cash each; those of 100 cash denomination, composed respectively of 3 kinds of the value of 100, 200, and 500 cash each; and those called *Kuan* of which there were only 2 kinds, viz., notes of 1 *Kuan* and notes of 2 *Kuan*. The one *Kuan* note was equal in value to one tael in silver. In the 12th year of Chih Yüan (1275), the government made in addition to those above referred to, another kind of note of minor denomination called *Li ch'ao*. It was in three kinds having the values 2, 3, and 5 *Wên*."—*Journ. P.O.S.*, ii. 272–3. For description and history of various other issues of notes see pp. 267–70.

"Some provincial magistrates . . . lost their offices because of the assignats. After having tried for years to support and maintain (these notes), the people had no longer any confidence in them, but were positively afraid of them. For the payment for government purchases was made in paper, the fund of the salt manufactories consisted of paper, the salaries of all the officials were paid in paper, the soldiers received their pay in paper. Of the provinces and districts, already in arrear, there was not one that did not discharge its debts in paper. Copper money, which was seldom seen, was considered a treasure. The capital collected together in former days to supply the border fortifications was quite exhausted, and was a thing not even spoken of any more. So it was natural that the prices of commodities rose, while the value of the paper money fell more and more." This caused the people, "already disheartened, to lose all energy, the soldiers were continually anxious lest they should not get enough to eat, and the inferior officials in all parts of the empire raised complaints that they had not even enough to procure the common necessaries. All this was a result of the depreciation of the paper money." [Ma-tuan-lin.] "The assertion that paper money was one of the leading causes of the fall of the *Sung* dynasty is a thesis which will hardly be gainsaid by those who have read the history of this institution from its glorious beginning to its wretched end."—*Vissering*, pp. 207–8, 218.

Measures.—"The Sung went back to the division of 9 *ts'un* and 81 *fên*, since which the decimal system has prevailed."—*Williams, Ch. Commercial Guide*, p. 283.

[The *ch'ih* of this [Sung] dynasty is calculated by M. Rondot to have been equal to 10·05924 in. The ancient books give its value as 10·828 in.]—*Ibid.* p. 283. *Edkins* (*Journ. R.A.S.*, xviii. 20) says 10·625.

"The *ho chan ching piao ch'ih* (name of cubit) of the Sung dynasty was equal to one *ch'ih* 6 *fên* odd of the Chou *ch'ih*."—*Pai shih lei pien, Ko chih ching yüan*, c. 49, *Jih yung ch'i wu lei*, p. 6*a*. For other *ch'ih* see *ibid.* pp. 6*a*, 7*a*.

"In the year 1,072 a new land measurement was introduced, called *fang t'ien chih fa*. A square 1,000 *pu* each way was 4,166 *mu*, or about 700 acres; 16 *pu* were one *fang*."—*Ch. Rev.*, xv. 53.

[Wine was measured with a *chiao*—the predecessor of the modern *hu*.]—*Shih wu yüan shih, Ko chih ching yüan*, c. 51, *Jih yung ch'i wu lei*, p. 13*b*.

Kin.

"It is said in the history of the Chin dynasty, that, in the period of Chêng Yüan, the system of paper currency called *Ch'ao yin* came into use; and that the printing bureau for the fabrication of these notes as well as the bureau for exchange [of] *Chiao ch'ao* had then been established. . . . The function of the assistant director of this bureau consisted in signing the note and stamping it to certify its genuineness. It is said that the note was surrounded with an ornamental border, with flower figures on the upper part, and an extract from the law was written on it horizontally. On the left, some characters were printed and, on the right, the number was marked; on the outside of this number, was written in *Chuan shu*, that 'the fabricant of counterfeit notes is punishable with death, and every informant on discovery or arrester of persons guilty of this crime is to be recompensed with the reward of 300 Kuan, etc.' On the corner of the border under the number, were the words 'certified by the department of Finance and signed by the chief clerk or the director' and further the words 'printed by Imperial order.' Every sheet of the note was marked with the name of the place of issue in exchange for actual cash and indicated at the same time that at the bureau of such and such places the value might be redeemed in cash in return for the note. . . . The notes did not bear a fixed term and were put in circulation for indefinite periods. If the characters on the face of the note became effaced or darkened, or torn or worn out, such old notes were to be changed for new ones by the bureau of the district in which the bearer might happen to stay when the bearer of the note required cash to be paid in lieu of the note, or if he demanded a new note for the old one, he was to pay a certain amount of cash to defray the office expenses. The assistant director signed the note with the day, month, and year. The minister and other high public functionaries of the Financial department *Hu pu* signed their names and put the stamp on the word 'Paid out cash,' according to the ordinary rule to be observed under such circumstances."—*Journ. P.O.S.*, ii. 270–2.

Mongol Period (1280 *to* 1368).—*Table VII.*

"The History of the Yüan Dynasty states that in the 13th year of Shih Tsu it was forbidden to use small coins in Chiangnan. In the 1st moon of the 17th year a decree was issued calling in all the copper money of Chiang Huai. In the 6th moon the copper money of the Sung [dynasty] was also disused. In the 4th moon of the 19th year the plan was adopted of making the people borrow the money on interest [from the officials]—the standard rate being fixed at 3 *fên* (per tael). In the 22nd year it was decreed that all the copper money in the empire should be recalled, and in the 6th moon it was forbidden by imperial command to issue any copper money whatever. In the 23rd year it was prohibited to send copper money across the sea for purposes of trade."—*Yüan Shih*, Sect. *Ch'ih Huo Chih*, Comm. in *Vissering*.

"Paper money, in the form of bank-notes of from 50 to 1000 *cash*, was made current in 1285."—*Giles, Bio. Dic.*, p. 387.

In 1284 Kublai Khan "ordered the statesman Lu Shi-jung to draw up a plan for his consideration respecting the issue of new paper money. It took place in 1287, and after that the Mongols only thought of increasing the number of their notes in circulation, which they called *pau chau* or *precious bills*. Those rated at a thousand cash, issued between 1264 and 1294, replaced those valued at 5000 cash, which had been created during the years 1260–1263. They were fabricated from the bark of the paper mulberry (Broussonetia), and were a Chinese foot square. Those valued at 1000 cash during the years 1308–1311, took the place of those rated at 5000 cash during the years 1264–1294; they were worth a tael of pure silver, or a mace of pure gold. In this way, the government was reimbursed for the capital of the first issue, by a fifth of their value, and with a twentieth of the second emission. Before the close of the dynasty, this paper money had already lost much of its credit; and in 1351, government had been obliged still to make other changes in the system, but all its efforts and schemes were insufficient to raise their value, and the Mongols were driven out of China, which they had beggared with their *pau chau*."—*Ch. Repos.*, xx. 295.

"In the 9th moon of the 2nd year [1309] of the *Chih Ta* [period] it was imperially decreed that people going over the sea in junks to trade with gold, silver, and copper money should not be allowed to do so. In the 10th moon the rules for the use of copper money were promulgated throughout the empire. In the 1st moon of the 3rd year it was ordered that the coinage of previous dynasties should be used together (*lit.*, mixed) with the *Chih-ta* coins. In the 2nd moon the *Shang Shu Shêng* [President of the Bureau for regulating coinage] stated that the *Chih Ta* notes and the copper money should have the same relative values; and in the 8th moon an imperial decree authorizing the use of copper money on this system was published in the capital and provinces. In the 11th moon the *Shang Shu Shêng* issued a further amount of *Chih Ta* notes, which were to be used with the copper money [in payments] in equal parts."—*Yüan Shih*, Sect. *Ch'ih Huo Chih*, Comm. in *Vissering*.

"The shape of coins instituted at the Nine Treasuries during the reign of king Ch'êng of the Chou continued during subsequent dynasties without being at any time discarded. But in the Yüan dynasty, although the *chiao ch'ao* [exchange bonds] and *pao ch'ao* [government notes] were used [by the people] as *cash*, metal money was no longer coined. In the third year of the reign of Wu Ti (style of reign *Chih Ta*) a coinage system was for the first time instituted, and the *Tzŭ Kuo* and *Ch'üan Huo* offices established to control it. This money was called *Chih Ta T'ung Pao*, one cash of which was equal to a thousandth part of a tael in *Chih Ta* silver notes; and *Ta Yüan T'ung Pao*, of which one cash was equal to 10 cash of the *Chih Ta T'ung Pao* coinage. The copper money of previous dynasties had all [been made] according to the ancient regulations and circulated together with the *Chih Ta* coins; and the *Tang Wu*, *Tang San*, and *Chê Êrh* coins were also used with the older money. In the following year, because the coined money was not equal to the amount required for use, Jên Tsung issued a decree ordering the old and new (money) to be used together; but abuses increased greatly, so that the silver *ch'ao* notes together with the old and new copper money fell out of use, and the departments which had been established [for the purpose of controlling the currency] were abolished."—*Ibid.* Also in *Perny*, p. 220, and *Journ. P.O.S.*, ii. 274.

In 1343 it "was proposed that the system of *Ch'ao* should be modified and the president of the Li-pu in assenting to the opinion of the Prime Minister To-To proposed that a note of one *Kuan wen* should be made exchangeable into 1,000 copper cash (*Wên*)."—*Journ. P.O.S.*, ii. 275.

"In 1350 the Government issued inconvertible paper-money, a step that paralysed trade and reduced the people to barter."—*Giles, Bio. Dic.*, p. 742.

"Ma-twan-lin has brought his 'Examination' down only to this time [end of Sung dynasty], but from *Wang-k'i's* Continuation . . . we learn how one issue succeeded another, how every time new names were invented to delude the people, solemn promises were made that henceforth the government would fulfil what it had charged itself with, and how the result was that again and again old debts were paid by incurring new in order to defer the impending bankruptcy of the state."—*Vissering*, p. 217.

[For measures see previous period.]

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

Money.—T'ai Tsu "fixed the coinage upon a proper basis, government notes and *cash* being equally current."—*Giles, Bio. Dic*, p. 194.

"The first care of the founder of the Mîn [Ming] dynasty was to cast a metal coin, of copper, on the ancient model. The government reserved to itself the right of coining it. These copper coins were of five kinds. In spite, however, of the advantages which commercial transactions derived from the new coinage, a certain uneasiness was felt concerning it, which it became necessary to counteract. With this object the imperial council caused bank notes to be made which were called *Tá mîn paò tchaò* [*Ta Ming Pao Ch'ao*]. As these notes at length came to be to some extent discredited, the defensive measure of using gold and silver in exchanges was renewed in 1403. The most severe penalties were enacted against those who violated the rules. Under each emperor of this dynasty copper coins were cast at regular intervals, bearing the *niên haŏ* [*nien hao*, year] with the words *Tōng paò* [*T'ung Pao*]. . . . Since that time the coining of money in China has undergone but slight variations in weight and form."—*Biot*, epit. *Perny*, *Append. du Dic. Fr.-Lat.-Ch.*, p. 220. See also *Simcox*, ii. 253; *Vissering* (for descriptions of the various issues of coins), and *Ch. Repos.*, xx. 295.

"Their current money of the kingdom is made of gold and silver, without any sign or print, but goeth by weight; so that all men carry a balances with them, and little pieces of silver and gold. . . . And for things of a greater quantity, they have bigger balances in their houses, and weights, that are sealed [=stamped], for to give to every man that which is theirs, for therein the justices have great care. In the government of Chincheou they have copper money coined, but it is nothing worth out of that province" [Fuh kien?].—*Mendoza, Hist.*, i. 34, 35.

"Copper money continued to be cast, and worn-out paper was called in from time to time, though in 1450, by a supreme absurdity, the use of copper money itself was prohibited for a time. Base money made of tin was in circulation, and in 1467 the ordinance of Tai-tsou was revived, requiring the taxes to be paid half in copper and half in paper. . . . Paper money, however much depreciated, like copper money, however much debased, can be made at a pinch to serve the purpose of a medium of exchange; some such medium was necessary up to a certain point, though Chinese ingenuity reduced the necessity to a minimum. And the supply was liable to fall short even of the modest, irreducible demand, so that if the cultivators had to pay any part of their taxes in paper, the holders of it could make their own terms."—*Simcox*, ii. 253.

"After this, nothing more is heard of the Ming paper, and little of currency troubles, perhaps because the use, as at present, of uncoined silver for commercial purposes became general. In the middle of the 16th century, an emperor is reported to have said that each of his predecessors had coined copper money to the value of about £3,000,000 sterling, and that he proposed to issue three times that amount. No fresh issues of paper are mentioned, but the old ones seem to have remained in circulation till they died a natural death. According to M. Biot, an elementary arithmetic, published in 1593, speaks of the paper *tchao* and copper cash as both legal tender, though the examples given in the work are of such different date and origin that they give no reliable clue to their comparative value."—*Ibid.* ii. 253–4.

"At and after this date various regulations were issued respecting the use of silver in small bars, from which it appears that all attempts to restrain the use of silver for exchange had been given up. And with the use of silver in all transactions of importance, of course the demand for copper became less clamorous; and the existing supply may have proved fairly adequate, when its use was restricted to the petty trading of the masses. The circulation of paper was not formally put a stop to until the present dynasty, but the subsisting solution

such as it is, of the currency problem must have been worked out gradually by the unaided ingenuity of the commercial classes during the last century and a half of Ming rule."—*Ibid.* ii. 254.

"It was . . . about 500 years ago, that silver began to be regularly sent to the capital as a representative of the taxes from the provinces, and gradually took the place of paper money, which had followed on the invention of block printing in the tenth century."—*Edkins, Chinese Currency*, p. 25. See also pp. 13, 28.

"In proportion as silver took" the place of copper "coined copper was no longer in so much request. Official salaries, for example, entirely ceased to be paid in cash."—*Ibid.* p. 28.

"In 1555 the casting of cash in Yünnan was commenced, on account of copper being produced there in abundance. The disuse of paper made a new supply both of silver and of copper cash a necessity, and from that time forward both metals have been needed."—*Ibid.* p. 13.

"Under the old regulations *cash* were coined at the *Pao Yüan Chü* at Nanking and at all the provincial treasuries, as follows:—

At 21 mints in Peking there were coined yearly				12,830,400	*cash.*
„ 15½	„	Kuanghsi	„	9,039,600	„
„ 39½	„	Shensi	„	23,036,400	„
„ 19½	„	Kuangtung	„	11,372,400	„
„ 10	„	Ssŭch'uan	„	5,832,000	„
„ 22½	„	Shantung	„	12,122,000	„
„ 40	„	Shansi	„	23,328,000	„
„ 22½	„	Honan	„	13,122,000	„
„ 21	„	Chekiang	„	11,664,000	„
„ 115	„	Kianghsi	„	67,068,000	„

The fixed yearly output [in Yünnan] was 33,012,000 *cash.*"—*Ming Hui Tien*, Sect., in *Vissering.*

"We are told that in 1578 the government received from Yünnan 13,764 taels in paper money, 944 piculs of grain, and 5,769 strings of shells. Two hundred years later the amount received in hemp, cloth and silver amounted to 14,801 taels of this last metal. The strings of shells used as money had disappeared. The cumbersome grain tribute in heavy bags had become changed for silver. But hemp and cloth were still received by the government tax collector because they could be exchanged for silver and the expense of conveyance of these articles was not very great."—*Edkins, Ch. Currency*, p. 12.

"In the 2nd year [1629] of Ch'ung Chêng, all the mints being open, the amount of copper used increased greatly, and copper consequently became scarce. Chêng San-chün requested that an official might be sent to buy copper. Chu Ta-shou . . . decided upon the model for the coins, each cash to be of the [full] weight of 1 *mace* and every 1000 of the [full] weight of 1 *tael.* The Nanking *cash* being light and thin it was fixed that each *cash* should have a weight of 8 *fên* (*candareens*). Nevertheless, abuses increased day by day, and the greater part of the coins were made mixed with lead and sand, so that [a column of] 100 did not fill up [the length of] an inch, and if thrown down abruptly they broke to pieces."—*Ming hui tien*, quot. *ibid.* p. 12.

[Parker says that the Yung Ch'ang people used cowries for small coin during the Ming dynasty, as the Laotiens do to-day.]—*Ch. Rev.*, xx. 39.

Measures.—[M. Rondot calculates the *ch'ao ch'ih*, *tung ch'ih*, and *chüeh ch'ih* of this period to have been equal to 13·422 in., 12·8754 in., and 12·58415 in. respectively.]—*Williams, Ch. Commercial Guide*, p. 283.

Manchu Period (1644 *to* —).—*Table IX.*

Money.—"Under the present dynasty . . . coins have been cast in greater or less quantity under each emperor. In some provinces attempts have been made to introduce large cash worth ten of the small ones. But the people refused so steadfastly to use them that the idea had to be abandoned."—*Biot*, epit. *Perny, Appendice du Dictionnaire Français-Latin-Chinois*, p. 220. For representations of the various coins of the Manchu period, *v. Journ. N.-C.B.R.A.S.*, 1858 and 1880.

"The different denominations of money are: 1. 布。幣。刀。 *Pu*, *pi* and *tao*. . . . Together with the knife-shaped coin the character 刀 as a denomination of currency is lost. 布 and 幣 (hempen and silk cloth), however, are still extant . . . and the second word, used by itself or as part of a compound, has become the standard term for currency."—*Ch. Repos.*, ii. 444.

"The only coin of the Chinese is called *cash* (or *tseën*), which is made of 6 parts of copper and 4 of lead. The coins are thin and circular, and nearly an inch in diameter, having a square hole in the centre for the convenience of tying them together, with a raised edge both around the outside and the hole. Those now in use have the name of the emperor stamped upon them in whose reign they were cast. Notwithstanding their little value they are much adulterated with spelter; yet on account of their convenience in paying small sums and for common use they generally bear a premium; about 1100 can commonly be obtained for a dollar. The use of silver coin, however, appears to be increasing among the Chinese, as by recent accounts we learn that silver dollars have been made in Fuhkeën and other places, contrary to the laws of the empire."—*Ibid.* ii. 445. See also i. 14; and *Williams, Ch. Commercial Guide*, p. 265.

"Under the present dynasty, the system of paper currency was put in operation for the first time in the 8th year of Shun Chih (1651), when notes worth about 128,172 *Kuan* and some odd numbers were fabricated and, afterwards, every year this fixed amount was issued until the 18th year, when the fabrication was entirely stopped."—*Journ. P.O.S.*, ii. 278. For description of the paper money, usually of denominations of hundreds of cash up to a thousand, issued by native mercantile firms, see *Williams, Midd. King.*, i. 132; *Ch. Repos.*, xx. 289–92.

"The absence of a national coinage in the precious metals among so commercial a people as the Chinese, is so singular an exception to the general usage, even of Asiatic nations, that one is led to inquire into the reasons for it; and his surprise is rather increased to find that the cause is to be found in the commercial freedom which has done so much to elevate the people. The Government on the one hand is not strong enough everywhere in its wide domain to punish those subjects who counterfeit its coin; and on the other hand, not honest enough itself to issue pieces of a uniform standard for a length of years, and thereby obtain the confidence of its subjects. It will not receive debased metal in payment of taxes, and it is not able to force tax-payers to take adulterated coin. The result has been that all parties have adopted a form of bullion that partakes of the nature of coin in the single point, that the pieces are of a known weight and purity; and yet which can be tested without much loss, and bears no effigy to authenticate its origin."—*Williams, Ch. Commercial Guide*, p. 265. See also pp. 266–7.

In Maimaichen and Kiakhta "the *kirpich* or brick of tea is the money unit and standard of value, in which the price of every other kind of exchangeable property is expressed."—*Erman, Travels in Siberia*, ii. 182.

"In many places [in Ssŭ Ch'uan, Kuei Chou, and Hu Pei] the salt, when of the hard kind like blocks of stone, is practically small money, and its retail value varies unerringly so many fractions of a farthing per pound according to the freight rates of boats in demand and the number of miles coolies have to walk. A lost traveller could almost grope his way about the country by simply asking the retail price at each village, and the next one in any direction."—*Parker, China*, p. 218.

[For the issue of a native dollar in Fu Kien in 1838 see *Williams, Ch. Commercial Guide*, p. 270.]

"In the reign Hsienfêng [1851–62] the government became so impoverished that it resorted to many expedients to revive its credit; iron cash and paper notes were substituted for the copper cash. The former were cast of the full weight of one mace, and larger ones bearing the different values of 10, 20, 50, and 100 cash each, were made at Peking in 1853 and 1854. A few tons of this wretched emission were forced upon the people, but the attempt signally failed as a whole, and the iron cash remained at the capital in the hands of the officials, who had wasted fully a million of taels in the foolish enterprise. Since the opening of the Japanese trade many tons of small copper cash have been imported into China, where they pass current with others."—*Ibid.* p. 267.

"Spanish, Mexican, and South American dollars (though not acknowledged by the Government) are employed as a commercial medium throughout the maritime provinces; but the habit of stamping them soon takes from them one of the chief advantages of coined money—that of having a fixed and certain weight. The broken dollars in circulation, being always taken by their weight, do not differ materially from sycee silver. The only difference is, that the former has a fixed, the latter an uncertain, standard of purity; and dishonesty practised with the former does not requite the labor, and is more readily detected than when practised with the solid ingots of the latter."—*Ibid.* p. 267.

"The *nominal moneys* of account are the 兩 *liang*, 錢 *ch'ien*, 分 *fên*, and 厘 *li*, called by foreigners *tael*, *mace*, *candareen*, and *cash*, the proportion of which, one to the other, is decimal. The candareen is equal, *only in accounts*, to ten cash."—*Ibid.* pp. 267–8.

"The *circulating medium* in transactions with foreigners at the open ports is chiefly whole and broken dollars; the value of the dollar in relation to the tael varies in different transactions. In calculations, or accounts between foreigners and merchants, and almost always in bargains among the Chinese themselves, taels are converted into dollars at the rate of" taels 715 to 720 per $1,000.—*Ibid.* p. 268.

"The *value of the tael* in relation to sterling money was reckoned by the East India Company at 6*s.* 8*d.*, but its intrinsic value varies according to the price paid for dollars per ounce in London."—*Ibid.* pp. 268–9.

"Transactions at Canton [and other ports] are now conducted by means of Mexican dollars, with a continually increasing proportion of bank notes from Hongkong."—*Ibid.* p. 269. For counterfeiting see p. 270.

"Since that time [1036] the influence of silver has been increasing to the present day, for during this century the change of grain to silver in the contributions of the people to the expense of the Government has in many localities been made for the first time."—*Edkins, Ch. Currency*, p. 2.

"Even now soldiers are paid in grain when they are upon the old *régime*, but the new drilled troops are paid in silver."—*Ibid.* p. 2.

"The *taxes are paid both in money and kind.* According to the regulations concerning *coinage*, there are foundries and mints, where the metal is prepared and cast, and also store-houses in which the coin is deposited, until required for public service. The quantity of metal coined in the former, and the period of its issue from the latter, are fixed by the Board of Revenue, 'in order that the successive supplies of coin for the use of the people may correspond with their wants, and be regulated according to the market-prices of gold, silver, grain, and other articles in general use and consumption.'" . . . "On account of the inconvenience which would attend the payment of large sums in their coin, of which they have only one kind (the *tsëen*, or cash), and as paper currency is not in use, ingots of silver, of one and of ten Chinese ounces (*lëang* or taels) weight, are used in payments to government. Gold is also used—whoever has the charge of collecting or receiving money due to government 'shall be answerable for the delivery of the same in no other than perfectly pure bullion, whether gold or silver.'"—*Ch. Repos.*, ii. 68.

"There are some bankers not connected with ordinary mercantile business; but the majority are either agents, drawable at will, in which case no interest is allowed; or they take money at an interest not exceeding 12 per cent., in which case some days' notice must be given before any portion can be withdrawn. They do not appear to differ materially from similar establishments in Europe; but they are not chartered or privileged banking companies. Paper money was formerly issued by the government, but not at present in its own name or guaranty, though no restrictions are placed on its circulation." "Promissory notes circulate with nearly the same facility as in Europe. . . . At Peking, Tientsin, and all important towns at the north, the rate of exchange between copper cash, bank notes, and sycee, is settled daily by agreement among the bankers."—*Williams, Ch. Commercial Guide*, pp. 271–2.

"Nearly allied to the banks are the establishments of *pawnbrokers*, which are very numerous in China. The licensed ones are of three classes,"—with redeeming periods of 3, 2, and 1 year.—*Ibid.* p. 273.

"The rate of *interest* for ordinary loans depends, in China, as everywhere else, on the risks of property; but nowhere in the empire does it reach the legal limit. At Canton, the rate ranges from 10 to 15 per cent. per annum according to circumstances, and 12 per cent. if no special agreement is made. On loans made on pledges, if a small amount, the legal rate is usually charged; and this usage throughout the empire is pretty uniform, so far as can be learned."—*Ibid.* p. 273.

"Bullion is rated by its fineness, which is expressed by dividing the weight into a hundred parts, called touches. If gold is said to be 94 or 98 touch, it is known to have 6 or 2 parts of alloy; the remainder is pure metal. Silver is estimated in the same manner; and without alloy, or nearly so, is called *sycee*, which bears a premium according to its purity. It is cast into ingots (by the Chinese called shoes, from their shape)."—*Ch. Repos.*, ii. 445.

"*Gold* and *silver* could not legally be exported from China, except in foreign coins, but by the treaties, treasure was made free of all duty."—*Williams, Ch. Commercial Guide*, p. 274.

"The depreciation of copper for purchasing articles in the market in 800 years has been such that five cash now are required to buy what one cash would have bought then. . . . If it be asked what are the causes of this great diminution in the purchasing power of copper cash, it may be replied that silver in the Ming dynasty became its competitor. In proportion as silver took its place, coined copper was no longer in so much request."—*Edkins, Ch. Currency*, pp. 27–8.

"On the whole it is quite clear that the value of silver if judged by gold as the standard has gone down in proportion to the growth of foreign trade. Silver became cheaper as more was imported."—*Ibid.* p. 27.

"The value of silver in copper cash has gone through great vicissitudes. It has been three thousand and it has been one thousand taels."—*Ibid.* p. 13.

[For a table of money weights and description of 5 kinds of scales see *Williams, Ch. Commercial Guide*, pp. 274–5.]

Weights and Measures.—"Chinese weights and grain measures, and the linear, long, and land measures, all vary in different parts of the country; but as a general rule they are the largest and longest in the southern provinces. The *kin* [*chin*] decreases in weight, the *ch'ih* in length, the *mau* in area, and the *tau* in quantity, as one approaches the capital, though exceptions are not uncommon."—*Ibid.* p. 278.

"The use and inspection of standard weights and measures in China is prescribed by law, both upon officials and traders, under penalty." "In A.D. 1704, not many years after the publication of a law requiring uniformity of weights and measures, that law had already come to be disregarded." "At the present day it would not, perhaps, be too much to say that each shopkeeper recognises no standard, whether of weights or measures, but his own, which again, he considers himself at liberty to change at will. At the same time a trade standard is usually adopted by the local guild to which he belongs, and to this standard competition often obliges him to approximate. The system, or want of it, is understood by his customers, and no great harm done, beyond making bargaining more complicated. Some examples of these local usages . . . will be found in Dr. Williams' Chinese Commercial Guide, Ch. v."—*Report on the Weights and Measures of China*, p. 3. A uniform system is insisted on in matters affecting the revenue (pp. 3–4).

Measures of Weight.—"1. Avoirdupois—

[10 millet grains	=	1 *lei*
10 *lei*	=	1 *chu*
24 *chu*	=	1 *liang* = 1·3 oz. av.]
16 *liang* ('taels')	=	1 *chin* ('catty') = 1·3 lbs.
[30 *chin*	=	1 *chün*
4 *chün*	=	1 *shih* (cwt. lit. 'stone')]
100 *chin*	=	1 *tan* ('picul') = 133·3 lbs."

"The sub-divisions of the *liang* ('tael') are nominal. The only dimensions in practical use are the *liang* or 'tael,' the *chin* or 'catty,' and the *tan* or 'picul.' Valuables are weighed by Silver Measure (*v. infra*). The general ratios between the tael, catty, and picul are those given above, but these may vary locally."

"2. Silver Measure—

10 *hu*	= 1 *ssŭ*	10 *li*	= 1 *fên*
10 *ssŭ*	= 1 *hao*	10 *fên*	= 1 *ch'ien*
10 *hao*	= 1 *li*	10 *ch'ien*	= 1 *liang.*"

"The standard of value in China . . . is a *liang* (or ounce) weight of pure silver. . . . The *ch'ien*, *fên*, and *li*, are commonly rendered 'mace,' 'candareen,' and 'cash' respectively; but . . . the *fên* and its sub-divisions are really names of decimal places; so that *fên* = 'tenths,' *li* = 'hundredths,' and so on."—*Report on the Weights and Measures of Ch.*, pp. 8–9. See also *Williams, Ch. Commercial Guide*, pp. 279–81; and *ibid.* for Biot's calculations from the weight of coins, as to the weight of the catty in the different dynasties.

"The Chinese use three instruments for weighing, to wit, balances, steelyards, and money-scales."—*Ibid.* pp. 278–9. See the descriptions given in *ibid.* and in *Report on the Weights and Measures of Ch.*, p. 5.

Measures of Length.—"1. Linear Measure:

[1 *fên* is 1 *li* (grain)]

10 *fên*	= 1 *ts'un*	....	=	·1 *ch'ih* =	1·41 inches
10 *ts'un*	.....	=	1 *ch'ih* =	14·1	„
2½ *ch'ih*	.....	=	1 *pu*		
2 *pu*	.....	=	1 *kung*		
2 *kung*	.....	=	1 *chang*		
10 *ch'ih*	= 1 *chang*	=	10 *ch'ih* =	141	„
10 *chang*	= 1 *yin*	=	100 *ch'ih* =	1,410	„

"The unit is the *ch'ih* ('covid'), or Chinese foot. The *pu* (pace), and *kung* (bow), are used in land measurement (*v. Area*). The *pu* is variously given as the half, and as the equivalent of the *kung*, according as it is estimated to be the distance from right foot-print to left foot-print of a man walking steadily, or from right foot-print to right foot-print. At Foochow, however, in land-surveying,

5 *ch'ih* = 1 *pu*
5 *ch'ih* 6 *ts'un* [5·6 *ch'ih*] = 1 *kung.*

"2.—Itinerary Measure:

5 *chih* = 1 *pu*
360 *pu* = 1 *li*
10 *li* = 1 *t'ang-hsün*
250 *li* = 1 *tu* or degree."

"The unit is the *li*, 100 of which make a day's journey. As the distance traversed must depend on the nature of the ground, the value of a *li* varies. Thus in a mountainous country, the distance between two points may be estimated as either two or five *li*, according as the traveller is ascending or descending. At every tenth *li* (of ascent) is a resting-place or guard-house (*t'ang-hsün*)." "The formula 250 *li* = 1 *tu*, or degree, is of foreign origin, having been introduced by the Catholic missionaries attached to the Court in the 18th century."

Area.—"Land Measure.

[5 *ch'ih* = 1 *kung*
2 *kung* = 1 *chang.*—*v. supra, Length.*]
1 square *chang* = 4 sq. *kung* = 1 *ching* = [121 sq. ft.]
15 *ching* = 1 *chüo* = [1,815 sq. ft.]
4 *chüo* = 1 *mou* = [7,260 „]
100 *mou* = 1 *ch'ing* = [72,600 „]

The *mou* is variously described as an area =

240 *kung* long × 1 *kung* broad.
or 120 „ „ × 2 „ „
or 15 „ „ × 16 „ „

"Its precise dimensions would necessarily be determined by the length of the *kung* taken as a standard. At Shanghai the official *kung* was stated to be, in 1861, 66 inches long; thus making the *mou* = 7,260 sq. ft. On this basis land is still measured by the Chinese officials; but the *mou* adopted by the Municipal Council, and used in transactions between natives and foreigners within the Settlements = 6,600 sq. ft." "The sub-multiples of the *mou*, as given in this table, are not usually employed in practice; but the *mou* being taken as the unit, is subdivided, in title-deeds, on the decimal system." 4. Cubic Measure.—A regularly graduated scale for measuring solids does not obtain in practice. In buying earth or stone however (when not, as commonly, bought by the load), and in measuring timber rafts for taxing purposes,

1 *fang* or *ma* = 1 *chang* × 1 *chang* × 1 *ch'ih*
= 100 cubic *ch'ih*."—

Ibid. pp. 7–8. And see *Williams*, pp. 287–8; *Ch. Rev.*, xii. 512 (measuring land with a string).

"The *ch'ih* differs according to the province and the prefecture, the city and the ward, the craft and the usage; a result of the wide expanse of the empire, and the disregard or ignorance of the laws among its people. Some of these are derived from ancient official *ch'ih*, but the majority seem rather to be the caprice of custom in the region where they are found."—*Williams, Ch. Commercial Guide*, p. 284.

[For different calculations of the length of the *ch'ih* see *Report on the Weights and Measures of China*, pp. 4–5, and *Williams*, pp. 286–7.]

[For a table of measures for long distances see *Williams, Ch. Commercial Guide*, p. 286.]

Capacity.—Measures of capacity "consist of a measure based on the musical *ch'ih* (f), known as the '*Chia* Measure,' and of another, the 'Measure of the Board of Revenue,' which is based on the standard *ch'ih* (ϕ)—

[f = musical foot; ϕ = standard foot; ϕ^3 = cubic content of standard foot; f^3 = cubic content of musical foot.]

1 *hu* = 10 *tou* = 1·62 f^3 = 8·6093442 ϕ^3
1 *tou* (*chia*) = ·162 f^3 = ·086093442 ϕ^3
1 *shêng* = 1 *tou* = ·0162 f^3 = ·0086093442 ϕ^3
1 *ho* = ·01 *tou* = ·00162 f^3 = ·00086093442 ϕ^3
1 *yo* = ·005 *tou* = ·00081 f^3 = ·00043046721 ϕ^3

"To reduce chia *tou* to Revenue *tou* multiply by ·2724."—*Report on the Weights and Measures of China*, p. 5.

"[120 grains of millet fill one *shao* (spoon)
10 *shao* = 1 *yo*]
2 *yo* = 1 *ho*
10 *ho* = 1 *shêng* (pint)
10 *shêng* = 1 *tou* (peck)
5 *tou* = 1 *hu* (bushel)
(10 *tou* = 1 *tan* or 'picul')"

"There are certain nominal sub-divisions of the *yo* which are given by some writers, but they are of little credibility or interest."

"The number of *tou* in a *hu* varies as follows:

Chia measure (old reckoning) 1 *hu* = 10 *tou*.
„ „ (modern „) „ = 2·72 „
Granary „ („ „) „ = 5 „

"Moreover, in some of the provinces (as in Kiangsu) the *hu* = 2·5 *tou*."

"Measures of capacity, except in connection with the public granaries, are apparently disappearing from use, since at the present time even fluids, such as milk and oil, are sold by weight rather than by measure."—*Ibid.* p. 8. For a more extensive table, including some measures not in use, see *Williams*, pp. 281–2.

"*Miscellaneous Measures.*—Sufficient data for a proper classification of these are not to hand;" those given are in use at Chinkiang.

"1. Paper—

100 *chang* (sheets) = 1 *tao* (knife)
50, 100, 150 *tao* [according to quality] = 1 *k'un* (bale).

"2. Porcelain—

8 or 10 cups = 1 *tsa*
128 pieces = 1 *chê* or *t'ung*.

"3. Salt—

88 *catties* = 1 *pao* (bag)
8 *pao* = 1 *yin* (permit)
500 *yin* = 1 *p'iao* (certificate)."

"These are the amounts given for Huai-an salt; for Chêkiang salt, 77 catties = 1 *pao*, and 6 *pao* = 1 *yin*."—*Report on the Weights and Measures of China*, p. 9.

PRODUCTION.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

Hsi Chung, 20th cent. B.C., is said "to have been the first to employ horses as draught animals."—*Giles, Bio. Dic.*, p. 269.

"They [Huang Ti, Yao, and Shun] used oxen (in carts) and yoked horses (to chariots), thus providing for the carriage of what was heavy, and for distant journeys,—thereby benefiting all under the sky."—*I ching*, App. III. Sect. II. ch. 2, 17; *Legge, Yi King*, p. 384.

[The pestle and mortar are mentioned in *ibid.* ch. 2, 19.]

"The Chinese from the most ancient times have cultivated the art of welding clay, and they claim the invention of the potter's wheel, like most of the great nations of antiquity. It is generally ascribed by them to the ancient emperor Shun . . .; but some attribute it to his yet more fabulous predecessor Huang-ti, who is given a Director of Pottery among the other officers of his court."—*Journ. P.O.S.*, i. 67.

[The *Shih ching* (III. ii. VI. 6) speaks of mines of iron worked in Shen Si by Duke Liu in the 18th century before our era.]

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

"Shu Chün, grandson of Hou Chi, first used the ox in ploughing." The Commentary says: " . . . using the ox in agriculture originated with Shu Chün."—*Shan hai ching, Ko chih ching yüan*, *c.* 48, *Kêng chih ch'i wu lei*, p. 1*b*. The horse was also used as a beast of burden.

[A wooden carriage-driver is mentioned in *Shih wên lei chü, Yüan chien lei hau*, *c.* 325, *Ch'iao i pu*, p. 10*b*.]

[The loom, with the cylinder for the warp, and the shuttle of the woof are mentioned in *Shih ching*, II. v. IX. 2.]

[Grain was ground in mills.]—*Ko chih ching yüan*, *c.* 52, *Jih yung ch'i wu lei*, p. 7*a*.

[Hirth says that the iron industry of China assumed important dimensions during the centuries which followed the introduction of the monopoly by Kwan Chung (d. 645 B.C.).]—*Journ. N.-C.B.R.A.S.*, N.S. xxii. 57–8. But see p. 58 (note) where the Ch'in dynasty (255–206) is given as the date from which it came into prominence.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

[Chao Kuo, an official under the Emperor Wu Ti of the Han dynasty, is said by some to have been the first to substitute oxen for human labour in ploughing.]—*Giles, Bio. Dic.*, p. 71.

"Production was almost at a standstill."—*Ssŭ-ma Ch'ien*, quot. *Giles, Hist. of Ch. Lit.*, p. 103.

"During the Han dynasty the horse deteriorated with everything else; in the south the growing pressure of population and the increase of waterways probably crushed him out of existence as a coadjutor of man in the labour market."—*Hong Kong Daily Press*, Sept. 19th, 1895.

"When the poet Tu was prefect of Nan Yang, he made a hydraulic machine to cast agricultural implements. It produced a great effect with little labour, and the people found it a great convenience."—*Hou Han shu, Ko chih ching yüan*, *c.* 48, *Kêng chih ch'i wu lei*, p. 11*b*.

[A seven-wheel fan, turned by a man, is mentioned in *Hsü po wu chih, Yüan chien lei han*, *c.* 357, *Ch'an yeh pu*, p. 30*b*.]

[A machine was used for sowing grain.]—*Giles, Dic.*, No. 7348.

Period of Disruption (221 *to* 589).—*Table IV.*

"Ma Chün was the most skilful official in the world. He lived in the capital [of the Wei state] where there were many places suitable for making gardens, but no water to water them. Consequently he made a 'water-mill' (*fan ch'ê*), and got children to turn it; the water [thus raised] could pour out by itself [on the fields or gardens] in a continuous stream. It was a hundred times better than the ones commonly in use."—*Wei lüeh, Ko chih ching yüan*, *c.* 48, *Kêng chih ch'i wu lei*, p. 7*a*.

"Tsu Ch'ung-Chih made a wooden ox and walking horse on the pattern of Chu-Kou Liang's [used for carrying grain]; he made a machine which worked without wind or hydraulic force, moving of itself by means of the engine without needing human labour."—*Pei shih, Yüan chien lei han*, *c.* 357, *Ch'an yeh pu*, p. 28*a*.

From the Restoration of Unity to the end of the Five Dynasties (589 *to* 960).—*Table V.*

"Beasts of burden are numerous among the Chinese; they do not know the Arab horse, but they have horses of another kind; they also have asses and camels in great numbers; their camels have two humps."—*Reinaud, Rel. des Voy.*, i. 34.

"Reservoirs were made [in 620, near the banks of the lake] and the water conducted to them by ditches . . . leading from the lake, or, in some places, from the sea. The water dried up, and the salt remained behind as a deposit. But the majority of salt-workers in those days followed the old method of boiling."—*Journ. N.-C.B.R.A.S.*, N.S. xxii. 81.

[The working of a gold mine discovered in Shensi in 743 was discouraged on superstitious grounds.]—*Ch. Rev.*, xiv. 218.

Sung Period (960 *to* 1280).—*Table VII.*

[Women and children were employed in evaporating salt from sea-water.]—*Journ. N.-C.B.R.A.S.*, N.S. xxii. 82, 70.

[A printing machine was used for banknotes. It was first made of wood, but was replaced in 1276 by machines made of copper or brass.]—*Journ. P.O.S.*, ii. 272–3.

Mongol Period (1280 *to* 1368).—*Table VII.*

[The horse, or pony, ass, camel, and elephant, were largely used as beasts of burden.]—*Yule, Marco Polo*, i. 390–1 (3rd ed.).

"All over the country of Cathay there is a kind of black stones, existing in beds in the mountains, which they dig out and burn like firewood . . . no other [fuel] is used throughout the country. It is true that they have plenty of wood also, but they do not burn it, because those stones burn better and cost less."—*Ibid.* i. 428.

[Furnaces were used in the potter's trade.]—*Gray, China*, ii. 241.

[Clay for brick-making was tempered or kneaded by the feet of buffaloes led or driven over it, but in other places was trodden by men.]—*Ibid.* ii. 244.

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

"From the Chinese History (*Tung kien*) it appears that coal mines were being worked near Cho Chou and Peking before the close of the Ming dynasty."—*Ch. Rev.*, xi. 60.

"In the district of Tsz-chuen, near the capital of Shan-tung there were as many as 16 old mines worked in the Ming dynasty which had been lost or filled up."—*N. and Q. on C. and J.*, ii. 97.

"During Hientsong's reign a systematic attempt was made to work the gold mines reputed to exist in Central China, but although half a million men were employed upon them it is stated that the find did not exceed thirty ounces."—*Boulger, Short Hist.*, pp. 92–3.

"After the 15th century . . . pits were dug on the shore, and bamboos laid crosswise over them. The whole was covered with double mats, and sand was strewn on the top. Every morning and evening the covering of sand was soaked with sea-water by the tide, and the salt liquor found its way into the pits. As soon as the water had retired from the shore, the salt-workers came out with flaming bundles of straw to test the saltness of the moisture, and they were not convinced of their work being good unless the salt vapour which rose from the pits extinguished the fire. The brine thus produced was drawn off and carried to the salt-works, and salt was obtained from it uncommonly quickly. . . . About the same date, at the salt-works in the north, the most convenient plan was found to be to obtain the salt by exposure to the air and sun."—*Ch. Rev.*, xi. 83–84.

Manchu Period (1644 *to* —).—*Table IX.*

"Their expenditure of human labor appears enormous to those who are accustomed to the manufactories and engines of Western lands."—*Williams, Midd. King.*, ii. 17.

"Manual labour is the chief dependence of the farmer, fewer cattle, carts, ploughs, and machines being employed than in other countries. In rice fields no animals are used after the wet land has received the shoots; transplanting, weeding, and reaping being done by men."—*Ibid.* i. 276.

"The abundant population and over-crowded labour-market may have something to do with the disinclination of the people to the use of labour-saving machinery. . . . The mason who wishes to move a block of stone knows no better means for the purpose than the shoulders of his fellow-men supplemented by bamboos and ropes. The carpenter who wants to saw up a fallen tree does so with his own hand, without a thought of the easier device of a saw-mill. So it is with every branch of industry. Many of the contrivances employed are extremely ingenious, but since their invention no further advance has been made towards relieving the workman from any part of his toil."—*Douglas, Soc. in Ch.*, p. 138.

"The mechanical arts supply their wants, but having no better models before them, nor any scientific acquaintance with elementary principles and powers applicable to a great number of purposes, these arts have remained stationary. The abundance of labor must be employed, and its cheapness obviates the necessity of finding substitutes in machinery."—*Williams, Midd. King.*, ii. 63.

"As in all primitive and uneducated states of society, the Chinese have a rooted objection to machinery of all kinds. Just as they now oppose steam navigation in the inland waters of the empire, so, until quite lately, they rebelled against the importation of all labour-saving contrivances. Some years ago, a Chinaman, imbued with Western ideas, landed at Canton a machine for sewing boots, and especially the leather soles worn by the natives. At this innovation the cobblers at once took alarm. They rose in their thousands and destroyed the new-fangled machine. In the same way the promoters of the first steam cotton-mills were compelled to submit to the destruction of machinery which, if it had been allowed to work, would have given employment to several thousands of people."—*Journ. N.-C.B.R.A.S.*, N.S. xxi., quot. *Douglas, Soc. in Ch.*, p. 147.

"The waste of fuel, of human and beast labour, of time, and of patience is of course gigantic, but it might have serious effects upon the popular economy of the province were machinery suddenly introduced, carriage cheapened, and strict honesty incontinently insisted upon."—*Parker, China*, p. 218.

[The dung of animals was largely used for fuel.]—*Dudgeon, Land Question*, p. 6.

"Horses and mules in the plough work from six to seven hours a day. The severity of their labour depends, of course, upon the nature of the soil and the breadth of the furrow."—*Gray, China*, ii. 176.

[Wooden pestles for crushing grain worked in a mortar by levers, either by water- or animal- or human-power.]—*Williams, Midd. King.*, i. 772.

[Animals trod out corn or drew rollers over it.]—*Ibid.* ii. 127–8; and see AGRICULTURE.

[In Kiang Si the light plough was often drawn by a woman and directed by her husband. *Cf.* DIV. OF LAB.]—*Barrow, Travels*, pp. 141–2.

"For the first time in a long residence in Tientsin we have seen men dragging the plough this Spring. It is a common enough sight in the poorer up-country districts, where indeed the farmer's *lao-tei-tei* may often be seen vainly trying to rival the patient ass and stolid ox in this practice of husbandry."—*P. and T. Times*, Mar. 26, 1898.

[Leaves of tea-plant were trodden out by labourers and the

following day rubbed between their hands before being fired.] —*Ibid.* ii. 209–12.

[In brickmaking, the clay was tempered by the feet of buffaloes driven over it or trodden by men.]—*Gray*, *China*, ii. 244.

[The sugar-mill for pressing the cane is described in *Williams*, *Midd. King.*, ii. 11, and *Scarth*, *Twelve Years*, pp. 48–51.]

"They use the ordinary eastern handmill for grinding rice." "It consists of two flat circular stones, which they rub one on the other, turning the upper one by means of a wooden pin, which is fixed on it as a handle near the rim. The grain passes through a small aperture in the centre of the upper stone, whose circular motion spreads it over the lower stone and reduces it to powder. The flour is expelled at the edges of the stones, and it falls into a stone receiver."—*Gray*, *China*, ii. 131–2. See also p. 134, and *Dudgeon*, *Diet*, *etc.*, p. 71.

"Grass-cloth . . . is produced from a nettle, and with large wooden things like butter-pats and a rough bamboo thumb-protector the women beat out the fibre on the threshing- or drying-floor in front of the farmsteads."—*Little* (*Mrs. A.*), *Int. Ch.*, p. 440.

"The loom for plain weaving is very similar to that in use in England and other European countries. The frames for warping and beaming differ, however, in some respects from those [used in Europe]. For weaving flowered or figured silks and satins, the draw-loom in its very primitive state is still used in China. The draw-boy sits above the frame, and with unerring precision and the utmost regularity pulls the strings or cords by which he can bring down the necessary warp-threads preparatory to the movement of the shuttle."—*Gray*, *China*, ii. 229.

[Furnaces were used in metallurgy, glass-blowing, etc. Ignorance caused the products to lack uniformity.]—*Williams*, *Midd. King.*, ii. 21. *Cf.* ARTS.

"On the hills near the Shu-hing pass of the western branch of the Canton River there are . . . water-wheels by which pestles are kept at work pulverising the dye."—*Ibid.* ii. 145.

[For the shadoof and chain-pump see *Gray*, *China*, ii. 118–21.

[The shadoof was used in irrigation. For this and other methods of raising water for irrigation purposes, see AGRICULTURE. Contrivances used in building, carpentry, etc., are described under ARTS.]

"It is by no means rare to see children under twelve years of age in full charge of a shop or stall, and even sculling ferry-boats, the large scull enabling young brains to move boat-loads of people."—*Scarth*, *Twelve Years*, p. 15.

"At Hankow and at Nankin . . . [I saw] in these [cotton] weaving shops a machine for winding silk threads from bobbins. The threads as they were wound off were made to pass through water, for the purpose of rendering them soft and flexible."—*Gray*, *China*, ii. 144.

"The use of the sieve does not dispense with the additional labour of separating by hand the bad leaves, and the stems from the good leaves [of the tea plant]. This task is allotted to women and girls, who, seating themselves with baskets of the leaves on their laps, dexterously use both hands in picking out all the stems and bad leaves which the sieve has failed to get rid of."—*Ibid.* ii. 207.

"The buffalo is used in rice cultivation, and the ox and ass in dry ploughing; horses, mules, cows, and goats likewise render service to the farmer in various ways, and are often yoked in most ludicrous combinations."—*Williams*, *Midd. King.*, ii. 3.

"The brine [of salt] is sometimes obtained [in Yün Nan] by driving tunnels into the hillsides."—*Ibid.* i. 184.

"Gold mines occur in Shensi, and gold is collected in some of the streams; other metals also are worked."—*Ibid.* i. 151.

[Yünnan province is covered with mines of gold, iron, and copper.]—*Boulger*, *Short Hist.*, p. 316. Silver mines used also to be worked (*Edkins*, *Ch. Currency*, pp. 14, 15; *Bridgman*, *Ch. Chrest.*, pp. 260–1; *Williams*, *Ch. Commercial Guide*, p. 275, and *Midd. King.*, i. 184).

"The quicksilver mines [of Kueichou] are in Kaichau, north of the provincial capital, and apparently exceed in extent and richness all other known deposits of this metal; they have been worked for centuries."—*Ibid.* i. 178.

[Printers ground their own ink.]—*Ibid.* i. 601.

ARTS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

"Be to me as the yeast and the malt in making sweet spirits; as the salt and the prunes in making agreeable soup." (*Shu ching*, Pt. IV. Bk. VIII., Pt. iii. 2). "醴 is the product in its earlier stage, before the process of distillation is commenced, after the washing and fermentation, when 'the juice and the refuse are mixed together,' what is called 'sweet spirits.'"—*Legge*, *Ch. Class.*, III. i. 260, note. In the earliest times there was no fire (*Kang chien i chih lu*, *c.* 1, p. 2). For cooking see also *Tsêng chu jên wu lei tien*, *Yin shih lei*, *c.* 36, p. 1.

[Fu-hsi's successors are said to have introduced working in metals.]—*Ibid.* III. i.; Prol. p. 75.

"Casting bronze vases was common in the Hia dynasty, and continued to be so during the Shang and Chow dynasties."—*Journ. P.O.S.*, ii. 143.

"The age of a fairly large number of vases has been fixed with certainty as far back as the Shang dynasty. Farther back no one has ventured to go, though a still higher antiquity is conjectured for some vessels. If this is correct, we should probably have to skip several centuries, as bronze-casting has never flourished in China during the decay of a dynasty. We are therefore justified in assuming a phase of its development at the beginning of the Hsia dynasty, and immediately before rather than under the later successors of Yü. We have no definite notices of this art from this or the still earlier periods. The only indication we possess is the assertion of Confucius in the *Chun-tsieu* that, as long ago as the time of Yü, his minister Lin-tsze sent people to various places to collect old vessels and other remarkable antiquities for him."—*Richthofen*, *China*, i. 372; see also p. 369.

"The Chinese were, as every one admits, the first to make both silk and the finer products of the potter's art."—*Journ. P.O.S.*, ii. 143.

"The earliest notice in the *Shu King* of silk culture occurs in the *Yu Kung*. It is said the mulberry grounds were made fit for silk-worms, when speaking of the draining of Yen Chau (parts of Shantung and Chihli), as if it was a usual culture; other references to silk in the same book show it to have been a well-known fabric at that date (2204 B.C.)."—*Williams*, *Midd. King.*, ii. 32–3.

[For the mythical origin of weaving, see *N. and Q. on C. and J.*, i. 30, and *Pai shih lei pien*, *Ko chih ching yüan*, *c.* 48, *Kêng chih ch'i wu lei*, p. 18*b*.]

[Spinning is mentioned in *ibid. c.* 53, *Chü ch'u ch'i wu lei*, p. 16*b*.]

"Shun made [taught the people to make] earthen vessels at Ho Pin [Ting t'ao tsien, Shantung]; there was thus no fear of the utensils being defective."—*Shih chi*, *Yüan chien lei han*, *c.* 358, *Ch'an yeh pu*, p. 26*a*.

"White lead was known in the days of the Great Yü, the engineer-monarch, and most certainly during the Shang dynasty."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 145.

[Salt was evaporated from sea-water in the time of Yü.]—*Journ. N.-C.B.R.A.S.*, N.S. xxii. 54.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Hunting and Fishing.—[In those times of nascent civilization the chase was an important means of subsistence for the pioneers who were clearing the forest. The habitual arm of the chase was the bow and arrow.]—*Legge*, *Ch. Class.*, IV. ii. 474, 626; i. 131; ii. 412, 289.

[Solitary hunters pursued the goose or the wild-duck (*Shih ching*, I. vii. VIII. i), the boar (I. ii. XIV.; II. iii. VI. 4), the wolf (I. viii. II. 3), the fox (I. xv. I. 4) in the first month, or at the commencement of our year, the hare (II. v. III. 6; IV. 4). They hunted also the badger, the deer, the tiger, the panther, the rhinoceros, boars, etc. Some of the odes referred to describe grand hunts, and not only those of solitary individuals. In the chase they used dogs (I. viii. VIII.; II. v. IV. 4).]—*Ibid.* IV. i. 135, 36; ii. 292; i. 152, 229; ii. 338, 342; i. 158; ii. 342.

[The great hunts of the chiefs were conducted *en battue*. They surrounded the woods with large nets, fixed to the ground by stakes, and intended specially to catch the hares, which were driven into them (*Shih ching*, I. i. VII.). They set fire also to the grass and bushes of a large plain, to collect the game in a place determined on, where they killed it easily with the arrow (I. vii. III. and IV.). The chief, mounted in a carriage and four, kills at his ease the game thus collected. The ode eulogizes his courage, and says that he fought against tigers with bare breast.]—*Ibid.* IV. i. 13, 127–31.

[When they had a considerable number of men, or when the ground was not covered with vegetation high enough to raise a conflagration, they arranged the men in a circle, and made them all march towards a single point, beating back the game (*Shih ching*, I. xi. II. 2; xv. I. 4; II. iii. V. and VI.). These grand hunts took place principally in the second moon, corresponding to our month of February (I. xv. I. 4). The hunters offered to their prince the boars of three years, and kept for themselves the smallest, which were only one year old. The grand hunts *en battue* were entirely similar to those which the missionary Gerbillon saw in the 18th century, when accompanying the Emperor K'ang Hsi to Tartary (*Duhalde*, iv. 293, fol. Ed.). At the times described in the Shih Ching, they celebrated them on the two sides of the valley of the Yellow River, about the 35th parallel of latitude, in Ho-nan, in the eastern part of Shen-Si, where much of the country was still uncultivated.]—*Ibid.* IV. i. 192, 229–30; ii. 288–92; i. 229; ii. 291; i. 36, 191; ii. 292.

"In winter, traps and pitfalls were dug for wild animals, and sometimes set with spring bows; rabbit nets were set in the woods where nine paths meet; but all holes and ditches were required to be filled up before the summer, to guard against accidents among the cultivators."—*Simcox*, ii. 47.

[Fishing formed also an important means of subsistence. They fished with the line (*Shih ching* I. v. V. i.; II. viii. II. 4); but the ordinary method was with nets (I. v. III. 4; v. iii. IX.). On the banks of large rivers they formed a stockade of wood, in front of which they arranged the nets (I. viii. IX.; II. v. III. 8). The nets were made of fine bamboo (I. viii. IX.; II. ii. III.). Like those which were used to take hares, they were fitted with bags (I. xv. VI.), which the fish entered and so was taken. II. ii. III. names several kinds of fish, including the carp (see also I. xii. III.). We find also (IV. i. [ii.] VI.; II. iv. VIII. ii.) a certain number of fish given as pond-fish.]—*Ibid.* IV. i. 101; ii. 412; i. 96, 159; ii. 340; i. 159; ii. 269; i. 241, 208; ii. 588, 319. Fishing is further mentioned in works quot. in *Yüan chien lei han*, *c.* 358, *Shou yeh pu*, p. 8*a*, etc.

Cooking, *etc.*—[The various kinds of flesh were grilled upon live charcoal, or roasted on the spit (*Shih ching*, III. ii. I. 7; II. 2), or cooked in stew-pans like fish (I. xiii. IV. 3; II. v. IX. 7). They took the meat from the pan (or boiler) by means of spoons made from the wood of the jujube tree (II. v. IX. i.). Frying, boiling, baking, and roasting are mentioned in *Shih lei t'ung pien*, *c.* 23, p. 6*b*.]

[The grains of rice were bruised in a mortar (*Shih ching*, III. ii. I. 7) to free them from the husk; and when so cleaned the grain was winnowed, or passed through a sieve (*ibid.* and II. v. IX. 7). It was then washed and cooked with the steam of boiling water (III. ii. I. 7). Cakes of rice and wheaten flour were made, the rice and millet being boiled in the grain.]—*Legge*, IV. ii. 471, 356.

[They separated wine (spirits) from the lees by straining it through herbs, or through a basket with a rough bottom (*Shih ching*, II. i. V. 3); after which it was served at feasts.]

[They kept themselves warm by burning wood of different kinds (*Shih ching*, I. xv. I. 6), and among others that of the mulberry tree (II. viii. V. 4).]

"The art of obtaining fire by friction was still practised when Confucius wrote, and different woods were to be used for this purpose in different seasons."—*Simcox*, ii. 48.

"At the end of the autumn the reeds and withered branches and weeds were cut and burnt for charcoal, which was used as a disinfectant and insecticide, as well as for fuel."—*Ibid.* ii. 47. See also *Ko chih ching yüan*, *c.* 50, p. 26*b*.

Spinning, *Weaving*, *etc.*—[The winter evenings were occupied in spinning, weaving, and making ropes (*Shih ching*, I. xv. I. 7).]

[The dyeing of the stuffs took place in the 8th moon, about the month of September, and also the steeping of the hemp (*Shih ching*, I. xv. I. 3).]—*Legge*, IV. i. 229.

Carpentry, *&c.*—"In working with the wood of the *tsze*, when the toil of the coarser and finer operations has been performed, they have to apply the paint of red and other colours."—*Shu ching*, Pt. V. Bk. XI. 4; *Legge*, III. ii. 417.

[Cartwrights and wheelwrights are mentioned in the *K'ao kung chi*, *c. shang*, pp. 15*a*, 30*a*, etc.]

[Several odes (*Shih ching*, I. v. I; III. i. IV.; iii. II. 5) mention the art of cutting and polishing precious stones.]

"We may consider it as proved that bronze casting and the manufacture of iron implements as well as goldsmith's and silversmith's work were well advanced long before Confucius. The history known as *Kwo yü* shows that this was the case in regard to work in bronze."—*Edkins*, *Ch. Currency*, p. 16.

Dyeing.—[Dyes of indigo, yellow, and red colours were extracted from the indigo and two other plants (*Shih ching*, I. xv. I. 3; II. viii. II. 2). Hemp and similar plants were steeped in the moats (*ibid.* I. xii. IV.).]

"It can be inferred from the contents [of the *Chou li*] that it was written in the time of the Chou dynasty. The 41st book treats of metalwork. According to this there were six ways of mixing the bronze, which were applied as follows:—

5	parts	copper	and	one	part	tin	—for bells and cauldrons.
4	„	„	„	„	„	—	„ large and small axes.
3	„	„	„	„	„	—	„ lances and pikes.
2	„	„	„	„	„	—	„ large knives and swords.
4	„	„	„	„	„	—(so in Biot, but "*three* parts of tin" is probably meant)	for arrow-heads and styles for writing (on bamboo).
1	„	„	„	„	„	—for metal mirrors."	

"The prescribed measurements for the several vessels and tools are then given in detail, more particularly in the case of the officially tested and certified measures, which were made of bronze."—*Richthofen*, *China*, i. 373.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

Pottery.—Julien "places the invention of porcelain between 185 B.C. and A.D. 85, and opening the first kiln, at Sinping (not far from the present centre of Honan province), under the reign of Changtí of the Eastern Han dynasty. From this the manufacture gradually extended as raw materials were found in other localities, especially in Fauliang, on the eastern shores of the Poyang Lake, where the best ware is still made."—*Williams*, *Midd. King.*, ii. 23.

Paper-making.—"The invention of paper at this time was the result of foreign trade. The paper of Alexandria came to China brought by merchants and ambassadors. With it came ink made of lamp black."—*Journ. P.O.S.*, ii. 148. See also *N. and Q. on C. and J.*, i. 67–8, and *Edkins*, *Ch. Currency*, p. 1.

[*Spinning and weaving* were taught to the people of Wu Yüan.]—*Hou Han shu*, *Yüan chien lei han*, *c.* 356, *Ch'an yeh pu*, p. 24*b*.

[The bow (of wood or horn) was used in *hunting*.]—*Ko chih ching yüan*, *c.* 41, *Wu pei lei*, p. 7*a*.

Brewing.—[Chang Ch'ien is said to have taught his countrymen the art of making wine, which he had learnt from the Persians. One name for this wine was 'black crystal'; it has also been confused with koumiss.]—*Giles*, *Bio. Dic.*, p. 12. Distilling is referred to in *Ko chih ching yüan*, *c.* 22, *Yin shih lei*, pp. 4*a*, 5*b*.

Salt-boiling.—"In Kiai chau [in Shansi] is a remarkable deposit of salt in a shallow lake (18 miles long and 3 broad), which is surrounded by a high wall. The salt is evaporated in the sun under government direction, the product bringing in a large revenue; the adjacent town of Lung-tsüen, containing 80,000 inhabitants, is devoted to the business. Salt has been obtained from this region for two thousand years."—*Williams*, *Midd. King.*, i. 95. It was also boiled from sea and fresh water (*Yüan chien lei han*, *Shih wu pu*, *c.* 391, pp. 8*b*, 11*a*, 13*b*, etc.).

[Charcoal was used in *smelting* iron.]—*Ko chih ching yüan*, *c.* 50, p. 29*a*.

Dyeing.—[Silks, fans, etc., were dyed with varnish made from the persimmon.]—*Shih lei t'ung pien*, *Kuo pu*, *c.* 84, p. 4*b*.

Candle-making.—"King Chao of the Yên state made candles from the oil of the *cassia lignea*."—*Shih i chi*, *Shih lei t'ung pien*, *c.* 73, *Ch'i yung pu*, p. 12*a*.

Wall-building.—"The *kan*, mentioned in the *Shuo wên*, were the poles on both sides of a wall when pounding it; they were used to support the boards inside which the earth was pounded down to form the wall. It is the *ch'ung ch'iang chu*, post for pounding walls, of the present day. The horizontal pole under the post was called *ti ch'ih*, 'ground cubit.'"—*Shih wu yüan shih*, *Ko chih ching yüan*, *c.* 20, *Kung shih lei*, p. 25*a*.

Period of Disruption (221 *to* 589).—*Table IV.*

Hunting.—"It appears from the edifying anecdotes preserved in history that the pleasures of the chase were still a snare to Chinese monarchs, but they were seldom left without some superior man to keep before them the moral ideas of earlier and greater days."—*Simcox*, ii. 127.

Fishing.—"The fishermen [were in the habit of] putting the hair of the small monkey on the four corners of their nets, by which means they succeeded in taking large numbers of fish. It is said that the fish, seeing this [hair] were attracted towards it as a man is attracted towards embroidery."—*Wên ch'ang tsa lu, Ko chih ching yüan*, c. 48, *King chih ch'i wu lei*, p. 21*a*.

Cooking.—"Shih Chi-lung used wax candles as fuel for cooking."—*Shih shuo, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 12*b*.

"Mention is made of Szch'wan salt in A.D. 265, when the Wei general Têng Ai set his troops to work at boiling salt. . . . The brine is brought up by long bamboo tubes, raised by a windlass turned by bullocks, and is then evaporated by hydrogen gas, supplied in limitless profusion by the same wells. Some of the wells at Kung Tsing close by have no gas, and coal has to be employed for the evaporation."—*Journ. N.-C.B.R.A.S.*, N.S. xxii. 69.

Weaving.—[Cloth was woven from hemp.]—*Ko chih ching yüan*, c. 68, p. 24*b*.

Pottery.—Manufactories of porcelain had "been established at Si-ngan-fu and Loyang under the first Wei (A.D. 220–264), and under the T'sin dynasty (A.D. 265–419) blue china of high repute was made in the province of Tche-kiang."—*Simcox*, ii. 131.

Printing.—"It was at the close of this transitional period that we first detect traces of the art of printing, still in an embryonic stage, and not destined for many years to displace altogether the tedious labours of the scribe. It seems, however, to be quite certain that before the end of the sixth century the Chinese were in possession of a method of reproduction from wooden blocks; but, as far as we can learn, the work was of the roughest description, and made a poor show side by side with the calligraphic triumphs of the day."—*Giles, Hist. China*, p. 52. See also p. 314. (For the introduction of movable type, see SUNG PERIOD.)

From the Restoration of Unity to the end of the Five Dynasties (589 to 960).—*Table V.*

589–907.

[Hunting and hawking were much resorted to.]—*K'ung t'ieh, Yüan chien lei han*, c. 358, *Shou yeh pu*, p. 22*a*.

[Extraction of salt from ponds and wells continued.]—*P'ei wén yün fu*, c. 53, p. 39*a*.

[There were copper foundries in Wei Chou.]—*Yüan chien lei han*, c. 358, *Ch'an yeh pu*, p. 25*b*.

[Houses were whitened by a powder made by crushing white stone, the surface produced being "as hard and smooth as jade."]—*Ibid.* p. 26*b*.

[Satin is said to have been first made at this time.]—*Ko chih ching yüan*, c. 27, p. 11*b*.

Hirth gives reasons for believing that the manufacture of porcelain was first practised on a large scale at the beginning of the 7th century A.D. "From about the year A.D. 600 the porcelain industry began to flourish in various parts of the Empire."—*Hirth, Anc. Porc.*, p. 5. "In ancient times no vases were made of porcelain, and up to the T'ang dynasty all such vessels were made of copper; it was not till then that pottery came into vogue."—*Chang Ch'ien-t'ê, P'ing hua pu*, quot. *Ko chih ching yüan*, c. 36, p. 12.

907–960.

"In the beginning of the tenth century printing was invented [by the Turkish Emperor Li Ssŭ Yüan (*Ch. Rec.*, xv. 184)]; and in A.D. 932 [it] . . . received the Imperial sanction, a printed Imperial edition of all the sacred works having been then published."—*Meadows, Ch. and their Reb.*, p. 334; see also *Giles, Bio. Dic.*, p. 465.

Fêng Tao (881–954) "will be chiefly remembered as the inventor of the art of block-printing. It seems probable, indeed, that some crude form of this invention had been already known early in the T'ang dynasty, but until the date of Fêng Tao it was certainly not applied to the production of books."—*Giles, Hist. of Ch. Lit.*, p. 210.

"Wood engraving or printing from blocks, which was introduced in 953 for printing bank-notes, was almost immediately applied to the multiplication of books."—*Simcox*, ii. 209; see also *Mendoza, Hist.*, i. 132.

Sung Period (960 *to* 1280).—*Table VI.*

["The manufacture of pottery continued to flourish." The characteristic vases, etc., of the period were pale blue, white, flame-colour, pale green, and grey.]—*Julien, Hist. et fabr., etc.*, p. 17; *Hirth, Anc. Porc.*, pp. 13–19.

[Marco Polo says the sugar manufacture was carried on in Fuh-kien, but the process of refining was unknown in the Sung period.]—*Yule, Marco Polo*, ii. 180, 183 (1st ed.).

[The silk manufacture was carried on in all parts of China visited by Marco Polo, and in particular the weaving of "cloth of silk and gold."]—*Ibid.* ii. *passim*.

[Bronze-work was noted for its artistic finish.]—*Richthofen, China*, i. 372.

From information given by Ma-tuan-lin "it appears that the making of money was a troublesome and laborious work, every little piece being cast separately. The way in which the copper mines were worked was, moreover, far from perfect."—*Vissering, On Ch. Currency*, p. 149.

Printing only reached its full development in this period. "The honour of being the first inventor of movable types undoubtedly belongs to a Chinese blacksmith named Pí Shing, who lived about A.D. 1000, and printed blocks with them nearly five hundred years before Gutenberg cut his matrices at Mainz. They were made of plastic clay, hardened by fire after the characters had been cut on the soft surface of a plate of clay in which they were moulded. The porcelain types were then set up in a frame of iron partitioned off by strips, and inserted in a cement of wax, resin, and lime to fasten them down." "This invention seems never to have been developed to any practical application in superseding block-printing."—*Williams, Midd. King.*, i. 603. See also *Giles, Historic China*, p. 314; *Bio. Dic.*, p. 627; *Douglas, Lang. and Lit.*, pp. 83–4.

"In 983 mention is made of steel plates [for book-multiplication] to be delivered to the imperial college."—*Simcox*, ii. 209.

"Movable types are first mentioned in the eleventh century. But Chinese invention stopped short here. The casting of metal types and the printing press were European ideas."—*Journ. P.O.S.*, ii. 151; Wylie (*N. and Q. on C. and J.*, i. 160) says 1041–48.

[The machine for printing bank-notes has been referred to under PRODUCTION.]

Mongol Period (1280 *to* 1368).—*Table VII.*

Friar Odoric, after describing fishing with trained cormorants, as practised on some river he came to on his journey between Foochow and Hangchow, says: "After departing thence and travelling many days, I witnessed another fashion of fishing. The men this time were in a boat, where they had a tub full of hot water; and they were naked, and had each of them a bag slung over his shoulder. Now they dived under water for half a quarter of an hour or so, and caught the fish with their hands, stowing them in the bags. . . . And when they came up again they emptied the bags into the boat, and they themselves got into the tub of hot water, and others went in their turn and did as the first, and so great numbers of fish were taken."—*Yule, Cathay*, i. 112, 113.

[The months of December, January, and February were assigned for hunting and fowling, to the extent of some 40 days' journey round the imperial city.]—*Yule, Marco Polo*, i. 352.

[The flowers of the numerous cotton trees in the south of Min Ling were gathered to weave the cloth called *chi pei*.]—*Mo k'o hui hsi, Ko chih ching yüan*, c. 27, p. 22*b*.

[Marco Polo describes the manufacture of salt in Chihli by washing the soil in water which is afterwards boiled and allowed to crystallise out.]—*Yule, Marco Polo*, ii. 95. See also ii. 114, 116–17, 133, &c.

[Salt is also said to be extracted from sea-water on the coast of Che-kiang.]—*Ibid.* ii. 171.

[He also mentions brine-wells in Yün Nan.]—*Ibid.* ii. 39–40.

[Marco Polo says that sugar was largely manufactured in the province of Fuhkien, and the rest of Southern China, but the art of refining it was unknown under the Sung dynasty.]—*Ibid.* ii. 171, 180, 183 (1st ed.).

At T'ai-yuen Fu in Shansi "they grow . . . vines, supplying great plenty of wine; and in all Cathay this is the only place where wine is produced. It is carried hence all over the country."—*Ibid.* ii. 6 (1st ed.).

Ming Period (Restoration of Chinese Supremacy) (1368 *to* 1644).—*Table VIII.*

"The third book of the *Tao Shuo*, §§ 9, 10, gives an account of the composition of the colours used during this dynasty in the manufacture of porcelain." "The blue colour used for painting under the glaze was originally brought from one of the Mohammedan countries on the west of China as tribute, according to the Official Description of the Province of Kiangsi." When the supply ran short, "an inferior blue was produced from the incineration of the *Wu ming yi*, a cobaltiferous ore of manganese found in different parts of China. The Mohammedan blue was broken up with the hammer, and the pieces which showed on fracture vermilion spots were picked out as the first class blue, those with silver stars being used for the medium colour, and from each sixteen ounces of these pieces three ounces remained after the incineration in a covered vessel. The remaining fragments were thrown into water, impurities drawn off by magnetic iron ore, and the residue yielded another thirtieth part by weight of the true blue. If this blue were employed alone the colour was apt to spread, and it was necessary to add a proportion of native blue, not too much, or the colour would be heavy and dull. The 'first class blue' was a mixture of 10 parts of the first with one of the last, the 'average blue' of about equal parts, and this came out of the kiln with each stroke of the brush clearly defined. The first class blue mixed with much water and spread over the surface in mass gave a pure and transparently bright tint." "The red colour used in the decoration of the bowls and cups of the reign of Hsüan tê is said to have been painted on the paste, so that the red designs shone through the glaze, dazzling the eyes. It is described as obtained by powdering rubies from the west, but this is impossible, and its being painted on under the glaze shows it to have been a copper silicate, the same doubtless that gave the bright red, *hsien hung*, to the monochromes of the period." "The red for painting over the glaze, *fan hung*, was made by heating *ch'ing fan*, sulphate of iron, to a red heat, adding to each ounce of this five ounces *ch'ien fên*, carbonate of lead, mixing the two with glue. This mixture produced a fine coral red." "*Ton yu sê*, bean-oil colour, was made by mixing pea-green liquid glaze with purified ashes (of lime and ferns) and ferruginous clay." "*Tzŭ chin sê* a brown or coffee colour, the *fond laque* of French authors, by adding powdered *Tzŭ chin shih* to the ordinary white glaze. Père d'Entrecolles is therefore mistaken in stating this to be a new invention in his time." "*Ts'ui sê*, the colour of the king-fisher's feathers used on Chinese jewellery, was made from an oxide prepared from old copper and saltpetre mixed with water. This is the 'turquoise blue' of collectors." "The yellow colour, *huang sê*, was made by mixing in a mortar powdered lead, *hei ch'ien mo*, with a fourteenth part by weight of *che shih*, hæmatite iron." "The green colour, *lu sê*, by mixing 16 ounces of purified powdered lead, 1½ ounce of oxide of copper, and 6 ounces of powdered quartz." "*Tzŭ sê*, a purplish brown colour, by mixing 16 ounces of powdered lead, 1 ounce of *shih tzŭ ch'ing*, native silicate of cobalt, and 6 ounces of powdered quartz." "*Chiao ch'ing*, literally watered blue, by adding native silicate of cobalt to the ordinary white glaze." "*Ch'ün pai*, pure white, by mixing the liquid glaze with purified ashes (of lime and ferns)."—*Journ. P.O.S.*, i. 116-8.

Mendoza says that Chinese "earthen vessels" are made of "very strong earth, the which they do break all to pieces and grind it, and put it into cisterns, with water, made of lime and stone; and after that they have well tumbled and tossed it in the water, of the cream that is upon it they make the finest sort of them, and the lower they go, spending that substance that is the coarser: they make them after the [same] form and fashion as they do here, and afterward they do gild [and colour] them, the which will never be lost: then they put them into their kilns and burn them."—*Hist.*, i. 33–4.

"They do make great store of silk, and excellent good, and give it very perfect colours, which doth exceed very much the silk of Granada, and is one of the greatest trades that is in all the kingdom. The velvets, damasks, satins, and other sorts of webs which is there made is of so small a price that it is a wonder to speak it. . . . They have great store of flax, wherewith the common people do apparel themselves: also hemp for the caulking of their ships, and to make ropes and hawsers."—*Mendoza, Hist.*, i. 14, 15.

"They have great abundance of paper . . . made of the film of canes . . . : it is very good cheap: their printed books are made thereof: the most part of it can be written but on one side, for that it is so thin."—*Ibid.* i. 123.

"The pumps which they have in their ships are much differing from ours, and are far better: they make them of many pieces, with a wheel to draw water, which wheel is set along the ship's side within, wherewith they do easily cleanse their ships, for that one man going alone in the wheel doth in a quarter of an hour cleanse a great ship, although she leak very much."—*Ibid.* i. 150.

"As regards the manufacture of gunpowder [probably taught to them by the Portuguese], the *Wu-pei-che* does not afford any precise instructions, although various formulas are given for the preparation of suffocating compounds, etc. The nearest approach to a description of gunpowder as at present fabricated is the recipe given for producing a spattering fire from tubes to be attached to common arrows. The particulars of this are as follows:—

	Catty.	*Tael.*	*Mace.*
Saltpetre	1	—	—
Sulphur	—	4	5
Pine charcoal	—	4	8
Cinnabar	—	1	6

One of the suffocating compounds is described as consisting of nitre and sulphur, camphor, resin, orpiment, and arsenic; and others were to be manufactured from a large variety of vegetable drugs mixed with copperas, borax, etc."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 102–3.

Semedo "also notices those advantages of the Chinese method of block-printing which have since led to the adoption of the modern 'stereotype edition.'"—*Simcox*, ii. 270. For foreign influence on printing, see *Mendoza, Hist.*, i. 132–3.

Manchu Period (1644 *to* —).—*Table IX.*

"The mechanical arts and implements of the Chinese partake of the same simplicity which has been remarked in their agricultural,—as if the faculty of invention or the notion of altering a thing had died with the discoverer, and he had had the best guarantee for the patent of his contrivance in the deprivation of all desire in his successors to alter it. This servility of imitation marks them in many things, but in machinery and metallurgy is chiefly owing to ignorance of the real nature of the materials they use, a knowledge which has only recently become familiar to ourselves. In the absence of superior models, it produces a degree of apathy to all improvement which strangely contrasts with their general industry and literary tastes. Simplicity of design pervades all operation, and when a machine directs in the best-known manner the power of the hand which wields it, or aids in executing tiresome operations, its purpose is considered to be fully answered, for it was intended to assist and not to supplant human labor. Yet with all their simplicity some of them are both effectual and ingenious, and not a few are made to answer two or three ends. For example, the bellows, an oblong box divided into two compartments, and worked by a piston and two valves in the upper, which forces the wind into the lower part and out of the nozzle, is used by the travelling tinker as a seat when at work and a chest for his tools when his work is done; though it does not, indeed, serve all these purposes with efficiency."—*Williams, Midd. King.*, ii. 18.

"Many of the common manipulations of Chinese workmen afford good examples of their ingenious modes of attaining the same end which is elsewhere reached by complex machinery. For instance, the baker places his fire on a large iron plate worked by a crane, and swings it over a shallow pan embedded in masonry, in which the cakes and pastry are laid and soon baked. The price of fuel compels its economical use wherever it is employed; in the forge, the kitchen, the kiln, or the dwelling, no waste of wood or coal is seen. As an instance in point, the mode of burning shells to lime affords a good example. A low wall encloses a space ten or twelve feet across, in the middle of which a hole communicates underneath the wall through a passage to the pit, where the fire is urged by a fan turned by the feet. The wood is loosely laid over the bottom of the area, and the fire kindled at the orifice in the centre and fanned into a blaze as the shells are rapidly thrown in until the wall is filled up; in twelve hours the shells are calcined. Toward evening scores of villagers collect around the burning pile, bringing their kettles of rice or vegetables to cook. . . . The lime is taken out next morning and sifted for the mason."—*Ibid.* ii. 56.

"The Chinese have been jogging on so quietly for ages, without alterations in their institutions, that they have brought all the material appliances of life to perfection; that is, they obtain their ends with the least possible waste of power and materials, at the cheapest cost. Their dress is the most comfortable and the cheapest; their vessels suit all their wants, and have had water-tight partitions for ages. . . . They make the most beautiful silks with a loom that is simplicity itself. . . . Their saw requires far less iron than ours; their bellows give a *constant* draft of air, and is merely an oblong or cylindrical box, with a piston worked in it. But I never saw a windmill in China, not even a picture of one. In their water-mills for grinding flour, there is no trouble or expense in keeping the machinery in order while at work. To each pivot or axle a small bamboo pipe constantly supplies a dripping of water, which prevents all heating from friction. In propelling their boats, the powerful scull admits of a child doing as much work as a man could do with our methods. They will cook a dinner for a dozen with a mere handful of fuel. The boiler is cone-shaped and large, say two feet in diameter by one foot deep; it covers the whole of the fire merely with a small portion of the lower part of the cove, but the heat and flames enfold the rest. Water and rice are put in

the bottom, with an open frame over them about half the depth of the pan; on this are placed dishes of fish, fowl, or vegetables to boil; the whole is covered with a wooden cover, in the centre of which is a round hole about 4 inches in diameter, and in this another bowl is often placed, the contents of which are cooked by the steam."—*Scarth, Twelve Years*, pp. 120–1.

Hunting.—[The grand hunts *en battue* were similar to those which took place under the Later Feudal Period.]—*Duhalde*, iv. 293 (fol. ed.).

K'ang Hsi "loved all manly exercises and devoted three months annually to hunting."—*Giles, Hist. of Ch. Lit.*, p. 385.

Chia Ch'ing "gave up the annual hunting excursions, which had been associated with Manchu energy."—*Giles, Bio. Dic.*, p. 126.

Fishing.—"The various modes of catching and rearing fish exhibit the contrivance and skill of the Chinese quite as much as their agricultural operations. Some persons reckon that at least one-tenth of the population in the prefecture of Kwang-chau derive their food from the water, and necessity leads them to invent and try many ingenious ways of securing the finny tribes. Nets woven of hempen thread are boiled in a solution of gambier to preserve them from rotting. The smacks which swarm along the coast go out in pairs, partly that the crews may afford mutual relief and protection, but chiefly to join in dragging the net. In the shallows of rivers rows of heavy posts are driven down and nets secured to them, which are examined and changed at every tide. Those who attend these nets, moreover, attach scoops or drag-nets to their boats, so loaded that they will sink and gather the sole, ray, and other fish feeding near the bottom. Lifting-nets, twenty feet square, are suspended from poles elevated and depressed by a hawser worked by a windlass on shore; the nets are baited with the whites of eggs spread on the meshes."—*Williams, Midd. King.*, ii. 14–15.

"In moonlight nights low, narrow shallops, provided with a wide white board fastened to the wale and floating upon the water are anchored in still water; as the moon shines on the board the deceived fish leap out upon it or into the boat; twenty or thirty of these decoy boats can be seen near Macao engaged in this fishery on moonlight evenings. Sometimes a boat furnished with a treadle goes up and down near the shores striking boards against its bottom and sides; the startled fish are caught in the net dragging astern. The crews of many small boats combine to drive the fish into their nets by splashing and striking the water, or into a pool on the margin of the river at high tide, in which they are easily retained by wattles, and scooped out when the water has fallen. Divers clap sticks together under water to drive their prey into the nets set for them, or catch them with their toes when, terrified at the noise, they hide in the mud. Neither fly-fishing nor angling with hook and line is much practised; its tedium and small returns would be poor amends to a Chinese for the elegance of the tackle or the science displayed in adapting the fly to the fish's taste."—*Ibid.* ii. 17.

"Cormorants are trained in great numbers to capture fish in the rivers and lakes; they will disperse at a given signal and return with their prey, but not often without the precaution of a net-ring. A single boatman can easily oversee twelve or fifteen of these birds, and although hundreds may be out upon the water each one knows its own master. If one seize a fish too heavy for him alone, another comes to his assistance, and the two carry it aboard; but such cases are very rare compared with others where the weak or young bird is unceremoniously robbed of its capture. . . . They do not fish during the summer months."—*Ibid.* ii. 16.

[Scarth describes a peculiar kind of fishing by means of a live fish as decoy, tethered to a rod, which the man holds in one hand, while with the other he spears, with an arrow-pointed trident, the fish attracted by the captive.]—*Twelve Years*, p. 7.

"Mussels are caught in cylindrical basket-traps attached to a single rope and drifted with the tide near the bottom. Similar traps for catching land-crabs are laid along the edges of rice fields, baited with dried fish. When the receding tide leaves the river banks dry the boat people get overboard and wade in the mud, or push themselves along on a board with one foot, in search of such things as harbor in the ooze."—*Williams, Midd. King.*, ii. 16–17.

Scarth describes the eel-fishers of the Han river (Swatow): "Each . . . had a sort of sledge, the size and shape of the stave of a small cask; in the middle of this was a railing, about 18 inches high; he had a small basket for his fish, and an adze-shaped spade with a handle about two feet long. With one foot, or sometimes kneeling with one knee upon the sledge, and holding on by the rail with the hands well down, . . . the man propelled the sledge forward with the other foot . . . [at a wonderful speed]. To catch the eels or other fish that are in the mud, the men appear to watch for air bubbles, and then dig about them. They are very quick at their work, and it employs a large number."—*Twelve Years*, pp. 65–6.

[An exhaustive account of the methods of fishing is given in *Pol Korrigan, Causerie sur la Pêche Fluviale en Chine.*]

Wax-industry.—"In a few days [after being placed in the trees] the larvæ [of the *coccus pela*] begin to spread over the branches, but do not touch the leaves; the bark soon becomes incrusted with a white powder, and is not disturbed till August. The loaded branches are then cut off and boiled, when the wax collects on the surface of the water, is skimmed off, and melted again to be poured into pans for sale. A tael's weight of eggs will produce two or three catties of the translucent, highly crystalline wax; it sells there for five mace a tael and upward. The annual income is reckoned at Tls. 2,000,000. The purposes to which this singular product is applied include all those of beeswax."—*Williams, Midd. King.*, i. 353–4.

Tea-preparation.—[The leaves of the tea-plant, after being dried in the open air were trodden by labourers, and the following day rubbed between their hands and then fired over charcoal fires. If of superior quality they were exposed to the sun instead of being fired a second time. This refers to Congou and Souchong teas. Oolong was prepared in the same way except that the leaves, after the first drying, were sprinkled with water. In the case of caper, bags the size of footballs filled with the moistened leaves were rolled on the floor by the feet of labourers who supported themselves by grasping horizontal wooden poles.]—*Gray, China*, ii. 209–12. For fuller description see *Williams, Midd. King.*, ii. 42–4.

"The operation of giving green tea its color is a simple one. A quantity of Prussian blue is pulverized to a very fine powder, and kept ready at the last roasting. Pure gypsum is burned in the charcoal fire till it is soft and fit for easily triturating. Four parts are then thoroughly mixed with three parts of Prussian blue, making a light blue powder. About five minutes before finally taking off the dried leaves this powder is sprinkled on them, and instantly the whole panful of two or three pounds is turned over by the workman's hands till a uniform color is obtained. His hands come out quite blue, but the compound gives the green leaves a brighter green hue. The quantity is not great, say about half a pound in a hundred of tea; and as gypsum is not a dangerous or irritating substance, being constantly eaten by the Chinese, the other ingredient remains in an almost infinitesimal degree. . . . Turmeric root has been detected, too, in a very few analyses, but probably these were lots that needed to be refined at Canton to cover up mildew or supply a demand."—*Ibid.* ii. 47–8. For details of the various processes see *Ch. Rec.*, iv. 114–6, and for adulteration see pp. 49–50.

"Brick tea is cured by pressing the damp leaves into the form of a brick or tile, varying in size and weight, eight to twelve inches long and one thick; in this form it is far more easily carried than in the leaf. In Tibet . . . it appears more as a soup than an infusion. The brick tea is composed of coarse leaves, or of stalks moistened by steaming over boiling water, and then pressed till dry and hard. When used, a piece is broken off and simmered with milk and butter and water, with a touch of vinegar or pepper. The pressing and drying is assisted by sprinkling the mass with rice-water as it is forced into the moulds."—*Ibid.* ii. 50.

Cooking and Baking.—"The art of cooking has not reached any high degree of perfection. Like the French it is very economical, and consists of stews and fried dishes more than of baked or roasted. Salt is proportionately dear from its preparation being a government monopoly, and this has led to a large use of onions for seasoning. The articles of kitchen furniture are few and simple; an iron boiler, shaped like the segment of a sphere, for stewing or frying, a portable earthen furnace, and two or three different shaped earthen pots for boiling water or vegetables constitute the whole establishment of thousands of families. A few other utensils, as tongs, ladles, forks, sieves, mills, &c., are used to a greater or less extent, though the variety is quite commensurate with the simple cookery. Both meats and vegetables, previously hashed into mouthfuls, are stewed or fried in oil or fat; they are not cooked in large joints or steaks for the table of a household. Hogs are baked whole for sacrifices and for sale in cook-shops, but before being eaten are hashed and fried again. Cutting the food into small pieces secures its thorough cooking with less fuel than it would otherwise require, and is moreover indispensable for eating with chopsticks. Two or three vegetables are boiled together, but meat soups are seldom seen; and the immense variety of puddings, pastry, cakes, pies, custards, ragouts, creams, &c., made in western lands is almost unknown in China."—*Williams, Midd. King.*, i. 781.

"A furnace, which resembles one of our coppers, stands in the middle of a room . . . filled with charcoal; and a lid just fitting the aperture is suspended by chains from a [movable] beam [fixed like a crane]. Upon this lid the cakes . . . are set, and it is moved to its position over the fire, or withdrawn from it, by making the fulcrum turn round upon its axis, at the pleasure of the baker. The necessity for a peel is thus avoided, and the articles to be baked can be ranged with the exactest reference to order."—*Lay, Ch. As They Are*, p. 159.

The grain of rice "is deprived of its skin by wooden pestles worked in a mortar by levers, either by a water-wheel or more commonly by oxen or men. It is cleaned by rubbing it in an earthen dish, scored on the inside, and steamed in a shallow iron boiler partly filled with water, over which a basket or sieve containing the rice is supported on a framework; a wooden dish fits over the whole and confines the steam. By this process the kernels are thoroughly cooked without forming a pasty mass. . . . Bread, vegetables, and other articles are cooked in a similar manner; four or five sieves, each of them full and nicely fitting into each other, are placed upon the boiler and covered with a cowl; in the water beneath, which supplies the steam, meats or other things are boiled at the same time."—*Williams, Midd. King.*, i. 772.

"There is a great art in boiling rice which the Chinese alone seem to possess. . . . It is prepared dry, when the rice-water is either thrown away, used as a drink, or given in food to pigs, or it is prepared wet as a kind of porridge, the congé being retained. This latter would seem to be the preferable mode of cooking it (although . . . not the most common in China), for it yields to boiling water a considerable portion of its nitrogenous and mineral constituents in which it is already deficient."—*Dudgeon, Diet, etc.*, pp. 69–70.

"The sugar-mill consists merely of two upright cylinders, between which the cane is introduced as they turn, and the juice received into reservoirs; it is then boiled down and sent to the refiners to undergo the necessary processes to fit it for market; much is lost by this slovenly manufacture."—*Williams, Midd. King.*, ii. 11.

[For tallow-boiling see *ibid.* ii. 11–12.]

Spinning, Weaving, Dyeing, etc.—"The attention of the Chinese government to this important branch of industry [silk] has been unremitted, and at this day it supplies perhaps one half of all the garments worn by the people." "While the worms are growing, care is taken to keep them undisturbed by either noise or bright light; they are often changed from one hurdle to another that they may have roomy and cleanly places; the utmost attention is paid to their condition and feeding, and noting the right time for preparing them for spinning cocoons. Three days are required for this, and in six it is time to stifle the larvæ and reel the silk from the cocoons; but this being done by other workmen, those who rear the worms enclose the cocoons in a jar buried in the ground and lined with mats and leaves, interlaying them with salt, which kills the pupæ but keeps the silk supple, strong, and lustrous; preserved in this manner, they can be transported to any distance, or the reeling of the silk can be delayed until convenient. Another mode of destroying the cocoons is to spread them on trays and expose them by twos to the steam of boiling water, putting the upper in the place of the lower one according to the degree of heat they are in, taking care the chrysalides are killed and the silk not injured. After exposing to steam the silk can be reeled off immediately, but if placed in the jars they must be put into warm water to dissolve the glue before the floss can be unwound."—*Williams, Midd. King.*, ii. 33–34. For detailed description see various works quoted in *Ko chih ching yüan*, *c.* 4ª, *Kêng chih ch'i wu lei*, pp. 14*b*–15*a*.

"The loom in China is worked by two hands, one of whom sits on top of the frame, where he pulls the treadles and assists in changing the various parts of the machine. The workmen imitate almost any pattern, excelling particularly in crapes, and flowered satins and damasks for official dresses. The common people wear pongee and senshaw, which they frequently dye in gambier to a dust or black color; these fabrics constitute most durable garments."—*Williams, Midd. King.*, ii. 35. See also *Scarth, Twelve Years*, pp. 8–14.

"In the temple attached to the pagoda at Ningpo, and also in several other large temples at Foochow and elsewhere, silk-throwing is carried on. . . . The silk is hung in long lines from one end of the temple to the other, the end of the threads hanging towards the ground from a wooden frame-work. To the threads is attached a bullet-shaped weight, with a small iron pin to which the silk is fastened. The people employed take in each hand a flat piece of wood, something like but rather larger than . . . castanets. With the fingers of one hand at the wrist of the other, one piece of wood is pushed sharply forward, and the other drawn back. The bullet, being between the two, has thus a rapid rotatory motion given to it. It spins round . . . and twists the silk attached to it; but . . . too tightly for European notions, and the thrown silk brings a better price when the twist is less close."—*Ibid.* p. 19.

"I once saw two girls at this work [embroidery] at the village of Mongha. They were seated upon a low stool, and extended their legs across another of twice the height of their seat. In this way a support was provided for the frame on which the piece to be embroidered was spread forth. . . . The finest specimens of embroidery are, as far as my observation goes, done by men, who stand while at work—a practice which these damsels could not imitate, as their feet are small. . . . The Chinese have preserved both these arts [*i.e.* the ancient *opus phrygicum*, in which the figures were inserted by the needle, and the *opus plumarium*, in which they were wrought in with the woof] in their highest state of perfection."—*Lay, Ch. As They Are*, pp. 273–7. See also *Williams, Midd. King.*, ii. 36.

"The durable cotton cloth made in the central provinces, called *Nankeen* by foreigners, because Nanking is famous for its manufacture, is the chief produce of Chinese looms. It is now seldom sent out of the country, and the natives are even taking to the foreign fabric in its stead. Cotton seed in that part of China is sown early in June, about eighty pounds to an acre; in a good year the produce is about two thousand pounds, diminishing to one-half in poor seasons. It is manured with liquid bean-cake, often hoed, and the bolls gathered in October, usually by each family in its own plot. The seeds are separated by passing the pods between an iron and wooden roller on a frame, which presses out the seeds and does not break them. The clean cotton is then bowed ready for spinning, and the cloth is woven in simple looms by the people who are to wear it after it is dyed blue. The looms used in weaving cotton vary from twelve to sixteen inches in width; they are simple in their construction; no figures are woven in cotton fabrics, nor have the Chinese learnt to print them as chintz or calico."—*Ibid.* ii. 37.

[The processes used by Chinese dyers for combining and fixing colours are unknown in Europe. The dyes are chiefly vegetable. *Polygonum tinctorium* (a species of knot-grass growing in the southern provinces) is used to obtain a sky-blue, and *Tsatis indigotica* (wood found in Eastern China), for dark blue. A green dye is obtained from *Rhamnus utilis*.]—*De Courcy, L'Emp. du Mil.*, p. 453.

"The manufacture of mats for sails of junks and boats, floors, bedding, etc., employs thousands. . . . Rattans are largely worked into mats, chairs, baskets, and other articles of domestic service."—*Williams, Midd. King.*, ii. 61.

[The process of dyeing, in which indigo is generally used, is fully described in *Gray, China*, ii. 144, and *Williams, Ch. Commercial Guide*, pp. 123–5.]

"The Chinese mode of calendering is very rude and simple. A wooden roller, round which the cloth has been wound, is placed on a board about three feet square, which is made fast to the earth. Upon the roller is placed a large stone. The workman, standing upon the stone, sets it in motion with his feet, and succeeds in imparting to the cloth a bright, glossy appearance. This mode of calendering appears to be universally practised throughout China. At Nankin, Woo-see, and other cities on the banks of the Grand Canal, . . . the stones used for this purpose were much heavier than those used at Canton. The calenderers, however, in the northern cities, are much inferior as workmen to those of Canton."—*Gray, China*, ii. 145.

Pottery.—"Two substances enter into all kinds of this ware [porcelain]; one a strong, infusible material which endures great heat, and the other, fusible at a low temperature, which communicates its transparency to the other as they together pass through the furnace. The first of these is called *kaolin*, from the name of a range of hills east of Kingteh Chin, known as *Kao Ling* or 'High Ridge,' a word that has been adopted in Europe as a term for all varieties of the argillaceous or felds-pathic components of porcelain. The other is known as *peh-tun-tsz'*, a Chinese term properly applied to the bricks of prepared silex, called *tun*, but now generally adopted to denote the fusible element. The discovery near Jao-chau fu of both of these in great purity led to the establishment of the kilns there in A.D. 583; and Chinese artists discriminate many varieties of each."—*Williams, Midd. King.*, ii. 23. See also *Salvétat's* pref. to *Julien*.

"The kaolin comes from decomposed granite, and is reduced by trituration and several washings to an impalpable powder; this last precipitate is put on cloths, one above another, and dried under slight pressure to a uniform paste ready for the furnace. The cakes of *peh-tun-tsz'* are prepared in a similar manner; other workmen mix the clay and the quartz—the bones and the flesh, as they are aptly termed by the Chinese—in such proportions as the ware requires. In general, Chinese porcelain is more silicious than European."—*Williams, Midd. King.*, ii. 23–4.

"To make ready the paste for the furnace, the bricks of both ingredients are trodden in a large basin by buffaloes or men till they are well mixed into a watery mass, which is then worked and kneaded again on slate slabs in small pieces till it is delivered into the hands of workmen to be fashioned on lathes and frames into the desired forms and sizes. These craftsmen work with very simple machinery, as is apparent from the rude drawings of their operations. M. Selvétat gives high praise to their skill in producing large jars without the aid of the machinery used in Europe, and indicates the great use they make of their feet in these operations—a feature of all Asiatic artisans which attracts the traveller's notice wherever

he goes. Some of their procedures are inferior and ruder than the Japanese potters exhibit."—*Ibid.* ii. 24. For details of the glazing, colouring and baking processes see pp. 24–30.

"The manufacture of enamels and cloisonné wares has lately received a great stimulus from their foreign demand. A copper vase is formed of the desired shape by hammering and soldering, on whose clean surface the figures to be enamelled are etched to show where the strips of copper are to be soldered before their interspaces are enamelled. This solder is made of borax of silver, and melts at a higher temperature than the enamel, which is reduced to a paste and filled into each cell of the pattern by brushes and styles, until the whole design is gone over. The various colored *liao*, or ingredients, are prepared in cakes by artists who keep their composition secret, but all the substances occur in China. The quality of the ware depends on the skill in mixing these cakes and fusing the colors in a charcoal fire, into which the piece is placed; imperfections and holes are covered and filled up when it is cooled, and the piece is again and again exposed to the fire. After the third ordeal it is ground smooth and polished on a lathe, and the brass work gilt. The specimens now made show very fine work, but their coloring hardly equals those of Kienlung's reign or still earlier in the Ming dynasty. Much inferior work has also been palmed off for that of the golden period of this art."—*Ibid.* ii. 60–1.

"During the dreadful ravages of the Taiping rebellion the manufactories [of porcelain] at Kingteh were all stopped."—*Ibid.* ii. 23.

Carpentry.—"Handicraftsmen of every name are content with coarse-looking tools compared with those turned out at Sheffield, but the work produced by some of them is far from contemptible. The bench of a carpenter is a low, narrow, inclined form, like a drawing-knife frame, upon which he sits to plane, grove, and work his boards, using his feet and toes to steady them. His augurs, bits, and gimlets are worked with a bow, but most of the edge-tools employed by him and the blacksmith, though similar in shape, are less convenient than our own. They are sharpened with hones or grindstones, and also with a cold steel like a spoke shave, with which the edge is scraped thin."—*Williams, Midd. King.*, ii. 56-7.

Carving of Ivory and Mother-of-Pearl.—"A variety of small chisels are used, either level at the edge or slanting on one side to a point. Some have a projecting tooth on one side so as to pass under the figures. They are small and lie in a row on the bench at which the workman sits. He holds the object in his left hand, and scrapes away the ivory with his right. He resorts to no means for abridging the labour of his task. . . . The mother-of-pearl counter is lodged in a hollow and thus rendered steady while under the graving tool. . . . In the island of Honan, near Canton, are many who get their living by the manufacture of pearl studs. The shell is cut with a saw into small squares, which are rounded and shaped by a file. The boring of the holes, and the application of the polisher complete the process. . . . [We saw] a man . . . gilding a pair of those curious cups used at the marriage ceremony. . . . These vessels are small, and rest upon three feet, terminating at the top in two concave lips, which extend upwards in a broad sweep. The leaf-gold, in books of exactly the same size as those in ordinary use among us, lay at the bench before the artist; some of it he had been spreading upon the vessel he held in his hand, which was covered with a piece of paper, lest perspiration should injure the polish. He had a *maloo*, or white cornelian burnisher, nearly of the same form as that used by ourselves, and with it he was burnishing the inside of a cup."—*Lay, Ch. As They Are*, pp. 271–3.

Lacquer-work.—"The lacquered-ware peculiar to China and Japan owes its lustre to the prepared sap of a kind of sumach (*Rhus vernicifera*) cultivated in both countries for this purpose. Wood oils are obtained from other plants such as the *Cureas*, *Augia*, *Eleococcus*, and *Rhus semi-alatus*, and the different qualities of lacquered-ware are owing to the use of these inferior ingredients. The body of lacquered-ware is usually seasoned pine, well smoothed, and the groves covered with hempen lint or paper. A sizing of pig's gall, often mixed with very fine sand, makes a priming. The prepared lacquer is composed of the sap dissolved in spring-water, adding ground-nut oil, pig's gall, and rice vinegar in the sunshine with broad flat brushes till it is thoroughly mixed."—*Williams, Midd. King.*, ii. 30.

"The principal object in preparing the wood is to cover it with a priming that will receive the lacquer and remain impervious to changes in temperature. This preparation varies a good deal according to the quality of the ware; it is laid on evenly, coat after coat, allowing each to dry before the next is spread. The last coating is rubbed with pumice or the finest sandstone, finishing this priming with a smooth piece of slate. When ready the piece is taken into a close room having paper lattices and shut out from any air, where it receives a coating of clear lacquer. It is then put into a dark room to dry. The operation is repeated ten or fifteen times for the best kinds. . . . Coloring matter to give the lacquer a brown hue, or to make an imitation of *venturina* (or *aventurine*, a brownish glass spangled throughout with copper filings) by mixing gold leaf, is added during these operations."—*Ibid.* ii. 30–1.

"The gilding is performed by another set of workmen in a large workshop. The figures of the design are drawn on thick paper, which is then pricked all over to allow the powdered chalk to fall on the table and form the outline. Another workman completes the picture by cutting the lines with a burin or needle, and filling them with vermilion mixed in lacquer, as thick as needed. This afterwards is covered by means of a hair-pencil with gold in leaf, or in powder laid on with a dossil; the gold is often mixed with fine lampblack. The proper lacquer is seldom used otherwise than in making this ware."—*Ibid.* ii. 31. For some obsolete kinds see p. 31.

[The process of oil-making from pea-nuts and cassia leaves is described by *Gray, China*, ii. 138, 146.]

"The oils obtained from the nuts of other trees by simple pressure and by refining them afterward are quite numerous. The details of their manufacture and application may yet furnish many new hints and processes to western arts. The oil of the Eleococcus, after pressing (according to De Guignes), is boiled with Spanish white in the proportion of one ounce to half a pound of oil; as it begins to thicken it is taken off and poured into close vessels. It dissolves in turpentine and is used as a varnish, either clear or mixed with different colors; it defends woodwork from injury for a long time, and forms a good painter's oil. Boiled with iron rust it forms a reddish brown varnish. In order to prevent its penetrating into the wood when used clear, and to increase the lustre, a priming of lime and hog's blood simmered together into a paste is previously laid on."—*Williams, Midd. King.*, ii. 31–2.

Metallurgy.—"In the arts of metallurgy the Chinese have attained only to mediocrity, and on the whole do not equal the Japanese."—*Ibid.* ii. 18–19.

"Steel is everywhere manufactured in a rude way, but the foreign importation is gradually supplying a better article. The quality of this metal made is best shown by the carvings in the hardest stones for ornaments, which have never been exceeded elsewhere. Iron is cast into thin plates and various machines of considerable size, but the largest pieces they make, viz., bells and cannon, are small compared with the shafts and steam-hammers turned out abroad. Wrought iron is chiefly worked up into nails, screws, hinges, and small articles needed in daily life, though its quality is remarkably good. The *peh tung*, argentan or 'white copper' of the Chinese, is an alloy of copper, zinc, nickel, iron, and occasionally a little silver. 'When in a state of ore, it is said to be powdered, mixed with charcoal dust, and placed in jars over a slow fire, the metal rising in the form of vapour in a distilling apparatus, and afterward condensed in water' (*Davis, Chinese*, ii. 246). When new, this alloy appears as lustrous as silver, and is manufactured into incense-jars, flower-stands for temple service, boxes, etc."—*Ibid.* ii. 19–20.

[For the manufacture of pewter vessels, spangles, and laying-on of feathers, see *Lay, Chinese*, pp. 269–71.]

"Copper is less used than iron for culinary vessels. . . . The alloy [of copper and tin] is run into thin plates, and the gongs are made by long and expert hammering until the requisite sonorousness is obtained."—*Williams, Midd. King.*, ii. 20. For bell-founding and metal mirror manufacture see pp. 20–1.

"I saw a blacksmith a few days since mending a pan, the arrangement of whose tools was singularly compact. His fire was held in an iron basin not unlike a coal-scuttle in shape, in the back corner of which the mouthpiece of the bellows entered. The anvil was a small square mass of iron, not very unlike our own, placed on a block, and a partition basket close by held the charcoal and tools, with the old iron and other rubbish he carried. The water to temper his iron was in an earthen pot, which just at this time was most usefully employed in boiling his dinner over the forge fire."—*Ch. Repos.*, x. 473.

"The arrangements of farriers' shops in China are very similar to those of European countries, saving that the tools are of the simplest character. The manner of trussing up the poor beast which is to be shod would seem, however, an unnecessary exercise of caution in the case of a majority of the overworked horses and mules. The animal is fastened to a frame and lifted almost entirely off the ground, while a rope twisted about his nose and tightened at will with a turn-stick controls the least attempt at unruliness. Iron shoes are employed in the north; in the south, where horses are little used, they are usually left unshod, though the fore feet are often covered with leather shoes which fit the hoof."—*Williams, Midd. King.*, ii. 4–5.

"The Chinese attempts at the manufacture of knives and shears are very contemptible, and their needles are of the most sorry description. In fact, every kind of iron or steel work is executed in a very rude manner."—*Ibid.* p. 275.

[For the methods of repairing cast-iron articles, porcelain, etc., see *ibid.* ii. 58–9.]

[K'ang Hsi employed the Jesuits in casting cannon.]—*Giles, Hist. of Ch. Lit.*, p. 385.

Glass-making.—"The manufacture of glass is carried on chiefly at Canton. . . . The importation of broken glass for re-melting has entirely ceased, but flints are carried from England for the use of glass-blowers. The furnaces are small, and from the ignorance, on the part of the workmen, of the constituents of good glass their products are not uniform. Foreign window-glass is now brought [to China] so cheaply that the native inferior article, which distorts objects seen through it, is dissappearing."—*Ibid.* ii. 21–2.

[For a full description of glass-blowing see *Lay, Chinese*, pp. 266–8.]

"Three new manufactures have been introduced during the present century, viz., that of glass, bronze-work, and Prussian blue. . . . The establishment of government arsenals at Fuhchau, Shanghai, Nanking, and Tientsin has stimulated and suggested as well as taught the people many applications of machinery."—*Williams, Midd. King.*, ii. 62.

Stone-working.—"The cutting and setting of hard and precious stones is carried on to some extent. Spectacles are cut and ground in lathes from crystal, smoky quartz, and a variety of rose quartz resembling the cairngorm-stone, which the Chinese call *cha-tsing*, or 'tea-stone,' from its color. Their spectacles are not always true, and the wearer is obliged to have them ground away until his eyes are suited. The pebble is cut in a lathe, by a wire-saw working in its own dust, into a round shape with plane edges. . . . The cutting of diamonds is sometimes attempted, but it is not a favourite gem among the Chinese. Diamonds and corundums are both employed to drill holes in clamping and mending broken glass and porcelain; tumblers, jars, etc., are joined so securely in this way without cement as to hold fluids. Both these gems are used to cut glass, but another mode, not uncommon, is to grease the place to be fractured, and slowly follow the line along by a lighted joss-stick until it breaks."—*Ibid.* ii. 22.

Brick-making.—"In many parts of this vast empire, bricks are now, and for centuries past have been, made in great numbers. . . . The surface soil or encallow, as it is termed by brickmakers, is first removed. The clay is then tempered or kneaded by the feet of buffaloes, which for this purpose are led or driven over it by boys, backwards and forwards for several hours. At the town of You-tou, however, which is near Woo-su Hien, the clay is trodden by men. . . . When the clay has been rendered soft and pliable, it is at once formed, by means of wooden moulds, into bricks, which are placed on what may be termed tracks, in rows, and at short distances from each other, so as to dry. As a protection from the inclemency of the weather, the tracks, with their contents, are not unfrequently placed under long mats, sometimes under tile sheds. Brickmakers, if poor, often cover them with straw only. When the bricks have been well dried they are conveyed to the kilns, which, like those in which the clay tiles are baked, are very large. . . . Some are so large as almost to resemble fortifications."—*Gray, China*, ii. 244.

Leather-working.—[For details of skin-tanning and leather-working see *Williams, Midd. King.*, ii. 38.]

Shoe-making.—"Shoes. The sole is very thick and made of felted paper, and consequently immovable. For women [it is an inch or 1½ inch thick]; . . . the edges of the sole are painted white, and the upper parts are beautifully embroidered with silk and gilded wire. Maidservants . . . and women who work for their livelihood [wear these] shoes [which] are intended for the foot in its natural size. . . . The model on which they are made is divided at the 'waist' into two parts, for the convenience of insertion and removal, which two parts are kept in their places by a tongue or wedge driving between them. . . . The last is prepared from the pumelo tree, a kind of citron, and is very neatly finished. . . . [The sole is made] broad in front, so as to allow the toes to expand."—*Lay, Chinese*, p. 273.

Paper-making.—"Chinese paper is made from bamboo, by triturating the woody fibre to a pulp in mortars after the pieces have been soaked in ooze, and then taking it up in moulds; the pulp is sometimes mixed with a little cotton fibre. Inferior sorts are made entirely from cotton refuse; and in the North, where the bamboo does not grow, the bark of the *Broussonetia*, or paper mulberry, furnishes material for a tough paper used for windows, wrappings, and account books, etc. Bamboo paper has no sizing in it, and is a frail material for preserving valuable writings, as it is easily destroyed by insects, mildew, or handling."—*Williams, Midd. King.*, i. 599.

Printing.—"The mode of printing is so well fitted for the language that few improvements have been made in its manipulations. . . . Cutting the blocks and writing the characters form two distinct branches of the business; printing the sheets, binding the volumes, and publishing the books also furnish employment to other craftsmen." When the leaf has been written out it is pasted on and cut into the block. The printer's "machinery is very simple. Seated before a bench, he lays the block on a bed of paper so that it will not move nor chafe. The pile of paper lies on one side, the pot of ink before him, and the pressing brush on the other. Taking the ink brush, he slightly rubs it across the block twice in such a way as to lay the ink equably over the surface; he then places a sheet of paper upon it, and over that another, which serves as a tympanum. The impression is taken with the fibrous bark of the gomuti palm; one or two sweeps across the block complete the impression, for only one side of the paper is printed. Another and cheaper method in common use for publishing slips of news, court circulars, etc., consists in cutting the characters in blocks of hard wax [*cf. infra*], from which as many as two hundred impressions can often be taken before they become entirely illegible. The ink is manufactured from lampblack mixed with vegetable oil; the printers grind it for themselves."—*Ibid.* i. 600–1.

"The number of good impressions which can be obtained from a set of blocks is about sixteen thousand, and by re-touching the characters ten thousand more can be struck off."—*Ibid.* i. 602.

"Most certainly the Chinese have used movable type in other cases besides the fount manufactured for the Imperial printing-office in the reign of Kien-lung. At the present day, according at least to current belief, the *Peking Gazettes* are printed with *wooden* type; and founts of leaden type are also not unknown. . . . Reprints of the *Peking Gazettes* produced in the provinces are (at least in some cases) worked from *wax* blocks, on the softened surface of which the characters are traced with sufficient distinctness to serve for a considerable number of impressions."—*N. and Q. on C. and J.*, ii. 79.

"Kienlung directed the casting of a large font of lead types for government use."—*Ibid.* i. 603.

"The Emperor Kanghi ordered about two hundred and fifty thousand copper types to be engraved for printing publications of the government, and these works are now highly prized for their beauty. The cupidity of his successors led to melting these types into cash."—*Ibid.* i. 602.

Book-binding.—"The sheets [when printed] are taken by the binder, who folds them through the middle by the line around the pages, so that the columns shall register with each other, he then collates them into volumes, placing the leaves evenly by their folded edge, when the whole are arranged, and the covers pasted on each side. Two pieces of paper stitch it through the back, the book is trimmed, and sent to the book-seller. If required, it is stitched firmly with thread, but this part, as well as writing the title on the bottom edges of the volume and making the pasteboard wrapper, are usually deferred till the taste of a purchaser is ascertained. Books made of such materials are not as durable as European volumes, and those who can afford the expense frequently have valuable works enclosed in wooden boxes."—*Ibid.* i. 601–2. See also *Journ. Asiat.*, Sér. IV. xi. 38.

[For the manufacture of pith paper, scented ink, and vermilion, see *Williams, Midd. King.*, ii. 61–2; 113–4; *Pharm. Journ.*, 3rd Ser., iv. 710.]

[For preparations made from camphor and cassia, see *ibid.* ii. 55–6.]

AGRICULTURE AND REARING.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

"In ancient times . . . [the people] were not acquainted with the methods of agriculture" (*Shén Nung shih chí, Kang chien i chih lu*, *c.* 1. p. 2), [but see following extract]. The legendary origin is as follows:—Shên Nung "fashioned wood to form the share, and bent wood to make the plough-handle. The advantages of ploughing and weeding were then taught to all under heaven."—*I ching*, App. III. Sect. II. ch. 2, 13; *Legge, Yi King*, p. 383.

"That the Chinese themselves did not learn agriculture in China is beyond a doubt. Just as the family life of the Vedic Aryans is coeval with their existence as a pastoral people, so that of the Chinese does not go back to a time when the black-haired people were not agricultural."—*Simcox*, ii. 20.

"The black-haired people brought with them habits of settled labour. Their wealth did not consist, like that of nomads, in their herds and flocks. Shun's governors of provinces in the Shoo are called Pastors or Herdsmen, and Mencius speaks of princes generally as 'Pastors of men' (*Mencius*, I. Pt. I. vi. 6.); but pastoral allusions are very few in the literature of China. The people could never have been a tribe of shepherds. They displayed, immediately on their settlement, an acquaintance with the arts of agriculture and weaving. The cultivation of grain to obtain the staff of life, and of flax to supply clothing, at once received their attention. They knew also the value of the silk-worm, and planted the mulberry tree."—*Legge, Ch. Class.*, III. i. Prol. p. 191.

"The old Chinese lived close to Nature; took on themselves her tasks, made the most of her gifts. They had superintendents of the mountains, the woods, the streams, and the lakes; they worshipped gods of the land and grain. From oldest time, the ruler, as representative of the national religion, has paid annual honors to the spirits of the land, holding the plough and opening the first furrow of the year, in presence of the people. . . . At the same season, the labors of the other sex in China were religiously opened by the empress with her attendants, entering on the delicate task of breeding silkworms in the palace park [*Tcheouli*, 3. vii (13)]. Of this industry one of her first predecessors was, in the same way as Shin-nung in agriculture, regarded as the inventor."—*Johnson, Or. Rel.—Ch.*, pp. 68–9.

[The available land was practically all under cultivation, since the military manœuvres were postponed until the fields were clear of crops.]—*Chou-li*, ii. 175.

"Some of its [China's] most fertile spots have unquestionably been under cultivation for upwards of 4,000 years."—*Simcox*, ii. 7.

During Yü's great labours he, along with Tseih, sowed grain, "showing the multitudes how to procure the food of toil in addition to flesh meat."—*Shu ching*, Pt. II. Bk. IV. Ch. i. 1; V. xxvii. 8; *Legge, Ch. Class.*, III. i. 77–8. Numerous further references to agriculture and rearing and the teaching of them to the wild tribes occur in the Classics.

"The nature of the characters used for domestic animals clearly show the occupation of the first Chinese who attempted writing."—*Ch. Rec.*, ix. 380.

[The "hundred grains," *i.e.*, all the various kinds of grain (*Shu ching*, Pt. II. Bk. I. Ch. V. 18) are made out by Fan Shih-lin of the Ming dynasty as follows:—under the name of *liang*, including millet, wheat, etc., 20 kinds; of *tao*, including rice, and all grains that grow in water, 20 kinds; of *shu*, *i.e.*, beans, peas, etc., 20 kinds; of *su*, vegetables, 20 kinds; and of *kuo*, fruits, 20 kinds.]—*Legge, Ch. Class.*, III. i. 44, note.

"Of the six grains which figure in modern maxims—rice, millet, pulse, wheat, panic, and rye—the earliest enumerations do not mention rice."—*Simcox*, ii. 14. See also *Richthofen, China*, i. 420–1.

"Although it was not cultivated by them, cotton . . . was known to this people at a very early date; and it is supposed that a reference to it occurs in the Shoo-king."—*Gray, China*, ii. 141–2.

"There is ample evidence in the Classics that [horses] were both known and used [before] the establishment of the dynasty of Hsia. We read in the *Shu Ching* of the milk-white steeds that were harnessed to the chariot of Yao."—*Balfour, Leaves*, p. 72.

"Under the Emperor Yü and his successors, the horse seems to have been regularly trained to the exercises of the battle-field, the labours of agriculture, and the excitement of the chase."—*Ibid.* p. 73.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Agriculture.—[According to the *data* furnished by different odes, the system of cultivation with irrigation was established in the vast plain which forms the lower valley of the Yellow River, from the gorge of the Dragon's-gate (in Shan Si) to the Gulf of Pei Chih-li, into which this great river then emptied itself. Every space of ground assigned to a family of husbandmen was surrounded by a trench for irrigating it, which formed its boundary (*Shih ching*, II. vi. VI.); and these trenches communicated with larger canals which were conducted to rejoin the river. The complete system adopted for the purpose of irrigation is expounded in detail in the *Chou li* (Bk. XV. art. 遂人), which confirms the indications in the *Shih ching*.]—*Legge, Ch. Class.*, IV. ii. 373; and Prol. p. 149.

According to the *Li chi*, "hills and mounds, forests and thickets, rivers and marshes, ditches and canals, city walls and suburbs, houses, roads, and lanes took up one-third of the whole country, the rest being cultivable fields."—*Legge, Li Ki*, i. 245–6.

[Much of the country on the two sides of the valley of the Yellow River was still uncultivated.]—*Legge, Ch. Class.*, IV. ii. 292.

[The mention of the "clearing away the roots" in *Ch. Class.*, IV. ii. 381 shows that the Chinese were still continually reclaiming untilled jungle for the plough.]

In the first month of spring "the king gives orders to set forward the business of husbandry. The inspectors of the fields are ordered to reside in the lands having an eastward exposure, and (see that) all repair the marches and divisions (of the ground), and mark out clearly the paths and ditches. They must skilfully survey the mounds and rising grounds, the slopes and defiles, the plains and the marshes, determining what the different lands are suitable for, and where the different grains will grow best. They must thus instruct and lead on the people, themselves also engaging in the tasks. The business of the fields being thus ordered, the guiding line is first put in requisition, and the husbandry is carried on without error."—*Li chi*, iv. i. i. 15; *Legge*, i. 255.

"In the management of a field, when the soil has all been laboriously turned up, they must proceed by orderly arrangement to make its boundaries and water-courses."—*Shu ching*, Pt. V. Bk. XI. 4; *Legge*, III. ii. 417.

[The rice and millet were sown in spring, on which occasion there was a ceremony (*Shih ching*, IV. i. [ii.] I.), the celebrated ceremony of husbandry, the ritual of which is described in the *Kuo yü* (art. 5). II. vi. VI. says that the country about Nan Shan was made cultivable by Yü. The wheat and barley were ripe in summer. In autumn took place the ceremony of the ingathering (IV. i. [ii.] IV.).]—*Ibid.* IV. ii. 582, 373, 586; and see *Li chi Yüeh ling*, *Yüan chien lei han*, *c.* 356, *Chüan yeh pu*, p. 7*b*.

[Weeding is recommended in a special manner (*Shih ching*, II. vi. VIII. 2; IV. i. [iii.] V. and VI.). The weeds were gathered in heaps and burned. Insects which eat the 'heart and leaf, the roots and the joints' of the young plants were removed, the husbandmen expressing a wish that the Spirit of husbandry would take the insects and commit them to the flames (II. vi. VIII. 2). The ashes nourished the soil. The assiduous uprooting of weeds has always been recommended by the Chinese government to the cultivators of the ground. It is noted by Confucius and by Mencius as a necessity; and its continuation for twenty centuries is, no doubt, an essential cause of the astonishing fertility of the Chinese soil, from which parasitical herbs have disappeared.]—*Legge, Ch. Class.*, IV. ii. 380, 600, 603; and Prol. p. 150.

[In general they left the land fallow for one year, and then cultivated it for two years. If they still found weeds in it the second year, they carefully uprooted them (*Shih ching*, II. iii. IV.). The harvest was a time of great labour and of much rejoicing (II. vi. VIII.). This ode says that the reapers left some ears of grain, and even small handfuls of it, for the poor widows who came to glean. The superintendent of agriculture came to the field, and rejoiced with the husbandmen. They then assigned over the share that was due to the State from the returns of the harvest.]—*Legge*, IV. ii. 284, 380; and Prol. p. 150.

Rearing.—[The principal kinds of cereals mentioned in the *Shih ching* are rice, wheat, barley, buckwheat, two sorts of millet, called *shu* and *chieh*, which resembled, the one the *milium globosum*, the other the *holcus sorgho*. The labours of cultivation of each month are described in I. xv. I. and IV. i. [iii.] V. and VI.]—*Ibid.* IV. i. 226; ii. 600.

[They cultivated indigo, or some similar plant, from which they extracted a deep blue dye (*Shih ching*, I. xv. I. 3; II. viii. II. 2). They cultivated also plants which gave a yellow dye and a red (I. xv. I. 3).]

[The hemp and similar plants, the *ch'u* (boehmeria), the *chien* (a sort of rush), and the *ko* (dolichos), were steeped in the moats (*Shih ching*, I. xii. IV.).]—*Legge, Ch. Class.*, IV. i. 208.

[Beyond the great valley, particularly towards the west in Shen Si, and eastwards about the T'ai mountains in Shan Tung, there existed vast forests. The first chiefs of the House of Chou, duke Liu and T'an Fu, began the clearing of the forests of Shen Si (*Shih ching*, III. 8; ii. VI.). The people of the State of Lu drew materials for building from the neighbourhood of Mount T'ai. II. iv. VI. mentions the great herds of cattle and sheep as the chief riches of powerful families: a natural circumstance among a people still far from numerous, and spread over a vast territory. The large herds of horses, necessary for the war-chariots, fed at pleasure, without restraint of any kind, in the open territory assigned to them (IV. ii. I.). In the neighbourhood of houses they fastened the feet of the horses with tethers while they were feeding (II. iv. II.).]—*Ibid.* IV. ii. 441, 483, 307, 611, 299.

One of the chiefs of the House of Ch'in, "named Fei-tsze, had made himself famous at this time by his skill in rearing horses."—*Ibid.* III. ii. 614, note.

"In the dynasty of Chou [the horse] became the subject of special legislation. Horses were divided into six classes, *viz.*, those for the Emperor and nobility, those to be used in war, those for draught and field labour, those for government posts, those for private riding or journeying, and those for carrying burdens."—*Balfour, Leaves*, p. 73.

As long as the warlike spirit of the time was kept up, "the breed and mettle of horses were preserved at a high standard."—*Ibid.* p. 73.

"The feudal state of Wei was famous for its asses."—*Giles, Dic.*, No. 12,542.

"Around the homestead, with its five mow, the space beneath the walls was planted with mulberry trees with which the women nourished silk-worms, and thus the old were able to have silk to wear. Each family had five brood hens and two brood sows, and thus the old were able to have flesh to eat. The husbandmen cultivated their farms of 100 mow, and thus their families of eight mouths were secure from want."—*Mencius*, iv. i. 13.

[In ordinary houses they reared pigs (*Shih ching*, III. ii. VI. 4) and dogs to be eaten. The *Shih ching* mentions only the watch-dog (I. ii. XII. 3), and the hunting-dog (I. viii. VIII.; II. v. IV. 4). In two passages where Mencius describes what is necessary to a family of husbandmen (I. Pt. i. III. 4; VII. 24), he notices the raising of dogs and pigs for food. Each house had also its fowl-house, filled with cocks and hens, or they roosted in holes in the walls (*Shih ching*, I. vi. II. i. *et al.*). The odes of the *Shih* do not speak of geese nor of tame ducks. They make frequent mention of these birds in their wild state; and we might hence presume that they were not yet in that age generally domesticated; yet in Mencius (III. Pt. ii. X. 5) we have a 鵝, which is the name appropriate to a tame goose, which is cooked and eaten, and in the *Tso chuan*, under the 28th year of duke Hsiang, mention is made of a 鶩, or tame duck; and an author who lived under the Han dynasty, about 100 B.C., says that the domestic birds mentioned in the *Chou li*, XXXIX. par. 2, were geese and ducks. Beef and mutton (*Shih ching*, II. i. V. 2; III. ii. III) indicate the rearing of cows and sheep.]

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

"The Emperor said that agriculture was the root of everything under the sun, and springs and streams were used for irrigation in order to grow the 5 kinds of grain."—*Han shu Kou hsü chih, Tzü shih ching hua*, *c.* 54, p. 34*a*.

"The land near the rivers and lakes was cleared of weeds by fire and ploughed with water."—*Han Wu Ti chao, Shih lei fang pien*, *c.* 17, *Jen shih pu*, p. 2*a*.

"Chi Sheng said: For sowing the spotted and black hemp seed the land should be cultivated three times. For each acre (*mou*) of field two pecks of hemp seed should be allowed. The best time to sow is at the beginning of the third moon. In general, every two feet should have one root; if planted too densely it will not grow. When hoeing it should be hoed thoroughly, if it be left uncultivated the seed would not be produced in any quantities. It should be sown near grain land so that it would not be harmed by cattle, but if it be sown on bean land, both would be injured. In the 6th moon, on the spare land, the *mang ching*, a vegetable like the turnip, may be sown."—*Kuang chun fang pu*, *c.* 12, p. 8*a*.

"The Emperor Ling of the Han dynasty made a 'turning wheel' (water-pump) and a 'thirsty crow' (bent water pipe) and placed them at the west bridge outside the Yü (Jade) Gate to water the fields to the southward and economize the labour of the people in irrigating their fields."—*Ko chih ching yüan*, *c.* 49, *Jih yung chi wu lei*, p. 15*a*.

[A sowing machine was invented.]—*Giles, Dic.*, No. 7,348.

[178 B.C. The rite of the Imperial ploughing was revived to guard against neglect of agriculture.]—*Simcox*, ii. 112. *Cf.* ECCLESIASTICAL.

"When the Emperor Wu-ti, of the Han dynasty . . . was making his great garden, the Grandees, says the History, presented him with fruit-trees from various distant countries, among them peach-trees [of several kinds, one of which was from Persia]."—*Mém. conc. les Ch.*, xi. 283.

[Chang Ch'ien (2nd century B.C.) is said to have brought to China the walnut, cultivated grape, the knotty bamboo, and hemp.]—*Giles, Bio. Dic.*, p. 12.

"The unwholesome luxury in which the horses were reared, and the vast numbers . . . appropriated to the imperial use, resulted, first in the degeneracy of the breed, and then in an alarming mortality."—*Balfour, Leaves*, pp. 73–4. And see MILITARY.

"When Fan K'o of Nan Yang was Prefect of Kuei Yang, in the Wu State, he taught people to plant mulberry trees and rear silkworms."—*Hsieh Ch'êng Hou Han shu, Yüan chien lei han*, *c.* 256, *Ch'an yeh pu*, p. 16*a*.

"A native of Lo, called Tan Fu, otherwise known as Chung Ju . . . could make *mutan*, peonies, into a thousand sorts—the red and white vied with each other in beauty, and no one knew the secret of his skill."—*Lung ch'êng lu, P'ei wên yün fu*, *c.* 67 *shang*, p. 139*a*.

Period of Disruption (221 *to* 598).—*Table IV.*

About A.D. 350 "the earliest mention of the tea plant being cultivated for the infusion made from its leaves is met with."—*Simcox*, ii. 130.

"Tea does not grow in the northern provinces of China and Japan; its range lies between the twenty-third and thirty-fifth degrees of latitude, and reaching in longitude from Yedo to Assam. . . . The people in different parts of China gave different names to the successive pickings of the leaves, which have now become disused. . . . Tea is so nearly akin to the various species of camellia that the Chinese have only one name for all. Two species of camellia are cultivated for their oily seeds, the oil being known as tea-oil among the natives; it is used for lamps and cooking. There is probably only one species of the tea plant, and all the varieties have resulted from culture; but the *Thea viridis* is most cultivated. The nuts are ripe in October. They are put in a mixture of sand and earth, dampened to keep them fresh till spring; they generate heat and spoil if not thus separated. In March they are sown in a nursery, and the thrifty shoots transplanted the next year in rows about four feet apart. Leaves are collected when the plant is three years old, and this process is continued annually to a greater or less extent, according to the demand and strength, until the whole bush becomes so weak and diseased that it is pulled up for firewood to give place to a new shoot. On the average this is about the eighth year. The plants seldom exceed three feet; most of them are half that height, straggling and full of twigs, often covered with lichens, but well hoed and clean around their roots."—*Williams, Midd. King.*, ii. 40.

[A variety of useful and ornamental plants were brought from Central Asia and Arabia.]

From the Restoration of Unity to the end of the Five Dynasties (589 *to* 960).—*Table V.*

"Agriculture had made no progress, as the area estimated to produce a year's food for one person is slightly larger than before."—*Simcox*, ii. 164.

"When [Kao Tsu] died, he left his successor in a position to collect seven hundred thousand [horses] from the different

provinces of his realm; and before long the stock of horses had so much increased that it was said they were actually more numerous than all the camels, sheep and cattle in the land." "On one occasion . . . the vanquished Tartars were compelled to pay tribute to the Chinese in horses. The animals not only sickened themselves [from change of climate and food] but introduced a terrible epidemic among the horses of the country—a fact which was attributed to bad faith on the part of the Tartars, until experience and observation disclosed the true reason."—*Balfour, Leaves*, pp. 74, 77. Also in *Simcox*, ii. 258.

"The Tang dynasty . . . gave up the richest lands on the banks of the Wei, in Shen Si, to 400,000 horses."—*Journ. N.-C.B.R.A.S.*, N.S. xxii. 101.

"In A.D. 787 complaints were made of a dearth of horses, animals which seem never to have been naturalized in China."—*Simcox*, ii. 135.

"Under the Tang, Sung, and Ming dynasties these establishments [breeding stations] were sometimes private and sometimes under government; but want of space, coupled with bad management, at last produced great confusion and corruption."—*Ibid.* xxii. 101.

[Suleyman mentions the following fruits as grown in China: the apple, peach, citron, pomegranate, quince, pear, banana, sugar-cane, melon, fig, grape, cucumbers of various kinds, lotus, [water-chestnut ?], walnut, almond, hazel-nut, pistachio, plum, apricot, "sorbes," and cocoa-nut. The palm [date-palm ?] is not common. Wine and vinegar are made from rice, but grape-wine is unknown.]—*Rel. des Voy.*, i. 22–3.

[Peonies were cultivated at this period, as proved by the mention of a wonderful plant of this kind, growing in the gardens of the Emperor Ming-hwang, whose fragrant flowers were scarlet by day, and turned yellow in the evening, losing all their scent.]—*Mém. conc. les Ch.*, xi. 490.

Sung Period (960 *to* 1280).—*Table VI.*

[Agriculture was fostered by T'ai Tsu.]—*Giles, Bio. Dic.*, p. 70.

"Our ascertaining the date of the introduction of cotton as a textile plant into China depends very much on the meaning of certain words rendered *cotton* by some annotators in the *Shu King*. The weight of proof is, however, strongly adverse to this view; but a historical notice, dated about A.D. 500, plainly refers to cotton robes; in A.D. 670 it was called by a foreign name *Kih pei*, a contracted form of the Sanscrit name *karpasi*. The present name of *mien hwa*, or 'cotton-flower,' was naturally given to it from the resemblance of its seed envelope to the silky covering of the seeds of the *mah-mien shu*, or tree cotton (*Bombax*), common in Southern China. It was, however, one thing to admire cotton cloth brought as tribute, and quite another to introduce cotton-growing into China, which does not seem to have been attempted until the Sung dynasty. Early in the eleventh century the plant was brought over and cultivated in the north-western provinces by persons from Khoten, where it was grown."—*Williams, Midd. King.*, ii. 36–7. See also *Legge, Ch. Class.*, III. i. 111, note.

"The provinces in which it [cotton] was first cultivated were Kwang-tung and Fo-kien. . . . It appears, however, from a book on the cultivation of cotton, written by a literate named Lu Kwong-kee, who flourished in the Ming dynasty . . . that the provinces of Shan-si and Shen-si were scarcely, if at all, behind those of Kwang-tung and Fo-kien in this enterprise."—*Gray, China*, ii. 142.

"When, at the close of the thirteenth century, the dynasty of Sung was overthrown by the Mongol hordes, the supply [of horses] was found to be entirely inadequate to resist the charge of the invading cavalry."—*Balfour, Leaves*, p. 74.

[It appears from several poems of the Sung dynasty—especially one by Sze-ma-kwang, that peach-trees were planted along the roads and on the banks of the canals.]—*Mém. conc. les Ch.*, xi. 281.

[Grafting the persimmon on the peach-tree is mentioned in *Kuang shih lei fu, Hua pu*, c. 30, p. 3*b*.]

Mongol Period (1280 *to* 1368).—*Table VII.*

"Like other travellers, Ibn Batuta observes that Cathay is the best cultivated land in the world; 'in the whole country you will not find a bit of ground lying fallow,'" for "private owners are not allowed to leave their holdings untilled, and . . . the State is interested in providing every plot with a cultivating owner, since so only can the land tax be raised without difficulty."—*Simcox*, ii. 236.

"The opposition to cotton cultivation on the part of silk and hemp growers was so persistent that the plant had not fairly won its way into favour until the Yuen dynasty; and this was owing to a public-spirited woman, Lady Hwang, who distributed seeds throughout Kiangnan, now the great cotton region."—*Williams, Midd. King.*, ii. 37.

"From Kiang-soo a knowledge of cotton cultivation spread quickly through Hoonam, Hoopeh, Honam, Ngan-hwuy, and other provinces."—*Gray, China*, ii. 142.

[The natives in the south of Min Ling competed in planting cotton trees. "Some had 1000 trees."]—*Mo k'o hui hsi, Ko chih ching yüan*, c. 27, p. 22*b*.

[Rhubarb was produced in large quantities in the mountainous region south of Suchau and Kanchau, as well as in Shansi, Shensi, Honan, and Ssüch'uan. Ginger was grown in southern Shensi, Fukien, and Kien-ning Fu.]—*Yule, Marco Polo*, i. 196, 197 (note), 242; ii. 12, 19, 179, 180.

[For a treatise on the cultivation of mulberries presented to the Emperor in 1318, see *Literature*.]

"The Mongol demand for horses was naturally larger than that of the native rulers; and fourteen great centres—in Corea Yünnan, Karakorum, and other suitable districts—were kept up to supply horses for the army."—*Simcox*, ii. 222.

"It was the horses of the Mongols which conquered China; but so badly did the humid atmosphere suit the animals themselves, and so widespread was the corruption practised by the native cavalry inspectors, that, when the Yuens were ousted in their turn, they actually found themselves without sufficient horses on which to take to flight."—*Balfour, Leaves*, pp. 74–5.

Marco Polo says that the people of Kansuh kept tame yaks (caught young) as beasts of burden and for ploughing, and also bred a cross between the yak and the common cow—"the cattle from this cross are wonderful beasts, and better for work than other animals."—*Yule, Marco Polo*, i. 266. Like other references to customs so near the date of the conquest, this may probably be taken as referring to the preceding Period also.

Yule's note on yaks (*Marco Polo*, i. 269): "The tame yaks are never, I imagine, 'caught young,' as Marco says; it is a domesticated breed, though possibly . . . occasionally refreshed by a cross of wild blood. They are employed for riding, as beasts of burden, and in the plough. . . . The tame yak is used across the breadth of Mongolia. Rubruquis saw them at Karakorum. . . . Mr. Ney Elias tells me he found yaks everywhere along his route in Mongolia, between the Tui river (long. *c.* 101°) and the upper valleys of the Kobdo, near the Siberian frontier. At Uliussutai they were occasionally used by the Chinese settlers for drawing carts, but [not] for loads or for riding, as in Tibet. He has also seen yaks in the neighbourhood of Kwei-hwa-ching ('*Ten-duc*'). This may be taken as the eastern limit of the employment of the yak; the western limit is in the highlands of Kokand."

Friar Odoric says that, at Canton, "the geese are bigger and finer, and cheaper than anywhere in the world. For one of them is as big as two of ours, and 'tis all white as milk, but has a bone on the top of its head about the size of an egg, which is of a blood colour; while under its throat it has a skin hanging down for half a span. And these geese are as fat as fat can be, yet one of them well dressed and seasoned you shall have there for less than a groat. And as it is with the geese, so also with the ducks and fowls.; they are so big that you would think them perfectly marvellous."—*Yule, Cathay*, i. 106-7.

"Here [Foochow] be seen the biggest cocks in the world. And there be hens also that are white as snow and have no feathers, but have wool only upon them, like sheep" (Friar Odoric). [The "silk fowl." Martini, 1659, speaks of "woolly hens" in Ssŭ Ch'uan. See *Kircher, China Illustrata*, p. 196.]—*Ibid.* i. 110.

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

Semedo (*Relazione della gran monarchia della Cina*) "admires the horticultural skill of the Chinese, and their use of hot-water pipes to force the growth of plants."—*Simcox*, ii. 270.

[Even bones and rags were carefully gathered and sorted for manure.]—*Simcox*, ii. 270.

[Grafting peach with plum trees was said to make the fruit larger.]—*Kuang chün fang p'u*, c. 54, p. 3*a*.

"The great travail and continual labour of the inhabitants of this country is a great help unto the goodness and fertility thereof, and is so much that they do neither spare nor leave mountains nor vallies, neither rivers, but they do sow and plant all such things as they perceive that the place will yield, according unto the goodness thereof: as orchards with fruit, great fields of wheat, barley, rice, flax, and hemp, with many other things: all which travail unto them is very easy, remembering with what great liberty they do enjoy their goods, and the great and infinite number of people that there is, as well for handicrafts, as for to till and cultivate the ground."—*Mendoza, Hist.*, i. 13.

"They do sow wheat, barley, rye, oats, and many other kinds of grain. . . . In the marish grounds . . . they do sow rice, which is a common victual unto all the people of the kingdom and unto them that dwell near them: and . . . when it is dearest, you shall have a *haneg* for a ryal of plate." [All these grains yielded four crops annually.] "On their high grounds, that are not good to be sown, there is great store of pine trees, which yield fruit very savory; chestnuts greater and of better taste than commonly you shall find in Spain: and yet betwixt these trees they do sow maiz, which is the ordinary food of the Indians of Mexico and Peru, and great store of panizo, so that they do not leave one foot of ground unsown."—*Ibid.* i. 15. Spanish fanega = $1\frac{3}{5}$ bushel English.

[Mendoza (*ibid.* i. 14) mentions among the fruits cultivated by the Chinese "three sorts of oranges—the one very sweet, which doth exceed sugar in their sweetness; the other sort not so sweet as the first; the third . . . somewhat sour"; a kind of plums, called *lechias*, melons, and a large kind of russet apple.]

"In all parts of this kingdom there is great store of sugar, which is the occasion that it is so good cheap; for you shall have a quintal of very excellent white and good sugar, when it is dearest, for the value of six ryals of plate. There is a great abundance of honey, for that their delight is in hives, by reason whereof not only honey, but wax, is very good cheap; and there is so great quantity thereof that you may lade ships, yea fleets, thereof."—*Ibid.* i. 14.

"On their dry and tough lands, though they be stony, they gather great store of cotton wool."—*Ibid.* i. 15.

"In all probability, the seeds of the tobacco plant were brought to China by the Portuguese or the Spaniards, during the sixteenth century, after which the cultivation of the plant soon became general."—*Gray, China*, ii. 149.

Manchu Period (1644 *to* —).—*Table IX.*

"The soil of China is as diversified as its climate; the general characteristic of it, however, is great fertility. This fertility is in a good measure artificial, being made so by the amount of labour bestowed upon it. The aids afforded by nature to fertilize the country are improved to the best advantage. These are the long rivers which flow from the mountains on the western side of the country across to the ocean, and which are intersected by numerous canals throughout their whole lengths. . . . Notwithstanding the numerous population of China, tracts of land are found in various parts of the empire, which support scarcely any inhabitants. Some of them are in the vicinity of large cities. The existence of such waste is owing to the ignorance among the people of those principles of agriculture, the application of which would render them fertile. The most of them are marshes which need draining and manuring."—*Ch. Repos.*, iii. 122–3.

"The Chinese have been well called gardeners instead of agriculturists. . . . The great requisites in their system are manure and water, and to obtain these their whole energies are devoted. The soil is rarely allowed to lie fallow, and in most parts produces two crops annually. It is assiduously pulverized, and different soils are also mixed together to improve the quality of both. They will carry sand for a long distance to mix with a clayey, heavy soil, and loam to put with that which appears too loose. During the two months of winter in the southern provinces, the soil is sometimes thrown up into heaps where it has been mixed with some vegetable matter, thus making a kind of compost, and also presenting a larger surface to the air. After those lands which require flooding are covered with water, they are hoed and turned over until the whole surface is reduced to mud; this process has a still further fertilizing tendency."—*Ibid.* iii. 123–4.

"Simon, sent by Napoleon to report on the Chinese system of agriculture, stated that in no other part of the world had he seen such results as were here produced by manual and personal labour. The northern provinces are said to yield two crops annually; the southern, five in two years: this has continued for ages, aided by skilful processes of sowing and rotation (*Julien and Champion, Industr. de l'Empire Ch.*, p. 176)."—*Johnson, Or. Rel.—Ch.*, pp. 74–5.

"Horticulture is a passion, and the vegetable garden is the Chinaman's paradise. Four or five crops easily come of his acre per year. . . . The arts of grafting, pruning, dwarfing, enlarging, and varying species, and the laws of selection, have been well understood for ages. Of the tree-peony alone hundreds of varieties have been cultivated, some for more than a thousand years (*Darwin, An. and Pl. under Domes.*, ii. 248). The Dutch Embassy in the seventeenth century observed that farmers put their fruit whole into the ground, and then sent out the shoots at good distances apart, so raising great trees in a short time (*Dutch Embassy*, ii. 67)."—*Ibid.* p. 76.

[Agricultural boards in almost every village obliged farmers and landed proprietors, under penalty of confiscation, to keep their lands and estates in a good state of cultivation.]—*Gray, China*, ii. 107–8; and see REG. OF LAB.

Yang Tsung-jên, who became Viceroy of Hu-Kuang in 1722, "encouraged agriculture by unofficial tours, during which he distributed rewards out of his own pocket."—*Giles, Bio. Dic.*, p. 916.

W. L. G. Smith says that the greater part of China is under cultivation. "The pick-axe, the iron rake, and the hoe are in constant requisition, and more used . . . than the plow and the harrow. The ground, whether sown or planted, is usually raised into beds like those seen in American gardens, and is daily manured from the time the bed is finished till the produce . . . has attained maturity. The use of not a single foot of land is overlooked, nor its tillage omitted. Everything, animal and vegetable, that is not used in some other way is turned to the account of manure, and sprinkled over the earth. There are no fences usually, not even the hedges so common in Europe. The cattle and sheep are stalled most of the time. Occasionally they are led out to clip the isolated tufts of grass, or glean some wheat or bean field lately harvested, or browse upon the cotton shrub after the last picking. They are watched, lest they may go into forbidden ground, and in due time are returned to the stable. The children are the shepherds of China."—*Smith, Observations*, pp. 38–9.

"*Province.*	*Principal Productions.*
Chih-le	Millet, ginseng, fruits, tobacco, [coal, saltpetre, skins].
Shan-tung ...	Corn and fruits, drugs, wines, [skins].
Shan-se	Silks, wines, [iron, salt, marble, jasper,] musk.
Ho-nan	The garden of China; rhubarb, musk, indigo.
Kiang-soo ...	Medical herbs, [China-ware, gold, tin, lead, salt].
Gan-hwuy ...	Varnish-trees, green teas, silks, rice, millet.
Kiang-si	Coarse cloths, hemp, [China-ware,] drugs.
Foo-keen	Black teas, camphor, sugar, indigo, tobacco.
Che-keang ...	Silk, paper, wines, Lung-tsing-cho, a costly tea.
Hoo-pih	Teas, paper, rice, rhubarb, musk, tobacco.
Hu-nan	[Gold, silver, tin,] drugs, [mercury,] hemp.
Shen-se	Woollens, [iron, copper,] drugs, [furs,] millet.
Kan-suh	[Gold, quicksilver,] musk, tobacco.
Sze-chuen ...	[Copper, iron, tin,] rhubarb, rice, [salt,] drugs.
Kwang-tung ...	Rice, silks, fish, vegetables, [copper, iron, tin].
Kwang-si ...	Fruits, rice, cassia, [iron, lead,] sugar [tin].
Yun-nan	Rich in [metals,] rice, musk, betel-nut.
Kwei-chou ...	[Considerable metallic wealth,] tobacco, drugs."—*Martin, China*, beg. of vol. i.

"The stock on the great majority of farms in the southern and central provinces of China is very small, and consists chiefly of a yoke or two yokes of draught cattle, either buffaloes or bullocks. Milch cows are very few in number, and, as in the southern and central provinces, there are no grazing farms. The stalls for the cattle are immediately contiguous to the dwelling-house. . . . Many of the farmhouses are in very lonely and retired positions, others are erected in villages. Some are so large as to contain accommodation for several families of people. In the same farmhouse it is not unusual to find members of three generations, together with their attendants."—*Gray, China*, ii. 111–2.

"The Chinese farmer knows nothing, and refuses to be taught anything about the selection of seeds."—*N.-C. Herald*, Aug. 13, 1902.

"The hills are terraced chiefly for rice cultivation or to retain soil which would otherwise be washed away; and this restricts their gradation, generally speaking, to the southern and eastern provinces."—*Williams, Midd. King.*, ii. 6.

"In general, only the most favourable hills are chosen, such as have a good soil, and a moderate ascent. The terraces are walled up by stone, and the banks being used also for paths become in time very firm. When there is a natural stream of water, sluices are made in the banks through which it can run."—*Ch. Repos.*, iii. 126.

"To prepare the fields for rice-crops, they cover them with lime, which serves to manure the land and to destroy noxious insects. . . . The land is then irrigated, except when the rain has fallen in frequent and heavy showers. Several ingenious and useful methods of irrigation are in use among the

Chinese. One of them is by the water from deep wells, with one of which, in some districts at least, almost every field is provided. The shadoof or the rope and bucket are the means used. In all rural districts where the fields are not provided with wells there are ponds, from which the water is drawn in two or three ways. The first is very simple. Two men hold a bucket suspended between them by means of ropes attached to each of its sides. This vessel they keep in a swinging motion, dipping it with great rapidity into the pond, and as quickly pouring its contents over the field which they wish to irrigate. Another appliance is the chain-pump [see description and illustration, p. 119]," worked by buffaloes, asses, mules, ponies, or by hand. "In districts where the land is high above the channel of the river the farmers are obliged to have recourse to the water-wheel [see pp. 120–1]." "In the Island of Formosa the fields are supplied with water from the slopes of the lofty mountains, so that the chain-pump and water-wheel are seldom needed there."—*Gray, China*, ii. 118–21. See also ii. 196; *Williams, Midd. King.*, ii. 6–7; and *Ch. Repos.*, iii. 124–5.

"When the land has been irrigated it is covered with manure. This consists of various kinds of excrement, feathers of birds—those of geese, ducks, and fowls in particular—human hair, which is preserved by the barbers and sold to the farmers for this purpose, Peruvian guano, bone dust, bean cake, and a composition consisting of the dung of horses, cows, and pigs, and fine mould. A compost of this nature is made in large quantities by the inhabitants of several villages in the vicinity of Canton. . . . In the northern provinces of Chi-li, also, . . . I found a similar compost much valued. . . . The urine of cows and of horses is appreciated . . . as a good liquid manure." "The manure, however, which is regarded as most valuable by Chinese farmers is night soil."—*Gray, China*, ii. 121–3. And of pigeons, for esculent plants (*ibid.* ii. 189), and *ling*, rich mould and vegetable matter from the bottoms of rivers (*Scarth*, p. 8); see also *Gray*, ii. 193; and *Ch. Repos.*, iii. 124; and arsenic (*Journ. N.-C.B.R.A.S.*, N.S. ix. 181).

"The high state of cultivation in which the market-gardens are kept would draw from our English gardeners expressions of admiration and respect."—*Gray*, ii. 193.

"When the fields have been covered with manure, the plough is put in operation. The object of a Chinese ploughman is not so much to make straight furrows as to mix the earth thoroughly with the manure and water by which it has been previously overspread. In the southern provinces, and in the Island of Formosa, buffaloes draw the plough through the soil set apart for the rice crops, and, the fields being literally saturated with water and manure, it is usual to see the ploughman and his buffaloes above their knees in slush. In ploughing lands for wheat, barley, or millet, the difficulty of drawing the plough is considerably lessened, as the fields are not irrigated for these crops. For what by the Chinese is termed 'wet ploughing' the buffalo is not, as some writers on China suppose, reserved."—*Ibid.* ii. 124.

"When the plough has done its work, the fields are harrowed. The fortune-tellers are now called upon to select a lucky day or days on which to sow the seed. . . . The seed of the rice plant, which has been well soaked in water, is not thrown broadcast, like wheat, barley, or millet, over the field. It is sown very thick in a corner of the field which has been previously banked up for that purpose; and, when the shoots have grown a few inches, they are taken up and transplanted over the surface of the field. . . . The labourers, who are very expert in the work of transplanting them, are able to prick out upwards of twenty in a minute. . . . The holes dibbled for the plants run in straight lines, and are close to each other. So quickly does the rice plant grow, that in the course of a few days the whole country presents a rich, green appearance."—*Ibid.* ii. 124–5.

"Rows or drills are almost always employed in planting, the mode of sowing by hand as in other countries being seldom practised. The previous preparation of the soil is done mostly by man; buffaloes are used to assist him in ploughing and harrowing. When practicable, the rows are put in the direction of north and south. . . . In gardens, the seeds are planted in beds, and two crops of vegetables are obtained by planting one among the other, but which come to maturity at different times."—*Ch. Repos.*, iii. 126.

"The mode of increasing the flavor [of fruits] by grafting is known, and in some places it is frequently practised."—*Ibid.* iii. 126.

"The ripe grain is cut with bill-hooks and sickles, or pulled up by the roots; scythes, mowing-machines, and cradles are unknown where human arms are so plentiful. Ricestraw is made into brooms and besoms; the rice is thrashed out against the side of a tub having a curtain on one side, or bound into sheaves and carried away to be stacked. The thrashing-floors about Canton are made of a mixture of sand and lime, well pounded upon an inclined surface enclosed by a curb; a little cement added in the last coat makes it impervious to the rain; with proper care it lasts many years, and is used by all the villagers for thrashing rice, peas, mustard, turnips, and other seeds, either with unshod oxen or flails. Where frost and snow come, the ground requires to be repaired every season; and each farmer usually has his own."—*Williams Midd. King.*, ii. 9. See also *Gray*, ii. 126–7.

"Each village as well as each farm is provided with a threshing-floor which is for the public good, and is used by the peasants to whose cottages small portions of arable land are attached. In some villages several of these threshing-floors, which are made of chunam or asphalte, and are open to the heavens, are contiguous to one another."—*Ibid.* ii. 127.

[In parts of Kuangtung buffaloes tread out the corn. In other districts mules, asses, and ponies are employed. In many provinces grain is threshed by means of rollers, drawn by oxen, mules, asses, or ponies.]—*Ibid.* ii. 127–8.

"When the crop planted in February has been harvested in June the ground is again made ready, by a similar process, to receive seed a second time towards the end of July; and in the early part of the following November the whole country is again adorned with fields of golden beauty."—*Ibid.* ii. 129.

"For winnowing the grain the Chinese use a machine similar in all respects to that which was, and is still, used by many of our English farmers. In some instances, however, they adopt a much more primitive mode of winnowing. Having selected a day when a fresh breeze is blowing, labourers stand with their backs towards the wind, and let the grain fall gently from a tray. . . . Another mode resorted to . . . is tossing up the grain with a fork against the wind. The grain undergoes a further sifting or cleansing by being tossed up on bamboo or rattan trays, and occasionally on wooden shovels."—*Ibid.* ii. 128–9.

[After two rice crops the fields in some places are planted with tea-oil or esculents.]—*Ibid.* ii. 132–3.

"Besides the cereals . . . a formidable list of crops" is cultivated.—*Ibid.* pp. 135–7. Wheat, millet, beans, peas, pea-nuts, hemp, indigo, tobacco, cotton, silk, mulberry, cassia (wild cinnamon), and sugar are some of those named.

"Tobacco was first brought to China by the Manchus, who are said to have got it from Japan, through the Corean peninsula. Some opposition was then raised to its growth in the country, on the ground that soil would thereby be withdrawn from the more desirable cultivation of grain; but now it is widely cultivated, and largely smoked by both sexes."—*Giles, Historic China*, p. 122.

"The departments of floriculture and arboriculture have received great attention, but the efforts of their promoters are directed to producing something curious or bizarre, rather than improving the quality of their fruits or enlarging the number of their flowers. A common mode of multiplying specimens is to slit the stem and insert half of it in damp earth tied around the stalk until it has rooted, and then cutting off the whole. Dwarfing trees or forcing them to grow in grotesque shapes employs much time and patience. The juniper, cypress, pine, elm, bamboo, peach, plum, and flowering-almond are selected for this purpose; the former is trained into the shapes of deer or other animals, pagodas, etc., with extraordinary fidelity, the eyes, tongue, or other parts being added to complete the resemblance. The principle of the operation depends upon retarding the circulation of the sap by stinting the supply of water, confining the roots, and bending the branches into the desired form when young and pliable, afterwards retaining them in their forced position in pots, and clipping off all the vigorous shoots, until, as in the case of the cramped feet of women, nature gives up the contest and yields to art."—*Williams, Midd. King.*, ii. 12–13.

"The tea-plant . . . is so robust as to flourish in almost every variety of climate. I have seen it cultivated with much success in Hok-shan, Fā-yune, and other districts of the province of Kwang-tung which are within the tropics; and I have also found it in large quantities, not only in the central and southern provinces of China proper, but in various districts of inner Mongolia, where the winter season is extremely severe. It, however, flourishes best in the provinces of Fo-kien, Kiang-su, Hoonam, and Hoopeh."—*Gray, China*, ii. 204.

"A great variety of trees, some of which are little known out of China, are to be found in the orchards. In addition to the peach, apricot, custard-apple, rose-apple, pine-apple, pear, plum, walnut, date, cocoa, plantain, banana, persimmon, citron, orange, lemon, quince, guava, olive, pomegranate, and vine—the last mentioned being grown in many varieties—there are the li-chi, the fruit of which is of the size of a strawberry, the stone being inclosed in soft succulent pulp of a very delicious flavour; the lung-ngan, or dragon's eye; the wampee, whose fruit, about the size of a pigeon's egg, is much esteemed, and the carambolo. Of these fruits the carambolo is, perhaps, gathered in greatest abundance. . . . The orange orchards or groves are not by any means large. They are, however, very numerous, and supply the natives with an abundance of excellent fruit."—*Ibid.* ii. 194.

"The very extensive reed-fields to be found along the banks of the Yang-tsze deserve to be noticed." The wealth of some of the prefectures is derived in great measure from this source.—*Ibid.* ii. 150.

"The Chinese name for the potato is Yang-yu, or 'foreign root,' and in Sz-chuan I was informed that it had been introduced long ago by the foreign teachers, *i.e.*, the early French missionaries."—*Cooper, Travels*, p. 186.

"Many plants are cultivated for their oil, used in the arts or in cooking. The seeds of two or three species of *Eleococca* belonging to the Euphorbiaceous family and the *Curcas purgans*, are gathered, and by pressure furnish an oil to mix with lacker and paints, or to smear boats as a preservative against teredoes and other insects. It is deleterious when taken into the system, but does not appear to injure those who use or express it. The tallow-tree (*Stillingia sebifera*) grows over the eastern provinces; it is a beautiful tree, resembling the aspen in its shape and foliage, and would form a valuable addition to the list of shade-trees in any country."—*Williams, Midd. King.*, ii. 11.

"The Chinese do not confine themselves to cultivation on dry land only: they also cultivate the bottom of the waters, and in the beds of shallow lakes, ponds, and brooks, produce fruits, unknown to Europeans. The water-chestnut, or mai-tai as they term it, the fruit of which is inclosed in a case formed by its root, is one of the most noteworthy of these products, and is grown in large quantities."—*Gray, China*, ii. 194–5.

"There are very extensive water lily or lotus ponds in the vicinity of the cities and villages of the southern provinces."—*Ibid.* ii. 195.

"Flowering shrubs, flowers, and herbs are exceedingly numerous, and flowers as well as fruits may be had in abundance at any season of the year."—*Ibid.* ii. 196.

Rearing.—"The rearing of fish is an important pursuit, the spawn being collected with the greatest care and placed in favourable positions for hatching. The *Bulletin Universel* for 1829 asserts that in some parts of China the spawn so taken is carefully placed in an empty eggshell and the hole closed; the egg is then replaced in the nest, and, after the hen has sat a few days upon it, reopened, and the spawn placed in vessels of water warmed by the sun, where it soon hatches."—*Williams, Midd. King.*, i. 349. See also *De Courcy, L'Emp. du Mil.*, p. 464.

[Gold-fish of various kinds were reared in earthenware jars.]—*Gray, China*, ii. 201–2.

"Upon the open plains of the southern and central provinces it is customary to see herds of buffalo [*bos bubalus*] graze." It "is of immense service to farmers by its capacity for great and long-continued exertion in the yoke. . . . The specimens vary considerably, and the measure of strength and size to which they attain depends largely upon the way in which they are reared."—*Ibid.* ii. 151–2.

"What may be termed the milch cow of the southern farmer, although he uses it for the purposes of the team, belongs to the humped or zebra kind, and is similar in point of size to the smallest breeds which are reared in the north of Scotland."—*Ibid.* ii. 153.

"The cattle in the northern provinces of China and Mongolia are very similar to the middle-horned which are reared in Devonshire and in Yorkshire. . . . As dairy cattle the cows are much appreciated." Flocks of sheep "are very rarely indeed to be met with in" the southern provinces. "In the north of China, however, . . . flocks of sheep are very numerous. The breed is that known as the broad-tailed sheep." "In the eighth month of the year—which corresponds with our October—the rutting season commences. At this time ten ewes are allotted to each ram. Rams without horns are preferred. In the second month of the year—which corresponds with our March—the lambing season is at hand."—*Ibid.* ii. 156–9.

"Cattle for the Russians is quite a new item of industry [at Chefoo], and if it encourages active breeding, instead of further impoverishing local agriculture, it will be a very good thing for the province."—*Parker, China*, p. 156.

"Sheep-shearing takes place in the month of June. The custom . . . of washing the sheep in a running stream before shearing them . . . is not practised in China. The wool, however, is well washed as soon as it has been removed from the back of the sheep. For this purpose it is put into large wicker baskets, which are placed along the bed of a shallow creek or running stream, and the wool is washed by men who stand in them, performing this operation with their feet. The wool is greatly used by the Chinese, who value it much more than the flesh."—*Gray, China*, ii. 160. For sheep-folds, see pp. 160–1.

[Sheep suffered much from scab, ophthalmia, murrain, foot-disease, and apoplexy.]—*Ibid.* ii. 162–3.

"Although sheep are not reared to any great extent in the southern provinces, goats are bred in great numbers." The herds "were not as a rule so large as those in the north. The goats are almost invariably black, which renders them of greater value in the estimation of the Chinese."—*Ibid.* ii. 164.

"Swine occupy an important place in the Chinese farm-yard. The pigs are not quite so large as those of our own country. They are very well formed, and except for a slight hollow in the back, they bear a striking resemblance to the prick-eared pig of England. They are mostly white, or white and black. This remark, however, applies only to the pigs of the south of China. In the northern province and in Mongolia they are all black." "For breeding purposes, sows which have short snouts and bristly hair are considered the best; and those boars are preferred which, from the time of their weaning, have been kept apart from sows. As a rule, the boars are kept by aged and indigent cottagers, who suspend sign-boards from the doors of their cottages indicating in large letters that a boar is kept upon the premises. The owner takes the animal to the various farm-yards, and the fee does not exceed two hundred cash. While the boar remains at the farm-yard, the owner is boarded and lodged by the farmer or pig-dealer. Such an occupation is regarded by the Chinese as one of the most degrading which a man can pursue. The sows are of a very prolific nature. They bear two litters in the year, and have from ten to fifteen, and sometimes from eighteen to twenty, young at a time. . . . The Chinese seldom or never allow a sow to suckle more than twelve pigs at a time; and all above that number are sold." "When a sow is near the time of farrowing, she is put into a stye by herself."—*Ibid.* ii. 165–7; and see pp. 167–70.

"The Chinese . . . are not famous for any remarkable breed of horses. In this respect they are unlike most of the nations of Europe, and many of Asia. There is a great scarcity of horses in the southern provinces. In many parts of Kwang-tung and Kiang-si there may be said to be none. . . . In the north, however, where the population is not so dense, and where there are vast plains, more attention is paid to the breeding and rearing of horses," but "although as a rule handsome, docile, and intelligent, [they] do not generally exceed ten hands in height. . . . The usual colours are chestnut, gray, and bay. . . . There are also throughout the Empire various specimens of what is termed in natural history the tangum, or piebald, or skewbald horse."—*Ibid.* ii. 170–2. See also *Ch. Repos.*, xi. 86.

[Cooper (*Travels*, p. 189) says that the mules of Yünnan, usually called the "iron breed," are small, but "perform prodigies in the way of weight-carrying and travel, 400 pounds weight being an ordinary load."]

"The Chinese possess a handsome and docile race of mules. . . . Asses are very numerous in the northern and central provinces. . . . The ass of China is remarkable for its strength. In proportion to its size, it can carry heavier weights, and continue to toil longer without sustenance than any other beast of burden."—*Gray, China*, ii. 175.

"Chinese farms, like English, have their ducks, geese, and fowls. Pigeons are also reared by farmers in considerable numbers."—*Ibid.* ii. 180. For the processes described see pp. 181–8.

"Throughout the Empire there are institutions called Poo-ap-chong, in which ducks' eggs are artificially hatched in large quantities."—*Ibid.* ii. 182. For process of incubation, see pp. 182–3.

"Many varieties of pigeons are to be found in China. Tumblers, carriers, fantails, and croppers are reared in large numbers."—*Ibid.* ii. 188.

[Silkworms were reared in large quantities in most parts of the Empire. In the neighbourhood of Cheefoo, there are silk-worms which produce what is termed by Chinese silk merchants "mountain silk." These worms are very large, and are found upon oak trees.]—*Ibid.* ii. 221–30. For the seven harvests, see pp. 224–6.

"In many of the gardens it is customary to find apiaries; and it may be observed that in the practical management of bees this people are not one whit behind accomplished disciples of the illustrious Huber."—*Ibid.* ii. 199.

[For agricultural implements, see IMPLEMENTS.]

LAND-WORKS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

Shun "deepened the rivers."—*Shu ching*, Pt. II. Bk. I. Ch. III. 10.

"Yu said, 'The inundating waters seemed to assail the heavens, and in their vast extent embraced the mountains and overtopped the hills, so that people were bewildered and overwhelmed. I mounted my four conveyances, and all along the hills hewed down the woods. . . . I also opened passages for the streams throughout the nine provinces, and conducted them to the sea. I deepened moreover the channels and canals, and conducted them to the streams.'"—*Shu ching*, Pt. II. Bk. IV. Ch. I. 1; *Legge, Ch. Class.*, III. i. 76-7.

[For Yü's other labours see *ibid.* III. i. 92, 94, 102, 105, 108, 113, 117, 119, 125, 128-40, 141.]

"Mencius tells us that Shun, in connection with Yu's labours, entrusted to Yih the direction of the fire to be employed, and Yih consumed the trees and tangled vegetation of the forests and marshes, so that the birds and beasts were driven away."—*Legge, Ch. Class.*, III. i. 77, note.

[The labours of the great Yü are mentioned in the *Shih ching*, II. vi. VI. i., and III. iii. VII. 1. III. i. X. 5 says that the course of the river Fêng in Shen Si was regulated by him. IV. iii. IV. 1. says positively that he delivered the world from the flood.]—*Legge, Ch. Class.*, IV. ii. 373-5; 546; 462; 638; see also *Shih chi Ho ch'ü shu, Tzŭ shih ching hua*, c. 54, p. 33*b*; and *Lün yü, Yüan chien lei han, Chü ch'u pu*, c. 341.

Yü "had the merit of suggesting, directing and superintending; but all the talent and strength of the empire were helping. Yih and Tseih are mentioned by himself as his coadjutors. Passages from the Shoo itself, the 'Historical Records,' etc., indicate that he was also in correspondence with Kaou-yaou, the Sze-yŏ, Pih-e, and the pastors of the provinces, and so had all the resources of the empire at his disposal." His labours probably began at the bursting of the Ho at Lung-mun and Mount Leang.—*Legge, Ch. Class.*, III. i. 94, 96, notes.

"The nine branches of the Ho were conducted by their proper channels. Luy-hea was formed into a marsh; in which the waters of the Yung and the Tseu were united." That is, "the northern part of the Yen-chow, the delta of the Ho, was rescued from the inundating waters by Yu."—*Shu ching*, Pt. III. Bk. I. Ch. III. 13-15; *Legge, Ch. Class.*, III. i. 99-100, and note.

"Hsia Hou Shih [*i.e.*, Yü] got rid of the floods by opening the rivers in order to divide the depths and allow no [place for] flood, and made them flow eastwards into the sea."—*Shih chi, Tzŭ shih ching hua*, c. 54, p. 34*a*.

"Yü divided the nine continents, made the nine roads, enclosed the nine marshes, and surveyed the nine mountains."—*Ibid. P'ei wên yün fu*, c. 49, p. 70*b*. For doubts as to the reality of Yü's engineering exploits see *Hirth*, p. 125.

[The origin of wells is ascribed to the legendary ruler Huang Ti. See *Chou shu, Ko chih ching yüan*, c. 9, p. 1*a*.]

"[The legendary] Shên Hung made wells—nine of them. . . . They were in Têng Chou."—*Po liu t'ieh, Ko chih ching yüan*, c. 9, p. 1*a*.

In "梁 *liang*, beam, bridge, the radicals water and wood show that, when about 2500 B.C. the characters, according to tradition, were made, bridges were often formed of a single beam of wood."—*Ch. Rev.*, xiv. 214.

[The tablet of Yü on Mount Hêng referred to by many Chinese writers does not seem to have had any real existence. *v. Legge, Ch. Class.*, III. i. Prol. pp. 66-73.]

[The *Po wu chih, Yüan chien lei han, Chu ch'u*, c. 340, states that the walled city originated in the time of Yü, but according to the same work "Huai-nan Tzŭ says: 'Kun (Yü's father) built a walled city of 9 *jên*'" (*i.e.*, about 70 feet).]

[The extracts given under the Manchu Period relating to the unscientific nature, and small usefulness compared with their extent of public works, probably apply with equal force to those of all previous periods.]

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

"The construction of the canals and water-courses belongs to the same department of public works. A double spadeful makes a furrow a foot deep and wide; it is with such channels that the cultivator waters his own field; a little ditch of double this size separates each field or lot of 100 mow, and the earth dug out from it is raised and forms a little footpath between the plots; the water-course which surrounds a tsing (the nine lots, with a central well, which form a hamlet) is four feet deep nd wide, and is called a little canal, and has a footway along it. he hundred is surrounded by a channel of eight feet and a oadway. All five sorts of footway are planted at the edges ith wood, which serves for a defence. In theory the depart-ents are bounded by canals drawn direct from the large natural reams which have names of their own, and are, in fact, rivers ontrolled for irrigation purposes. The size of the rivers and he necessity of providing against inundations caused by their verflow was always a force working in favour of centralization. Iencius contrasts the administration of Yu, which convoyed he waters safely to the outer seas, with that of his contem-poraries, who were content if they could only carry their floods off into the territory of the adjoining states: a waste of water hateful to the benevolent mind of the sage."—*Simcox*, ii. 63.

"By heightening the dyke every year it would be prevented from sinking in the water. In spring and winter 'inner' clay should be used, and in autumn and summer 'outer' clay, and then, even if muddy water got in, it would not destroy it."—*Kuan Tzŭ, Tzŭ shih ching hua*, c. 54, p. 33*b*.

[Wells are mentioned. See *Yüeh Ya T'ang ts'ung shu, Chung wu chi wén*, c. 6, p. 14*a*.]

"Sun-Shu Ao led the Chi Ssŭ River to water the waste of Ling Lou. . . . The Commentary [says] that Ling Lou was the present Lu River."—*Huai-nan Tzŭ, Tzŭ shih ching hua*, c. 54, p. 33*b*.

"In the 20th year of the Emperor Shih of Ch'in [227 B.C.], Wang Pên divided the canal and led its water to the south-eastwards in order to water Liang; so it was called the Liang ditch."—*Shui ching chu, P'ei wén yün fu*, c. 26*b*, p. 167*b*.

"At Chien Chiang the men of Wu built a city wall and dug out a canal. North-eastwards it communicated with the Shê Yang Lake, and N.W. it joined the Sung K'ou flowing into the Huai [forming] a through grain route."—*Tso chuan, ibid.* c. 26*b*, p. 166*a*.

"When Fu Cha, King of Wu, raised a troop to go out to war with the North he dug out a deep ditch between Shang and Lü."—*Kuo yü, ibid.* c. 26*b*, p. 166*a*.

"To fortify the country they made 5 ditches and 5 miry roads, on which trees were planted."—*Chou li Hsia kuan ssŭ hsien, ibid.* c. 26*b*, p. 164*a*.

"Sui Jên was in charge of the wastes of the country. Every 100 men (10,000 *mow*) had a watercourse in their field, by which there was a miry road admitting of the passage of one carriage. Every 1,000 men had a brook, by which there was a path (admitting 2 carriages)."—*Chou li Ti kuan, ibid.* c. 68, p. 105*b*.

"The care of the highways was regarded as of equal importance with that of the water-courses and the markets. . . . There are five recognised sorts of roadway, from the foot-tracks along the hills, which are trodden by use and filled up by the wild grass if not frequented, and the paths along the water-courses of the homestead, to the roads for local traffic and the great imperial highways, kept open, in theory for distant tribute bearers, feudal princes coming to pay their homage at court, and the imperial progresses (Tcheou-li, ii. 198, 280, 564)."—*Simcox*, ii. 63.

"Ts'ae says that we are not to understand . . . that King Woo used any efforts to open roads to the barbarous regions beyond the limits of the empire proper;—it was his virtue and fame which drew them, and they came, 'climbing the hills as if they had been ladders, and in boats across the sea.' It certainly would not have been discreditable to King Woo to have good roads made throughout all his dominions; and . . . the opening of the thoroughfares is described [in the *Kuo yü*] as his work."—*Legge, Ch. Class.*, III. ii. 346, note.

"Many ramparts in the country round and near (its capital city), are a disgrace to its high ministers and great officers."—*Li Chi, Legge, S.B.*, xxvii. 92.

"Parts of it [the Great Wall] had been erected by different States before Hwang-ti's accession."—*Simcox*, ii. 101.

[Complaints against the Prince of Liang for using up the people's strength in making city walls and moats are referred to in *Shih chi Chin shih chia, P'ei wên yün fu*, c. 26*b*, p. 166*a*. City walls with gates, watch-towers, moats, etc., are mentioned in *Wu yüeh ch'un ch'iu, Yüan chien lei han, Chü ch'u pu*, c. 340, 347; *Lu chi Lo yang chi, ibid.*; *etc.*]

"When there are trees on a terrace which has a house built on it, it is called a kiosk (*hsieh*)."—*Erh ya hsieh su, Ko chih ching yüan, T'ai lei*, p. 8.

"Observatories (*kuan t'ai*) on which pavilions were built, were erected to enable a distant view to be obtained."—*Tso chuan chu, chüan shang.*

"The Pai Chiao (Worship of Heaven and Earth) Terrace of Prince Wu was situated in the Hêng Shan. Its ruins still exist."—*Yüeh Ya T'ang ts'ung shu, Chung wu chi wên*, c. 3, p. 11*a*.

"As T'ai Wang, Wang Chi, and Wên Wang requested Heaven's decree, 3 altars were built. The altar was made by heaping up earth."—*Chou shu, P'ei wên yün fu*, c. 14, p. 51*a*.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

"Some of the greatest public works, in the shape of roads, bridges, canals, and aqueducts, were constructed during this period, and still remain to testify to the glory of the Hans."—*Boulger, Short Hist.*, p. 19.

Excavating.—"The reach between the two great rivers was opened in the Han dynasty." "The distance . . . is about ninety miles, and the canal here is carried largely upon a raised work of earth kept together by retaining walls of stone, and not less than twenty feet above the surrounding country in some parts."—*Williams, Midd. King.*, i. 36, 35. This subsequently formed part of the Grand Canal. See MONGOL PERIOD.

"Among other great and important works, Mingti constructed a dyke, thirty miles long, for the relief of the Hoangho, and the French missionary and writer, Du Halde, states that so long as this was kept in repair there were no floods."—*Boulger, Short Hist.*, p. 17.

"In the *Commentary on the Water History* (*Shui ching chu*) it says: When Wang Liang was magistrate of Ho Nan he wished to lead the waters of the Ku to supply water for the capital. The canal was made, but the water did not flow into it. For this he was degraded. [Chang] Shun made the dam of Lo, and then the canal was navigable, the Government and people of Lo both depending upon it [the canal]. Thus leading the waters of the Ku [to the capital] originated with Chang Sung."—*Yüeh Ya T'ang t'sung shu, Hou Han shu pu chu*, c. 9, p. 14*b*.

Shih Lu, an engineer who flourished under the First Emperor, "constructed a canal 60 *li* in length, with 36 locks, through the mountainous country of 海陽 Hai-yang in Kuangtung. It was known as the 靈渠, and was subsequently lengthened and used for military purposes by the famous general Ma Jung [A.D. 79-166]."—*Giles, Bio. Dic.* p. 657.

[Moats round palace walls are mentioned in *Han shu Chiao ssŭ chih, P'ei wén yün fu*, c. 13*a*, p. 52*a*; and dykes in *Han shu Wu Ti chi, Tzŭ shih ching hua*, c. 54, p. 34*a*.]

"When Ma Chên was Prefect of Hui Chi, he dug a pond at Chien Hu, the water in which could water 9,000 *ching* (1 *ching* = 100 *mu*) of fields."—*Han shu Ma Chên chuan, Yün fu shih i*, c. 22, p. 14*b*.

"When Chao Hsin-ch'ên was promoted to be Prefect of Nan Yang, . . . he opened a drain and sluice, by which the people [agriculturists] were benefited."—*Han shu Chao Hsin-Ch'ên chuan, P'ei wén yün fu*, c. 26*b*, p. 166*a*.

"Whatever district Ma Yüan was in he always opened drains there to benefit the people."—*Yüan chien lei han*, c. 35, p. 14*b*.

"Hsieh Hui, whose style was Hsüan Shih, had on the south of his house a road, by which was an ancient well."—*I yüan, P'ei wên yün fu*, c. 53, p. 39*b*.

"The house of Chia Yi was situated on the east of the Nan Temple of Hsiang Chou; in it was a well, with the upper part narrow and lower part large. It was like a jar, and had been dug by Chia Yi."—*Ching Chou chi, ibid.* p. 49*a*.

"In the courtyard of Cho Wên-chün there was a well. . . . It is still there, and called Wên-chün's well."—*Lang huan chi, ibid.* p. 50*a*.

"In the *History of Kuang Chou* it says: 'In the Prefecture of Yü Lin there was a stone well. . . . It secretly communicated with the river. In the winter and summer seasons it was filled up; its name was Ssŭ Ming Well, and it provided water for the whole prefecture."—*Huan yü chi, ibid.* p. 50*a*.

[Well-digging is mentioned in *Han shu Wang Mang chuan, ibid.* p. 37*a*.]

"Wei Wu led the waters of the Chang from the west side of Nieh City, passing under the Copper Bird Terrace, and flowing underground to the east of the city. It was called the Ch'ang Ming drain."—*Shui ching chu, ibid.* c. 26*b*, p. 169.

"When Shih Ch'i was magistrate of Yeh, he led the waters of the Chang to water Yeh. By this means Ho Nei became productive."—*Han shu Kou hsü chih, Tzŭ shih ching hua*, c. 54, p. 34*a*.

"In the *Commentary on the Water History* (*Shui ching chu*) it says: 'Ma Yüan made the road of Ti and opened the canal in order to drain off a freshet.'"—*Yüeh Ya T'ang ts'ung shu, Hou Han shu pu chu*, c. 7, p. 14*a*.

Levelling.—Kao Tsu "called upon his subjects to aid his efforts for their welfare by assisting in the execution of many works of public utility, among which roads and bridges occupied the foremost place. . . . As Singnan was difficult of access in those days, he constructed a great high road from the centre of China to this somewhat remote spot on the western frontier. This road still exists, and has been described by several travellers in our time. It was constructed by the labour of 100,000 men through the most difficult country, crossing great mountain chains and broad rivers. The Chinese engineers employed on the making of this road, which has excited the admiration of all who have traversed it, first discovered and carried into execution the suspension bridge, which in Europe is quite a modern invention. One of these 'flying bridges,' as the Chinese called them, is 150 yards across a valley 500 feet below, and is still in use. [See *infra, Raising.*] At regular intervals along this road Kaotsou constructed rest-houses for travellers, and postal-stations for his couriers. No Chinese ruler has done anything more useful or remarkable than this admirable road from Loyang to Singanfoo."—*Boulger, Short Hist.*, p. 10, and see *Williams, Midd. King.*, i. 150, 153.

Ch'in Shih Huang Ti "impressed upon the governors [of provinces] the importance of improving communications within their jurisdiction. Not content with this general precept, he issued a special decree ordering that 'roads shall be made in all directions throughout the Empire,' and the origin of the main routes in China may be found with as much certainty in his reign as that of the roads of Europe in the days of Imperial Rome."—*Boulger, Short Hist.*, p. 6.

Raising.—"He [Ch'in Shih Huang Ti] built the Great Wall, which is nearly 1,400 miles in length, twenty-two feet in height, and twenty feet in thickness, forming the most prominent artificial object on the surface of the earth."—*Giles, Historic China*, p. 33.

"Their most remarkable engineering work is certainly the Great Wall, which defends the whole northern frontier of the country, extending over hill and dale for more than 1,200 miles, as the crow flies. It is, however, of very varying strength in different places, . . . There are also towers at short distances, . . . The wonder is, that a people who 2,000 years ago were competent to such undertakings should have attempted nothing on the same scale since that time."—*Fergusson, Hist. of Ind. and East. Arch.* p. 708. "Some portions of it were already in existence, and he [Ch'in Shih] formed the plan of joining and extending them along the whole northern frontier."—*Williams, Midd. King.*, i. 29.

"Beyond the Yellow River to its western extremity, the Great Wall, according to Gerbillon, is mostly a mound of earth or gravel, about fifteen feet in height, with only occasional towers of brick, or gateways made of stone. At Kalgan portions of it are made of porphyry and other stones piled up in a pyramidal form between the brick towers, difficult to cross but easy enough to pull down."—*Ibid.* i. 31. The portions from the Chü Yung Pass eastwards, as well as that which crosses Shansi, were built at a later period. See *Gerbillon*, and *cf.* MING PERIOD.

[City walls are said to have been first built by Ch'in Shih Huang Ti. They probably arose from the ramparts of earlier times.]

"Shih Huang wishing to cross the sea in order to see where the sun rose, built a stone bridge."—*San Ch'i lüeh chi, Shih lei t'ung pien*, c. 77, *Kung shih pu*, p. 22*a*.

"Li Ping built seven bridges to represent the Great Bear."—*Hua Yang Kuo chih, ibid.* p. 21*b*.

"It has been maintained by some writers that the Chinese were the inventors of chain or suspension bridges. . . . We are told that there is a famous bridge of this kind on the road to Yun-nan, in the province of Kwei-chow. It is thrown over a rapid torrent between two lofty mountains, and was constructed by a Chinese general, in the year 35 of the Christian era. At each end of the rocky mountain a gate has been erected between two stone pillars, six or seven feet high by seventeen or eighteen feet wide. Between these pillars four chains are suspended by large rings, and united transversely by smaller chains. Over these chains is a flooring of planks of timber, which are renewed as often as they become decayed. Other chain bridges have been constructed in China in imitation of this, but none of them are either so large or have been so durable."—*Gray, China*, ii. 105.

"In the *Commentary on the Water History* (*Shui ching chu*) it says: 'The Ling Terrace was built by Kuang Wu; it was 6 *chang* high and 20 *pu* in area.'"—*Yüeh Ya T'ang ts'ung shu, Hou Han shu pu chu*, c. 1, p. 14*b*. Other altars and terraces are mentioned in *Yüan chien lei han*, c. 249, *Chü ch'u pu, T'an.*

[High towers are mentioned in the *Ko chih ching yüan*, c. 19, *Kung shih lei*, pp. 25*b*–26*a*.]

"The Prefect of Hung Nung, Chang Pai-ya, of the Han, had a cemetery; a low wall was built on its four sides by piling up stones."—*Shui ching chu, P'ei wên yün fu*, c. 13*a*, p. 53*b*.

"Inside the large walled city of Nan Ch'êng there was a small walled city. Around this wall were 70 wells dug or repaired by Kao Tsu,"—*Ibid.* c. 53, p. 49*a*.

"The Ch'in appointed Li Pin to be prefect of Shu province. He made the Pai Chang dam. It could sufficiently water several thousands of *ching* of fields. Through this Shu became productive."—*Li tao yao chüeh, Yüan chien lei han*, c. 35, p. 26*a*.

"When the king of Han stationed his troops at Jung Yang, on its south side he raised paths."—*Shi chi Kao Tsu chi, P'ei wên yün fu*, c. 49, p. 72*b*.

"His [Shao Hao's] capital was at *Khü*-fâu, the city of Confucius; and I have seen, at a little distance from it, perhaps the only pyramid in China, which is in memory of him, and said to be on or near his grave."—*Legge, Li Ki*, i. 283, note.

Period of Disruption (221 *to* 589).—*Table IV.*

[Wells are mentioned in *Nan shih, Ko chih ching yüan*, c. 9, p. 2*b*; *Yu Yang tsa tsu, P'ei wén yün fu*, c. 53, p. 37*a*; *Wu Chün-ch'i Ch'un ch'iu, ibid.* p. 39*a*, etc.; ponds, in *Hsü Wên hsien t'ung k'ao, Yün fu shih i*, c. 22, p. 14*b*; canals, etc., in *Chiang Chi San chou lun, P'ei wén yün fu*, c. 26*b*, p. 164*b*; *Po wu chih, ibid* pp. 166*a*, 166*b*, etc.; *Chin shu Fu Hsiu-i chuan, Tzŭ shih ching hua*, c. 54, p. 34*b*.]

"Liang Wu Ti banked up the River Hwai somewhere near 盱眙 with the object of drowning the Toba armies. The dyke was 200 feet high by 1,400 feet broad at the base, and 450 at the top."—*Ch. Rev.*, xiii. 432.

"One of the great works of his [Wu Ti's] reign was the bridging of the Hoangho at Mongtsin, at a point much lower down its course than is bridged at the present time."—*Boulger, Short Hist.*, p. 22.

[Towers are mentioned in *Wei shu, Ko chih ching yüan*, c. 19, *Kung shih lei*, p. 26*a*; *Shih wu chih yüan, ibid.* p. 25*a*; *Nan Shih, ibid.* p. 25*a*; bridges, in *I t'ung chih, Shih lei t'ung pien*, c. 77, *Kung shih pu*, p. 21*b*; *Kuang yü chi, ibid.* p. 21*a*; *Kuang chih, ibid.* p. 22*b*; *Ch'êng tu chi, ibid.* p. 22*b*; altars in *Sung shu Yüan Ti chi, P'ei wén yün fu*, c. 14, p. 54*b*, etc.; walled cities and ramparts, in *Pei shih I shu chuan, ibid.* c. 13, p. 52*b*, etc.; dams, etc., in *Chin chung hsing shu, Yün fu shih i*, c. 43, p. 6*a*; *Pei shih Pi chou chuan, ibid.* p. 6*a*; *Nan shih Chang Shao chuan, Tzŭ shih ching hua*, c. 54, p. 35*a*; *Nan shih Liu Hsiu-chih chuan, ibid.* p. 35*a*; *Pei Ch'i shu Tu pi chuan, ibid.* p. 35*a*; *Chin shu Fu Ti chuan, ibid.* p. 34*b*; locks, in *Chin shu Hsieh An chuan, ibid.* p. 35*a*; *Wu lu, Yüan chien lei han*, c. 35, p. 26*b*; and embankments, in *Chin chi, ibid.* p. 11*b*, etc.]

[The *Shih wu chi yüan* says that towers in which relics were preserved were first built in China in the 10th year of the reign of Ch'ih Wu (247) of Ta Ti of the Wu dynasty.]—*Ko chih ching yüan*, c. 19, *Kung shih lei*, p. 25*a*.

[The first pagoda was erected about A.D. 250 at Nanking. See *Milne, Life in China*, p. 429; *Ch. Repos.*, xix. 535–40; *Fergusson, Hist. of Ind. and East. Arch.*, p. 695; *etc.*]

From the Restoration of Unity to the End of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

"Of all his [Yang Ti's] works none will compare with the great system of canals which he constructed, and in connection with which his name will live for ever in history. Although he reigned no more than thirteen years, he completed nearly 5,000 miles of canals. Some of these, such as the Grand Canal from the Hoangho to the Yangtsekiang are splendid specimens of human labour, and could be made as useful to-day as they were when first constructed. The canal named is forty yards wide and is lined with solid stone. The banks are bordered with elms and willows. These works were constructed by a general *corvée* or levy *en masse*, each family being required to provide one able-bodied man, and the whole of the army was also employed on this public undertaking."—*Boulger, Short Hist.*, p. 26.

"The *Peh Shi* history says that in A.D. 605 seven million men and women were set to work to clear out a canal joining the Loh-yang River and the Yellow River, and enabling boats to take grain to the royal parks."—*Ch. Rev.*, xxi. 57.

[Reservoirs, fed by canals, were built at Hangchow. They had fallen into decay by the end of the period.]—*Simcox*, ii. 200.

"The reach between the two great rivers was . . . repaired by the wise founder of the Sui dynasty."—*Williams, Midd. King.*, i. 36.

"The princes of the Tang dynasty kept . . . open" the reach of the Grand Canal between the two great rivers.—*Ibid.* i. 36.

[Canals, ditches, etc., for irrigation purposes, for the relief of floods, or watering of wastes are mentioned in *Sui shu Lu Pên chuan, Tzŭ shih ching hua*, c. 54, p. 35*a*; *Ta yeh Shih i chi, P'ei wên yün fu*, c. 26*b*, p. 166*a*; *T'ang shu Ch'iang hsün chuan, Tzŭ shih ching hua*, c. 54, p. 35*a*; *T'ung tien, Yün fu shih i*, c. 22, p. 14*b*; *T'ang shu Ti li chih, ibid.* c. 43, p. 6*a*; *Yo Yang Fêng t'u chi, P'ei wên yün fu*, c. 33, p. 6*a*; *Chiu T'ang shu Wên tsao chuan, Tzŭ shih ching hua*, c. 54, p. 35*a* (the Hou Hsiang or Yu Shih Canal, near Lang Chou, 97 *li* long); *T'ang shu Ti li chih, ibid.* p. 35*a*; and grain canals (new or repaired), in *T'ang shu Tsung shih ch'i wu chuan, Tzŭ shih ching hua*, c. 54, p. 35*a*; *T'ang shu Wang Po chuan, P'ei wên yün fu*, c. 33, p. 5*b*; *T'ang shu Shih huo chih, ibid.* p. 5*b*; *Pi ta ting chuan, Yüan chien lei han*, c. 35, p. 2*a*.]

"The Emperor Yang of the Sui dynasty laid out the Western Park, in which he formed a lake 10 *li* in area. On the north of this lake was the 'Dragon-Scale' Canal."—*Yüan chien lei han*, c. 35, p. 15*a*.

"Owing to drought and inundation Ch'ên Chou and Chai Chou had no harvests. So Kao Yü, following the configuration of the land, built a dyke 180 *li* long and at the right time confined and let out the water, thus saving the people from hunger."—*T'ang shu Kao Yü chuan, Tzŭ shih ching hua*, c. 54, p. 35*b*.

"When Lo Ying was Department Magistrate of Chien Chou he dug out the rugged rock and clove the hills in order to allow ships to pass."—*Yüan chien lei han*, c. 35, p. 16*a*.

[Wells are mentioned in *Yü ch'üan shui, P'ei wên yün fu*, c. 53, p. 49*b* (octagonal); *Kuang chih, ibid.* p. 40*b*; *Wên hsien tsa chi ibid.* p. 40*b*.]

"In the days, over a thousand years ago, when a Shan empire ruled in Yün Nan, there was already mention of the local Black Salt wells."—*Parker, China*, pp. 219–20.

[Li Pi, a Department Magistrate at Hangchow, where the springs were spoilt owing to the proximity of the sea, made 6 wells by bringing water from the Western Lake.]—*Sung shih Su shih, Tzŭ shih ching hua*, c. 54, p. 36*a*.

"Amongst the numerous 'Great Walls' of China there were three built by 張仁愿 in the year A.D. 708 to entrap the Turks. These ran in three lines, north from Ning-hia and Yü-lin, to the north bank of the Hwang Ho."—*Ch. Rev.*, xiii., 401.

"In the reign of Ching Lung, the people in the palace subscribed money to build a tower of 15 storeys."—*Yu nan ch'êng chi, Ko chih ching yüan*, c. 19, *Kung shih lei*, p. 26*a*.

"In the 3rd year of the reign of Yung Hui [652], in the Tzŭ En Buddhist temple Sha-mên Hsüan-Chuang built a tower of 5 storeys; its outside was made of brick and its inside of clay."—*Ibid.* p. 26*a*.

"At the Feast of Lanterns, the Emperor was in the Eastern capital. He built a lantern-tower (燈樓 *têng lou*), festooned with coloured silken fabrics, and consisting of 20 apartments; it was 150 *chang* in height."—*K'ai yüan i shih, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 11*a*. See also, for highly decorated towers, *Chêng Ch'u Hui Ming huang tsa lu, Ko chih ching yüan*, c. 50, *Jih yung ch'i wu lei*, p. 8*b*.

"When Governor of the modern Ch'êng-tu in Ssŭch'uan, he [Li Tê-Yü] built the famous look-out from which any movements on the part of the southern wild tribes on the one hand, and of the Turfan on the other, would be at once detected."—*Giles, Bio. Dic.*, p. 467. See also *Yüan chien lei han, Chü ch'u pu*, c. 340.

"The 24 bridges located in Yang Chou were built in the Sui dynasty."—*Tu mu shih, Shih lei t'ung pien*, c. 77, *Kung shih pu*, p. 21*b*.

"The pagoda of the K'ai Pao Buddhist temple was the highest of all the pagodas in the capital. It was skilfully constructed."—*Kuei t'ien lu, Ko chih ching yüan*, c. 19, *Kung shih lei*, p. 25*b*.

"In the neighbourhood of the city of Chin-kiang I saw one [pagoda] of iron consisting of nine stories. This structure, which is not more than sixty or seventy feet in height, stands within the grounds of the Kham-Loo Sze, or Sweet Dew Monastery. It is of great antiquity, having been erected during the Tong dynasty, and on each of its sides are numerous representations of Buddha."—*Gray, China*, p. 87.

907–960.

[A well, covered inside and out with silver foil, is mentioned in *Wu tai shih pu, Ko chih ching yüan*, c. 9, p. 3*a*.]

[The *Lei Fêng T'a*, or "Thunder-Peak Tower," near the Western Lake at Hangchou was built about A.D. 950.]—*Williams, Midd. King.*, i. 118.

Sung Period (960 *to* 1280).—*Table VI.*

"When the Sung emperors lived at Hangchau they made the extension [of the Grand Canal] up to Chinkiang the great highway which it is to this day."—*Williams, Midd. King.*, i. 36.

The Grand Canal "had a predecessor in an old canal extending across the peninsula of Shantung from the Bay of Kiaochow to that of Laichow, called the *Kiao-lai-ho*." "Just when the latter was opened, I cannot say, but the name of the First Emperor of the Songs (A.D. 960) is prominently connected with it—tradition ascribing the permanence of the bridges, that are still to be seen, to the potent incantations employed by him. These bridges are seventy-two in number, each resting on the masonry of a lock. It follows that the difference of level between the backbone and the sea must be considerable, and the navigation slow and difficult. Yet the abandonment of this route in favour of a better one was caused by the silting up of its northern entrance; which then as now was exposed to the action of the floods of the Yellow River." "About one hundred miles in length, this canal not only shortened the distance between the northern capital and the rich rice fields of the south, but what was deemed of more importance, it saved the grain fleet from the necessity of doubling a dangerous promontory. Though no longer connecting the two seas, it is still used in places for local transport."—*Peking and Tientsin Times*, March, 1898.

"The water supply of the town [Hangchow] was in a deplorable state; the reservoirs built during the Tang dynasty and the canals which fed them had been allowed to fall out of repair, and the public health was suffering from the want of drinkable water. . . . Canals and cisterns were cleaned, the lake dredged and dyked, and the embankment laid out as an ornamental promenade, with bridges over the openings for admitting water into the town reservoirs from the Kiang and the lake. The new causeway was formed almost entirely of the refuse and soil obtained in deepening and cleansing the lake bottom, and besides serving as a convenient roadway, it was planted with avenues of trees and became a favourite pleasure resort of the citizens. Martini describes the lake as still edged in his time with quays of cut stone and crossed by causeways, furnished with lofty bridges to allow of the passage of boats. . . . All the neighbourhood . . . contributed cheerfully to the work, which was accomplished in four years."—*Simcox*, ii. 200–1.

"In the reign of Yüan Yu [1086-94] the magistrate of Hang Chow, Su Shih [Su Tung P'o], having opened the Western Lake (*Hsi Hu*) heaped up rape to form banks, which extended several *li* across between the North and South Hills. Both its banks were planted with willow trees."—*Sung shih Ho ch'ü chih, P'ei wên yün fu*, c. 49, p. 69*b*.

"On the west of Hsia Tu City there was an 8 *chang* moat."—*Yu nan ch'êng chi, ibid.* c. 26*b*, p. 165*b*.

"The *sui* (溪), canal, *kou* (溝), ditch, *hsieh* (洫), watercourse, and *hui* (澮), a rill in a field, conducted the water to the stream. The breadth and depth of the *sui* were 2 feet: the dimensions of the *hsieh* were double those of the *kou*, the breadth of the latter being 2 *hsin* (尋) fathoms (8 *ch'ih*), and its depth 2 *jên* (仞) fathoms (also 8 *ch'ih*)."—*Shih chün fa êrh ssŭ su, ibid.* p. 169*a*.

"When Hu Su was magistrate of Ch'ao Chou he made a stone pond 100 *li* in area to prevent deluges. The name given it was Hu Kung Pond."—*Sung shih Hu Su chuan, Yün fu shih i*, c. 22, p. 14*b*.

"[As regards] 'city-protecting wells,' formerly 72 of them were dug by Yang Yen-lang, a general of the Sung dynasty. In the depth of winter the soldiers used to draw water from them and water the city. This made the army hesitate, and they dared not approach—whence the name 'city-protecting.'"—*Pa chou chih, Yüan chien lei han*, c. 34, p. 29*a*.

[The wells made in the T'ang dynasty for the supply of fresh water to Hangchow, which had fallen into decay, were repaired.]—*Sung shih Su shih, Tzŭ shih ching hua*, c. 54, p. 36*a*; and see previous Period.

Whilst invading China "the Mongols had to make their own road, and they crossed several ravines by improvised 'bridges made of spears and the branches of trees, bound together by strong chains.'"—*Boulger, Short Hist.*, p. 53.

"In the beginning of the reign Ching Yu [1034] Chiang Tsun, in compliance with the Empress Dowager's wish, collected all the stone tablets in Ch'ang An as material for building a tower."—*Wang P'i-chih Ch'êng shui yen t'an, Ko chih ching yüan*, c. 19, *Kung shih lei*, p. 25*b*.

"The 'sixteen-corners' (*shih liu chiao*) was a pagoda built by the common people."—*Ou Yang-hsiu Chi ku lu, ibid.* p. 25*b*.

"On the top of a hill in the N.W. of the Ying T'ien Prefecture there were two iron pagodas."—*Shan t'ang ssŭ k'ao, ibid.* p. 26*b*.

"Wei Huang, when Sub-Director of the Court of Sacrificial Worship, was appointed a magistrate (governor) of Canton, where he built a city wall 5 *li* in circumference, opened a canal along the N.E. gate, and deepened the W. and E. bays in order to make sluices to them for shutting or opening at a definite time."—*Sung shih Wei Hsiang chuan, ibid., Tzŭ shih ching hua*, c. 54, p. 36*a*.

"When Yao-tso, magistrate of Honan Prefecture, was transferred to be Department Magistrate of Pien Chou, the river Fan used to flood suddenly. The people of the Department were much troubled by it, so Yao-tso made a dyke on which 10,000 willow trees were planted, and dug a 'willow stream' so that the people were benefited."—*Sung shih Ch'ên Yao-tso chuan, ibid.* p. 36*a*.

"In the reign of T'ien Hsi [1017–22] the river flowed out widely, and the Department Magistrate of Hua Chou made a 'wooden dragon' to lessen the violence of the water, and also made a long dyke which was called by the people 'Mr. Ch'ên's dyke.'"—*Ibid.* p. 36*a*.

[A stone dyke, outside which 10 rows of large trees were planted, was built on the side of the Ch'ien T'ang River, in order to lessen the force of the current and avert inundations.]—*Shên Kua Mêng chi pi t'an, Tzŭ shih ching hua*, c. 54, p. 36*b*.

"In Soochow there was a tower made of brick called Kung Chiang Tower. It was not higher than 3 *chang* and not bigger than an arm's span, and would move if one shook it. The wind-bells on the top were frequently shaken down by people. But it was repaired as often as it was spoiled. It had now been enclosed by the Government with a balustrade, but still busybodies climbed over the balustrade to shake it."—*Ch'i hsiu lei kao, Ko chih ching yüan*, c. 19, *Kung shih lei*, p. 27*a*.

Mongol Period (1280 *to* 1368).—*Table VII.*

"The Grand Canal was completed, if not actually designed, by Kublai Khan; and thus Cambulac, the Peking of those days, was united by inland water communication with the extreme south of China. The work seems to have been begun by the Emperor Yang Ti, seven centuries previously, and one of its primary objects, the conveyance of grain to the capital, has now ceased to exist as such; but even thus, the balance, a great and at that time useful undertaking, remains in favour of Kublai Khan."—*Giles, Historic China*, p. 87.

"The greatest original work of Kubla's reign—the construction of the Grand Canal—is an example of the strength and weakness of the early Mongol Government. The conception is statesmanlike and magnificent; the Suez Canal is probably the only similar work of equal magnitude that has so thoroughly subserved the purpose for which it was undertaken, and Kubla's object was as legitimate as his means were well chosen. Kiang-nan, the district south of the lower part of the [Yang-tzŭ] Kiang . . . , was the natural granary of the empire; the court, the capital, the army and the civil service in the North, all depended for their food supply on this province. Before the canal, the only through cheap transport had been by the exposed sea passage along the coast. The canal brought Kingsse and Khanbalig within forty days' easy navigation of each other, and gave to all the intervening provinces the boon of a navigable river exactly along the main line of natural traffic. In the year after the canal was opened in 1289, 1½ millions of rice measures were received in this province for transport to Peking."—*Simcox*, ii. 224. See also REGULATION OF LABOUR.

"You must understand that the Emperor has caused a water communication to be made from this city [Kwa-chau] to Cambulac, in the shape of a wide and deep channel dug between stream and stream, between lake and lake, forming as it were a great river on which large vessels can ply."—*Yule, Marco Polo* (2nd ed.), ii. 136.

"If the time in which it [Grand Canal] was dug, and the character of the princes who planned it, be considered, few works can be mentioned in the history of any country more admirable and useful. When it was in order, before the inflow of the Yellow River failed, by means of its connection with its feeders, an uninterrupted water communication across the country from Peking to Canton existed, and goods and passengers passed from the capital to nearly every large town in the basins of the two great rivers. The canal was designed by Kublai to reach from his own capital as far as Hangchau, the former capital of the Sung dynasty."—*Williams, Midd. King.*, i. 31–2.

"Though Kublai has had the credit of this useful work, it existed in parts of its course long before his day. [See previous Periods.] . . . Its entire length is about 650 miles . . . but it varies in its breadth and depth more than any important canal either of America or Europe. . . . In some places the bed is cut down thirty, forty, and even seventy feet. . . . The sluices which keep the necessary level are of rude construction, and thick planks, sliding in grooves hewn in stone buttresses, form the only locks. Still, the objects intended are all fully gained, and the simplicity of the means certainly does not derogate from the merit and execution of the plan."—*Ibid.* i. 36–7; see also *Klaproth, Mémoires*, iii. 312; *De Guignes, Voyages à Peking*, ii. 195; *Davis, Sketches*, i. *passim*.

"The distance between the stone piers in some of the floodgates was apparently so narrow as only just to admit the passage of our largest boats."—*Ibid.* i. 245.

"The work from Peking to the Yellow River was opened by the Mongols about 1289, in which they merely joined the rivers and lakes to each other as they now exist."—*Williams, Midd. King.*, i. 36.

"The Hu'i T'ung Canal, lying to the south of the city of Chi Ning Chou, was dug in the reign Chih Chêng [1341–68] for the purpose of transporting grain."—*Ho chih, Yün fu shih* i, c. 20, p. 5*b*. The opening of this canal is referred in *Ch. Rev.*, xvii. 115, to the Ming Period, but apparently on insufficient grounds. Its construction saved the tribute junks the fortnight's sea journey from Liu Chia Ho, in T'ai ts'ang Chou, near Shanghai, to Tientsin.

[In 1352, 70,000 workmen at a time were employed to divert the course of the Huang Ho into one of its deserted beds.]—*Simcox*, ii. 230.

"In Kublai Khan's time there is frequent allusion to trouble with the 'barbarians at the salt wells.'"—*Parker, China*, p. 220.

[Near Ya-chou, in Ssŭ Ch'uan, there are some very ancient salt wells which were working in 1330.]—*Ibid.* p. 219.

Marco Polo "also ascribes to Kubla the planting of fine avenues of trees along the course of the high roads, a good work in which he was encouraged by the dictum of his religious advisers that 'he who plants trees lives long.'"—*Simcox*, ii. 222.

"The Emperor hath taken order that all the highways travelled by his messengers and the people generally should be planted with rows of great trees a few paces apart; and thus . . . no one can miss the way by day or night. Even the roads through uninhabited tracts are thus planted. . . . But where the ground is so sandy and desert that trees will not grow, he causes other landmarks, pillars or stones, to be set up to show the way."—*Yule, Marco Polo* (2nd ed.), i. 426.

"It is obvious that even roads and waterways are a doubtful boon when their chief use is to transport the armies, or the increased taxes required to maintain the armies, of an alien conqueror."—*Simcox*, ii. 225.

"In the rear of the Great Wall, in the Nankau Pass, there is an archway of some architectural pretension . . . which is interesting as having a well-ascertained date, A.D. 1345 (v. *Journ. R.A.S.*, N.S. vii. 331; v. 14, *seq.*). Its dimensions are considerable, and it is erected in a bold style of masonry. . . . The upper part is a true arch, though it was thought necessary to disguise this by converting its form into that of a semi-octagon, or three-sided arch. On the keystone is a figure of Garuda, and on either side of him a Naga figure, with a seven-headed snake hood, and beyond that a class of flowing tracery we are very familiar with in India about the period of its erection. . . . It is interesting as exemplifying a class of Indian ornamentation that came into China from the north. If we had a few specimens of art penetrating from the south, we might find out the secret of the history of Buddhist art in China."—*Fergusson, Hist. of Ind. and East. Arch.*, p. 708.

Ming Period (Restoration of Chinese Supremacy) (1368 *to* 1644).—*Table VIII.*

"Useful work was accomplished in the building of a canal from Pekin to the Peiho, which thus enabled grain junks to reach the northern capital by the Euho and Shaho canals from the Yangtse-kiang. Another useful public work was the repairing of the Great Wall, effected along a considerable portion of its extent by the efforts of 50,000 soldiers, which gave the Chinese a sense of increased security."—*Boulger, Short Hist.*, pp. 92–3.

"Within the province of Chihli there are two walls, inclosing a good part of the basin of the Sang-kan ho west of Peking; the inner one was built by an emperor of the Ming dynasty."—*Williams, Midd. King.*, i. 29.

"The Yun ho flows into the canal on its eastern side nearly at right angles, and a part of its waters flow north and part south, while a strong facing of stone on the western bank sustains the force of the influx. . . . This enterprise of leading in this river seems to have been the work of Sung Li, who lived under Hungwu, the first emperor of the Ming dynasty, about 1375. In his time, a part of the canal in Shantung became so impassable that the coasting passage by sea began to be most used. This was the very thing the canal had been intended to prevent; Sung accordingly adopted the plan of an old man named Piying, to concentrate the waters of the Yun ho and neighbouring streams, and bring them down upon the canal. . . . History states that Sung employed 300,000 men to carry the plan into operation, and that the work was completed in seven months."—*Davis, Sketches*, i. 245.

"The Ming and Tsing emperors have done all they could to keep it [Grand Canal] open throughout."—*Williams, Midd. King.*, i. 36.

[Some coal mines were worked in the North.]—*Ch. Rev.*, xi. 60.

[The decay of high roads, "which has produced injurious political results," is "certainly one" of the consequences following the disuse of horses.]—*Simcox*, ii. 258–9.

The Great Wall "seems to be strongest and highest in the neighbourhood of Pekin, where it has generally been seen by Europeans. There it is 20 feet in height, and its average thickness is 25 feet at the base, tapering to 15 feet at the summit." The dimensions of the towers "are generally about double those just quoted for the wall."—*Fergusson, Hist. of Ind. and East. Arch.*, p. 708: and see ABSOLUTE MONARCHY.

[For a description and history of the Porcelain Tower at Nanking see *Williams, Midd. King.*, i. 102.]

In the reign of Mu Tsung [1567–72] "the breach in the Yellow River was closed, though fresh breaches took place in 1569 and 1570."—*Giles, Bio. Dic.*, p. 187.

Manchu Period (1644 *to* —).—*Table IX.*

"The public works of China are probably unequalled in any land or by any people, for the amount of human labour bestowed upon them; the natural aspect of the country has been materially changed by them, . . . But their usefulness, or the science exhibited in their construction, is far inferior to their extent."—*Williams, Midd. King.*, i. 28–9.

"The engineering works of the Chinese have been much extolled by some writers, but have less claim to praise as works of science than their buildings have as works of art."—*Fergusson, Hist. of Ind. and East. Arch.*, p. 707.

Excavating.—"Their canals, it is true, are extensive; but . . . their construction is most unscientific."—*Ibid.* p. 707.

"The comparative inefficiency of the [Grand] canal at the present day is due to changes in the course of the rivers feeding it, as well as to neglect of dredging and other necessary works."—*Simcox*, ii. 225; see also *Naut. Mag.*, 1865, p. 18, and *Hong-kong Daily Press*, Jan. 23rd, 1901.

"Lately an attempt has been made to reopen the passage [of the Grand Canal] from Hungtsih Lake north into the old bed, so that boats can reach Tientsin from Kwachau."—*Williams, Midd. King.*, i. 36.

"During the ravages of the Nientoi rebels (1865–6), the *Kiao-lia-ho* figures as a military barrier. Li Hung-chang, the now [1898] Grand Secretary, having driven the rebels out of the peninsula caused the canal to be deepened so as to cut off their return."—*Peking and Tientsin Times*, March, 1898.

"There are some other inferior canals in the empire. Kienlung constructed a waste-weir for carrying off the surplus waters of the Yellow River of about a hundred miles in length, by cutting a canal from Ifung hien in Honan, to one of the principal affluents of Lake Hungtsih. It also answered as a drain for the marshy land in that part, and has probably recently served to convey the floods from the main stream into the lake."—*Williams, Midd. King.*, i. 37. For the serpentine canals in the Fu Chou district, see p. 131.

"In the vicinity of Canton and Suchau are many channels cut through the plains, which serve both for irrigation and navigation, but they are not worthy the name of canals. Similar conveniences are more or less frequently met with in all parts of the provinces, notably those on the plain and low coast-lands."—*Ibid.* i. 37.

[Gold mines, no longer worked, are said to have existed in Chihli and Shansi.]—*Naut. Mag.*, 1865, p. 100.

"Coal mines exist in the hill-ranges west of Peking, and . . . beyond the inner Great Wall" near Hsüan-hua Fu. There are also some further east, near Jehol.—*Ibid.* pp. 100–1.

[For copper mines in Yün Nan, see *Ch. Rev.*, xii. 135.]

Levelling.—"The Chinese . . . have never been distinguished either for the vast extent or solid construction of their highways." Their place is to a great extent supplied by rivers and canals. "The rivers, indeed, are the highways." "Notwithstanding the little importance which seems to have been attached to the construction of roads in China, there are, of course, many highways running in all directions through the vast empire. Those, however, by which the southern and central provinces are traversed are no better than ordinary pathways. In the great majority of instances, these roads are so narrow as to render it impossible for travellers either to ride or walk two abreast. The roads which lead to the more secluded villages are, of course, much inferior. In the northern provinces, however, where water communication is not so great, and where travelling in carts or wagons, or on horses or mules, is almost universally practised, the roads are wide; but they are much neglected, and the ruts in them are so deep as to render travelling—more especially in Chinese carts or wagons which are invariably without springs, a thing to be avoided by delicate persons. In the wet season, they are neither more nor less than mud pools, as no metal . . . is ever placed upon them."—*Gray, China*, ii. pp. 99–100.

"The streets in large towns south of the Hwang Ho are paved, and the sewers run under the cross slabs. . . . The roadways are not usually over ten feet wide."—*Williams, Midd. King.*, i. 40.

"All along the highways and byeways of China, mile-stones and guide-posts of granite are erected at intervals. It is provided by law that at the end of each distance of ten *li*, or 3½ English miles, there shall be along every highway a beacon, on which, if need be, a fire may be lit to announce the approach of an invading army. This law, however, is not universally obeyed, and the beacons along the highways of the southern and midland provinces of the empire are few and far between."—*Gray, China*, ii. 101; see also *infra, Raising.*

"All imperial roads are constructed and kept in repair by the central government. Ordinary highways are formed and kept in repair by the people, and in some instances, as works of merit, by private individuals. By the side of a road which has been constructed or repaired at the expense of a private citizen, there is erected a slab either of black marble or granite, on which an account of the deed of merit is faithfully recorded."—*Ibid.* i. 102.

"The public roads, in a country so well provided with navigable streams, are of minor consequence, but these media of travel are not neglected."—*Williams, Midd. King.*, i. 37.

"I have travelled over 600 leagues by land in China, and have found many good roads, most of them wide and planted with trees. They are not usually paved, and consequently in rainy weather are either channelled by the water or covered with mud, and in dry weather so dusty that travellers are obliged to wear spectacles to protect their eyes. In Kwangtung transportation is performed almost wholly by water, the only roads being across the lines of navigation. The pass across the Mei ling is paved or filled up with stones; at Kih-ngan, in Kiangsi, are paved roads in good condition, but beyond the Yangtsz, in Nganhwui, they were almost impracticable, but became better as we proceeded northward, and in many places had trees on both sides. Beyond the Hwang ho they were broader, and we saw crowds of travellers, carts, mules and horses. In Shantung and Chihli they were generally broad and shady, and very dusty. This is no doubt disagreeable, but we went smoothly over these places, while in the villages and towns we were miserably jolted on the pavements. . . . Some of the thoroughfares leading to Peking are paved with thick slabs of stone. One feature of the roads through the northern provinces which attracts attention is the great number that lie below the level of the country. It is caused by the wind sweeping along them and carrying over the fields the dust made and raised by the carts. . . ." These defiles through the loam are often fifteen feet deep. "The banks are protected by revetment walls or turf, if necessary. Those near Hangchau, and the great road leading from Chehkiang into Kiangsi, are all in good condition. Generally speaking, however, . . . the roads are not well repaired, and large holes are frequently allowed to remain unfilled in the path, to the great danger of those who travel by night."—*De Guignes, Voyages à Peking*, ii. 214. *Cf. Annales de la Foi*, vii. 377.

"Mountain passes have been cut for facilitating the transit of goods and people over the high ranges in many parts of the empire. The great road leading from Peking south-west through Shansi and Shensi, and thence to Sz'chuen, is carried across the Peh ling and the valley of the river Hwai by a mountain road, 'which, for the difficulties it presents and the art and labour with which they have been overcome, does not appear to be inferior to the road over the Simplon' (*Penny Encyclopædia*, xxvii, 656). At one place on this route, called Li-nai, a passage has been cut through the rock, and steps hewn on both sides of the mountain from its base to the summit. The passage across the peak being only wide enough for one sedan, the guards are perched in little houses placed on poles over the pass. This road was in ancient times the path to the metropolis, and these immense excavations were made from time to time by different monarchs. The pass over the Mei ling, at Nan-ngan, is a work of later date, and so are most of the other roads across this range in Fuhkien and Kwangtung."—*Williams, Midd. King.*, i. 39.

Raising.—"Among secondary architectural works deserving notice are bridges and honorary portals. There is good reason for supposing that the Chinese have been acquainted with the arch from very early times, though they make comparatively little use of it. Certain bridges have pointed arches, other have semi-circular, and others approach the form of a horse-shoe, the transverse section of an ellipse, or even like the Greek Ω, the space being widest at the top. In some the arch is high for the accommodation of boats passing beneath; and where no heavy wains or carriages cross and jar the fabric, it can safely be made light."—*Ibid.* i. 753. An example of this class is the fine marble bridge near the Emperor's summer palace of Yüan-ming Yüan.

"Their bridges . . . are sometimes of great length, but generally made up of a series of small arches, constructed on the horizontal-bracket principle, as nine-tenths of the bridges in China are, and consequently narrow and unstable. When they do use the true arch, it is timidly and without much knowledge of its principles."—*Fergusson, Hist. of Ind. and East. Arch.*, pp. 707–8; see also *Naut. Mag.*, 1865, p. 18.

"Over . . . most of the . . . canals and rivers are a great variety of bridges. . . . Some of their bridges, of three, five, and seven arches . . . are extremely light and beautiful to the eye, but the plan on which they are usually constructed does not imply much strength. Each stone, from five to ten feet in length, is cut so as to form a segment of the arch, and as, in such cases, there is no keystone, ribs of wood fitted to the convexity of the arch are bolted through the stones by iron bars, fixed fast into the solid parts of the bridge. Sometimes, however, they are without wood, and the curved stones are morticed into long transverse blocks of stone. . . . There are, however, other arches wherein the stones are smaller and pointed to a centre as in ours."—*Barrow, Travels in China*, pp. 337–8; see also plate facing p. 338.

"Bridges in the southern provinces of the empire are . . . very inferior to those which I have described. Had I not visited the north of China, I should certainly have returned to England under the impression that the art of bridge-building was all but unknown to the inhabitants of the Celestial Empire. Thus the bridges in the south of China consist as a rule of two or three long slabs of granite, resting on buttresses of the same material. In not a few cases they are . . . unfenced. . . . Some of these flat-arched bridges are built of granite and are very imposing. . . . On many of the bridges which span the Grand Canal there are characters carved in *basso-relievo*."—*Gray, China*, ii. 103–4.

"Bridges are sometimes built by the Government, sometimes by the people."—*Ibid.* ii. 104.

"The [system] of hollow iron cylinders filled up with concrete . . . . has long been known to the Chinese and employed by them in the construction of their bridges. I am able to speak confidently in at least two instances"—in Chekiang and Fukien.—*N. and Q. on C. and J.*, ii. 180.

"Bridges with houses erected along their sides, are to be found in some parts of the empire." There are also some suspension bridges. "Nor are the Chinese strangers to pontoons or bridges of boats."—*Gray, China*, ii. 104–5.

"It is singular how the term *triumphal arch* came to be applied to the *pai-fang* and *pai-lau*, or honorary portals or tablets of the Chinese; for a triumph was perhaps never heard of in that country, and these structures are never arched. They consist merely of a broad gateway flanked with two smaller ones, and suggest a turnpike gate with side-ways for foot passengers rather than a triumphal monument. They are scattered in great numbers over the provinces, and are erected in honor of distinguished persons, or by officers to commemorate their parents, by special favour from the Emperor. Some are put up in honor of women who have distinguished themselves for their chastity and filial duty, or to widows who have refused a second marriage. Permission to erect them is considered a high honor, and perhaps the term *triumphal* was given them from this circumstance. . . . Some of the *pai-lau* are elaborately ornamented with carved work and inscriptions; and as a protection to the frieze a ponderous covering of tiles projects over the top, which, however, exposes the structure to injury from tempests. They are placed in conspicuous places in the outskirts of towns, and in the streets before temples or near government offices. Travellers looking for what they had read about have sometimes strangely mistaken the gateways at the heads of streets or the entrance to temples for the honorary portals. Those built of stone are fastened by mortises and tenons in the same manner as the wooden ones; they seldom exceed twenty or twenty-five feet in height. . . . Among the numerous *pai-lau* in and near Peking, two or three deserve mention for their beauty. One lies in the Confucian temple in front of the *Pih-yung Kung*, and is designed to enhance the splendour of its approach by presenting, as it were, a frame before its façade. It is built of stone and overlaid with square encaustic tiles of many hues. The arrangement of the colors, the carving on the marble, and the fine proportions of the structure render it altogether one of the most artistic objects in China. Another like it is built in the Imperial Park, but the position is not so advantageous."—*Williams, Midd. King.*, i. 756–8.

"In the *Mêng liang lu* it says: 'In front of the Fa Ming Buddhist temple outside the Liang Shan Gate there was a bridge called "Camel Bridge" (*Lo t'o ch'iao*).' At the present day this bridge is inside the city and the Fa Ming Buddhist temple had long since been destroyed. The bottom of the bridge was small, and the stream running under it connected with the Tung Ho (E. River)."—*Yüeh Ya T'ang ts'ung shu, Tung ch'êng tsa chi*, c. *hsia*, p. 44*a*.

[An iron chain-bridge, three hundred feet long, in W. Ssŭchu'an, is mentioned in *Little* (*Mrs. A.*), *Int. Ch.*, p. 404. "Planks were laid loosely upon the chains, starting up at each of the ponies' steps, and the whole bridge swayed like a ship at sea."]

Ch'iu Yüeh-hsin (1712–1773) "advocated the clearing out of waterways so as to let off floods; and at his proposal the practice

of filching the banks and beds of rivers for agricultural purposes was prohibited—unfortunately only for a time."—*Giles, Bio. Dic.*, p. 159.

In Ch'ien Lung's reign "every effort was made to perfect the conservation of the Yellow River."—*Ibid.* p. 143.

Li Yü-mei, whilst Director-General of the Yellow River, "introduced the use of brick in the embankments as cheaper and more effectual than broken stone and reeds."—*Ibid.* p. 476.

"No one can visit China without admiring its numerous pagodas. These are erected in or near cities, often on the banks of rivers and streams. They are of various kinds. Those of the first class are lofty and graceful towers, consisting of seven, or nine stories; in some instances, of thirteen. The towers, which are generally octagonal, diminish in height and width as they ascend, and above each story there is a projecting roof of tiles. These are generally glazed and of a green colour; and each corner of the roof is ornamented with a bell. As a rule pagodas are built of bricks, the facing being often of stone. In some parts of the empire [mostly central provinces] they are made of [cast] iron." "The ascent from story to story is effected by a spiral staircase consisting of stone steps, and constructed within the outer and inner walls, of which almost all pagodas consist."—*Gray, China*, ii. 87–8.

"Besides pagodas of the first class, consisting of seven, nine, or thirteen stories, there are others which consist of three or five stories. Those constituting the second class are very numerous in the south, and are, as a rule, called literary pagodas, and occasionally pencil pagodas, from their supposed resemblance to a Chinese pen or pencil. They are found not so generally in the vicinity of cities and towns as in the neighbourhood of villages, and on the banks of rivers, streams and creeks. Like those of the first class, they are considered to exercise a good geomantic influence over the adjacent country, causing peace, wealth and literature to flourish and abound."—*Ibid.* ii. 94–5.

"Many persons think that pagodas are not now erected by the Chinese. This, however, is a mistake. At the district city of Sam-shuee in the province of Kwang-tung, one of nine stories was erected in 1827; and at a large market town named Cum-lee-hoi, in the district of Sam-shuee, I visited, in 1861, a pagoda which had been erected during the preceding year."—*Ibid.* ii. 95.

"Besides pagodas, there are temple towers in China called Man-Kok, which are erected for the purpose of exercising a good geomantic influence over the localities adjacent. . . . These temple towers are very numerous in the province of Kwang-tung, and more particularly in the large and thickly populated island of Honan at Canton." "There are also in some of the cities of China other structures called pagodas, erected for the sake of the good geomantic influence they are supposed to exercise."—*Ibid.* ii. 96.

"The form of the Chinese *tah* is probably derived from the spire on the top of the Hindu dagoba, as its name is doubtless taken from the first syllable; but their purpose has so long been identified with the geomantic influences which determine the luck of a place that the people do not associate them with Buddhism. . . . Those in the southern and central provinces seldom contain idols of any pretensions. They are ascended by stairways built in the thick walls on alternate sides of the stories. In the north there is another kind, designed to contain a *shé-li*, or relic of Buddha, having a large room near the base for worshipping the idol placed in it, but otherwise entirely solid and nearly uniform in size to the top; the stories are merely numerous narrow projections, like eaves or string courses, on which hundreds of small images are sometimes placed. These structures more nearly resemble the Indian *dagoba* than the other kind, and are always connected with a monastery while those are not uniformly so placed, though under a priestly oversight. No town is considered complete without a pagoda, and many large cities have several; there must be nearly two thousand in the empire, some of which are quite celebrated. It is rare to see a new one. . . . They . . . are mostly built in so solid a manner that they are likely to remain for centuries. . . . There are two inside of Canton, and three near the Pearl River, below the city; fifteen others occur in the prefecture. Suchau has two, Ningpo one, Fuhchau two, and Peking six in and out of the walls. One of those at Canton was built by the Moslems about a thousand years ago, a plain brick tower nearly two hundred feet high. . . . The ignorance of the Chinese of later days of the Hindu origin of pagodas has led to their regarding those now in existence as of native design, and appropriated by the Buddhists for their own ends."—*Williams, Midd. King.*, i. 744–6.

"Mr. Milne, in his interesting work, has a good account of pagodas; he shows that while their model is of Hindu origin, and has been carefully followed since the first one was erected (about A.D. 250) at Nanking, the popular geomantic ideas connected with their octagonal form and great height have gradually increased and influenced their location. The Buddhists seem themselves to have lost their ancient confidence in the protection of the *shé-li* (or *saina*) supposed to be built in them. The number of Indian words transliterated in Chinese accounts of these edifices further proves their foreign origin. For convenience and accuracy in describing them, it would be best to restrict the word *pagoda* to the hollow octagonal towers, the word *dagoba* to the solid ones covering the relics, and *tope* to the erections over priests when buried."—*Ibid.* i. 745–6.

"Amongst the most ancient pagodas of the country were those erected over the tombs of Buddhist priests distinguished for their zeal and earnestness in the discharge of their sacred duties. The pagodas, however, are now no longer erected for this purpose."—*Gray, China*, ii. 92

"Pagodas were not erected by the Chinese as beacons . . . Beacons are provided throughout the empire. [See *supra, Levelling.*] . . . In some instances they are built on the plains, and in others on the high hills."—*Ibid.* ii. 97.

[A remarkable cenotaph of white marble was erected in memory of the Teshu Lama in the Huang Ssŭ, N. of Peking, in 1780.]—*Williams, Midd. King.*, i. 79–80.

"The land has no dykes or hedges: stones are set up to mark the boundaries of each portion and it is a serious offence to meddle with these."—*Dudgeon, Diet, Dress, etc.*, p. 285.

"The entire absence of walls, fences, or hegderows, makes a cultivated plain appear like a vast garden."—*Williams, Midd. King.*, i. 40.

"A wall encloses all towns above a *sz'* or township. . . . The gardens and best houses are mostly walled in from sight."—*Ibid.* i. 40.

"At present this remarkable structure [Great Wall] is simply a geographical boundary, and except at the gates nothing is done to keep it in repair."—*Ibid.* i. 31.

"From near the eastern extremity of the Wall in the province of Chihli, extending in a north-easterly direction, there was once a wooden stockade or palisade, forming the boundary between Liautung and Kirin, which has been often taken from its representation on maps as a continuation of the Great Wall. It was erected by the Manchus, but has long since become decayed and disused."—*Ibid.* i. 30.

Railways.—"China stands [1900] in regard to railways much as Iceland does to snakes. Generally speaking, they are conspicuous by their absence, the exception serving only to prove the rule. . . . Permanent way exists at the rate of 1 mile to 2241⅓ square miles of area, and this despite the fact that railways were introduced . . . more than twenty years ago."—*Krausse, China in Decay*, p. 278; and see pp. 278–301.

[For military fortifications and ditches see MILITARY.]

HABITATIONS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

"In the great wild age [*i.e.*, very ancient times] people lived in wild places or caves."—*I ching, I Hsi tz'ŭ hsia.*

"In the highest antiquity they made their homes (in winter) in caves, and (in summer) dwelt in the open country. In subsequent ages, for these the sages substituted houses, with the ridge-beam above and the projecting roof below, as a provision against wind and rain."—*I ching*, App. III. Sect II. ch. 2, 21, *Legge, Yi King*, p. 385.

"In winter people dwelt in caves, and in the summer in nests made of branches of the juniper tree; but the sages of later ages used metals and clay to build dwelling places."—*Li Chi, Li Yün.*

"The ancient duke T'an Fu made for them kiln-like huts and caves, ere yet they had any houses."—*Shih ching*, III. i. III.; and see following extracts.

[In the 14th century before our era, the inhabitants of western China had no houses, but lived in caverns or grottos, a hole at the top of the vault serving as an outlet for the smoke (or, left open "for purpose of light," *Legge*, IV. ii. 437). Such was the first abode of T'an Fu, called also the ancient duke, the grandfather of King Wên (*Shih ching*, III. i. III.). "T'an Fu," says that ode, "lived in a cavern like a potter's kiln; there were then no houses." Another ode, however (III. ii. VI. 3, 4), attributes to duke Liu buildings considerably extensive, such as large stables and sheep-folds. According to the *Shih ching* (III. i. III.), and Mencius (I. Pt. ii. XV. 1, 2) the first establishments of the Chinese in the western regions were destroyed by the Tartars.]—*Legge, Ch. Class.*, IV. ii. 437, 486–7; II. 52.

"'In early times,' says chapter 30 of the *Li ki* (I. 22), 'the sovereigns, our ancestors, had no palaces nor dwellings; but in winter they lived in artificial caverns, and during the summer in nests (huts?) made of branches.' The *Yih king* (ch. 15) has: 'In remote antiquity men dwelt in caverns and lived in the wilderness,' and Liu Ngan wrote in the second century before our era: 'There were amongst the peoples of antiquity men who lived in caves of declivities, and yet were not forsaken by the spirits.' Now seeing that in the northern provinces of China the soil consists chiefly of loess clay, the conclusion becomes obvious that by those 'caves in declivities' are meant caves dug out in the steep banks formed by rivers and riverlets washing out their courses through the loess; for, there is no reason to doubt that the savage Chinese generally lived on the banks of streams, this being a phenomenon amongst uncivilized races all over the globe." "In process of time, culture advancing, the dwellings excavated in steep banks of clay may have gradually given way to small huts of clay. As big forests most likely covered the loess plains in primeval times, branches of trees may have entered into the construction of these huts; people may even have constructed huts of branches and covered them over with a layer of clay."—*De Groot, Rel. Syst.*, ii. i. 372.

"Such dwellings [huts of branches covered with clay], so easily erected from the materials which the soil supplied, constituted the common abodes of the living in semi-historical times, being clearly defined in the *Shi king*, in an ode generally believed to date from the twelfth century before our era. Celebrating some of the exploits of Tan-fu [see *supra*], an ancestor of the royal house of Cheu, who about the year 1325 B.C. migrated with his clan from the present Shensi province [then Pin] to the country of Ki and there founded a colony which afterwards became the principality of Cheu, this ode says: 'They made for themselves dwellings of clay along the rivers Ts'ü and Ts'ih. Their old chiefs and Tan-fu dwelt in sheds and caves resembling potter's kilns, for there were no houses then. Arrived at the foot of Mount Ki . . . he called his overseers of works and the chieftains of the people, and ordered them to erect houses. The strings were stretched, the boards tied together and filled up, and so the temples for the dead were made, grand and beautiful.'"—*Ibid.* ii. i. 372–3. See also *Simcox*, ii. 19–20.

"Huai-nan Tzŭ says: 'Shun built houses by making walls and covering them with a thatched roof. When they were finished he directed the people to leave their caves and live in their respective houses. This was the beginning of house-building.'"—*Ch'u hsüeh chi, Ko chih ching yüan, Kung shih lei tsung*, p. i.

[In early times there was no difference in name, all residences being called *kung*, "palace." See ABSOLUTE MONARCHY. The *Shih ku chu* makes a similar remark concerning the *tien*: "all large and high residences were commonly called *tien*, 'hall,' or 'palace'; [the name] was not confined to the Emperor's palace." See *Ko chih ching yüan, Tien lei*, p. 3.]

"Living in trees made people mad, and living on the earth made them sick—for this reason they built houses."—*Han wên.*

"The art of house-building was spread among the Tartar tribes by the Cheu family when they took refuge from the tyranny of the Shang dynasty in the Pin country, fifty miles north-west of Si-an-fu, and rather near the western boundary of the province of Shen-si. There the aboriginal tribes had lived in loess caves. This kind of house is there very convenient, warm, well-protected and economical. The loess deposits where they occur are found in the valleys with a vertical front of uncertain height varying from a few feet to several hundred feet. The rude savages who had been living in a single room were taught to make double chambers and upper rooms by their new friends from civilized China. This their friends did by instructing them in the art of making bricks in kilns. This seems to be the meaning of the passage *t'au fu t'au hiue*—'they taught the aborigines to make double houses and dig caves with the help of the kiln.' Yet the commentators explain the passage differently, as if it was meant to say that the people were taught to live in kilns, and Legge explains that the houses were shaped like kilns."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 261–2.

"Kung Liu used sandstone and forged metal to build houses, and T'ai Wang used earthenware to cover and build up a cave in order to occupy it."—*Shih, Ta ya, Chou Shih.*

"With regard to the houses of private individuals, the small degree of magnificence in that of Yao, proves that they must have been very simple."—*Mém. conc. les Chin.*, i. 224.

"T'ang [Yao] and Yü [Shun] built palaces with thatched roofs and clay steps. The Emperor Yü of the Hsia dynasty built low and mean (unadorned) palaces."—*Shih chi, Yao Shun Yü chi.*

"Liu T'ao said: 'When the Emperor Yao governed the Empire the low walls of palaces and houses were not white-washed; the main pillars, rafters, roof, supporters and balustrades were not engraved; and the straw of all the thatched roofs was not trimmed.'"—*Yüan chien lei han*, c. 341, *Chü ch'u pu.*

"When Yao ruled the empire, the earthen steps were three feet high, and the thatched roofs were not trimmed."—*Tzŭ chih t'ung chien kang mu.*

"In ancient Chinese houses, the door was always on the south-west side, as stated in the *Shi-King* II. iv. Ode 5, *Se kan*, and the *Ngao* was inside, next to it. At present the houses are so planned as to face southwards, or at least to have their chief entrance on the south."—*Lacouperie, West. Orig.*, p. 162.

"In that hall [hereditary chamber] there were five chambers appropriated to the five elements. The 'Wood Chamber' was to the north-east; the 'Fire Chamber' to the south-east; the 'Metal Chamber' to the south-west; the 'Water Chamber' to the north-west; and the 'Earth Chamber' in the centre." "In the time of the Hsia dynasty the Hereditary Chamber was wider from east to west than from north to south. In the time of the Chou dynasty there were also 5 chambers, but different in construction."—*Yüan chien lei han*, c. 346, *Chü ch'u pu, Shih*, pp. 17*b*–18*a*.

"The Hsia sovereign had a *shih shih*, 'hereditary chamber'; the Yin [Shang] (sovereign) a *ch'ung wu*, 'principal hall of a palace': and the Chou [sovereign] a *ming t'ang*, 'Hall of Light.'"—*K'ao kung chi.* The *ch'ung wu* of the Yin was three feet higher than the "principal hall" of the Hsia. See *Tzŭ chih t'ung chien kang mu, Chi lan.*

"In the Book of Rites, in the [chapter called] 'Winter Officers,' the workman says: 'In the principal hall of the king's palace of Yin there were four pillars.'"—*Yüan chien lei han*, c. 341, *Chü ch'u pu.*

"A 'deer terrace' was built, having jade rooms and jade doors. The width was 2 *li*, and the height 1000 feet."—*Kang chien i chih lu*, c. 2.

"The *kung*, 'palace,' and *shih*, 'chamber,' are interchangeable names; but when the four sides were great and lofty it was called 'palace,' when it was full of men and things it was called 'chamber'—*shih* meaning 'full.'"—*K'ung Ying-ta p'ien.*

"An emperor of the Hsia dynasty built a hall, the four sides of which were fitted with two double windows."—*Yüan chien lei han*, c. 346, *Chü ch'u pu, T'ang.*

"Like the city of ancient Egypt and Babylonia, the ancient Chinese village consisted of clustered groups of houses. The traditions embodied in the Chow Li as to the size and grouping of the clusters are not quite clear or consistent, but the discrepancies may only reflect the different usages of the three first dynasties."—*Simcox*, ii. 42.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

"In building a house, after all the toil on its walls, they have to plaster and thatch it."—*Shu ching*, Pt. V. Bk. XI. 4; *Legge, Ch. Class.*, III. ii. 417.

"In every house there were 4 corners; the S.W. corner was called *ao*; the N.W., *wu lou*; S.E., *yao*; and N.E., *i*."—*Erh ya, c. chung*, 5.

"When the superior man was about to build a house, he first built the stable and storehouse (or treasury), and lastly the dwelling house."—*Li Chi, Ch'u li.*

[The walls of houses were ordinarily made of earth. For the foundations they pounded the soil hard where it was intended to erect the walls (*Shih ching*, II. iv. V. 3); over this space they placed a frame-work of four planks, two of which corresponded to the two faces of the wall, and were arranged by the help of a plumb-line (III. i. III. 5). The interval between the planks was filled with earth wetted and brought to it in baskets (*ibid.* 6). They rammed in this earth with heavy poles of wood, and thus made a length of wall of a certain height, all the parts of which they brought to the same level, filling up where the earth failed, and paring away where there was too much (*ibid.*; see also *Êrh*

ya, ch. IV.). They then moved the framework higher, and proceeded to make the upper part of the wall. It was precisely the same kind of construction which we see in the south of France, and which goes by the name of *pisé*. The workmen encouraged one another by cries. For the foundation of a town and for the construction of a considerable edifice, a drum was sounded to inspirit the workmen (III. i. III. 6). The beams were of bamboo, of pine (II. iv. V.), or of cypress (IV. ii. IV. 9). They were cut and planed. The frames of the doors were also made of wood (IV. iii. V. 6).]—*Legge, Ch. Class.*, IV. ii. 304, 439, 440, 303, 629, 646.

"Living there in his plank house."—*Shih ching*, I. xi. III. i.

[The doors of the houses faced the south or the west (*Shih ching*, II. iv. V. 2), or mid-wise the south-west. They gave them their position by observing the shadow of the sun at noon. In winter the husbandmen ordinarily plastered the doors and stopped up the windows facing north (I. xv. I. 5) to keep out the cold.]—*Ibid.* IV. ii. 304; i. 230.

[The floor of the house was levelled by beating it, and it was then covered with a coarse kind of grass (*Shih ching*, II. iv. V. 6). People in easy circumstances placed at the south-east corner of their houses a special chamber, called the *Hall of Ancestors* (I. ii. IV. 3). It was adorned with pillars of wood like the entrance-hall. The sovereign, the princes, and the great officers alone had the right of erecting a building dedicated especially to the performance of the ceremonies in honour of their ancestors (III. i. VI. 3; IV. i. [ii.] VIII.; ii. IV.; iii. V.). A tiled path conducted to this building (I. xii. VII. 2).]—*Ibid.* IV. ii. 305; i. 25; ii. 447, 591, 620, 643; i. 211.

"Anciently, as now, the palace, mansion or public office was an aggregate of courts, with buildings in them, so that the visitor passed from one to another through a gateway, till he reached the inner court which conducted to the hall, behind which again were the family apartments. . . . Each gate had its proper name. The whole assemblage of buildings was much deeper than it was wide."—*Legge, Li Ki*, i. 71, note.

"The palace was much more long or deep than wide, consisting of five series of buildings, continued one after another, so that, if it had been according to etiquette, and all the gates had been thrown open, one might have walked in a direct line from the first gate to the last. The different buildings were separated by courts partially open and embracing a large space of ground. The gates of the different divisions had their particular names The first or outer gate, fronting the south, was called 皋門: the second was called 雉門; the third, 庫門; the fourth, 應門; and the fifth 路門, called also 畢門 and 虎門. Outside the second gate—the 雉門—was held the 'outer levee' (外朝), when the sovereign received the princes and officers generally. Outside the 5th gate—the 路門—was held the 'audience of government' (治朝), when the king met his ministers, to consult with them on the business of the State Inside this gate were the buildings which formed the private apartments, called (路寢), in the hall of which was held 'the inner audience' (內朝) and where the sovereign on occasions feasted those whom he designed specially to honour."—*Legge, Ch. Class.*, III. ii. 529–50, note.

"The door of a palace was called *wei* (door of harem); the passage of a palace, *kung*; the space between the door and the screen was called *ch'u*, 'porch': the hall by the side of the door was called *su*, 'side apartment'; the door screen was called *shu*, 'tree'; the gate tower was called *ch'üeh* (look-out above the gate); the door of the passage was called *hêng* (gate of passage); the space between the two steps was called *hsiang*; and both sides of the middle courtyard were called *wei*, 'stands.'"—*K'ang Hsi Tzŭ tien, Kuang yün.*

"The 5 [imperial] doors for entry and exit made the difference between inner and outer courts. The back chamber [of a palace] consisted of 9 rooms and was distinguished by having 9 maids of honour and 9 great ministers."—*K'ao kung chi.*

"The name 'college' was sometimes applied to the palace (*kung*), which for the princes was called the 'college of the prince,' and was half the size of the Imperial palace."—*Li chi, Ch'ü li.*

"When a *tsung miao* (ancestral temple) was called *kung* it was used specially for a duke or marquis."—*Shih ching, Chao nan.*

"A scholar might have one *mu* of '*kung*'; *kung* being a wall or low wall."—*Li chi, Ju hsing.*

"In the state of Lu the rafters of the Hsüan palace were engraved."—*Tzŭ chih t'ung chien kang mu.*

"Huai-nan Tzŭ said: 'King Wên of Chou made a jade door, which means that it was adorned with jade.'"—*Yüan chien lei han, Chü ch'u pu*, c. 344.

"In the *Hsiao ching*, Yüan Shên-chi says: 'The palace or office for proclaiming government affairs was situated to the southward of a state; its top was round, and the lower part square; there were 8 windows corresponding with the 8 winds; 4 doors corresponding with the 4 seasons; 9 chambers corresponding with the 9 continents; 12 suites of rooms corresponding with the 12 months; 36 inner doors corresponding with the 36 decades of the year; 72 latticcs (with sliding doors) corresponding with the 72 horary periods."—*Yüan chien lei han*, c. 341, *Chü ch'u pu.*

"The men of the Chou dynasty built the Ming T'ang, 'Brilliant Palace,' or 'Hall of Light.' By measuring it with the 9-foot bamboo-mat [its dimensions are found to be], from east to west nine bamboo-mats [*i.e.*, 81 feet], and from south to north seven bamboo-mats [*i.e.*, 63 feet]. The Commentary says: The 'Brilliant Palace' was a palace for disseminating the instructions of the government."—*Tzŭ chih t'ung chien kang mu, Chi lan.* See also *K'ao kung chi.*

"In the 23rd year [547 B.C.] of the reign of King Ling of Chou there was built the Kun Ming terrace. Its other name was the Hsüan Chao terrace. [For its construction] rare curious woods were collected and clever artists employed. Crystals were sifted to make mortar. The height of it was 100 *chang* (1,000 feet)."—*Yüan chien lei han*, c. 349, *Chü ch'u pu, T'ai.*

"Anciently all buildings of importance faced the south in point of fact."—*De Groot, Rel. Syst.*, i. i. 5.

"Any building of importance was, in ancient times, erected on a square terrace having two flights of steps in front. As the front faced the south, the steps were on the east and west." [For plan of official mansion of this period see *De Groot*, ii., plate facing p. 16.]—*Ibid.* p. 16.

"The *tu* was built by piling up earth and was called a *t'ai*, 'terrace.' When the *t'ai* had a house built upon it it was called a *hsieh*, 'kiosk.' When [the terrace and kiosk] had a *shih* with east and west apartments it was called a *miao*, temple, without the east and west apartments and with the *shih* it was called *ch'in*, a hall or retiring-room. A square, high building was called a *t'ai*, terrace, but one narrow, high and curved was called a *lou*, 'tower.'"—*K'ang Hsi Tzŭ tien, Kuang yün.*

"When the chamber for women is called '*kung*,' 'palace,' 'palace' means the withdrawing or private apartment. Those belonging to the Emperor [or prince] were called '*liu ch'in*,' the hall]."—*Chou li, Tien kuan chu.*

"Already in those ancient times the governing classes had regular store-houses in which they laid up ice for use during the summer months. In ch. 25 (l. 50) and in ch. 21 (l. 18) of the *Li ki* we read: 'In the last month of winter ice is abundant, in waters and meres it is then thick and strong; orders are issued to collect it, and it is carried to the stores. . . . In the middle-most month of spring the Son of Heaven opens the ice stores with a sacrifice of a lamb, first offering some ice in the back chambers and in the ancestral temple.'"—*De Groot, Rel. Syst.*, i. i. 265–6. See also *Chou li.*

"All the streets are at right angles, and the general plan of the typical city follows the analogy of the nine squares; but instead of the central plot only being occupied for public purposes, that is assigned for the palace of the prince, which has the public market on one side and the place of audience and the ancestral temple on the other. The width of the streets is measured in carriage breadths, and the narrowest are required to give a gangway for carts in the middle, and a path for men on one side and one for women on the other. The proportion between the height and thickness of the city walls is prescribed; that of private dwellings is left to custom or choice, but the angle of all roofs is determined by law, a greater slope being required in the case of thatched than of tiled roofs, as the water runs off them less easily. The roofs of barns and warehouses and the copings of walls are allowed to be still flatter."—*Simcox*, ii. 62–3.

[The cities were surrounded with a wall of earth, and with a ditch which was dug out first, and furnished the materials for the wall (*Shih ching*, III. iii. VII. 6; i. X. 3).]—*Legge, Ch. Class.*, IV. ii. 550, 461. See also LAND-WORKS.

"The Duke of Chou . . . made a walled city 1620 *chang* square, with suburbs 72 *li* round."—*Chou shu. Yüan chien lei han, Chü ch'u pu*, c. 340.

"The *Kung yang chuan* says: What is the *chih* (雉) of a walled city? Five plank-lengths make a section, 5 sections make a *chih* (crenelated wall), and a hundred *chih* make a *ch'êng* (city wall)."—*Yüan chien lei han, Chü ch'u pu*, c. 340.

"The Commentary on the *Kung yang chuan* says: The city wall of an emperor is 1,000 *chih* (in length) and 7 *chih* high; of a duke, marquis, or earl, 5 *chih* high; and of viscount or baron, 3 *chih*."—*Ibid.* c. 340. See also LAWS OF INT.

[Only huts were in the midst of the territories assigned to the different families,—mere temporary erections occupied by the labourers at the busiest times of the year. They were in a space of 2½ acres, and, no doubt, they cultivated vegetables about them. The proper dwellings were away from the fields, in a space for each family of other 2½ acres, and about the houses they cultivated especially mulberry trees.]—*Legge, Ch. Class.*, IV. ii. 375, and note.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

[Ordinary dwelling houses probably remained the same as during the previous Period.]

"The lofty house with its carved walls was very skilfully and ingeniously constructed."—*Ch'in shih, hsia.*

"Ch'in-shih huang built a house at the foot of Black Horse Mountain by piling up stones."—*Tzŭ chih t'ung chien kang mu, Chi lan.*

"On Ta Hsia Shan, beyond the border to the north-west, there was a palace with its walls made of gold; on Wang Ming Shan, beyond the border to the south, a palace with its walls made of red stone; on Lao Shou Shan, beyond the border to the south-west, a palace with its walls made of copper; on Kuei Ching Shan, beyond the border to the south-east, a palace with its walls made of blackstone; and on Hsi Ming Shan, beyond the border to the west, a palace with its walls made of white stone."—*Shên i ching, Ko chih ching yüan*, c. 20, *Kung shih lei*, p. 14*b*.

"In the Inner Palace of the Jade Hall there were twelve doors, the steps leading to them being of jade. The doors were in 3 grades. The terrace was more than 10 *chang* high. The beams connecting the ends of the rafters were made of jade; hence the name Jade Door."—*Han wu ku shih, Yüan chien lei han, Chü ch'u pu*, c. 344.

"The A-Fang palace was 3 *li* wide from east to west and 500 paces from north to south; its courtyard could contain 10,000 men, and in front of it there were placed 12 brass men."—*San pu chiu shih, ibid.* c. 341.

"In the Northern Palace there was a 'violet chamber' and double passages leading to the Wei Yang Palace."—*Tzŭ chih t'ung chien kang mu, Chi lan.*

[Beams of fragrant cedar wood were used in the construction of the Po Liang terrace in the palace (*ibid.*).]

"The projecting beam [a beam which projected from the pillars in the imperial palace] and the ornamented kingpost were the result of the highest efforts of the artists' talents."—*Han wên.*

"The Emperor [Wu] built a Spirit House. Its pillars were cast of brass covered with gold; its steps were made of red jade; the round beam supporting the roof was also inlaid with gold, and on it were perched birds and animals made of tortoise-shell. The end of the beam was carved to represent a dragon's head holding a round bell in its mouth. Brass was moulded to represent bamboo, and red and white clay [used in making cosmetics] was used as mortar, and pepper-juice mixed with *huo-ch'i* [a kind of pearl] to fix it on the top. All door-screens were made of translucent vitreous substance; the hangings were of white pearls weighted with tortoise-shells. The beds were of ivory, and there was a tent, called Tent A., made of vitreous substance, jewels, *ming yüeh*, and *yeh kuang* [names of pearls], mixed with all the various kinds of precious stones to be found in the world. Next to this there was Tent B. The former was occupied by the spirits, and the latter by the Emperor himself. In front of the courtyard a 'gem-tree' was planted; its branches were made of coral, its leaves of jasper, and its red and black fruits of jewels. These were [hollow] like small round bells, and gave forth a tinkling sound. The wings as if about to fly."—*Han wu ku shih, Yüan chien lei han, Chü ch'u tsung tsai*, c. 340.

"A 'red ground' was the ground of the palace which was smeared with red mud."—*Han shu, ibid., Chü ch'u pu*, c. 341.

"Wei T'o built a terrace to be used for the audiences of the Han Emperors. Its foundation was circular and 1,000 paces [in circumference], and its perpendicular height was 100 *chang*. It was ascended by a winding path. Its top was 3 *mu* in area."—*Yüan chien lei han*, c. 349, *Chü ch'u pu, T'ai.*

"Ts'ao Ts'ao of the Wei State built the 'Copper-Bird Terrace,' connected with the tower and pavilion by a double passage." The name was taken from the copper model of a bird, over 17 feet high, placed on the top of the tower.—*Tzŭ chih t'ung chien kang mu, Chi lan.*

"The *Ling Yün* terrace was built by Wên Ti of the Wei State. It was 13 *chang* (about 153 English feet) high. By ascending it one could see as far as Mêng Ching. On the terrace there was a look-out or watch tower very artistically constructed."—*I t'ung chih, ibid.*

"It is said of Han Wu Ti that 'the Emperor constructed a fairy apartment in which there were glass windows [琉璃窓].'"—*Ch. Rev.*, xv. 372. But *liu-li* may here only mean "translucent," v. *ibid.* xvi. 129.

"The people of the Mo To country wove phœnix feathers into embroidered silk out of which they made curtains and tents."—*Tung min chi, Ko chih ching yüan*, c. 53, *Chü ch'u Ch'i wu lei*, p. 22*b*.

"Ts'ao Shuang of the Wei kingdom built a cellar with figured-silk openings all round," *i.e.*, there were windows all round covered with figured-silk.—*Tzŭ chih t'ung chien kang mu, Chi lan*, and Comm.

"In ancient times [houses] both of the rich and of the poor could all be called *kung*, palace. Not until the Ch'in dynasty was that title appropriated to the Emperor's use."—*Shih chi, Ch'in chi.*

"In ancient times both scholars and the common people called residences *kung* ('palace'); but since the Han dynasty, the nobles having considered it a title belonging to the Emperor, inferiors have avoided the use of it."—*Ch'u hsüeh chi, Ko chih ching yüan, Kung lei*, p. i. Yen Shih-ku also says (*Shih-ku chu, Yüan chien lei han, Tien lei*, p. 3) that in ancient times large and high buildings were called *tien* and that the name was not confined to buildings in the palace.

"K'ung Ying-ta says: 'The names *kung*, "palace," and *shih*, "chamber," are used interchangeably,—a palace is called a chamber and a chamber is also called a palace.'"—*Shuo Wên, Kung.* See also *K'ung Ying-ta p'ien*, and *cf. supra.*

"The Emperor Hui rebuilt the city wall of Ch'ang An. Its circumference was 65 *li*. The south was in imitation of the shape of the Southern Dipper, and the north of the Northern Dipper. To this day people call the ancient capital of the Han the 'Dipper City.'"—*San pu huang t'u, Yüan chien lei han, Chü ch'u pu*, c. 340.

Period of Disruption (221 *to* 589).—*Table IV.*

"The Ruler of Ch'ên built the Lin Ch'un, Chieh Ch'i, and Wang Hsien lofts. Each was several tens of *chang* high and several tens of apartments adjoined each other successively. All were made of aloe wood, the ornaments being gold, jade, pearls, and beautiful plumage. There were pearl screens and precious stone curtains; and both clothing and articles of vertu were admirable. Nothing could be found to equal it, either in ancient or modern times. He accumulated stones to form a hill, led in water to make a pond, and everywhere planted flowers and herbs. The Ruler himself occupied the Lin Ch'un loft: his concubine Chang lived in the Chieh Ch'i loft, leaving the Wang Hsien loft for the two maids of honour, Kung and K'ung. They were connected by double passages."—*Tzŭ chih t'ung chien kang mu, Chi lan.*

"The Ruler of Ch'i built the Fang Lo, Yü Shou, and other palaces. The partition walls were coated with [a preparation of] musk, and were very finely engraved and adorned—exceedingly beautiful to behold."—*Ibid.*

"The [sovereigns of the] Wei kingdom built a Lei Nan palace. The door under the gate-tower was over 10 *chang* in height. They dug ditches and ponds, enlarged the imperial park, and made an outer city wall 20 *li* in circumference."—*Ibid.*

"The Wei kingdom enlarged the Western Palace. The outer low wall was 20 *li* in circuit."—*Ibid.*

"[The State of] Chao built a T'ai Wu Court in the Hsiang country, and in [the principality of] Yeh an 'East and West' Palace. Both were built of veined stone and varnished tiles. There were gold bells [hung from the corners of the roofs to frighten birds] with silver supports, pearl door screens, and jade partition-walls—all very skilfully made."—*Ibid.*

From the Restoration of Unity to the End of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

"Inside the Ch'ien Yang Gate there was a Ch'ien Yang Palace, with figured curtains and engraved balustrades. . . . Rafters were engraved to represent clouds and the pillars covered with embroidery. The beams were ornamented and the rafters inlaid with gems. All the main posts and pillars were most beautifully adorned and dignified in appearance."—*Ta yeh tsa chi, Yüan chien lei han*, c. 341.

"When the Western Imperial Park was built it had a circumference of 200 *li*. Inside it they dug out a lake over 10 *li* in circuit, and [in this lake] they built the Fang Chang, P'êng Lai, and Ying Chou Hills; the height of these was over 100 feet, and on them terraces, watch-towers, palaces and courts were arranged row above row. It [the whole park] was extremely beautiful. When the trees in the palace had shed their leaves, they cut flowers and leaves out of silk and satin to replace them and also used the same materials to make caltrop and nelumbium and water-caltrop to put in the pond. When the colour faded they replaced them with new ones."—*Tzŭ chih t'ung chien kang mu, Chi lan.*

"T'ang T'ai Tsung built a *Yü Hua Kung*, 'splendid palace of jade.' He issued a decree saying: 'Dig a moat around it . . . and let no ornament be added to the clay-work and no engraving to the wood-work.'"—*Shih chi, Shih lei t'ung pien, Kung lei.*

"The Emperor built the Yü Hua palace in an economical manner; only the chief court was covered with tiles, the rest had thatched roofs."—*Tzŭ chih t'ung chien kang mu, Chi lan.*

"Tung Shêng's book says: 'According to the [Book of] Rites the Imperial palace had in front of it a "Ch'ing" (pure or clear) Temple, on the right a "Liang" (cool) chamber, on the left a "Ming" (bright) hall, and at the back a retiring room, but they were all not of large size.'"—*Yüan chien lei han, Chü ch'u tsung tsai*, c. 340.

"The height of the Ming T'ang ('Brilliant Hall' or 'Hall of Light') was 294 feet; and its area 300 feet. It consisted in all of 3 storeys; the lower storey represented [or was planned according to] the 4 seasons, each following the colour of the 5 points of the compass [N., black; S., red; W., white; E., dark; middle, yellow]. The middle storey represented the 12 horary symbols; its roof was circular, supported by 9 dragons (carved in wood). The upper storey represented the 24 solar terms; it also had a circular roof covered with iron on the top to the height of one *chang*, and adorned with gold."—*Tzŭ chih t'ung chien kang mu, Chi lan.*

[Tiles were used for the roof of the An-lo Palace (*I t'ung chih, Shih lei t'ung pien, Kung lei*).]

"When Yang Yü-ling was Magistrate of Ling Nan he taught people to make earthenware tiles to cover their roofs instead of rushes. In this way conflagrations were put a stop to."—*K'ung t'ieh, Yüan chien lei han*, c. 358, *Ch'an yeh pu*, p. 26*b*.

"In the first year of the reign of Ta Yeh a *kuan fêng hsing tien*, 'travelling palace for inspecting the customs of the people,' was built. It had three apartments with 2 side-rooms; the pillars were red, and the walls carnation-colour. The beams and posts were engraved with oblique marks."—*Ta Yeh tsa chi, ibid., Chü ch'u pu*, c. 341.

[Tents of various kinds are mentioned in *Ko chih ching yüan*, c. 53, *Chü ch'u Ch'i wu lei*, pp. 19*b*, 22*a*.]

[Since the T'ang dynasty all temples, monasteries, etc., had a fish's tail pointing upwards placed on the roof-ridge, as a protection against fire. The name was apparently later on changed to "owl's tail" (*ch'ih wei*). The custom seems to have had its origin in an attempt to stop conflagrations in the Han dynasty, but the text does not say that the fish-tail was placed on the roof during that Period.]

907–960.

"Liu Hsi was extravagant. He gathered all precious things out of Nan Hai to make a jade hall and pearl court."—*Wu Tai Nan Han Liu Hsi shih chia, Shih lei t'ung pien*, c. 58, *Jén shih pu*, p. 4*a*.

Sung Period (960 *to* 1280).—*Table VI.*

"Several passages throw light upon the Man-tsz Tung or 'Cave-dwellers' of Sz Ch'uan. In the year 1072 complaint was made of the rapacity of a certain cave chief [峒 酋] near modern Ichang Gorge, and of the desire of certain Man [蠻] to join China. In the year 1012 the cave chiefs had already sent in tribute; one was named 田 士 瓊."—*Ch. Rec.*, xv. 53.

"The *Kang Mu* says: 'In the 4th year of the reign Chêng Ho of the Sung dynasty the new building of the Yen Fu palace was completed. Towards the E. it reached to Ching Lung, and towards the W. as far as T'ien P'o. The courts, lofts, pavilions and terraces could be seen one from the other. Ponds were dug out to make seas, and fountains opened to form lakes; there were farm houses for storks, and wooden stockades for deer; tame birds and fabulous beasts; and various kinds of enclosures for birds. There were also beautiful flowers and rare trees, strange rocks, precipices, and ditches. The scenery was not of the kind to be seen [elsewhere] on the Earth. In the midst of it also were built cottages and village shops with inns surmounted by black flags [to show where wine was sold].'"—*Yüan chien lei han, Chü ch'u tsung tsai*, c. 340.

"The Emperor built the Shang Ch'ing Pao Lu palace. The imperial courts were densely crowded together. In the palace [grounds] were hills surrounding the level space and it was enclosed with fine trees. All the lodges and houses were properly arranged with regard to [so as to face] the stream; the main posts and balustrades of the terraces and lofts were made of superior material with no colour applied—they possessed natural beauty [and so did not need it]. Above and below innumerable houses and kiosks were built."—*Tzŭ chih t'ung chien kang mu, Chi lan.*

"During this dynasty, in building houses and palaces only the 'owl-tail' [a pointed ornament (first called 'fish-tail') on the roof-ridge, to keep off conflagrations] was added on the top of the roof, and balustrades built—and nothing more."—*Nan T'ang shu, Lieh tsu pên chi, Ti i*, c. i.

Mongol Period (1280 *to* 1368).—*Table VII.*

The Archbishop of Soltania (supposed to be the Dominican friar John de Cora), writing about 1330, says that "A good half of the realm [of Cathay] and its territory is water. And on these waters dwell great multitudes of people because of the vast population that there is in the said realm. They build wooden houses upon boats, and so their houses go up and down upon the waters; and the people go trafficking in their houses from one province to another, whilst they dwell in these houses with all their families, with their wives and children, and all their household utensils and necessaries. And so they live upon the waters all the days of their life. . . . And if you ask of those folk where they were born? they can reply nought else than that they were born upon the waters, as I have told you."—*Yule, Cathay*, p. 243.

[John de' Marignolli, who was in China in 1346, also says he had seen floating wooden houses, inhabited by "excellent craftsmen" with their families; but he places them on the Cara-Moran (*i.e.*, the Huang Ho), which he identifies with the river Pison of Gen. II., and confuses with the Yang Tzŭ, the Ganges, and the Volga! See *Yule, Cathay*, p. 350.]

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

"Their houses commonly be very gallant, . . . and generally at the doors and gates of them are planted trees in gallant order. . . . These houses are within as white as milk, in such sort that it seemeth to be burnished paper. The floors are paved with square stones, very broad and smooth; their ceilings are of an excellent kind of timber, very well wrought and painted, that it seemeth like damask, and is of the colour of gold. . . . Every one of them hath three courts and gardens, full of flowers and herbs for their recreation. And there is none of them but hath his fish-pool furnished, although it be but small. [On] one side of their court is [a kind of shelf or counter] upon the which they have many idols carved and wrought of divers kinds of metals; the other three [sides] are painted with divers things of very great curiositie. But above all things they are marvellous clean, not only in their houses, but also in their streets: in the which commonly they have three or four necessarie or common places of ease, very curiously ordained and placed for that the people . . . shall not foul the streets."—*Mendoza, Hist.*, i. 26–7.

"'The roads and waterways are lined with great numbers of villages and little hamlets of two or three hundred fires a-piece; woods and orange groves, plains of wheat, rice, beans, pease, millet, panic, barley, rye, flax, and cotton, and gardens and houses of pleasure' succeed each other."—*Pinto*, quot. *Simcox*, ii. 262.

Manchu Period (1644 *to* —).—*Table IX.*

"Dwelling-houses are generally of one story, having neither cellars nor basements, and lighted by lattices opening into a court; they must not equal adjacent temples in height, nor possess the ornaments appropriated to palaces and religious establishments. The common building materials are bricks, adobie, or matting for the walls, stone for the foundation, brick tiling for the roof, and wood only for the inner work; stone and wooden houses are not unknown, but are so rare as to attract attention. The high prices of timber and the very partial use of window-glass have both tended to modify and restrict the construction of dwellings. The *ni chuen*, or sifted earth, is a compound of decomposed granite or gravel and lime mixed with water, and sometimes a little oil, of which durable walls are made by pounding it into a solid mass between planks secured at the sides and elevated as the wall rises, or by beating it into large blocks; when stuccoed and protected from the rain this material gradually hardens into stone. In houses of the better sort the stone work of the foundation rises three or four feet above the ground, and sometimes the finished surfaces, great size of the stones and the regularity of their arrangement make one regret that the same skill had not been expended on large edifices. In towns their fronts present no opening except the door, and when the outer walls of several houses join those of gardens and enclosures, the street presents an uninteresting sameness, unrelieved by steps, windows, balconies, porticoes, or front yards. The walls are twenty-five or thirty feet high, usually hollow, or too thin to safely support the roof unaided. In the common buildings a framework of wood is erected on the foundation, which has large stones so arranged as to receive the posts, and on these rests the entire weight of the roof. The brick nogging fills up the intervals, but supports nothing; it is sometimes solid, more frequently merely a face-work, and if the roof becomes leaky or broken a heavy rain will destroy the wall, as it soaks through the courses and washes out the mud within. In the central provinces common walls are often made of small bricks four inches square and one thick, which are laid on their edges in a series of hollows; between the courses a plank sometimes adds greater strength to the wall. These cellular constructions are more durable than would be imagined provided the stucco remains uninjured."—*Williams, Midd. King.*, i. 727–8; see also p. 729; *Dudgeon, Diet, Dress, etc.*, pp. 187–8, 191, 197–8; *De Groot, Rel. Syst.*, ii. i. 373; *Chambers, Designs of Chinese Buildings*, p. 11; *Davis, Chinese*, i. 360; *Smith, Village Life*, pp. 22–29; and *Simcox*, ii. 381.

"The stonework of the foundation is extremely solid and handsome, and in the neighbourhood of Canton it is always of granite."—*Davis, Chinese*, i. 365.

"The walls are of blue brick, frequently with an artificial facing or pointing, by which strangers are apt to be deceived as to the fineness of their brickwork. They work in stucco with great skill, representing animals, flowers and fruits, which are sometimes coloured to imitate nature, and the cheapness of this ornament makes it very common."—*Ibid.* i. 365.

"Although Chinese houses [in the north] are [nearly all] of one story only and without cellars, good houses are always raised above the ground, or the courtyards are lowered to prevent the houses being inundated."—*Dudgeon, Diet, Dress, etc.*, pp. 197–8.

"In towns, where space is of consequence, the houses and shops of the greater number of the inhabitants have a story above the ground-floor, and on the roof is often erected a wooden stage or platform for drying goods, or for taking the air in hot evenings. This custom contributes to make their houses very liable to catch and to spread fires during a conflagration."—*Davis, Chinese*, i. 366.

"The Leou, or upper story, consists of several large halls . . . , that occupy the whole breadth of the house, and cover the apartments on the ground floor. These are occasionally converted into lodging-rooms for strangers. . . . In every house they have a provision of wooden leaves, or sliders, two or three feet broad, and ten or twelve feet long, which, when rooms are wanted, they fasten to the floor and ceiling, and in a few hours form any number of apartments. Some of these sliders are open from the top to within four feet of the flooring, and, instead of glass, the open part is filled with very thin oyster-shells, sufficiently transparent to admit the light."—*Chambers, Designs of Ch. Buildings*, p. 10.

"In one of these large halls, usually in that nearest to the gate of the house, is the portrait and altar . . . of the household idol, so placed as to be seen by those that enter. The rest of the second story is distributed into apartments . . . for the family; and over the shops are lodging-rooms for the shop keepers."—*Ibid.* pp. 10–11.

"The fronts of the Chinese houses, towards the street, are either entirely plain, or employed as shops: for they never have any other opening than the door to the street: before which they hang a mat, or place a screen . . . to prevent passengers from looking in."—*Ibid.* p. 11.

[For the *ying pi*, wall or screen in front of a door, see *Dudgeon, Diet, Dress, etc.*, pp. 204–5.]

"All houses of consequence are entered by a triple gateway, consisting of one large folding-door in the centre, and of a smaller one on either side. These last serve for ordinary occasions, while the first is thrown open for the reception of distinguished guests. Large lanterns of a cylindrical shape are hung at the sides, on which are inscribed the names and titles of the inhabitant of the mansion, so as to be read either by day, or at night when the lanterns are lit," for door-plates and numbers are unknown (*Williams, Midd. King.*, i. 731).—*Davis, Chinese*, i. 361.

"The door is solidly constructed, and moves upon pivots turning in sockets."—*Williams, Midd. King.*, i. 731.

"The roughness of the gate is somewhat concealed by the names or grotesque representations of two tutelar gods, Shintu and Yuhlui, to whom the guardianship of the house is entrusted; while the sides and lintel are embellished with felicitous quotations written upon red paper, or with sign-boards of official rank. The door-keeper and other servants lodge in small rooms within the gateway, and above the porch is an attic containing one or two apartments, to be reached by a rude stairway."—*Ibid.* i. 731–2.

"Just within the gates is the covered court, where the sedan-chairs stand, surrounded by red varnished label-boards, having inscribed in gilt characters the full titles of any person of rank and consequence."—*Davis, Chinese*, i. 361.

"The general disposition of a Chinese dwelling of the better sort is that of a series of rooms separated and lighted by intervening courts, and accessible along a covered corridor communicating with each, or by side passages leading through the courts. In cities, where the houses are cramped and the lots irregular in shape, there is more diversity in the arrangement and size of rooms; and in the country establishments of wealthy families, where the gradual increase of the members calls for additional space, the succession of courts and buildings, interspersed with gardens and pools, sometimes renders the whole not a little complicated."—*Williams, Midd. King.*, i. 731.

"Chinese houses are laid out in a series of courts, the better class having invariably a reception room, offices or male servants' quarters in houses on a line with the lane. This forms the outer court of the house, and which is first entered. The second court is entered by another gateway having verandahs running round it. In front, facing south, is the main house with its two east and west wings, each having a small private court of its own, and communicating through the verandah with the chief court, which has two east and west side houses. In courts to one or other side of these side and wing houses are the female servants' quarters and other offices. On the opposite side is placed the garden, with its rookeries, pavilions, wells, lakes, mountains, bridges, tanks with gold fish, smoking room, and library. In the best houses a large building is usually set apart for private theatrical representations. These are often exquisitely panelled, ornamented and painted. . . . Behind the main court is a third and possibly a fourth court devoted to the Ancestral Hall, where the family gods are worshipped. The parents occupy the main house, the little children with their nurses the wings; the married sons and their families the side houses; old retainers are placed behind. If the aged mother be alive she is assigned quarters in one of the side houses. The entrance to the main court in still higher classed houses is through rooms devoted to the reception of guests. The back verandahs of all the houses are taken into the houses. . . . The inner verandahs are left for the use of the family and the comfort of the house. In wet weather they afford the means of communication between the different houses, for there is no internal connection between the main and side houses and reception-rooms. In summer they keep the rooms cool, and afford a place under cover for cooking and sleeping. The number of compartments in the verandahs is reckoned among the number of apartments of a house. The houses of the poor have no such verandahs."—*Dudgeon, Diet, Dress, etc.*, pp. 202–3. See also *Chambers, Designs of Ch. Buildings*, p. 8.

"Several families occupy a courtyard and enter by a small doorway on the street or lane. . . . The poorest people are content with one *chien* or compartment. Higher in the scale the court arrangement obtains, and several families may occupy such a house, the centre apartment being invariably devoted to the family altar, having a Buddhist shrine and family genealogical table, with red candles, fruit and incense burner, and mock ingot paper. . . . The two side compartments of the main house are used as sleeping quarters. No brick partitions exist as with us. The poor people have reeds papered resting on a piece of brick wall; the higher classes have handsomely carved and decorated wooden panellings. Such partitions, it is evident, contribute to the ventilation of the various rooms and the distribution of heat. There is thus no thorough separation of the various rooms."—*Dudgeon, Diet, Dress, etc.*, pp. 203–4.

"The partition-walls of the inner courts are frequently broken into compartments, which are filled with an open work of green varnished tile, or coarse porcelain."—*Davis, Chinese*, i. 365–6.

"Some of the houses have flat roofs with balustrading, which permits of access to the roofs either for drying and sunning purposes, and sometimes in the country for the drying of grain and fruit, where it is safe from thieves. In the country the houses generally are of mud or sun-dried bricks, with roofs of mud mixed with broken wheaten straw, or millet stalks covered with mud. Those of the better sort are roofed with slate or tile, in whole or in part, and built of stone with brick facings for the doors, windows and gable ends. Imperial buildings are roofed with yellow glazed tiles."—*Dudgeon, Diet, Dress, etc.*, p. 190.

"The roofs are covered with flat and semi-cylindrical tiles, the latter being placed over the joints of the former [see *Chambers*, Plate xii.]. . . . Like the Goths, they always leave the timber work of the roof exposed within side, and often make both it, and the columns that support it, of precious woods; sometimes enriching them with ornaments of inlaid ivory, brass, and mother of pearl."—*Chambers, Designs of Ch. Buildings*, p. 11. The mode of tiling is "derived from the use of split bamboos for the same purpose, as it is practised to this day by the Malays."—*Davis, Chinese*, i. 366. For a full description of roof-construction see *Williams, Midd. King.*, i. 729–30.

"The pillars of stone or timber in Chinese temples are often noticeable, owing to their size or length as single pieces. They are, however, unadorned with either capital or carved base, though the shaft may be finely carved and painted, the colour-decoration being often upon a thick coating of *papier mâché*, laid on to protect the wood. In two-story houses the sleepers of the floor are supported on tie-beams attached to the main posts, if they do not rest on the wall. Posts form an element of all Chinese buildings, either to support the roof or the verandah. The entrance is on the sides, and the wall is set back from the outer line of the eaves so as to afford a shelter or porch. Hipped roofs enable the architect to encompass the entire building with a verandah, this being a common arrangement in the

southern provinces. A slight ceiling usually conceals the tiling, but the apartment appears lofty owing to the cavity of the roof."—*Ibid.* i. 730.

"The ceilings of the palaces are richly panelled and ornamented, and, owing to the absence of an upper story, the rooms are built of a lofty character. The ceilings of the inferior houses are made of reeds, and papered. To husband the heat and render warming easy and inexpensive, the ceilings among the lower classes are placed low."—*Dudgeon, Diet, Dress, etc.*, p. 192.

"Handsome horn lanterns or frames filled in with gauze beautifully painted . . . into which candles are fixed, are suspended from the ceilings of the best houses."—*Ibid.* p. 204.

Among the poor, "the walls are lime plastered and white-washed; among the better classes . . . papered."—*Ibid.* p. 204.

"The floors of Chinese houses, where they are not of earth, as in the case of all those of the poorer classes in town and country, are laid with large square bricks, sometimes glazed or made of marble. Boarding is not known, and wood is too expensive to be thus employed. Moreover, with the warm fur and cotton wadded garments and thick soled boots and shoes, the want of wood floors is not felt."—*Ibid.* p. 190.

"The principal room, next to the entrance, serves to receive visitors as well as for eating: and within are the more private apartments, the doorways of which are screened by pendent curtains of silk or cotton."—*Davis, Chinese*, i. 360.

"Houses always consist of an odd number of compartments—one, three, five, or seven. The centre apartments are always slightly broader than the side or end ones. In summer over the court or courts is erected a mat awning as a protection from the sun. . . . These covered courts in summer form a part of the house. . . . These awnings are so constructed as to permit of the roof being closed entirely by day and of being drawn back at night. In the poor houses a single straw mat is stretched on poles across the window, or hung between the pillars of the verandah if they have such. These awnings sometimes cover the roof of the house. . . . In the narrow streets of Southern Chinese towns, mats or cotton awnings stretch from side to side, forming a sort of shaded gallery, piazza, or arcade along the whole street."—*Dudgeon, Diet, Dress, etc.*, p. 204.

"The large room or saloon . . . is commonly from eighteen to twenty-four feet deep, and about twenty broad. The side towards the court . . . is entirely open; having only a cane-mat, which lets down occasionally to keep out rain or sun-shine. It is paved with flags of stone or marble, of different colours: the side-walls are matted about three or four feet upwards from the pavement; the rest being neatly covered, either with white, crimson, or gilt paper: and instead of pictures they hang on them long pieces of satin or paper, stretched on frames, and painted in imitation of marble, or bambou, on which are written, in azure characters, moral sentences and proverbs, extracted from the works of their philosophers. Sometimes, too, they have pieces of plain white paper, with large characters pencilled in Indian ink by some celebrated hand, which they esteem vastly. The bottom or further end of the room is entirely composed of folding doors, the upper parts of which are of lattice-work, covered with painted gauze, which admits light into the bed-room. The doors are neatly made of wood; have several characters and figures on them, and are sometimes richly varnished, in red, blue, yellow, and other colours."—*Chambers, Designs of Ch. Buildings*, pp. 8–9.

"The bed-room . . . is divided from the saloon only by a partition of folding doors . . . which, when the weather is hot, are in the night thrown open to admit the air. It is very small, and contains no other furniture than the bed, and some varnished chests, in which they keep their apparel. The beds are sometimes very magnificent; the bedsteads made much like ours in Europe, of rose-wood carved, or lacquered work; the curtains are of taffeta, or of gauze; sometimes flowered with gold, and commonly either blue or purple. About the top a flip of white satin, a foot in breadth, runs all round; on which are painted, in panels of different figures, flower-pieces, landscapes, and conversation-pieces, interspersed with moral sentences and fables, written in Indian ink and vermilion."—*Ibid.* p. 10.

"A passage on the side of the bed-room leads to the study . . . , which is always closed on every side with walls, and lighted with windows. The walls are hung with moral sentences, as in the saloon, and antique paintings: the moveables consist of elbow-chairs, couches, and tables: there are several shelves filled with books, and on a table, near the window, are placed in great order pencils and other implements for writing, the instruments which the Chinese use in arithmetical computations, and some choice books."—*Ibid.* p. 10.

"Besides these apartments, the ground-floor contains the dining-hall . . . , the kitchen . . . , the couli's or servant's room . . . , the bath . . . , the necessary-house . . . , the offices or compting-houses . . . , and towards the street the shops."—*Ibid.* p. 10.

"The rear rooms are lighted by skylights when other modes are unavailable, and along the southern sea-coasts the thin laminæ of a species of oyster (*Placuna*) cut into small squares supply the place of window-glass. Commerce is gradually bringing this material into greater use all over the land, though the fear of thieves still limits it. Corean paper is the chief substitute for glass in the north."—*Williams, Midd. King.*, i. 732.

"No contrivance for warming the rooms by means of chimneys or flues exists, except that found in the *kang*, or brick bed, on which the inmates lie and sit."—*Ibid.* i. 731.

In the north, most of the apartments were "furnished with a couch or bed-place of brickwork, having a furnace below to warm it during the winter. This was usually covered with a felt rug or mat which, with the assistance of the warmth, gave perpetual lodging to swarms of vermin, and rendered the bed-places quite unavailable to the English travellers. These flues, however, are very necessary during the severe winters, when the fires in the better houses are lit on the outside; but in poorer ones the furnace is within, and serves the double purpose of cooking and warmth, the whole family huddling round it."—*Davis, Chinese*, i. 360–1.

"During the day the k'ang is turned into a sort of drawing or dining room or lounge, the rolled-up bedding forming an agreeable pillow." "Not only the bed but the floors of the best houses have often similar flues arranged under them, with a double layer of large square bricks, which keep the rooms, walls, and floors, constantly dry and warm." "In Mid and South China these earthen k'angs do not exist, their place being taken by wooded beds, which are not unfrequently so large as to constitute alone a kind of room, with compartments and panels, ornamented with painted gauze and silk, and very costly."—*Dudgeon, Diet, Dress, etc.*, pp. 193–6.

"In the best Chinese mansions there are seldom any stairs beyond the few stone steps by which they are raised above the general level of the ground."—*Davis, Chinese*, i. 365.

"The apartments of the Chinese are by no means so full of furniture as ours in England, and in this respect they have reached a point of luxury far short of our own." Chairs were uncomfortable; cushions rare. "Near the chairs are commonly placed those articles of furniture which the Portuguese call *cuspidores* or spitting-pots, rendered necessary by the universal habit of smoking." "A very usual ornament of dwellings consists in vases and jars" of porcelain. Rooms were perfumed by incense-sticks stuck in tripods, jars, etc.—*Ibid.* i. 368–70. For furniture see IMPLEMENTS.

The "palace was built on the general model of the dwellings of great mandarins."—*Staunton, Embassy*, ii. 139. For description see *ibid.* p. 139 *et seq.*

"The houses of the poor are dark, dirty, low, and narrow tenements, where the floor is of earth covered with mats or tiled, and the doorway the only opening, on which a swinging mat conceals the interior. The whole family often sleep, eat, and live in a single room. Pigs, dogs, and hens dispute the space with children and furniture—if a table and a few trestles and stools, pots and plates, deserve that name. The filthy street without is a counterpart to the gloomy, smoky abode within, and a single walk through the streets and lanes of such a neighbourhood is sufficient to reconcile a person to any ordinary condition of life. On the outskirts of the town a still poorer class take up with huts made of mats and thatch upon the ground, through which the rain and wind find free course. It is surprising that people can live and enjoy health, and even be cheerful, as the Chinese are, in such circumstances. Between these hovels and the abodes of the rich is a class of middle houses, consisting of three or four small rooms surrounding a court, each one lodging a family, which uses its portion of the quadrangle."—*Williams, Midd. King.*, i. 733–4.

"The bedrooms [in these houses] are small, poorly ventilated, and seldom visited except at night."—*Ibid.* i. 734.

"As a rule, gardens in China are not contiguous to, or in any way connected with, the houses of those to whom they belong. Situated beyond the precincts of the city, they are often a mile or two distant from the homes of the proprietors. (This remark applies only to gardens properly so called; for trees and flowers are not unfrequently found in the courtyards of the residences of Chinese gentlemen.)"—*Gray, China*, ii. 196. See also *Dudgeon' Diet, Dress, etc.*, pp. 202–3.

"The pavilion is a prominent feature of Chinese architecture, and its ornamentation calls out the best talent of the builder in making his edifice acceptable."—*Williams, Midd. King.*, i. 730.

"The silk towns in the province of Kwang-tung are very neat and clean, and in many respects different from others throughout the empire. Excepting those parts of the silk towns which are especially set apart for marketing, each house is detached and stands in its own mulberry plantation; partly, I suppose, because they are in consequence removed from noises and bad smells. The houses are generally large, and invariably built of bricks. The pathways which conduct the traveller from one silk town to another are well paved."—*Gray, China*, ii. 228.

"The country establishments of wealthy men furnish the best expression of Chinese ideas of elegance and comfort. In these enclosures the hall of ancestors, library, school-room, and summer-houses are detached and erected upon low plinths, surrounded by a verandah, and frequently decorated with tracery and ornamental carving. Near the rear court are the female apartments and offices, many of the former and the sleeping apartments being in attics. Considerable space is occupied by the quadrangles, which are paved and embellished by fish-pools, flowering shrubs, and other plants."—*Williams, Midd. King.*, i. 733. For detailed description of a country-house see *ibid.* i. 731–3.

"The magnificence of Chinese mansions is estimated in some measure by the ground which they cover, and by the number and size of the courts and buildings. The real space is often eked out by winding and complicated passages or galleries, decorated with carving and trellis-work in very good taste. The walks are often paved with figured tiles. Large tanks or ponds, with the nelumbium, or sacred lotus, are essential to every country-house, and these pools are generally filled with quantities of the golden carp, and other fish. Masses of artificial rock either rise out of the water, or are strewn about the grounds, in an affected imitation of nature, and on these are often planted their stunted trees."—*Davis, Chinese*, i. 367.

"Houses are rented on short leases, and the rent collected quarterly in advance. . . . The yearly rent of the best shops in Canton is from $150 to $400."—*Williams, Midd. King.*, i. 739.

[For arrangement of shops and warehouses see *ibid.* i. 736.]

"All the main dwellings of the Chinese face the south. Houses with street entrance facing the north are constructed to have the front entrance of the dwelling-house on the south."—*Dudgeon, Diet, Dress, etc.*, p. 200.

"The narrowness of the streets in Chinese cities is a source of many inconveniences; few exceed ten or twelve feet in width, and most of those in Canton are less than eight. No large squares having fountains and shrubbery nor any open spaces except the areas in front of temples relieve the closeness of these lanes. . . . At all times porters carrying burdens are impeded by the crowd of passengers, who likewise must pass Indian file lest they tilt against the porters. Ventilation is imperfect where the buildings are packed so closely, and the public necessaries and their offal carried through the streets by the scavengers pollute the air. Drainage is very superficial and incomplete; the sewers easily choke up or get broken and exude their contents over the pathway."—*Williams, Midd. King.*, i. 737.

"The streets are usually paved with slabs of stone laid cross-wise, and except near markets and walls are comparatively clean. They are not laid out straight, and some present a singularly irregular appearance from the slight angle which each house makes with its neighbours; it being considered rather unlucky to have them exactly even. The names of the streets are written on the gateways crossing them, whenever they are marked at all; occasionally, as at Canton, each division makes a separate neighbourhood and has its own name; a single long street will thus have five, six, or more names. The general arrangement of a Chinese city presents a labyrinth of streets, alleys, and byways very perplexing to a stranger who has neither plan nor directory to guide him, nor numbers upon the houses and shops to direct him. The sign-boards are hung each side of the door, or securely inserted in stone sockets; some of them are ten or fifteen feet high, and being gaily painted and gilded on both sides with picturesque characters, a succession of them as seen down a street produces a gay effect. . . . The edicts of government, handbills of medicines and the famous doctors who make them, notices offering rewards for children who are lost or slaves escaped, new shops opened, houses to let, or other events, cover blank walls in great variety, printed on red, black, white or yellow paper. . . . The shrines of the street gods occur in southern cities, located in niches in the wall, with altars before them."—*Ibid.* i. 738. See also *Dudgeon, Diet, Dress, etc.*, p. 199.

"On visiting native cities . . . one is filled with amazement at the state of filth in which the people live, and not only live, but thrive. The streets are narrow and never cleansed; the common sewer lies beneath the flagstones, and through the interstices between the stones can be seen the black, stinking slush in the sewer. The sewerage is not confined in a well-laid cemented drain, but it soaks through the loosely laid, uncemented stones, and thoroughly saturates the ground on which the tumble-down, over-crowded houses are built. Night soil is allowed to remain in wooden buckets inside the houses awaiting collection by the soil merchant, who sells it to the market gardener and the farmer. Urine is accumulated in earthenware jars, and is similarly disposed of. The houses are rarely swept and cleaned, hardly ever repaired. In every corner are filth and rubbish. And yet, in such circumstances—in which the sanitarian could inevitably prophecy typhus and typhoid—the population seems to thrive."—*Manson, Tropical Diseases*, p. 223.

"Streets in the north present a somewhat different, and on the whole less inviting because less entertaining and picturesque, aspect. Their greater width allows carts to pass, and it also offers more room for the garbage, the rubbish, and the noisome sights that are most disgusting, all of which are made worse in rainy weather by the mud through which one flounders."—*Williams, Midd. King.*, i. 741.

"The temples and assembly-halls are the only public buildings in Chinese cities belonging to the people. Their courts and cloisters, with such gardens, tea-houses, and pools as may be accessible, attract constant crowds, and furnish the only places of common resort. The priests derive no small portion of their income from travellers, and their establishments are consequently made more commodious and extensive than the number of priests or the throng of worshippers require."—*Ibid.* i. 738–9.

Williams comments on the "dull appearance of a Chinese city . . . when seen from a distance. . . . Temples, houses, and palaces are nearly of one height; their sameness being only partially relieved by trees mingled with pairs of tall flag-staffs with frames near their tops, which at a distance rather suggest the idea of dismantled gallows."—*Ibid.* i. 746.

"Only a part of the fleets of boats seen on the river at Canton are intended for transportation, a large number being designed for fixed residences, and perhaps half of them are permanently moored. They are not obliged to remain where they station themselves, but the boats and their inmates are both under the supervision of a water police, who register them and point out the position they may occupy. Barges for families, those in which oil, salt, fuel, or other articles are sold, lighters, passage boats, flower-boats, and other kinds, are by this means grouped together, and more easily found."—*Ibid.* i. 749.

"The internal arrangement of dwelling-boats is simple. The better sort are from sixty to eighty feet long, and about fifteen feet wide, divided into three rooms; the stem is sharp, and upholds a platform on which, when they are moored alongside, it is easy to pass from one boat to another. Each one is secured by ropes to large hawsers which run along the whole line at the bow and stern. The room nearest the bow serves for a lobby to the principal apartment, which occupies about half the body of the boat; the two are separated by trellis bulkheads, but the sternmost room, or sleeping apartment, is carefully screened. Cooking and washing are performed on a high stern framework, which is admirably contrived, by means of furnaces and other conveniences above and hatches and partitions below deck, to serve all these purposes, contain all the fuel and water necessary, and answer for a sleeping-place as well. By means of awnings and frameworks the top of the boat also subserves many objects of work or pleasure. The window-shutters are movable, fitted for all kinds of weather and for flexibility of arrangement, meeting all the demands of a family and the particular service of a vessel; nothing can be more ingenious."—*Ibid.* i. 750.

"The handsomest of these craft are called *hwa ting*, or flower-boats. . . . The smaller sorts at Canton are generally known as *tankia* boats; they are about twenty-five feet long, contain only one room, and are fitted with movable mats to cover the whole vessel; they are usually rowed by women. In these 'egg-houses' whole families are reared, live, and die; the room which serves for passengers by day is a bedroom by night; a kitchen at one time, a washroom at another, and a nursery always."—*Ibid.* i. 750–1.

"When their boats become unseaworthy they are still considered landworthy, and are transformed into houses by setting them bodily upon a stone foundation above the reach of the tide, or breaking them up to construct rude huts."—*Ibid.* ii. 16.

"Cave-dwellings still exist as abodes for millions of people. This is well known from the descriptions given by travellers, especially from those supplied by Dr. Von Richthofen (*China*, I. ch. 2)."—*De Groot, Rel. Syst.*, ii. i. 372.

"In Richthofen's *China* there is a picture of [cave] houses in five stories one above another, all of them having arched windows and doors. There is an outside staircase connecting the houses of each story. On the opposite page is another front of a house hollowed out of a loess bank. It is fenced by a low wall on the outside. This house . . . communicates with the outside simply by three windows and a door."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 261–2. *Cf.* EARLY FEUDAL PERIOD.

[For superstitions regarding the height, situation, etc., of dwellings, see REL. IDEAS.]

F O O D.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

Animal and Vegetable.—"The peoples of the earliest times ate when they were hungry and threw away the remainder when they had had enough. They ate unskinned flesh and drank blood."—*Fu Hsi shih chi, Kang chien i chih lu*, c. 1, p. 1.

"In ancient times they had no fire. The people ate wild fruits and the flesh of birds and animals."—*Shên Ming shih chi, ibid.* c. i. p. 2.

"In ancient times the people had no cooked rice."—*Huang Ti pên chi, Tsêng chu jên wu lei tien, Yin shih lei*, c. 36, p. 3.

[Yü and Ch'i showed the people how to procure grain as food in addition to flesh meat.]—*Shu ching*, Pt. II. Bk. IV. ch. i. i. ; *Legge, Ch. Class.*, III. i. 77-8.

"When Yao ruled over the empire he ate coarse rice with herb soup."—*Shih chi, Ko chih ching yüan*, c. 24, *Yin shih lei*, p. 10*b*.

"The Emperor Shun said: 'My people [*lit.*, the ploughers; incorrectly, the black-haired people] hunger. You, Hou Chi, must sow the 100 kinds of grain in their seasons.'"—*Shun tien*, c. 1, p. 4.

"Mencius said: 'The Emperor Shun ate cooked rice and masticated herbs.'"—*Hsia Mêng*, c. 6, p. 20.

"I Yin says: 'The best kind of cooked rice was [made from] the corn of Mount Yüan or the grain of the Southern Sea.'"—*Hsü shih shuo wên, Shih lei t'ung pien, Yin shih lei*, c. 23, p. 2*a*.

[The absence of rice in the earliest times (see AGRICULTURE) and the statement given above that there was no cooked rice, seem to indicate that a grain of a different kind to the rice afterwards commonly in use is referred to. But some of the references seem to indicate that rice was in use as food before the end of the Period.]

"P'êng Ch'ien, also known as P'êng Tsu, was skilful in spicing food and in cooking pheasant soup, which he used to serve to the Emperor Yao."—*Wang i chu, Ko chih ching yüan*, c. 24, *Yin shih lei*, p. 11*a*. See also *Ch'u tz'ŭ, Shih lei t'ung pien, Yin shih lei*, c. 23, p. 6.

"When I Yin was first appointed an officer he made wild-goose soup and offered it to the Emperor T'ang in an ornamented three-legged jade dish."—*Tz'ŭ lin hai ts'o, Shih lei t'ung pien*, c. 23, p. 7.

"When King Chou ruled over the empire, he ordered his cook to boil some wild-boar soup, which being not properly done, he killed the cook."—*Liu hsiang hsin hsü, Ko chih ching yüan, Yin shih lei*, c. 24, p. 11*a*.

"*Chi* (齏), seasoned vegetables, was made by putting vegetables in rice spirit."—*Shih wu kan chu, ibid.* c. 24, *Yin shih lei*, p. 13*b*.

"The *Records of Chou* says: 'When Yi Yin was appointed [to be Prime Minister] by T'ang, the latter bestowed upon him cuttle-fish condiment.'"—*Pei t'ang shu ch'ao, ibid.* c. 23, *Yin shih lei*, p. 7*b*.

["Bears' paws and leopards' wombs" are referred to as amongst the "extravagances" which Chou Hsin, the tyrant emperor, would demand.]—*Legge, Ch. Class.*, III. i. 269, note.

Beverages.—["Spirits of the black millet mixed with odoriferous herbs" are mentioned in the *Shu ching*, Pref., 65.]

"Rice-wine was discovered, according to the majority of authors, in the time of Yü."—*Gaubil*, quot. *Legge, Ch. Class.*, iii. ii. 399, note. According to King Ch'êng's "Announcement about Drunkenness" (*Shu ching*, Pt. V. Bk. X.), in the days of early simplicity and virtue, spirits were not used except at the great sacrifices.

"The daughter of the Emperor [Yü] ordered I Ti to brew some wine, which was found to be nice, and she (or he) offered it to Yü, who drank it, but found it sweet, so discharged I Ti, and abstained from good (or fine) wines."—*Chan kuo ts'ê, Shih lei t'ung pien*, c. 23, p. 15.

"I Ti first made wine by using the five spices. After that Shao K'ang [also] made wine of black grain."—*Shih pên, ibid.* c. 23, p. 16.

"P'ing Yüan-chün forced Tzŭ Kao to take wine, saying: 'In the *Proverbs* it says: Yao could drink a thousand *ch'ing* (goblets) of wine; Confucius could drink one hundred *ku* (goblets of 2 to 3 pints' capacity) of wine; and Tzŭ-lo, though loquacious, could still drink one hundred *ho* (wine jars) of wine. The sages of old all could take their drinks—why should you be an exception?'"—*K'ung Ts'ung Tzŭ, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 6*b*.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Animal and Vegetable.—[The stomach and palate of animals were specially esteemed (*Shih ching*, III. ii. II. 2); a preference which is still common, as may be seen in the description which Gerbillon gives of a hunt by K'ang Hsi (*Du Halde*, IV. 293, fol. ed.). The habit of eating the dog was very common in China according to the *Chou li, passim*, and the *Li chi*, VI. v. 5. In two passages Mencius (I. Pt. i. III. 4[8], VII. 24) notices the raising of dogs and pigs for food. Fowls, geese and ducks were eaten. Beef and mutton were placed only on the tables of chiefs and dignitaries who possessed large herds and flocks (*Shih ching*, II. i. V. 2; III. ii. III.). At great feasts eight different dishes of grain were set forth (II. i. V. 2). The turtle was considered a dainty dish (III. iii. VII. 3). The vegetable garden of every husbandman furnished him with cucumbers, pumpkins, and melons (I. xv. I. 6; II. vi. VI. 4). They ate also jujube-dates, which they struck down in the eighth moon, *i.e.*, about end of July (I. xv. I. 6). At the same time they cut down the large pumpkins. The cucumbers, melons, and the leaves of the *k'uei* were eaten in the seventh moon (I. xv. I. 6). They ate habitually the tender shoots of the bamboo (III. iii. VII. 3).]

"Roasted grain and other provisions" are mentioned in the *Shu ching*, Pt. V. Bk. XXIX. 5.

"The common people eat domestic animals, such as the fowl, pig, dog, and sow. A whole one might be taken at a meal."—*Huai-nan Tzŭ, Tsêng chu Jên wu lei tien, Yin shih lei*, c. 36, p. 1*b*.

"The flesh of the ox, sheep, and pig were cooked with flour. They were cut into small pieces and combined with grain, *i.e.*, 2 parts of grain to 1 of flesh were mixed so as to form a solid mass like a cake, which was then boiled."—*Li nei tsê, Yüan chien lei han, Shih wu pu*, c. 389, p. 7*a*.

"In spring they made *kuei* (膾), hashed meat, by using onions; and in autumn, [by using] the mustard plant. Meat or fish cut into small pieces was called *kuei* and into large pieces *hsien* (軒)."—*Nei tsê, ibid.* c. 24, p. 4*b*.

"Raw meat was called *hsien* (羶), and dried meat *k'ao* (薨)."—*Chou li chu, ibid.* c. 24, *Yin shih lei*, p. 1*a*.

"Meat cut and dried was called *fu* (脯): if dried whole it was called *la* (腊). The *fu* was placed in a bamboo basket, and the *la* in a basin. In sacrificing, the *fu* was often served before the minced pickles, whilst the *la* came after the fish."—*Li shu, ibid.* c. 24, p. 3*a*.

"The dried meat maker was in charge of dried meat; and the *fu* (脯) and *la* (腊) of animals hunted in the fields. The Commentary says: 'All animals hunted in the fields, whether birds or beasts, were dried whole without being cut into slices.' The Explanation says: 'The word *la* means evening, as it was put in the sun in the morning and dried by the evening.'"—*Chou li, ibid.* c. 24, p. 4*b*.

"*Ch'i* (肵) was the flesh on the roof of the pig's mouth."—*Shih chuan, ibid.* c. 24. *Yin shih lei*, p. 1*a*.

"The lips of the *hsing-hsing* [monkey] and the [hind] feet of the badger were considered delicacies."—*Lü shih Ch'un ch'iu, Shih lei t'ung pien, Yin shih lei*, c. 23, p. 6*a*.

"Fat flesh and strong wine . . . were called the food which damages the intestines."—*Ibid., Yüan chien lei han, Shih wu pu*, c. 389, p. 23*b*.

"At 60 years of age people cannot eat to repletion without [including] meat [in their diet]."—*Li chi, ibid.* p. 29*a*.

"The cock's liver, the wild goose's kidneys, the bustard's tripe, and the deer's stomach cannot be eaten by men, for they all are injurious."—*Li chi chu, ibid.* c. 388, *Shih wu pu*, p. 23*b*.

"In eating the wolf, one should reject the bowels; the wild cat, the spine; the hare, the lower end of the spine; the fox, the head; the pig, the brain; fish, the bone of the gills; turtle, the passages of its body. In Chêng's Commentary it says: 'Because they are injurious to man.'"—*Nei tsê, Ko chih ching yüan*, c. 21, *Yin shih lei*, p. 3*b*.

"The people ate the goose, but they discarded the flesh of its tail, and also ate the duck in the same manner."—*Nei tsê, Tsêng chu Jên wu lei tien, Yin shih lei*, c. 37, p. 4*a*.

"The King of Ch'i when he eat fowls, eat the feet (or toes) [and had to eat] several thousands before he was satisfied."—*Lü Shih Ch'un ch'iu, Shih lei t'ung pien, Yin shih lei*, c. 23, p. 6*a*.

"Ho-lu [Wang] once had a desire for sea-fish, but could not obtain any alive. So he sent a man to the sea-coast to salt some fish and dry it in the sun—hence it was called dried fish (鯊)."—*Yen fan lu, Ko chih ching yüan*, c. 26, *Yin shih lei*, p. 6*b*.

"Cuttle-fish salted and dried was called *ming hsiang* (明 𩽾), and if dried without being salted *fu* (脯) *hsiang*."—*Mu ts'ao, ibid.* p. 6*b*.

"*Cha* (鮓) was fish preserved with salt and boiled rice. It was [first] made by Shou Mêng of the Wu state."—*Shih wu kan chu, ibid.* c. 24, p. 8*a*.

[The introduction of *kuei* (see *suprâ*), hashed fish or meat, into Wu is attributed to Ho-Lu.]—*Wu Yüeh Ch'un ch'iu, ibid.* c. 24, p. 5*a*.

"In the *Commentary on the Cook* in the *Book of Rites* it says: 'Such as the *hsieh hsü* (蟹 胥), crab *hsü*, of Ch'ing Chou.' The *Shuo Wên* says: '*Hsü* was mince-meat made of crab.'"—*Shu wu i ming su, ibid.* c. 26, *Yin shih lei*, p. 7*b*.

"Young *pieh*, turtle, were not eaten during the sucking period, as that would be injurious [to the eater]."—*Li chi chu, Ku hsiang chai Yüan chien lei han*, c. 388, *Yin shih lei*, p. 15*b*.

[Dried or salted fish (鮑 *pao*) is mentioned in *Ku i hsin shu, ibid.* c. 388, *Shih wu pu*, p. 23*b*.]

"At any of the four seasons viands may be prepared for food, including the *cha yü* (edible *acalepha*) of Ching Chou."—*Chou li P'ao jên chu, Shih lei t'ung pien, Yin shih lei*, c. 23, p. 11*a*.

[Soups with and without vegetables in them are mentioned in *Li chi, Ko chih ching yüan*, c. 24, *Yin shih lei*, p. 10*a*.]

[*Chou* (粥), congee, is mentioned in *T'ai kung chin kuei, Shih lei t'ung pien, Yin shih lei*, c. 23, p. 9*b*.]

"Meat mixed with spices was called soup, which was sometimes made of pheasant or hare, or of fowl, dog, or quail."—*Nei tsê, Tsêng chu Jên wu lei tien, Yin shih lei*, c. 36, p. 4*b*.

"Hua Pên, a native of Chiang Pei, was fond of turtle soup (鼈 肉羹 *pieh ho*)."—*Ch'i hsieh chi, Ko chih ching yüan*, c. 26, *Yin shih lei*, p. 7*a*.

[Cooked rice is mentioned in *Ch'un ch'iu shuo t'i tz'ŭ, Shih lei t'ung pien, Yin shih lei*, c. 23, p. 5*b*.]

"In the middle month of winter rice boiled to the consistence of gruel was used to nourish the aged and weak."—*Li chi, ibid.* p. 9*b*.

"When Yen Ying was Prime Minister of the Ch'i State he eat husked grain."—*Yen Tzŭ Ch'un ch'iu, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 29*b*.

"The Imperial Cook was in charge of the preparation of meals for the king; he used 6 kinds of grain."—*Chou li, ibid.* p. 28*b*. See also *Chou li kuan chu, Gingell*, pp. 9-13.

"In the middle of autumn people ate hemp seeds, using dog's flesh as a digestive; in the latter part of autumn they ate grain, also using the flesh of the dog."—*Li chi, Tsêng chu Jên wu lei tien, Yin shih lei*, c. 37, p. 8*a*.

"The natives of Huai Nan preserved crabs with salt and wine. Into each vessel containing several tens of them they put half a piece of *tsao chia* (皁 莢), a tree whose seeds are used for dye. It could be kept for a year without changing its sweet flavour."—*Kuei t'ien lu, Ko chih ching yüan*, c. 26, *Yin shih lei*, p. 7*b*.

"'Peach *chu* (桋) and plum *chu*.' The Commentary says: '*Chu* means to pickle: the peach and plum could be pickled and preserved until they were dried up.'"—*Nei tsê, ibid.* c. 24, *Yin shih lei*, p. 14*a*.

[I Ya used 5 kinds of spice in preparing food for Duke Huan.]—*Chan kuo ts'ê, Shih lei t'ung pien, Yin shih lei*, c. 23, p. 6*b*.

"In the chapter *Tien Yüan* [of the *Chou li*, there occur the words]: 'The *hsiu* (脩) meat of the Court Butler.' The Commentary says: 'Meat seasoned with ginger and cinnamon and dried was called *hsiu*, and meat not seasoned with ginger or cinnamon, but salted and dried only, was called *fu* (脯), preserved meat.'"—*Chou li, Ko chih ching yüan*, c. 24, p. 2*b*.

[Condiments of 3 prices are referred to in *Fan Tzŭ chi jan, ibid.* c. 23, *Yin shih lei*, p. 7*a*.]

"The imperial cook was in charge of the royal food or viands, amongst which were one hundred and twenty bottles of condiment."—*Chou li, ibid.* p. 7*a*.

"Salt is of two kinds: one got from pools, called *ku* (鹽) salt; the other boiled down from sea or well water, and called *san* (散) salt."—*Chou kuan, Tsêng chu Jên wu lei tien, Yin shih lei*, c. 36, p. 5*b*.

"Salt called *hsien ts'o* (鹹 鹺). Chêng's Commentary says: 'The large kind of *hsien* was called *ts'o*; it was salt with a strong taste.'"—*Li chi, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 1*a*.

[Roast flesh, spiced with pepper and eaten with pickles, is referred to in *Chou kuan, Tsêng chu Jên wu lei tien, Yin shih lei*, c. 36, p. 5*b*.]

"The ox, sheep, deer, and wild deer are all delicious eating, but though they may nourish our bodies they may also foul the breath: so that ginger and cassia must be taken to spice the food."—*T'an kung, ibid.* p. 5*b*.

"The people of Wu were skilful in making soup. They spiced it with sweet or sour pickles; it always first tasted bitter and then sweet."—*Ch'u tz'ŭ, Yüan chien lei han, Shih wu pu*, c. 390, p. 25*a*.

"Tzŭ T'ai-shu once told Chao Chien-tzŭ as follows: 'For the 6 domestic animals (horse, cow, sheep, fowl, dog, and swine) 5 *shêng* (stag, deer, elk, wolf, and hare) and 3 sacrificial meats, the 5 flavours should be served."—*Tso chuan, Ko chih ching yüan*, c. 21, *Yin shih lei*, p. 2*a*.

"The sage regarded eating as one of the 'precious things,' so virtuous kings established the law of eating and drinking whereby to strengthen the weak and preserve robustness, make the body strong and the senses sagacious; but he did not care about seasoning [with] the five flavours or spices nor care to bring delicate or strange foods from far-off countries."—*Mi Tzŭ, ibid.* p. 1*a*.

"*Shui i* (水 醷) was apricot syrup. In the *Li chi*, under the heading *Nei tsê*, the words *shui i* are mentioned."—*Yang Chên wai chi, ibid.* c. 22, *Yin shih lei*, p. 25*a*.

"All kinds of fruit, such as the prune, almond, *ch'a* (a red fruit like the prune), and pear, are pleasant to the taste, but they cannot make people wise."—*Jên wu lei tien, Yin shih lei*, c. 36, p. 5*b*.

"In the second moon people picked the *fan* (蘩) plant (white southern-wood); in the 5th they boiled the prune, and in the 6th the peach."—*Hsia hsiao chêng, Tsêng chu Jên wu lei tien, Yin shih lei*, c. 36, p. 2*a*.

"The 'sesamum lump' (麻 團 *ma t'uan*) was made by Kung Liu, and the 'soup lump' (湯 團 *t'ang t'uan*) by Chou Kung."—*Shih wu kan chu, Ko chih ching yüan*, c. 26, *Yin shih lei*, p. 9*a*.

"Kung Sun-Wei Tzŭ said: 'Those who eat sweet food increase their flesh, but their bones are not benefited by it.'"—*Ku hsiang chai Yüan chien lei han, Yin shih lei*, c. 388, p. 3*b*.

"Liu Hsia-hui on seeing sweet cake said it gave nourishment to old people."—*Huai-nan Tzŭ, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 14*a*.

"In the 8th moon they sustained the old and weak by serving them with thin congee."—*Yüeh ling, ibid.* c. 22, *Yin shih lei*, p. 26*a*.

"Confucius, being once in distress in the country between Ch'ên and Chieh, boiled hay for food without using flour."—*Mi Tzŭ shu, Yüan chien lei han, Shih wu pu*, c. 389, p. 7*a*.

"The Jung viscount Kin-tchi . . . said: 'Our food, our drink . . . are all different from those of the Flowery States.'"—*Lacouperie, Lang. of China*, p. 18.

Beverages.—[In the *Shih ching*, I. vii. VIII. 2; II. ii. III.; III. iii. VII., etc., mention is made of wine (酒, spirits) as the habitual drink. As at the present day, this wine was a fermented drink extracted from rice (I. xv. I. 6). They mixed Chinese pepper (I. xii. II.) with spirits and meat to render them aromatic. Milk is not mentioned in the *Shih ching* as a drink. The present Chinese in general do not drink milk.]

[An infusion of some kind of leaf was drunk at this time. See PERIOD OF DISRUPTION, and *cf.* ABSOLUTE MONARCHY.]

"A jar of spirits, made from the black millet, mixed with odoriferous herbs."—*Shu ching*, Pt. V. Bk. XXVIII. 4.

"秬 is a species of black millet, used in the distillation of spirits. 鬯 is a species of fragrant grass employed to flavour the spirits. The two characters are used here [*Shu ching*, Pt. V. Bk. XIII. 25: 'black millet herb-flavoured spirit'] as a name of the spirit which was made from them."—*Legge, Ch. Class.*, III. ii. 449, note.

"Once when the Emperor Mu was at Sha Yen he asked for [something to] drink, but there being nothing ready, Kao Pên-jung stabbed the neck of the horse on the left side of the coach, and taking its pure blood gave it to the emperor to drink. The emperor drank and enjoyed it, and immediately rewarded him by presenting him with a pair of jewels worn by himself."—*Mu t'ien tzŭ chuan, Yüan chien lei han, Shih wu pu*, c. 391, p. 3*b*.

[For the distinctive foods of different ranks see LAWS OF INT.]

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

Animal.—[Common articles of diet probably remained the the same as in the previous Period.]

[Horse and deer-flesh are mentioned in *Ku chin chu, Yüan chien lei han, Shih wu pu*, c. 389, p. 33*b*; ox-flesh, eaten with pickles, in *Huai-nan Tzŭ, ibid.* p. 29*a*; pork and mutton, in *Hou Han shu, ibid.* p. 29*b*; boiled mutton with sweet almond-juice, in *Chih lin, ibid.* p. 38*a*; pig's liver, in *Tung Kuan Han chi, ibid.* p. 28*a*; ribs of bacon, in *Ibid.* p. 16*b*; roast goose, in *San Ch'in chi, ibid.* p. 37*a*; boiled monkey, in *Huai-nan Tzŭ, ibid.* c. 390, p. 23*b*; snake, in *Liu Tzŭ shu, ibid.* c. 391, p. 1*b*; dried meat (乾脯 *kan fu*), in *Tung Kuan Han chi, ibid.* c. 389, p. 16*b*; fried meat, in *Fang yen, Ko chih ching yüan*, c. 21, *Yin shih lei*, p. 3*a*; meat cooked with the bone (殽 *yao*) and cut in large slices (胾 *tzŭ*), in *Shih wén, ibid.* c. 24, *Yin shih lei* p. 1*b*; roast flesh of the male wolf, in *Lü shih Ch'un ch'iu, ibid.* p. 7*b*; venison eaten with cooked rice, in *Tang Chin Hsü yü chang chi, ibid.* p. 3*b*; preserved meat (膊 *po*), in *Fêng su t'ung, ibid.* p. 3*a*; and *t'ing* (脡), raw meat pickled, in *Shuo wén, ibid.* c. 26, *Yin shih lei*, p. 5*a*.]

[That dogs were eaten seems probable from the existence of the specialized occupation of dog-butcher. See *Shih chi, Yüan chien lei han*, c. 358, *Shou yeh pu*, p. 2*b*; and *cf.* DIV. OF LAB.]

[Intestines of fish are mentioned in *T'ien chung chi, Yüan chien lei han, Shih wu pu*, c. 391, p. 17*b*; eels preserved in brine, in *Han shu, ibid.* c. 389, p. 38*b*; *hsien ts'an* (鮮餐), a mixture of rice and fish, in *Chiao shih shuo hu, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 29*a*; *ho ti* (河祇), dried fish, in *Chi chih chi, ibid.* c. 24, p. 4*a*; *tsé* (鮓), preserved fish, called *chêng* (鮸) in the South, also known as *yü hsiu* (魚鏞), and, commonly, as *cha* (鮓), in *Shuo wén, ibid.* p. 8*a*.]

[Mutton soup is mentioned in *Chan kuo ts'é, ibid.* c. 24. *Yin shih lei*, p. 11*a*; meat soup (肉羹 *jou kêng*), in *Han shu, Yüan chien lei han, Shih wu pu*, c. 390, p. 24*a*; dog soup, in *Huai-nan Tzŭ, ibid.* p. 23*b*; owl soup, in *Chiao ssŭ chih, Ko chih ching yüan*, c. 24, *Yin shih lei*, p. 11*a*; camel-hoof soup, in *Tu shih chu, ibid.* p. 11*a*; dragon-soup, in *Shu i chi, ibid.* p. 11*a*; thick (糂 *chan*) and thin congee (酏 i), in *Yang hsiung fang yen, ibid.* c. 22, p. 26*a*; and bean congee, in *Han shu, ibid.* p. 27*b*.]

Vegetable.—[Table rice, made from grain, panicled millet, or black millet, is mentioned in *Lü shih Ch'un ch'iu, ibid.* c. 22, *Yin shih lei*, p. 29*a*; "dried rice," made of mulberry seeds and locusts, in *Wu shu, ibid.* p. 29*a*; parched rice (糗 *ch'iu*), in *Tung Kuan Han chi, Yüan chien lei han, Shih pu*, c. 389, p. 16*b*; meal (wheat and other), in *Han shu, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 29*b*; *hsiang fan* (橡飯), meal made of chestnut oak, in *K'ung Yen tsai ch'iung chi, ibid.* p. 29*b*.]

"In the Nine Classical Books the word vermicelli or wheat flour (麪 *mien*) does not occur. The article referred to in the *Chou Li* was like the *ch'ao mai* (炒麥), roast wheat, of the present day. Only in Wang Mang's time are the words 'eating vermicelli' (啖麪 *tan mien*) first seen."—*Hsüeh ch'ai chan pi, ibid.* c. 25, *Yin shih lei*, p. 1*a*.

"The method of making bean-curd (菽腐 *tou fu*) was never heard of during the Three Dynasties (Hsia, Shang and Chou). In the Han dynasty, [Liu] An, Prince of Huai Nan, first published the method to the world."—*Hsieh ch'o shih i, ibid.* c. 24, *Yin shih lei*, p. 14*b*.

[White salt is mentioned in *Wu shih Wai kuo chuan, Yüan chien lei han, Shih wu pu*, c. 391, p. 11*b*; *Han shih huo chih, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 1*a*; *Lü shih Ch'un ch'iu, ibid.* p. 5*a*; red salt, in *Pao p'o tzŭ, Yüan chien lei han, Shih wu pu*, c. 391, p. 8*a*; salted beans (豉 *ch'ih*), in *I ya, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 15*a*; *Tan ch'ien lu, ibid.* p. 15*a*; *mieh* (醯), condiment made from the elm, in *Po hu t'ung, ibid.* p. 7*b*; from the fruit of the *kou* (枸), a spinous shrub, in *Han shu Hsi nan i chuan, ibid.* p. 7*b*; and from the pearl oyster, in *Han lü, ibid.* p. 7*b*; *soy* (醬 *chiang*), in *Fêng su t'ung, ibid.* p. 7*b*; (The *Fêng su t'ung* says that it was first made by I Fu); *yao chiang* (藥醬), "medicine sauce," in *Han shu, Yüan chien lei han, Shih wu pu*, c. 391, p. 18*b*; 'bitter wine' (苦酒 *k'u chiu*), *i.e.* vinegar (醋 *ts'u*), in *Wei ming ch'én chuan, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 8*b*.]

"In the Nine Classical Books the word *ts'u* (醋), vinegar, does not occur, but there are *hsi* (醯), 'pickles,' and 'seasoning with acid flavours' (和用酸 *ho yung suan*)—nothing more. Only under the Han dynasty is the word *ts'u* first found."—*Hsüeh ch'ai chan pi, ibid.* p. 8*b*.

[Cakes (餅 *ping*) are mentioned in *Chu-ko K'o Lieh chuan, Yüan chien lei han, Shih wu pu*, c. 389, p. 12*a*; *Wu shih Wai kuo chuan, ibid.* p. 12*a*; *Ching Chao Chiu shih*, p. 12*a*; and *Han shu Po kuan piao, Ko chih ching yüan*, c. 25, *Yin shih lei*, p. 4*a*; *chi* cakes (集餅 *chi ping*), wheaten cakes stuffed with spice, in *Wu shih Wai kuo chuan, ibid.* p. 7*b*; steamed cakes (烝餅 *chêng ping*), said to have been made by King Chao of Ch'in, in *Shih wu kan chu, ibid.* p. 8*a*; and persimmon cakes (餅柿 *ping shih*), in *Ch'ün fang p'u, Shih lei t'ung pien, Kuo pu*, c. 84, p. 4*b*.]

"*Hu* (餬) cake was a cake that had been 'raised.' The name was also used for those which had sesame scattered over the upper surface. The names of the steamed cake (蒸餅 *chêng ping*), soup cake (湯餅 *t'ang ping*), wax cake (蠟餅 *la ping*), sugar and bean cake (饊餅 *sui ping*), cash cake (金餅 *chin ping*), rope cake (索餅 *so ping*), etc., were taken from their appearances."—*I ya, Ko chih ching yüan*, c. 25, *Yin shih lei*, p. 5*b*.

["Stone honey" (石蜜 *shih mi*), the dried juice of the sugar cane, is mentioned in *Nan chung pa min chün chih, Shih lei t'ung pien, Kuo pu*, c. 84, p. 20*b*; *Han shu, Yüan chien lei han, Shih wu pu*, c. 391, p. 24*b* (where it is stated that it came from India); *Pên ts'ao, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 11*b* (made of refined sugar mixed with milk); honey (蜜 *mi*), in *Shih chi, Yüan chien lei han, Shih wu pu*, c. 391, p. 25*a*; white honey, in *Pei T'ang shu ch'ao, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 10*a*; purple honey and red honey, in *Han wu nei chuan, ibid.* p. 10*a*; sugar-cane, in *Shih shuo, Shih lei t'ung pien, Kuo pu*, c. 84, p. 21*a*: 21*b*; *Han shu Chiao ssŭ ko, Yüan chien lei han, Shih wu pu*, c. 391, p. 4*a* (where it is stated that the juice is beneficial in cases of intoxication); syrups, in *Hou Han shu, ibid.* p. 5*a*; *Shih pên, ibid.* p. 29*b*; *ju t'ang* (乳糖) and *shih tzŭ* (獅子), sugars, in *T'an yüan, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 13*a*; *mao t'ang* (貍糖), "sugar-lion," in *Han Hsien Tsung Chi chu, ibid.* p. 13*a*; sugared peas (豌 *wan*), in *Shuo wén, ibid.* p. 14*a*; and cream (酪 *lo*), in *I ya, ibid.* c. 22, p. 25*a*.]

[Mulberry seeds as articles of food are mentioned in *Liu Ching-shu I yüan, Shih lei t'ung pien, Kuo pu*, c. 84, p. 33*a*; and palm-tree leaves, in *Tung Kuan Han chi, ibid.* p. 6*b*.]

[Pears and chestnuts are mentioned in *Shuo yüan, ibid.* p. 10*b*; water chestnuts, in *Shih i chi*, p. 27*b*; plums, in *Hsüan ch'ih shuo lin, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 14*b*; "sheep dates" or "sheep arrow dates" (羊矢棗 *yang shih tsao*), in *Shih lei t'ung pien, Kuo pu*, c. 84, p. 7*a*; *yü mên* dates (玉門之棗 *yü mên chih tsao*), in *Han Wu nei chuan, ibid.* p. 7*a*; *chung én* dates (仲恩棗 *chung én tsao*), 4 in. long with purple markings, in *Ta yeh shih i lu, ibid.* p. 6*b*; fruit of date-palm, in *Shén i ching, ibid.* p. 8*a*; oranges (桔 *chieh* = 橘 *chü*) and mandarin oranges (柑 *kan*), in *Kuang chih, ibid.* p. 15*a*; *Ku chin chu, ibid.* p. 15*a*; *Hsü shih shuo, ibid.* p. 13*b*; "Buddha's fingers," in *Shén i ching, ibid.* p 12*a*; *yü kan* (餘甘), a kind of olive, in *Ch'ün fang p'u, ibid.* p. 17*a*; *li chih* (荔枝) and *lung yen* (龍眼), in *Nan fang ts'ao mu chuang, ibid.* p. 32*b*; *Wei Wên Ti chao, ibid.* p. 32*b*; and betel-nut (檳榔 *pin lang*), in *Nan fang ts'ao mu chuang, ibid.* p. 31*b*.]

"The fruit of the cocoa-nut tree was as large as a pumpkin; . . . its taste was extremely pleasant, resembling that of a walnut. It also contained a juice, the drinking of which could cause intoxication. People commonly called it 'King Yüeh's head.' Formerly when the king of Lin Yi was at war with King Yüeh, the former sent a man to decapitate King Yüeh, and his head, when cut off, became a cocoa-nut. At the time of execution King Yüeh was greatly intoxicated, so the juice of the nut has the effect of wine."—*Nan fang ts'ao mu chuang, ibid.* p. 31*a*.

"The best melons (*cucumis*) are those [grown from] Liao Tung, Lu Chiang, or Tun Huang seeds. There are 'black melons,' 'fish melons,' 'dragon's paw melons,' or 'sheep's oil melons.' The large melons of Kua Chou were as large as a *hsü* (measure of 10 *sheng*)."—*Kuang chih, ibid.* p. 22*b*. The "wood-melon" (木瓜 *mu kua*) is referred to in *Su Sung-t'u ching pên ts'ao, ibid.* p. 31*a*; and the "dragon's-liver melon" in *Tung ming chi, ibid.* p. 23*a*.

"Persimmons differed in size and were of various shapes—some resembled the heart of an ox or of a deer, others were like the egg of a duck or of a hen, whilst others were square."—*Ko wu lun, ibid.* p. 3*b*; see also *Tung Kuan Han chi, ibid.* p. 4*a*.

"Grapes were found at Ta Wan. Chang Ch'ien, a commissioner in the West country, was the first to obtain the seeds there and bring them [to Ta Wan]."—*Han shu, ibid.* p. 1*a*. A quotation from the *Pên ts'ao*, in *ibid.* p. 31*b*, also ascribes to Chang Ch'ien the introduction of the walnut.

"The 'nameless tree' was grown in Ling Nan. Its fruit resembled the fruit of the chestnut, and was called 'nameless fruit.' In Persia it was called *a yüeh chün tzŭ* (阿月渾子)."—*Pên ts'ao, ibid.* p. 32*a*.

Beverages.—[Wine (酒 *chiu*) is referred to frequently, as in *Han shih huo chih, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 1*a*; *K'ung Ts'ung Tzŭ, ibid.* p. 6*b*; wine made from dates (糜飲酒 *mi ch'in chiu*), in *Ch'i liu pien, ibid.* p. 14*a*: from wild pears, in *Hua mu k'ao, ibid.* p. 14*b*; from peach kernels, in *Yu yang tsa tsu, ibid.* p. 15*a*: from *ch'ing t'ien* kernels (青田核 *ch'ing t'ien ho*), in *Ku chin chi, ibid.* p. 15*a*; *Shan hu kou shih hua, ibid.* p. 15*a*; sweet wine made from *calamus* (菖蒲酒 *ch'ang p'u chiu*), in *Hou Han shu, ibid.* p. 15*b*; and wine made from *t'ien mên tung* (天門冬), a kind of medicine, in *Wai t'ai pi yao, ibid.* p. 15*b*.]

"Li (醨) was rice-spirit."—*I li Chêng Hsüan chu, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 2*a*.

"White wine (or spirit) was called *sou* (溲), which was spoilt cooking rice. The word *sou* meant 'old,' as when the cooked rice became old it was spoilt. If it did not spoil, the spirit would not be sweet. *Tou* (投) meant to brew again."—*Shuo wén, ibid.* p. 2*b*.

"The grape was not in China until the early Han dynasty."—*Gaubil*, quot. *Legge, Ch. Class.*, III. ii. 399, note.

"Mêng T'o of Fu Fêng, presented a *hsü* (10 *tou*) of grape wine to Chang Jang."—*Tun Huang Chang shih chia chuan, Shih lei t'ung pien, Kuo pu*, c. 84, p. 2*a*.

"Constantly drinking 'bitter tea' (苦茶 *k'u ch'a*) is beneficial to the mind."—*Hua T'o shih lun, Ko chih ching yüan*, c. 21, *Yin shih lei*, p. 5*a*.

"*T'u* (荼 sow thistle) was a bitter tea."—*Shuo wén, ibid.* p. 4*a*.

Period of Disruption (221 *to* 589).—*Table IV.*

Animal and Vegetable.—[Rice, dried meat, pork, seasoned mincemeat, pickled meat preserved with salt, hashed bream and carp, pickled fish, dumplings, etc., continued to be eaten; see *T'sung Kung Hsiao Tzŭ chuan, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 30*a*; *Lu Shên chi ju, ibid.* c. 24, p. 3*a*; *Chi shên lu, ibid.* p. 2*b*; *Shên hsien chuan, Shih lei t'ung pien, Kuo pu*, c. 84, p. 9*b*; *Nan shih, Ko chih ching yüan*, c. 24, p. 1*b*; *Pei hu lu, ibid.* c. 26, *Yin shih lei*, p. 5*b*; *Ch'ing i lu, ibid.* c. 24, p. 6*b*; p. 9*b*; *Kang mu, ibid.* c. 25, *Yin shih lei*, p. 14*b*.]

[Roast ox-heart is mentioned in *Chin shu, Kuang shih lei fu, Yao chuan pu*, c. 28, p. 4*b*; *Shih shuo, Ko chih ching yüan*, c. 24, p. 7*b*; lamb's-eyes soup, in *Ch'ing i lu, ibid.* p. 11*b*; frogs, in *Nan Ch'u hsin wén, ibid.* p. 11*b*; sliced swine's neck, in *Hsieh kun chuan, ibid.* p. 2*a*; roast goldfinch, in *Hsiao chi hsiao tzŭ chuan, ibid.* p. 7*b*; duck soup, in *Nan shih, ibid.* c. 26, *Yin shih lei*, p. 2*b*; cress soup, in *Shih shuo, ibid.* c. 24, *Yin shih lei*, p. 10*b*; *huang han* (黃頷) soup, in *Nan Ch'i shu, Kuang shih lei fu, Yao chuan pu*, c. 28, p. 6*a*; steamed pork, in *Chin shu, Ko chih ching yüan*, c. 26, *Yin shih lei* p. 5*a*; and steamed bear's flesh, in *Nan shih, ibid.* p. 3*b*.]

[Dogs were eaten. See *Ch'i shu, Yüan chien lei han*, c. 358, *Shou yeh pu*, p. 2*b*.]

[The leek (草豆支 *ts'ao ch'ih*) as food is referred to in *Pên t'sao, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 15*b*; salted beans (康伯 *k'ang po*), in *Po wu chih, ibid.* p. 15*b*; fish condiment, in *Chin Wu Ti Yü shan t'ao shu, ibid.* p. 8*a*; crab condiment, in *T'ien chung chi, ibid.* p. 8*a*; "a condiment of 12 flavours," in *Shên hsien shih ching, ibid.* p. 7*b*; bean curd, in *Ch'ing i lu, ibid.* c. 24, *Yin shih lei*, p. 14*b*; curds from sheep's milk, in *Shih shuo, ibid.* p. 10*b*; and salt, in *Pei shih, ibid.* c. 23, *Yin shih lei*, p. 3*a*; p. 3*b*; *Hsing ch'a shêng lan, ibid.* p. 3*a*.]

[Various congees are mentioned: millet congee, milk congee, and congee made of bean-paste and sugar, in *Ch'ing i lu, ibid.* c. 22, *Yin shih lei*, p. 28*a*; "royal congee," made of large red millet, in *Kuo I-kung Kuang chih, ibid.* p. 28*a*; congee made of clay (eaten by famished troops), in *Nan shih, ibid.* p. 26*b*; sesame congee, in *Nan shih, ibid.* p. 28*a*; and red-bean congee, in *Ching Ch'u sui shih chi, ibid.* p. 27*b*.]

"When Chu Ko-liang made an expedition to the South, according to native custom he should, on crossing the Lu River (east of Kiangsi), cut off a man's head to sacrifice to the gods. Liang, however, ordered them to kill a sheep and a pig instead, and, taking wheaten flour cake, painted a man's head on it and used it in sacrificing. This was how the name *man t'ou* (饅頭) bread, or leavened wheat cake, originated."—*Shih wu chi yüan* and *Ch'i hsiu lei kao, ibid.* c. 25, *Yin shih lei*, p. 12*b*.

["Green lotus-leaf dumplings" (綠荷包子 *lü ho pao tzŭ*) are referred to in *Ch'ing i lu, ibid.* p. 13*a*.]

[Cakes of various kinds were eaten: a "ring-cake" (環餅 *huan ping*), made of flour and vermicelli, is mentioned in *Ch'i min yao shu, ibid.* p. 9*a*; "Tartar cake," in *Yu ming lu* and *Hsü Han shu, ibid.* p. 8*b*; leavened wheat cakes, sugar-and-bean cakes, *lao chiu* (牢丸) cakes, and milk cakes, in *Lu Shên chi fa, ibid.* p. 5*b*; and *Nan shih, ibid.* c. 26, *Yin shih lei*, p. 2*b*; steamed cakes, in *Chin shu, Kuang shih lei fu, Yao chuan pu*, c. 28, p. 7*a*; *Ch'i shu, ibid. Ping pu*, c. 28, p. 8*a*; *Wei lüeh, ibid.* p. 8*a*: *Wei chih, ibid. Yao chuan pu*, c. 28, p. 8*a*.]

[Syrups and honey continued to be taken: see *Fan yü tsa lu, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 25*a*; *Nan shih, ibid.* c. 23, *Yin shih lei*, p. 10*a*.]

[Tsung Ming Ti was fond of *chu t'i* (鯇鮧), *Silurus asotius*, steeped in honey.]—*Ibid.* p. 10*a*.

[Fruits continued to form an important element in diet. The fruit of the plantain, plums, peaches, water-chestnut, almonds, peach-nut, grapes, oranges, dates, chestnuts, crab-apple, etc., were eaten; see *Kuei hai kuo chih, Shih lei t'ung pien, Kuo pu*, c. 84, p. 33*b*; *Shu i chi, Chung Ting Kuang shih lei fu, La mei pu*, c. 29, p. 14*a*; *Yu ming lu, ibid. Hua pu*, c. 30, p. 1*a*; *Liang shu, Shih lei t'ung pien, Kuo pu*, c. 84, p. 28*a*; *Hou Chou shu, Chung Ting Kuang shih lei fu, La mei pu*, c. 29, p. 11*b*; *Hsi ching shih chi, ibid. Hua pu*, c. 30, p. 3*b*; *Pei Ch'i shu, Shih lei t'ung pien, Kuo pu*, c. 84, p. 2*a*; *Liang shu, ibid.* p. 13*b*; *Wu chih, ibid.* p. 13*a*; *Shên hsien chuan, ibid.* p. 9*b*; *Hsi ching shih chi, ibid.* p. 9*b*; *Yü Chang Ku chin chu, ibid.* p. 10*b*; *Yu Yang tsa tsu, ibid.* p. 5*b*; and *San Kuo tien lüeh, ibid.* p. 5*b*.]

Beverages.—"The *Tea Record* tells us that tea was not known in China before this date, which may be true as regards the particular species of shrub employed in the preparation of the national drink; but an infusion of some kind of leaf was familiar to the Chows, and its name occurs in the *Erh Ya*."—*Giles, Historic China*, p. 51.

Sun Hao (4th Emperor of the Wu dynasty) "is mentioned in connection with the early use of tea, which he is said to have offered to Wei Chao instead of wine."—*Giles, Bio. Dic.*, p. 691.

"Tea was never heard of in ancient times. In the Chin and Sung dynasties the people of Wu gathered its leaves and boiled them: this was called 'tea congee.'"—*Hsieh Tsung ch'a lun Ko chih ching yüan*, c. 21, *Yin shih lei*, p. 4*a*. In *P'ei wén ch'a shu, ibid.* p. 5*a*, it is stated that its use began in the Eastern Chin dynasty (A.D. 317–419).

"There were two kinds of spirit: rice spirit and plant spirit: the former made of 5 kinds of grain mixed with rice, and the latter of the root, stem, leaves, or fruit of a plant mixed with any kind of berry."—*Fa yüan chu lin, ibid.* c. 22, *Yin shih lei*, p. 4*a*.

"One Chinese peck of *t'ao* (稻) rice (a kind cultivated in the South) distilled into one peck of spirit made the best kind [of wine]; one peck of panicled millet distilled into one peck of spirit, was the next best; and one peck of maize distilled into one peck of spirit, was the inferior kind."—*P'ing t'ang chuan, ibid.* p. 4*a*.

[White wine, red wine, *ling* (酃) spirit, pepper wine (胡椒酒 *hu chiu chiu*), wine made from the flower of the pine tree (松花酒 *sung hua chiu*), chrysanthemum wine (菊花酒 *chü hua chiu*), grape wine (葡萄酒 *p'u t'ao chiu*), wine made from the *nan chu* (南燭) herb, are also mentioned: see *Lo ta ching hao lin yü lu, ibid.* p. 6*b*; *Hsiang chou chi, ibid.* p. 9*a*; *Po wu chih, ibid.* p. 13*a*; *Yüan hua chi, ibid.* p. 13*a*; *Hsi ching tsa chi, ibid.* p. 13*b*; *Ch'ing i lu, ibid.* p. 14*a*; *Shên hsien fu shih ching, ibid.* p. 15*b*.]

"Wang Yüan-sui, Prefect of Nan Jung, mixed the agreeable quality of white wine with the strong quality of red wine into another kind which was purified by white ashes. When it was cut open its flavour was uncommonly pleasant."—*Lo ta ching hao lin yü lu, ibid.* p. 6*b*.

[Spirits were sometimes flavoured with the enlarged stems of *Hovenia dulcis* (枳椇 *chih pei*).]—*I wu chih, ibid.* p. 6*b*.

From the Restoration of Unity to the End of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

Animal and Vegetable.—"Wên Ti set an example of simplicity and economy in food."—*Giles, Bio. Dic.*, p. 898?

[The ordinary foods were the same as in the previous period. Leg of mutton is mentioned in *T'ang yü lin, Ko chih ching yüan*, c. 24, p. 2*a*; venison, in *Yün hsien san lu, ibid.* p. 2*a*; deers' tails, in *Lu shan shih shu, ibid.* c. 23, *Yin shih lei*, p. 8*a*; preserved wild boar's flesh, in *Yu Yang tsa tsu, ibid.* c. 24, *Yin shih lei*, p. 9*b*; lamb, in *Tu Yang tsa pien, ibid.* p. 7*b*; minced meat (膾 *kuei*), in *Chin mên sui chieh, ibid.* p. 6*b*; *t'o* (腇), meat with the bone cut away, in *Hsing su, ibid.* p. 1*b*; roast sliced meat, in *Sui shih tsa chi, ibid.* c. 21, *Yin shih lei*, p. 3*a*; a dish made of the '5 acrid foods,' in *Chou ch'u fêng t'u chi, ibid.* c. 26, *Yin shih lei*, p. 9*b*; and pies, in *Ch'ing hsiang tsa chi, Kuang shih lei fu, Ping pu*, c. 28, p. 6*a*.]

[Soup called *huan shê kêng* (換舌羹), made of bamboo shoots and the womb of the white hare, is mentioned in *Yüan shih Yeh t'ing chi, Ko chih ching yüan*, c. 24, *Yin shih lei*, p. 12*b*; "natural soup" (自然羹 *tzŭ jan kêng*), in *Hsü ku hsien ch'ao, ibid.* p. 12*b*; *kan lu* (甘露) soup, in *T'ang*

Ming Huang tsa lu, ibid. p. 12*a*; *hsing* (鉶) soup and *tou* (豆) soup (seasoned beef, mutton, or pork contained in these vessels), in *P'ei Jung-ch'i yü lin, ibid.* p. 10*a*; *ch'én fu* (晨鳧), wild duck soup, in *Kuang shih lei fu, Yao chuan pu*, c. 28, p. 5*a*: soup made with pearls, &c., in *Tu i chih, Ko chih ching yüan*, c. 24, *Yin shih lei*, p. 12*b*; fish, raw fish, and hashed fish, in *Sui T'ang chia hua, ibid.* p. 6*b*; *Ch'ao yeh ch'ien tsai, ibid.* p. 6*a*; *Chien k'ang shih lu, ibid.* p. 6*b*; *Li tê yü shih, Kuang shih lei fu, Yao chuan pu*, c. 28, p. 5*a*; perch (魚尼 *lu*), in *Nan tu yen hua chi, ibid.* p. 4*b*; "tube-dumplings," in *Féng t'u chi, Ko chih ching yüan*, c. 25, *Yin shih lei*, p. 14*a*; *fên t'uan* (粉團) dumplings, in *K'ai Yüan i shih, ibid.* p. 14*b*; "*kuang lang*" (桄榔) vermicelli, in *Shu i chi, ibid.* p. 2*a*; "*fang féng*" (防風) congee, in *Chin luan mi chi, ibid.* c. 22, *Yin shih lei*, p. 28*a*; barley congee, in *Ching Ch'u sui shih chi, ibid.* p. 27*a*; congee made from lard, in *Yü chu pao tien, ibid.* p. 26*b*; and *lo tu* (雜鬧), a kind of congee, in *I wu chih, ibid.* p. 26*b*.]

[Cooked rice is mentioned in *Yu yang tsa tsu, ibid.* c. 22, *Yin shih lei*, p. 31*a*: rice cooked with pork and mutton, in *Fêng t'u chi, ibid.* p. 30*a*; rice coloured in various ways, in *Nao sui lu, ibid.* p. 30*a*; *Tu yang tsa pien, Kuang shih lei fu, Su mi pu*, c. 28, p. 2*a*; corn from the Pei Ming country, in *Shih i chi, ibid.* p. 1*a*; and wheat rubbed with almond, plum, and *nai* juice, in *Yüan An Ch'un ch'iu, ibid. La mei pu*, c. 29, p. 11*b*.]

"In Chin Tzŭ, in T'ai Yüan, there was duck weed which did not die in winter. It was very sweet for eating."—*Yu yang tsa tsu, Ko chih ching yüan*, c. 69, p. 1*b*.

[Pickles and seasonings continued to be used. Pickled vegetables are referred to in *Shêng lei, ibid.* c. 24, *Yin shih lei*, p. 14*a*; *Shih huo chih, ibid.* p. 14*a*; vinegar, in *Kuang po wu chih, ibid.* c. 23, *Yin shih lei*, p. 9*a*: ant-egg condiment, in *Pei hu lu, ibid.* p. 8*a*; bottle-gourd spice, in *Chin kung i hua, ibid.* p. 7*b*; five-coloured salts, in *Pei shih, ibid.* p. 6*a*; salt, in *Yu yang tsa tsu, ibid.* p. 5*a*; *Hui yüan hsiang chu, ibid.* p. 3*a*; *T'ang nan man chuan, ibid.* p. 3*a*; *I chou chi, ibid.* p. 3*a*; *T'ang Li shih ku chuan, ibid.* p. 3*a*; curd or cheese (酥 *su*), in *T'ang shu, ibid.* c. 22, *Yin shih lei*, p. 25*b*; and curd of mare's milk (馬酪 *ma ming*), in *Yu yang tsa tsu, ibid.* p. 25*a*.]

[The number of cakes used was very large. "Red cherry *pi lo*" (餥餭), stuffed wheat-cakes, are mentioned in *Yu yang tsa tsu, ibid.* c. 25, *Yin shih lei*, p. 11*b*; "silvery rolls" (銀餅餤 *yin ping t'an*), made of milk, curds, and fat, in *Chih yen, ibid.* p. 11*a*; *chih hua t'an* (脂花餤), in *Chin mén sui chieh, ibid.* p. 10*b*; thin cakes rolled up with meat, in *Liu shu ku, ibid.* p. 10*b*; "soup cakes" (湯餅 *t'ang ping*), in *K'ai Yüan chi, ibid.* p. 9*b*; steamed cakes, in *Ch'ing hsiang tsa chi, ibid.* p. 8*a*; *Ho pi shih lei, Kuang shih lei fu, Ping pu*, c. 28, p. 8*a*; boiled cakes, in *Ch'i man ts'ung hsiao, Ko chih ching yüan*, c. 25, *Yin shih lei*, p. 8*a*; "4-colour cakes," in *Pei shih, ibid.* p. 7*b*; "5-colour cakes," in *Yu yang tsa tsu, ibid.* p. 7*a*; biscuits, in *K'ung liu t'ieh, ibid.* p. 7*b*; "condolence cake," (胹餥餅 *yen ping*), or "stone-baked cake," (石鼇餅 *shih ao ping*), in *Tzŭ hsia lu, ibid.* p. 7*a*; "*ming ya*" (鳴牙) cakes, in *T'ui kêng lu, ibid.* p. 6*b*; "*érh i*" (二儀) cakes, in *Fêng nien lu, ibid.* p. 6*b*; cakes stuffed with scallions, in *Shih wu yüan shih, ibid.* p. 6*a*; "moon cakes," in *Hsi ch'ao lo shih, ibid.* p. 6*a*; "spring cakes," in *Kuan chung chi, ibid.* p. 5*b*; unleavened cakes, in *Yü chu pao tien, ibid.* p. 3*a*; *Sui shih chi, ibid.* p. 3*b*; cakes made of dates and chestnuts, in *Sui shih tsa chi, ibid.* p. 3*a*; cakes or pastry made of flowers, in *Shan t'ang ssŭ k'ao, ibid.* p. 3*a*; and sugar cake, in *Kuang shih lei fu, Ping pu*, c. 28, p. 7*a*.]

"Cakes baked in an oven were called *shao ping* (燒餅), baked cakes; if steamed in a basket, *chêng ping* (蒸餅), steamed cakes, or *man t'ou* (饅頭), dumplings; if cooked in boiling water, *t'ang ping* (湯餅), boiled cakes, *shih mien* (濕麵), 'damp flour,' or *pu to* (不托); if mixed with flax seeds, *hu ping* (胡餅), or *ma ping* (麻餅), 'flax cakes.'"—*Ch'ing hsiang tsa chi, ibid.* p. 6*a*.

[Stone honey (石蜜 *shih mi*), frosted candy (餹霜 *t'ang shuang*) or ice-candy (餹冰 *t'ang ping*), *la* honey (剌蜜 *la mi*), "juniper-flower honey" (檜花蜜 *kuei hua mi*), of pleasant but somewhat bitter taste; *san lo chiang* (三勒漿 *san lo chiang*), "three *lo* syrup"; sugar cane (柘 *chê*), of 4 kinds, were eaten; see *T'ang Hsüan-chuang Hsi yü chi, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 11*b*; *Wang shao T'ang shuang p'u, ibid.* p. 12*a*; *Hua wu k'ao, ibid.* p. 11*a*; *Lao Hsüeh An pi chi, ibid.* p. 10*b*; *T'ang kuo shih pu, ibid.* p. 25*a*; and *Wang Shao-P'u, Shih lei t'ung pien, Kuo pu*, c. 84, p. 20*a*.]

[The fruits eaten were of many kinds: *ma ju* (馬乳) grapes, yellow, white, and black grapes, "gentleman grapes" (貴人葡萄 *kuei jén p'u t'ao*) from Persia, plums of different colours, almonds, "gold and silver peaches," large yellow peaches, "half-moon-shaped peaches," *lin ch'in* (林檎 a species of *Pyrus*) fruit, oranges, persimmons, mulberries, *t'ien hsien* (天仙) fruit, *kan cha* (甘槎), sweet hill haw, *an lo* (菴羅), *amra* or mango (*Mangifera Indica*) "four-flavoured fruit" (四味菓 *ssŭ wei kuo*), *pu na* (布納) fruit, fruit of the *sung lu nien tzŭ* (送都念子), fruit of the *shih nan* (石南), "auspicious melon" (瑞瓜 *jui kua*), "five-coloured melon," "Wang T'an" (王瓾) fruit, "parrot's tongue" (鸚哥舌 *ying ko shé*), etc.; See *T'ang shu. Shih lei t'ung pien. Kuo pu*, c. 84, p. 1*a*; *Yu Yang tsa tsu, ibid.* p. 2*b*; p. 2*a*; *T'ang shu, ibid.* p. 33*b*; *Shih shuo, Ch'ung ting Kuang shih lei fu, La mei pu*, c. 29, p. 13*b*; *Shu i chi, ibid.* p. 13*a*; p. 11*a*; *T'ang shu, ibid., Hua pu*, c. 30, p. 4*a*; *T'ung tien, ibid.* p. 4*a*; *Yu Yang tsa tsu, ibid.* p. 4*a*; *Chêng Ch'ang chih wên chi, Shih lei t'ung pien, Kuo pu*, c. 84, p. 31*b*; *Kuo i kung kuang chih, ibid.* p. 31*b*; *T'ang shu, ibid.* p. 16*a*; *T'ai Chên wai chuan, ibid.* p. 16*a*; *Yu Yang tsa tsu, ibid.* p. 4*a*; *Ti li chih, ibid.* p. 3*b*; *I wên lei chü, ibid.* p. 33*a*; *Wang Hsiang-p'u Kuo p'u, ibid.* p. 33*a*; *Shih wu kan chu, ibid.* p. 32*a*; *Yin Ch'éng-shih Yu Yang tsa tsu, ibid.* p. 32*a*; *Shih wu kan chu, ibid.* p. 32*a*; p. 33*a*; *Shih i lu, ibid.* p. 32*a*; *Nan chou chi, ibid.* p. 32*b*; *T'ang shu, ibid.* p. 24*b*; *Shu i chi, ibid.* p. 22*b*; and *Lin hai i wu chih, ibid.* p. 32*b*.]

Beverages.—[Grape-wine, originally brought from the West, was now made in China: see *T'ang shu, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 14*a*; *Su Ta-hsiang chi, ibid.* p. 11*a*. Peach-blossom wine is mentioned in *Ch'u hsüeh chi, ibid.* p. 13*a*; "summer cockcrow spirit" (夏鷄鳴酒 *hsia chi ming chiu*), in *Shih ching, ibid.* p. 11*b*; "owl's-brain wine," in *Yu yang tsa tsu, ibid.* p. 11*b*; "dragon's-fat wine," in *Tu yang pien, ibid.* p. 11*a*; *t'i hu* (酏是 酏醐), spirit fermented from cream of mare's milk, in *Fo shu, ibid.* p. 25*b*; *Shih ku chu, ibid.* p. 11*a*; *i ch'un* (宜春) wine, in *T'ang shu, ibid.* p. 8*a*; wine mixed with plum juice (called *chu yen* wine, 駐顏酒), in *Shuo lin, Chung Ting Kuang shih lei fu, La mei pu*, c. 29, p. 14*a*; wine made from the sugar-cane mixed with spirit made from the root of the purple melon, in *Sui shu, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 15*a*; "sheep spirit" (羊酩 *yang ming*), in *Kuang shih lei fu, Yao chuan pu*, c. 28, p. 5*b*.]

"*Yü hsieh* (玉瑟), 'jade scallion,' was the name of the Emperor Yang's wine. The method of making it was obtained from the Tartars."—*Shu wu i ming su, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 16*b*.

[Tea, alone or mixed with spice, continued to be taken. It was looked upon as a digestive and a febrifuge; see *Ti lu man lu, Ko chih ching yüan*, c. 21, *Yin shih lei*, p. 5*a*; *Yeh Hou chia chuan, ibid.* p. 20*a*.]

907-969.

[The food and beverages of this sub-period probably differed in their general natures little, if at all, from that of the whole period. Rice moistened with cream, and with honey, is mentioned in *Wu Tai shih, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 25*b*, and c. 23, *Yin shih lei*, p. 10*a*; gruel (粥 *chou*) and *pu t'o* (不托) cakes, in *Wu Tai shih, Kuang shih lei fu, Ping pu*, c. 28, p. 7*a*; *hsüeh fu ping* (雪膚餅), "snow-skin" cakes, and *ch'ê ku yüan* (徹骨員), "bone-penetrating rolls," in *Chieh ch'éng yü, Ko chih ching yüan*, c. 25, *Yin shih lei*, p. 7*a*; purple wine and green wine, in *Wu Tai shih, ibid.* c. 22, *Yin shih lei*, p. 17*a*; *etc.*]

Sung Period (960 *to* 1280).—*Table VI.*

Animal and Vegetable.—[*Chien tao mien* (剪刀麵), "*chien tao* pastry," and *yüeh érh k'êng* (月兒羹), "*yüeh érh* soup," are mentioned in *Yün hsien san lu, Kuang shih lei fu, Ping pu*, c. 28, p. 8*a*; *hsi* (醯), vinegar for pickling, also called *ts'u* (醋), in *Shih p'in hsü chih, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 8*b*; "red univalve sauce" (紅螺醬 *hung lo chiang*), *kou ch'i* (枸杞), a kind of medlar, and *mei kuei* (玫瑰), rose, sauces, in *Lei ch'ing jih cha, ibid.* p. 8*a*; calabash spice (匏醬 *p'ao chiang*), used to season autumn vegetables, in *Sung shu, ibid.* p. 7*b*; salt, in *Ch'i hsiu lei kao, ibid.* p. 2*a*; *Tai ch'ih shu p'o, ibid.* p. 2*a*; *Yen fan lu, ibid.* p 2*a*; vermicelli (石脂 *shih chih*), in *Shih wu kan chu, ibid.* c. 25, *Yin shih lei*, p. 1*b*; *tsung* (糉), dumplings of glutinous rice done up in leaves, in *Ching Ch'u sui shih chi, ibid.* p. 14*a*; bread containing gold and pearls (bestowed by Chên Tsung upon his ministers), in *Yen i i mou lu, ibid.* p. 13*a*; congee, in *Yao chung chi, ibid.* c. 22, *Yin shih lei*, p. 27*b*; "peach-flower congee" (桃花粥 *t'ao hua chou*), in *Chin ch'éng chieh lu, Chung Ting Kuang shih lei fu, Hua pu*, c. 30, p. 3*a*; and curds from ewe's milk, in *Shan t'ang ssŭ k'ao, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 25*a*.]

[A large number of cakes and dumplings are referred to: *ching tun* (京飩), in *Nan Yüeh chih, ibid.* c. 25, *Yin shih lei*, p. 13*b*; *hun t'un* (餛飩), pork dumplings seasoned, rolled in flour, and steamed, in *Yen fan lu, ibid.* p. 13*b*; large and small *juan chih* (軟指), in *Wên Mou-chao Chin chih, ibid.* p. 9*b*; leavened wheat cakes, in *Yen fan lu, ibid.* p. 6*a*; *Lo chung chi wên, Kuang shih lei fu, Ping pu*, c. 28, p. 7*a*; *Yüan hua chi, ibid.* p. 8*a*; white *ch'i sou* (起溲) cakes, in *Hsü Ch'ang chi chi, ibid.* p. 7*b*; *pi lo* (畢羅) cakes called *po po* (波波) in the North, and *mo mo* (磨磨) in the South, in *Chi yün, ibid.* p. 7*a*; honey cakes (蜜糕 *mi kao*), in *Sung mo chi wên, ibid.* p. 4*a*.; sugared cakes, in *Kuei chih lu, ibid.* p. 7*a*; sugar-cane and stone-honey, in *T'ai p'ing yü lan, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 11*b*; sugar, in *Chi yün, ibid.* p. 11*b*; honey ("earth-honey" from the North and "wood honey" from the South), in *Erh ya i, ibid.* p. 11*a*; and "precipice honey" (崖蜜 *yai mi*), in *Yen fan lu, ibid.* p. 11*a*.]

[Fruits formed an important article of food. The pineapple (波羅菓 *po lo kuo*) is referred to in *Kuang yü chi, ibid.* p. 11*a*, as produced in the Kiungchow district; the *chi k'o têng* (給客橙) or *lu chieh* (盧柑), a kind of orange, in *Hua mu chih, Shih lei t'ung pien, Kuo pu*, c. 84, p. 13*b*; the fig (無花菓 *wu hua kuo* or 映日菓 *ying jih kuo*), in *Pên ts'ao, ibid.* p. 31*b*; dates and chestnuts, in *Sung shu, ibid.* p. 11*b*; and the "hooked nose peach" (勾鼻桃 *kou pi t'ao*), in *Yeh chung chi, Chung Ting Kuang shih lei fu, Hua pu*, c. 30, p. 3*b*.]

Beverages.—[Tea was largely drunk. It was taken mixed with aromatic herbs (*Ch'a su, Ko chih ching yüan*, c. 21, *Yin shih lei*, p. 8*b*), and was considered best when the leaves had been dried in the sun (*T'u Lung-k'ao P'an yü shih, ibid.* p. 9*a*) and not wrapped in paper (*Hsü tz'ŭ-shu ch'a su, ibid.* p. 10*a*). It might be mixed, in the proportion of 3 to 1, with *mu hsi* (a kind of *olea fragrans* with reddish flower), jasmine, rose, cinnamon rose, epidendrum, lotus-flower, orange, becho-nut, putchuk or apricot flower, picked when in full bloom, and kept in sealed chinaware vessels (*Ch'un fang p'u, ibid.* p. 10*b*); and should be made with good water properly boiled (*Chu ch'üan hsiao p'in, ibid.* p. 10*b*), roasted over a slow fire and boiled over a "lively" fire (*Yin hua lu, ibid.* p. 10*b*), spring water being better than river water, and river water than well water (*Ch'a ching, ibid.* p. 10*b*), and should be removed when the sound of the boiling water was like that of low waves or the murmuring of pine trees, and the bubbles like crabs' eyes (*Ch'a su, ibid.* p. 11*a*.]

[Wine is mentioned in many places, *e.g.*, *Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 24*a*; *chên i* (眞一) wine, made of rice, wheat, and water, in *Tung p'o chi, ibid.* p. 17*a*: "bamboo-leaf wine" (竹葉酒 *chu yeh chiu*), a nine-times fermented wine of I Ch'êng, in *Shan t'ang ssŭ k'ao, ibid.* p. 16*a*; "eternal Spring wine" (長春酒 *ch'ang ch'un chiu*), in *Kan chu, ibid.* p. 8*b*; *ping t'ang ch'un* (冰堂春 *ping t'ang ch'un*), "ice-hall Spring," ["Spring" referring to the season when made], in *I t'ung chih, ibid.* p. 8*b*; and *li hua ch'un* (梨花春), "pear-blossom Spring," in *Ch'ang lo chi, Chung Ting Kuang shih lei fu, La mei pu*, c. 29, p. 15*b*.]

Mongol Period (1280 *to* 1368).—*Table VII.*

Animal and Vegetable.—According to Odoric of Pordenone "the land hath great store of bread, of wine, of rice, of flesh and of fish of all sorts, and of all manner of victuals whatever that are used by mankind."—*Simcox*, ii. 232.

"*Ch'i sou* (起溲) is wheaten flour mixed with water."—*Yün hui, Kuang shih lei fu, Ping pu*, c. 28, *p. 7b. Cf.* previous Period.

Marco Polo's "general impression of the abundance and cheapness of all the necessaries of life, sometimes makes way for a more particular admiration, as of pheasants at a penny apiece, or the 'delicate living' evidenced by eating flesh and fish at the same meal."—*Simcox*, ii. 223.

"Human flesh was eaten" during the miserable state of things which prevailed at the end of the Yüan dynasty.—*Ibid.* ii. 231.

Beverages.—"The omission of any notice of tea probably indicates that the Mongols had not yet acquired a taste for that beverage, and remained faithful to the spiced rice wine."—*Ibid.* ii. 218.

[Marco Polo says that most of the people of Cathay drink wine brewed of rice and flavoured with spices, very intoxicating.]—*Yule, Marco Polo*, i. 427.

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

Animal and Vegetable.—[The ordinary articles of food probably underwent but little variation. Mutton is referred to in *Ch'ing Chou tsa chi, Ko chih ching yüan*, c. 26, *Yin shih lei*, p. 4*b*; dried pork with sauce (called 猪紅 *chu hung*, "red pork"), in *Shih wu kan chu, ibid.* c. 24, p. 1*b*; paté of beef and salted beans, in *Shih wu kan chu, ibid.* c. 26, *Yin shih lei*, p. 4*b*; suet of eggs and butter, in *Shih wu kan chu, ibid.* c. 24, p. 8*a*; "ginger duck" (薑鴨 *chiang ya*), duck stuffed with ginger and seasoned with the "5 flavours," in *Shih wu kan chu, ibid.* p. 5*b*; painted eggs, in *Ching Ch'u sui shih chi, ibid.* p. 6*a*; pressed unsalted dried fish (鱃 *hsiao*), in *Ming tao tsa chih, ibid.* p. 6*a*; mince made of hashed crab and sturgeon (酒浴 *chiu yü*), in *Shih wu kan chu, ibid.* c. 24, p. 7*a*; *yü chu kêng* (玉筯羹), "jade chop-sticks soup," made of boiled mare's milk, in *Shih wu kan chu, ibid.* p. 11*b*; jerked mutton gruel (糝 *san*), in *Shih ching, ibid.* c. 26, *Yin shih lei*, p. 5*a*; meat congee (臘粥 *la chou*), in *Shih wu kan chu, ibid.* c. 22, *Yin shih lei*, p. 27*b*; and bean curd (菽乳 *shu ju*), made by cooking pulse with milk, in *Shu wu i ming su, ibid.* c. 24, *Yin shih lei*, p. 14*b*.]

"In 1616 there was a famine, and a dog for eating was dearer to buy than a young man for a servant."—*Simcox*, ii. 249.

1642. "Human flesh was sold in the streets of the starving city [K'ai-fêng Fu]."—*Ibid.* ii. 250.

[Salt is frequently mentioned: see *I t'ung chih, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 5*b*; p. 6*a*; *Ssŭ kung chi, ibid.* p. 6*a*, etc. Vinegar, made from rice, was of two kinds, ordinary vinegar (醋 *ts'u*) and red vinegar (珠兒滴 *chu érh ti* or 紅醋 *hung ts'u*): see *Shih wu yüan shih*, and *Shih wu kan chu, ibid.* p. 9*b*. Eel condiment (盧鮒醬 *lu fu chiang*) is mentioned in *Yang Shên wai chi, ibid. p.* 8*a*.]

[Cakes, sugars, etc., were of numerous kinds. *Po yeh* (薄夜) is mentioned in *Shu wu i ming su, ibid.* c. 25, *Yin shih lei*, p. 6*a*; *chien fêng hsiao yu* (見風消油), a kind of *yü ping* (浴餅), a cake eaten at the time of bathing a newly-born child, in *Ch'ien ch'io lei shih, Kuang shih lei fu, Ping pu*, c. 28, p. 7*b*; candy, in *I t'ung chih, Ko chih ching yüan*, c. 23, *Yin shih lei*, p. 15*a*; "wheat-sprout candy" and "sesame candy" (which had changed names since the Later Feudal Period), in *Shêng-an Wai chi, ibid.* p. 13*a*; fruit, coloured with copper and preserved in honey (冥菓 *ming kuo*), in *Tan ch'ien lu, ibid.* p. 9*b*; "bitter honey" (苦蜜 *k'u mi*), also called *huang lien* (黃連) honey, "pear-flower" honey, and *ho shou wu* (何首烏) honey (of a dark-red colour), in *Shih wu kan chu, ibid.* p. 10*b*.; hill honey (said to be inferior to hive honey), in *Shu wu i ming su, ibid.* p. 9*b*; and ordinary honey, in *Ming wu k'ao, ibid.* p. 9*b*; *T'ai p'ing kuang chi, ibid.* p. 9*b*, etc.]

"The Liao aborigines of Ling Nan were fond of 'honey *chi*' (蜜鷄 *mi chi*). That was the mouse in the womb when its body was red and could move. It was soaked in honey to be served at table, and could still move about the dish. When held in chopsticks and chewed, it made a *chi chi* sound; so that it was called 'honey *chi*.'"—*Shêng-an Wai chi, ibid.* c. 26, *Yin shih lei*, p. 8*b*.

[The usual fruits were eaten. See *Shih lei t'ung pien, Kuo pu*, c. 84, p. 31*b*.]

Beverages.—Tea was the usual drink. "Among liquors, those having a clear colour and strong taste were best: those having a golden colour and bitter taste were next; and those having a black colour and sour taste were inferior."—*Tsui hsiang jih yüeh, Ko chih ching yüan*, c. 22, *Yin shih lei*, p. 22*b*.

"The *san pai* (三白), 'three white,' wine was made by Mr. Ku of Wu, by using good rice, water, and leaven; it had a cooling flavour."—*Shih wu kan chu, ibid.* p. 17*b*.

[Cocoanut wine is mentioned in *Sun kung t'an pu, ibid.* p. 15*b*; "reed wine" (蓆酒 *lu chiu*), [apparently so called because it was sucked through a reed], in *Shêng-an Wai chi, ibid.* p. 16*a*; *wên chang* (文章) "despatch (?) wine," in *Shih wu kan chu, ibid.* p. 15*b*; "lamb wine" (羊羔酒 *yang kao chiu*), in *Shih wu kan chu, ibid.* p. 11*b*; and "autumn dew white" [wine] (秋露白 *ch'iu lu pai*), in *Shih wu kan chu, ibid.* p. 9*a*.]

Narcotics.—Chêng Ho (d. *circ.* 1431) "has been said by some to have introduced the practice of opium-smoking into China."—*Giles, Bio. Dic.*, p. 112.

"Tobacco was introduced into China over 200 years ago, and although it was stringently objected to and edicts issued against it, it soon became common throughout the country."—*Dudgeon, Diet, Dress, etc.*, p. 115.

[Tobacco was prohibited to Manchus in 1641.]—*Gray, China*, ii. 149.

Manchu Period (1644 *to* —).—*Table IX.*

Animal.—"The articles of food which the Chinese eat, and the mode and ceremonies attending their feasts, have aided much in giving them the odd character they bear abroad, though uncouth or unsavoury viands form an infinitesimal portion of their food, and ceremonious feasts not one in a thousand of their repasts. Travellers have so often spoken of bird's-nest soup, canine hams, and grimalkin fricassees, rats, snakes, worms, and other culinary novelties, served up in equally strange ways, that their readers get the idea that these articles form as large a proportion of the food as their description does of the narrative. In general, the diet of the Chinese is sufficient in variety, wholesome, and well cooked, though many of the dishes are unpalatable to a European from the vegetable oils used in their preparation, and the alliaceous plants introduced to savor them."—*Williams, Midd. King.*, i. 771–2.

"The proportion of animal food is probably smaller among the Chinese than other nations on the same latitude, one platter of fish or flesh, and sometimes both, being the usual allowance on the tables of the poor. Rice, maize, Italian millet, and wheat furnish most of the cereal food; the first is emphatically the staff of life, and considered indispensable all over the land."—*Ibid.* i. 772. See also *Dudgeon, Diet, Dress, etc.*, pp. 77–9.

"There are . . . no people in the world that consume so little butcher's meat, or so much fish and vegetables."—*Davis, Chinese*, i. 332.

"The meats consumed by the Chinese comprise, perhaps, a greater variety than are used in other countries; while, at the same time, very little land is appropriated to rearing animals for food. Beef is not a common meat, chiefly from a Buddhistic prejudice against killing so useful an animal. Mutton in the southern provinces is poor and dear compared with its excellence and cheapness north of the Yangtsz' River, where the greater number of Mohammedans cause a larger demand for it. The beef of the buffalo and the mutton of the goat are still less used; pork is consumed more than all other kinds, and no meat can be raised so economically. Hardly a family so poor that it cannot possess a pig; the animals are kept even on the boats and rafts, to consume and fatten upon what others leave. Fresh pork probably constitutes more than half of the meat eaten by the Chinese; hams are tolerably plenty, and a dish called 'golden hams,' from the amber appearance of the joint, makes a conspicuous object in feasts. Horseflesh, venison, wild boar, and antelope are now and then seen, but in passing through the markets, mutton, pork, fowls, and fish are the viands which everywhere meet the eye." "Rats and mice are, no doubt, eaten now and then, and so are many other undesirable things, by those whom want compels to take what they can get; but to put these and other strange eatables in the front of the list gives a distorted idea of the every-day food of the people." "The blood of ducks, pigs, and sheep is used as food. . . . It is coagulated into cakes for sale, and in cooking is mixed with the meats and sauces. The blood of all animals is eaten without repugnance so far as concerns religious scruples, except in the case of Buddhist priests."—*Williams, Midd. King.*, i. 776–8. See also *Dudgeon, Diet, Dress, etc.*, pp. 77–9.

[Eating the flesh of the dog appears to have lasted from at least the time of Mencius to the present day, but it is said that in the North it is not now used as food (*cf.* Later Feudal Period, and v. *Davis, Chinese*, ii. 337; *Giles, China and the Chinese*, p. 207; etc.).]

[Brown bear known, and its paws regarded as a delicacy. Common cat and rat not much eaten. Dogs reared expressly for the table, but their flesh is expensive. *Hwang yang* (*antilope gutturosa*), or dzeron of Mongolia. Flesh of wild ass highly prized, but difficult to procure. Frozen carcass of wild boar brought to Peking in winter. Black pig common meat south of Yangtzŭ. Alpine hare, chicken, geese, ducks, pigeons, wild fowl, including wild duck, teal, grebe, wild goose, plover, snipe, heron, night-heron, egret, ibis, partridge, pheasant, ortolan or rice-bird, etc., etc. Chicken's and pigeon's eggs. A large sort of bat is eaten in Ssŭ Ch'uan. Frogs in great numbers. Oil and flesh of whale used for food. Sturgeon brought from Songari, etc. Young of hammer-headed and zebra shark, and of skate, regarded as delicacies. Eels, mullet, alewives or file-fish, bream, gudgeon, etc., etc. Several species of serrani [a kind of cod], called *shih pan* by natives and garoupa by foreigners. Shad. Crangons, prawns, shrimps, crabs, and other kinds of crustacea. *Lung-hai*, or "dragon-crab." Three or four kinds of cuttle-fish. King-crab (*Polyphemus*). Many species of *Helix* and *Lymnea*. Two or three kinds of fresh-water shell-fish (*Mytilus*) and snails (*Voluta*). Seaweed and other kinds of fuci boiled and used for food. "It may with truth be said that the Chinese eat nearly every living thing found in the water, some of the hideous fishing frogs and gurnards alone excepted."—*Williams, Midd. King.*, i. 317–39, 347–57. See also below.]

"The native Chinese are pork-sellers, the Mohammedans are the mutton-sellers. In the north, beef, mutton, and pork in the large cities are partaken of, alternating perhaps with a sirloin of camel, horse, mule or donkey, for these animals, when they sustain a fracture or severe accident, or are incapacitated for further work by reason of age, supply cheap meat to the poorer classes. The mutton is of first-rate quality. The beef is inferior to that of England, but would compare favourably with that of the Continent. The extensive prevalence of the Buddhist faith has had an influence inimical to the consumption of butcher's meat. Strict religionists of this sect ought not to eat meat wherein life has existed. Such at least is the theory—in their practice they break every precept of the gospel of Shakyamuni. . . . The pork is for the most part eaten fresh."—*Dudgeon, Diet, Dress, etc.*, pp. 77–9.

"A numerous class, who are followers of a god named Hong-Yuen-Shuee, refuse to eat ducks." "Non-consumers of ducks are . . . in a very decided majority."—*Gray, China*, ii. 180–1.

"Pigeons are regarded as a delicacy by the Chinese. They are generally placed upon the table at banquets in honour of marriages, and at private festivals; and they are served daily, as a rule, at restaurants, as an attractive *entremet*."—*Ibid.* ii. 189.

"Fish forms a large portion of the diet of th Chinese people, especially of the south. As many as one-tenth, perhaps, derive their food from the water. . . . Many fish that are in Europe not deemed worthy of being caught . . . form . . . the staple food of a large section of the inhabitants. . . . Smoked fish do not find favour with the Chinese. . . . Shell-fish are largely cultivated, and add considerably to the food supplies of the people. Oysters are very successfully cultivated. . . . The dried fins of a species of *Zygœna* are esteemed as food. At the International Fisheries Exhibition, held in London in 1883, over 300 species of fish from Swatow, in the south of China, were exhibited, nearly all of which are edible. . . . Fish-maws, especially cod-fish, are largely eaten, and form a large article of commerce. A large trade is also carried on in dried or salted fish roes, among which the roes of the mullet are both the most plentiful and the best. Various sauces are made of fish and eaten as a relish by poor people, as, for example, crabs. In the South Formosa . . . collection in the same exhibition about 200 species of mollusca are given, two dozen species of crabs, and nearly a hundred species of various kinds of fish, the large majority of which are of good eating and many considered delicacies. Cuttle-fish, dried jelly-fish, sharks' fins are among the marine food supplies. The fins of the shark in soups form a great delicacy for the table. Anchovies, eels, crabs, shrimps, prawns, are caught in very large quantities. Dried holothuria (bicho-de-mar), dried stomachs of fish, dried shell-fish, dried prawns and shrimps, shrimp husks, and shrimp sauce form large articles of food and commerce. The cartilaginous dried skins of a fish allied to the sturgeon is used for food. The bones of fish boiled and clarified are also used as an article of food. Cow's and deer's sinews boiled with eggs, shrimps, etc., are taken by invalids as a restorative tonic. The bicho-de-mar is a marine slug, or trepang, sometimes two feet long, but commonly from four to ten inches, and in girth two or three inches, prepared by drying and smoking and used as a dainty. . . . The sea-slugs are dried and smoked, soaked in warm water for several days to cleanse them, and afterwards boiled in soups, stews, etc., like dried fish maws (sharks' stomachs dried in the sun), which are similarly treated. . . . Birds' nests are the nests of a small swift known as the Salangan (*Collocalis brevirostris* or *esculenta*), elaborated by the bird from a sea-weed (*Gelidium*) found in the East Indies and the Straits, stewed into a jelly, and forming the chief ingredient of a costly and greatly-prized soup at all feasts of ceremony. These nests are rather brackets for the nests. They come from Java and other islands of the Malayan archipelago. They are formed of the salivary secretion of the bird. [See also *infra, Narcotics, etc.*]." "Fish are not the only produce of the sea that is thus utilized for food, but the entire marine vegetable world is also laid under contribution."—*Dudgeon, Diet, Dress, etc.*, pp. 92–6.

"The farmyard poultry are the same in China as with us. . . . All sorts of poultry and game are brought down frozen from Mongolia to Peking in winter, and include antelope, pheasants, partridges, wild boar, fowls, etc. China itself, from its dense population and scarcity of cover and protection, is not rich in game. . . . Large numbers of birds, particularly sparrows, are caught by gins, birdlime, and hawks, and sold for food."—*Ibid.* p. 85.

"Among reptiles eaten by the Chinese, the hind legs of the large frog (*Rana esculenta*: 'field chicken' in Chinese) are consumed. . . . Silkworms, and locusts in seasons of plague, are boiled and eaten."—*Ibid.* p. 85.

"The chrysalids [of the silk cocoon] are not thrown away as refuse, but are eaten by the workers as food of an excellent kind."—*Gray, China*, ii. 224.

"Insect food is confined to locusts and grass-hoppers, grubs and silkworms; the latter are fried to a crisp when cooked. These and water-snakes are decidedly the most repulsive things the Chinese eat."—*Williams, Midd. King.*, i. 780.

"Of preserved meats and extracts, none exist in China. Salt, sugar, honey, and simple drying, are plans that are adopted in relation to fruits. Drying is the one most usually adopted. . . . Nearly everything in China is preserved by being dried and salted, or dried and candied."—*Dudgeon, Diet, Dress, etc.*, pp 85–7. And see *ibid.* and *Williams, Midd. King.*, i. 775, for details of dried fruits, preserves, etc.

"It seems incredible to speak of a country without milk and dairy produce. It is remarkable that a third of the race should, after weaning, never again take to that food which is the natural nourishment of the young of all mammalia, not at least until they reach their second childhood, when, if their means permit, they hire a wet nurse or purchase the milk of women, to be had in many Chinese towns. . . . The milk of childhood is supposed to have peculiar strengthening, sustaining, and restorative properties. Cow's milk is not drunk, for much the same reason that its flesh is not eaten, one of the additional reasons adduced being its supposed phlogistic or heating character. In Peking alone, perhaps of all the great cities of Northern China, are cows to be seen, tied along with their calves, on the streets in large numbers. Veal cannot be had." "*Koumiss*, or fermented mare's milk, is unknown in China Proper."—*Dudgeon, Diet, Dress, etc.*, pp. 79–80, 83.

"As there is no milk, so there is no butter in China." "Eggs are largely consumed in China. . . . They are taken raw, or boiled, or poached, or more frequently made into omelettes with vegetables. . . . Pigeon and plover's eggs are added to soups. Duck's eggs are preserved in a coating of lime, clay, spices, and rice husk mixed together, which excludes the air. After a while the yolk becomes of a deep green, nearly black colour. The longer the eggs are kept in this covering the darker becomes the colour of the yolk, and the greater the supposed delicacy. They are invariably on the table at all dinners of ceremony, and are to be seen on the street exposed for sale. . . . Duck's eggs in a state much less advanced than this are also to be had."—*Ibid.* pp. 83–5. Dyed eggs were eaten at birth of a child. See *Gray, China*, ii. 184.

Vegetable.—"The cereals, rice, wheat, millets, maize, and such like, form the mainstay of the people." "*Rice* is the principal article of food among the southern Chinese. In the north, wheat and the millets compete with it as the chief staple of food. One and a half pounds daily is the allowance for an able-bodied man, boiled and mixed with salted vegetables or preserves to give it a flavour. . . . It is used by the Chinese along with various kinds of peas and beans in the north and fish in the south, substances rich in flesh-forming material. It is . . . very remarkable and worthy of particular notice that the Chinese . . . should have hit upon a combination of food giving a due proportion of heat-givers as in starchy food, to be consumed along with flesh-formers, as in fish and seeds of leguminous plants which have a highly nitrogenous character. As this combination of rice and fish holds good in the south, so in like manner with the cereals and pulse in the north, where the combination is precisely identical. . . . The Chinese have succeeded . . . in the attainment of the maximum of nourishment with the minimum of cost."—*Dudgeon, Diet, Dress, etc.*, pp. 68–9. For details see pp. 70–3.

"The albuminoid principle in peas and beans is made into cheese in the form of the so-called bean-curd. [For method of making, see ARTS.] This bean-curd takes the place in China of milk, cheese and butter in Europe. It is largely used by the Chinese when vegetables are not very plentiful. This substance enters into the composition of many articles of food. Every variety of bean is used as food. . . . Vermicelli is often made from beans as well as wheaten flour. . . . Green beans (*lü tow Phaseolus angulatus*) are . . . also manufactured into cakes. . . . Bean-sprouts, the germinated bean of the plant, are artificially raised for food in winter. These beans are also boiled with flour, allowed to ferment, mixed with salt and reboiled, and after a time sun-dried, pressed and strained, and constitute the well-known soy which has become the basis of all, or nearly all, of the meat sauces and condiments of the world. . . . Soy is believed by the Chinese to excite appetite and to correct any injurious qualities of food. . . . Spread between layers of wheaten cakes and otherwise placed in food, a rich and appetising relish is obtained. Pease-pudding and pea-soup are not found in China. In fact, except at dinners of ceremony, soups do not form a portion of their diet. The Mohammedan butchers in the north prepare a flavoured mutton soup or sauce, which is frequently used as a substitute for soy."—*Ibid.* pp. 73–5.

[Many nuts and seeds of fruits were eaten or used in the composition of various foods (cakes, soups, teas, etc.). See *ibid.* pp. 75–7; *Williams, Midd. King.*, i. 357–65; *Davis, Chinese*, i. 328; etc.]

"China is rich in fruits—apples, pears, apricots, plums, cherries, peaches, grapes, oranges, persimmons, dates, figs, jujubes, and most of these of several varieties. The grape is peculiar to the north, being grown between 30° and 40°, N. Lat. The orange belongs to the south. . . . The kernels of stone fruits (cherry, plum, apricot, peach) are eaten."—*Dudgeon, Diet, Dress, etc.*, p. 87.

"The catalogue of fruits comprises most of those occurring elsewhere in the tropic and temperate zones, and China is probably the earliest home of the peach, plum and pear."—*Williams, Midd. King.*, i. 774.

"The natives consume enormous quantities of pickles of an inferior quality, especially cabbages and onions, but foreigners consider them detestable. The Chinese eat but few spices; black pepper is used medicinally as a tea, and cayenne pepper when the pod is green."—*Ibid.* i. 775.

"The Chinese have a long list of culinary vegetables. . . . The consumption of cabbage, broccoli, kale, cauliflower, cress, colewort, and other cruciferous plants is enormous; a great variety of modes are adopted for cooking, preserving and improving them. The leaves and stems of many plants besides these are included in the variety of greens, and a complete enumeration of them would form a curious list. . . . Garlics, leeks, scallions, onions, and chives are eaten by all classes, detected upon all persons, and smelt in all rooms where they are eating or cooking. . . . Most of these vegetables are inferior to the same articles in the markets of Western cities, where science has improved their size or flavour. Several aquatic plants increase the list. . . . The sweet potato is the most common tuber; although the Irish potato has been cultivated for scores of years, it has not become a common vegetable among the people except on the borders of Mongolia."—*Ibid.* i. 773–4. And see *Dudgeon, Diet, Dress, etc.*, pp. 89–91.

"The Chinese eat largely of salads. These are commonly made of turnips, cabbage, radish, lettuce, cucumber, etc."—*Dudgeon, Diet, Dress, etc.*, p. 89.

"The Chinese pits of ice enable them thus to preserve vegetables fresh when otherwise they would be out of season. Even the delicate grape is in this way preserved fresh throughout nearly the whole year."—*Ibid.* pp. 89–91.

"Various species of the melon or gourd family (*Cucurbitacea*) are largely cultivated . . . and form in the hot season agreeable fruits and vegetables."—*Ibid.* pp. 91–2.

"*Cryptogamic* (flowerless) plants are largely cultivated and eaten . . . The common mushroom (*moh kwo*) is never absent from the feast. . . . The fungus called *fu ling* is found adhering to the roots of fir trees, or in the ground apart from the trees. They are used as food, made with rice flour into cakes. The fungus called *muh rh* (wood ear), growing on trees, is similarly used. Various kinds of lichen or mosses are also largely consumed by the better classes. Various sorts of sea-weed are eaten in soups or . . . alone with sauces. The Chinese are very fond of them, especially of the *Plocaria candida* or Ceylon moss."—*Ibid.* p. 88.

"In regard to condiments, spices, and flavourers, the Chinese use principally capsicums, garlic, onion, ginger, cardamoms, nutmeg, aniseed, cassia, cloves, pepper, etc. These are used in confectionery, in seasoning dishes, and as medicines. Mustard is not much employed . . . and its place as a counter-stimulant is supplied by the moxa and other forms of external irritation."—*Ibid.* pp. 87–8.

"Vinegar (*ts'u*) is extensively used. . . . The Chinese seem to consume vinegar with everything."—*Ibid.* p. 97.

"The consumption of sugar (*t'ang*) is enormous. It is an important ingredient in most dishes, and the variety and quantity of confectionery and cakes in different forms manufactured from and with it is astonishing. It is said that next to rice it is one of the chief constituents of nearly all the Chinese vegetable meals." "Honey, too (*feng mi*), is somewhat largely used." "From the roots and dried stems of the lotus or water-lily (*Nelumbium*) a kind of arrow-root is produced which is somewhat largely eaten."—*Ibid.* pp. 97–8.

"*Common salt* (*yen*) in China is of a very coarse, dirty-white, moist description. . . . Salt is chiefly consumed . . . in the form of salted vegetables, fish, and fruits."—*Ibid.* pp. 98–100.

"The stacks of salt along the river arrest the attention of the voyager; the immense quantity of this article collected at this city [Tientsin] is only a small portion of the amount consumed in the interior."—*Williams, Midd. King.*, i. 86.

Narcotics, etc.—"Tobacco (smoke-leaf, tanpaku) is universally used by men and women from the period of puberty, which is somewhat early. The tobacco is very mild, has less strength and flavour than that commonly used in Europe. None is chewed, and but comparatively little taken in the form of snuff." "China tobacco is much milder than the lightest home tobacco; the *shui yentai* (water pipe) purifies and mellows the smoke. There is no eating of the dry leaf with moist quicklime as in India, nor is there anything resembling the Indian *hookah*, in which is consumed a paste of tobacco mixed with the spices and charcoal."—*Dudgeon, Diet, Dress, etc.*, pp. 114–6.

"Cigars . . . are being imported from Manila in steadily increasing quantities, and find favour among many of the wealthier Chinese."—*Williams, Midd. King.*, i. 776.

"Snuff is largely used."—*Ibid.* i. 776.

"Opium is now largely cultivated in China and introduced (by treaty right) into the open ports. Both the growth and consumption seem extending."—*Dudgeon, Diet, Dress, etc.*, p. 116.

"It is unquestionable that the smoking of opium does a great deal of physical harm, and causes a vast waste of money and energy; but even the Chinese admit that the initial responsibility for its use by smokers was as much theirs as ours; and in any case they have during recent years deliberately extended the evil by allowing the undisguised cultivation of the poppy on a wholesale scale in China itself. Indian opium does not now represent one quarter of the total consumption."—*Parker, China*, p. 92.

"Many articles of food are sought after by this sensual people for their supposed aphrodisiac qualities, and most of the singular productions brought from abroad for food are of this nature. The famous bird's-nest soup [first used during this Period] is prepared from the nest of a swallow (*Collocalia esculenta*) found in caves and damp places in some islands of the Indian Archipelago; the bird macerates the material of the nest from seaweed (*Gelidium* chiefly) in the crop, and constructs it by drawing the food out in fibres, which are attached to the damp stone with the bill. The nest has the same shape as those which chimney swallows build . . . they rarely exceed three or four inches in the longest diameter. The operation of cleaning is performed by picking away each morsel of dirt or feathers from the nest, and involves considerable labour. After they come forth perfectly free from impurities they are stewed with pigeon's eggs, spicery, and other ingredients into a soup; when cooked they resemble isinglass, and the dish depends upon sauces and seasoning for most of its taste. [The habit of eating them began in Fukien, and may have been introduced from Burma. The best—large and yellow—came from that country, those procured from Fukien being small and white.] The biche-de-mer, tripang, or sea-slug, is a marine substance procured from the Polynesian Islands; it is sought after under the same idea of its invigorating qualities, and being cheaper than the bird's-nest is a more common dish; when cooked it resembles pork-rind in appearance and taste. Sharks' fins and fish-maws are imported and boiled into gelatinous soups that are nourishing and palatable; and the sinews, tongues, palates, udders, and other parts of different animals are sought after as delicacies. A large proportion of the numerous made dishes seen at great feasts consists of such odd articles, most of which are supposed to possess some peculiar strengthening quality."—*Williams, Midd. King.*, i. 780-1.

"Betel-nut (*Areca catechu*) is used very much as a masticatory, and is supposed to sweeten the breath, rectify and strengthen the stomach, and preserve the teeth. The leaves are not chewed with lime as in India. . . . The stimulant effects of betel, like those of tea, are not very great in China."—*Dudgeon, Diet, Dress, etc.*, p. 114. Williams (*Midd. King.*, i. 776) says it is "made up of a slice of the nut and the fresh leaf of the betel-pepper with a little lime rubbed on it."

[For the 8 sorts of food offered to the Emperor at certain dates, see LAWS OF INTERCOURSE.]

Beverages.—"The common beverages are tea and arrack, both of which are taken warm; cold water is not often drunk, cold liquids of any kind being considered unwholesome. . . . Coffee, chocolate and cocoa are unknown, as are also beer, cider, porter, [foreign] wine, and brandy."—*Williams, Midd. King.*, i. 776. For further particulars concerning tea (which is taken without milk or sugar) see *Dudgeon, Diet, Dress, etc.*, pp. 108-9.

"It is remarkable that the grape, although abundant, is not used in this country for the production of wine."—*Davis, Chinese*, i. 329.

The liquor taken by the Chinese "is known as toddy, arrack, saki, tsiu, and other names in Eastern Asia, and is distilled from the yeasty liquor in which boiled rice has fermented under pressure many days. Only one distillation is made for common liquor, but when more strength is wanted, it is distilled two or three times, and it is this strong spirit alone which is rightly called *samshu*, a word meaning 'thrice fired.'"—*Williams, Midd. King.*, i. 808.

"In regard to the consumption of spirits and wine, no more temperate nation exists on the globe, intoxication being almost unknown; and yet, nevertheless, there is a comparatively large consumption. . . . Spirit is more largely drunk all over China than is generally believed by us; the impression that opium has taken the place of spirits is quite erroneous." "Besides the *samshoo*, the Chinese have what is called a yellow wine, not unlike our weak sherry, which is largely consumed hot out of small wine-cups at feasts of ceremony. It is the only alcoholic beverage drunk on such occasions, and is much less injurious than the *samshoo*, which, being a strong spirit and possessing a sufficiently inflammatory character, is not heated." "There is no wine, in our sense of the word, in China."—*Dudgeon, Diet, Dress, etc.*, pp. 110-3.

[A toddy made from the juice of the cocoa-nut is drunk in Hainan and on the adjacent coasts. Leaves of many plants, *e.g.*, *Rhamnus theezans*, are used by the poor as a makeshift for true tea.]—*Williams, Midd. King.*, i. 360, 364.

"The Tartars are said still to preserve a remnant of their pastoral state, in their predilection for a strong liquor which is distilled from mutton."—*Davis, Chinese*, i. 330.

"The Chinese do not seem to sustain any damage from their use as a beverage of pure hot or warm water." "Their food, particularly their rice gruel and fresh vegetables, contains a large quantity of water, much more so than European food."—*Dudgeon, Diet, Dress, etc.*, pp. 103-8.

"Notwithstanding their general repugnance to eating and drinking what is cold, none better understand than the Chinese of the north the use of ice during hot weather."—*Davis, Chinese*, i. 330.

"The Chinese drink all their liquors heated. . . . In the northern provinces, however, they cool their melons and other fruits on masses of ice."—*Laou-seng-urh*, p. 113, note 14.

"Among other beverages in use, the best known is the summer drink known as acid congee, made of rice water, into which a little sugar, vinegar and ice has been placed. This and tea are sold everywhere on the streets. . . . The water-melon, which consists almost entirely of water, and which is largely consumed in summer, may without much impropriety be considered a grateful and, when iced, as it usually is, a cooling beverage."—*Dudgeon, Diet, Dress, etc.*, p. 110.

C L O T H I N G.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

[The invention of clothing—garments, hats, stockings, shoes, etc.—is ascribed to the legendary rulers Fu Hsi, Huang Ti, etc., and their Ministers. See *Wu yüan, Ko chih ching yüan*, c. 15, *Kuan fu lei*, p. 2*a*; c. 16, *Kuan fu lei*, p. 1*a*; *Ch'ün shu k'ao so, ibid.* c. 13, *Kuan fu lei*, p. 1*a*; *Ti wang shih chi, ibid.* c. 15, *Kuan fu lei*, p. 2*b*; *Ku chin chu, ibid.* c. 16, *Kuan fu lei*, p. 9*a*; *Wu yüan, ibid.* c. 18, *Kuan fu lei*, p. 1*a*; *Chia yü, ibid.* c. 15, *Kuan fu lei*, p. 2*b*; *Wu yüan, ibid.* c. 15, *Kuan fu lei*, p. 2*b*; *Lü shih Ch'un ch'iu, ibid.* p. 2*b*; *Shih pên, ibid.* c. 13, *Kuan fu lei*, p. 11*b*; *T'ung tien li p'ien, ibid.* p. 11*b*; *Wu yüan, ibid.* c. 16, *Kuan fu lei*, p. 4*b*; p. 1*a*; *Ta tai li, ibid.* c. 17, *Kuan fu lei*, p. 2*b*.]

"'The kings of ancient times had no hemp nor silk; they wore feathers and skins.' Ch'êng's Commentary [says]: 'This refers to the very earliest periods.'"—*Li yün, ibid.* c. 15, *Kuan fu lei*, p. 2*a*.

"The people . . . clad themselves in silk and their own coarse homestuffs, according to the means of each. And all this previous to the dynasty of Chow."—*Giles, Historic China*, p. 4. But see next extract.

"All the ancient writers agree in saying that Yao, Chun and Yu were clothed in simple cloth in summer and in lambskin in winter. Their head-dress, or rather the band which they folded round the head, was similarly of cloth in summer and skin in winter. The silk which the wife of Hoang-ti had discovered had disappeared. The celebrated and learned author of the Choue-ouen has proved that all the characters into the formation of which the ideogram for silk enters, do not go back before the Tcheou dynasty, and that all those which refer to the clothes of the ancients are only composed of the ideograms for hair and hemp."—*Mém. conc. les Chin.*, i. 225.

"The people of the earliest periods were simple, and chiefly wore deerskin, as they were pleased with its markings."—*Po hu t'ung, Ko chih ching yüan*, c. 16, *Kuan fu lei*, p. 1*b*.

"The *ch'iu* (裘) was a garment made of fur. The people of ancient times clothed themselves with skins of animals, and the fur garment was made in imitation of them."—*Shuo wên, ibid.* p. 1*a*.

"The dark clothes worn by the ancients were garments made of lambskin, and the yellow clothes garments made of fox skin. Although birds and beasts were plentiful, they chose the fur of the fox and lamb only, because [their skins] were both light and warm."—*Po hu t'ung, ibid.* p. 1*b*.

"The wild tribes with their coats buttoning on the left."—*Shu ching*, Pt. V. Bk. XXIV. 13.

"The people of ancient times did not know how to make clothes, so the sages made them—for winter, lustring and plain silk, which were both light and warm; for summer fine and coarse hemp fabrics, which were both clean and cool. They were made both to fit the body and be agreeable to the skin."—*Mo Tzŭ, Ko chih ching yüan*, c. 15, *Kuan fu lei*, p. 2*a*.

"When [King] Yao ruled over the kingdom, in winter he wore a cloak of deerskin, and in summer a garment of creeping *dolichos* (葛 *ko*)."—*Han Tzŭ, ibid.* p. 2*b*; see also *Shih li ssŭ chuan, ibid.* c. 16, *Kuan fu lei*, p. 2*b*.

"Kao Yao [Minister to Shun] chose the he-goat skin garment to wear."—*Shih Tzŭ, ibid.* p. 2*b*.

"From the time of the Three Kings down to the end of the Chou dynasty the common people wore the short serge garment (短褐 *tuan ho ju*), a short, warm garment surrounding the loins, and the long robe (深衣 *shên i*)."—*Ku chin chu, ibid.* p. 9*a*.

"Hwang Tî, Yâo, and Shun (simply) wore their upper and lower garments (as patterns to the people), and good order was secured all under heaven."—*I ching*, App. III. Sect. II. ch. 2. 15; *Legge, Yî King*, pp. 383-4.

"In antiquity fur was used for clothing and skin for head-coverings; then the name *mao* was introduced. So the *Shih ming* says: 'Hat (帽 *mao*) means head-covering (冒 *mao*).'"—*T'ung tien, Ko chih ching yüan*, c. 14, *Kuan fu lei*, p. 12*b*.

"The *huang shou* (黃收) was a cap worn by the Emperor [Yao]."—*Wu Hou ching, ibid.* c. 13, *Kuan fu lei*, p. 2*a*.

"The cap of the Hsia dynasty was called *mu ch'ui* (毋追). Its framework was made of varnished cloth covered with black cloth; in front it was 4 inches broad, and it was 3 inches high. The cap of the Shang dynasty was called *chang fu* (章甫) and was made, like the *wei mao* of the Chou and the *mu ch'ui* of the Hsia, of black cloth."—*San li t'u, ibid.* p. 2*a*. Under the Yin dynasty scholars wore the *hsü* (*Giles, Dic.*, No. 4734).

"The 'hair-binding' cap (束髮冠 *shu fa kuan*) was made by the ancients. The likenesses of the 3 ancient kings (T'ien Wang, Ti Wang, and Jén Wang) were chiefly painted [representing them] wearing this cap. It was called 'hair-binding' because it just covered the wearer's coiffure."—*Ch'ien ch'io lei shu, Ko chih ching yüan*, c. 13, *Kuan fu lei*, p. 7*a*.

"All caps or crowns (冕 *mien*) were made round in front and square at the back; the inside was red, and the outside plain (natural or original colour of the material)."—*San li t'u, ibid.* p. 11*b*.

"The *t'ou k'uang* (黃紘) were balls made of yellow cotton-silk strung on thread and fastened on the crown or cap so that they hung down about the ears [to prevent undesirable sounds from being heard]."—*Shih wu kan chu, ibid.* p. 11*b*.

"The *shên i* (深衣), long coat, was the costume of the ancient sages. It may be ascertained from the classics that it originated with Yu Yü Shih [Shun]. It was made of 50 *shêng*, measures of cloth, bleached with lime, and then cut up to make the coat. The upper and lower garments were made according to the ancient system."—*Shên chang ts'o yao, ibid.* c. 15, *Kuan fu lei*, p 6*a*.

"Court dress was introduced by Yu Yü Shih; thus the *Kuo yü* says: 'Court dress was worn when attending Court.'"—*Ku chin chu, ibid.* c. 16, *Kuan fu lei*, p. 4*b*.

"The 'perspiration coat' (汗衫 *han shan*), or shirt, was the inner garment worn during the Three Dynasties. In the *Book of Rites* it is called *chung tan* (中單), 'inner single [garment].' When Kao Tsu of the Han dynasty fought against Ch'u, on returning to his tent his coat was soaked with perspiration, so he changed the name to 'perspiration coat.'"—*Shên chang ts'o yao, ibid.* p. 11*b*.

"Yü made the *ju* (褕), a short, warm garment encircling the loins."—*Wu yüan, ibid.* p. 12*a*.

"Yi Yin was the first to introduce wide sleeves for women."—*Wu yüan, ibid.* c. 15, *Kuan fu lei*, p. 11*a*. For the introduction of long sleeves, see RESTORATION OF UNITY.

"The *lü* (綠), waist-cord or belt, of princes and Great Ministers was of five colours."—*Tsa chi, ibid.* c. 17, *Kuan fu lei*, p. 2*b*.

"Yao made the jade girdle ornament (玉佩 *yü p'ei*)."—*Wu yüan, ibid.* p. 12*a*.

"The *shang* (裳), lower garment, was the dress for the lower part of the body; its outside was made of gauze, and inside of lustring. Its colour, for an emperor or prince, was vermilion; for a Great Minister, white; for an inferior officer, natural colour or yellow. The various colours of the *shang* were seven in all, its front and back parts being different—three for the front, and four for the back. On it were embroidered 4 figures: water-grass, rice, axes, and 黼."—*Shên chang ts'o yao, ibid.* c. 18, *Kuan fu lei*, p. 1*a*.

"Yü was the first to make trousers (袴 *k'u*)."—*Wu yüan, ibid.* p. 4*b*.

"The 'calf-nose' breeches (犢鼻褌 *tu pi kun*) were made of 3 feet of cloth, the shape being like the nose of a calf. For the front and back parts one roll each was used, for the middle two angular pieces were cut out and sewn together—which was the same as the cow's head breeches (牛頭子褌 *niu t'ou tzŭ kun*) of the present time, and was otherwise called *shao tzŭ* (梢子)."—*Lei ch'ing jih cha, ibid.* p. 7*a*.

"Yi Yin made the lined gown (夾襖 *chia ao*)."—*Wu yüan, ibid.* c. 16, *Kuan fu lei*, p. 8*a*.

"Wên Tzŭ said: 'When Wên Wang punished Tsung his stocking was tied on his girdle.' From this it is known that the stocking was already introduced in the Shang dynasty."—*Chih ku tzŭ, ibid.* c. 18, *Kuan fu lei*, p. 7*b*.

"The people of the Three Dynasties . . . wore a horn-shaped stocking tied to the legs with bands. The concubine Wu of the Emperor Wên of the Wei Kingdom changed it to one made of gauze; after this it was embroidered with figures, and remained unchanged even to the present time"; but the band was dropped: see following extracts.—*Chung hua Ku chin chu, ibid.* p. 7*b*.

"The sock, or stocking (襪 *wa*), was the foot covering introduced under the Three Dynasties: its outside was made of crimson gauze, and its inside of cheap thin crimson silk. It was put on before putting on the shoe. It differed from that of the present day by having a band."—*Shên chang t'so yao, ibid.* p. 7*b*.

"The *Shih lu* says: 'In the Three Dynasties they [shoes] were made of skin or leather; those with single soles were called *li* (履), and those with double soles *hsi* (舄). Those belonging to the sacrificial robe were called *hsi*; to the Court dress, *li*; and to ordinary dress, *lü* (屨).'"—*Shih wu chi yüan, ibid.* p. 9*b*. But see below.

"The *li* (履), shoe, in the Hsia and Shang dynasties was made of grass."—*Shih lu, ibid.* p. 16*a*; *Kuo ssŭ hua lun, ibid.* p. 10*b*. See also LATER FEUDAL PERIOD, PERIOD OF DISRUPTION, and RESTORATION OF UNITY.

"Yi Yin [*circ.* 1766 B.C.] was the first to make the grass shoe (屩 *chüeh*)."—*Chung hua Ku chin chu, ibid.* p. 18*a*. See also LATER FEUDAL PERIOD and ABSOLUTE MONARCHY.

"Before the Three Dynasties people went barefoot; after the Three Dynasties they began to wear wooden overshoes."—*Kuo ssŭ hua lun, ibid.* p. 12*b*.

"Yü, of Hsia, when going up hill, sat on a hand-cart and used an iron spike like an awl to nail on under his wood-soled clogs. It is thought this was the same as the wooden shoe having a nail under the sole of the present time."—*Shih wu yüan shih, ibid.* p. 12*b*.

"King Wân dressed meanly."—*Shu ching*, Pt. V. Bk. XV. 9.

"Mih-tsze tells us that Yuĕ [a builder, afterwards Prime Minister to Wu Ting] wore coarse clothes of hair cloth, with a rope for a girdle."—*Legge, Ch. Class.*, III. i. 250, note.

"In Sui Jên's time women began to do up their hair into a coiffure; by Shun's time the head-dress was added, and in the time of Wên Wang there were further added artificial flowers made of plumage and long tail feathers, and the 'walking shake.'"—*Êrh i shih lu, Ko chih ching yüan*, c. 55, *Hsiang lien ch'i wu lei*, p. 6*a*.

[For the ornaments painted and embroidered on official robes, see ÆSTHETIC PRODUCTS, *Object-decoration*.]

[For ordinary hair-pins see also IMPLEMENTS, and for ornamental hair-pins see *Object-decoration* and *Fashions*.]

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

"Uniformity of costume was already established, and, as now, the chief mandarin of the district gave the signal for all under his government to begin or leave off their summer hats.

It was one of the duties of the Minister of Instruction to secure uniformity of costume, which the Han commentators supposed to have been desired as a check on the extravagance of the well-to-do."—*Simcox*, ii. 64.

"The people of the southern States cut their hair and go without clothes; those of the northern States wear turbans and fur garments."—*Lieh tzŭ, Yen shan wai shih*, c. 7, pp. 9-10.

"They appear to have worn shoes of leather, and stockings, and hats and caps, in addition to robes of silk."—*Giles, Historic China*, p. 12.

[References to sandals, clothes of hair-cloth, woven caps, shoes, *etc.*, occur in *Mencius*.]

Persons dying in old age "are dressed in an outer attire professedly borrowed from very high antiquity. . . . It consists of a long cloak of deep blue-brownish silk. Around the neck and on both lapels it has a plain white or bright blue hem about eight centimetres in breadth; the garment overlaps to the right, and the lapel is fixed on the shoulder and under the arm by means of strings, so that the hems cross over the breast. The sleeves are very spacious and long and, at the extremities, lined with a blue or white material which is folded over the wrists like cuffs. This gown is called *ch'im i* [*shén i*] (深衣) or 'deep garment.' It is frequently mentioned under this name in the ancient books of rites, which shows that it must have been one of the principal articles in the wardrobe of the ruling classes during the Chou dynasty. Commentators say it bore this name because, when worn, it *deeply* concealed the body. A picture of the dress, as it is supposed to have looked in those ancient times, is given in ch. 79 of the Khienlung edition of the *Li ki*."—*De Groot, Rel. Syst.*, i. i. 52. Its invention is attributed to Shun: see previous Period.

"Make the upper garment (衣 *i*) of lotus leaves, and gather *hibiscus mutabilis* to make the lower garment (裳 *shang*)."—*Ch'u tz'ŭ, Ko chih ching yüan*, c. 18, *Kuan fu lei*, p. 1*a*.

"The skirt (裙 *ch'ün*). In ancient times the upper and lower garments were made in one piece, but Wên Wang of the Chou dynasty ordered women to wear the skirt, and above the skirt to add the *ti* (翟), a garment adorned with feathers. They were both made of lustring."—*Ku chin chu, ibid.* p. 1*b*.

"The *Ch'uan sou ching* says: 'When Lao Tzŭ left Chou and Tso T'zŭ was in Wei, they wore the *ko* (袼), dolichos, kerchief and single shirt, and did not wear hempen clothes, but the short coat bound by the skirt. They did not wear the Taoist costume.'"—*Yen fan lu, ibid.* p. 2*a*.

"K'ung Chih had a hempen robe (縕 袍 *yün p'ao*) without lining."—*K'ung is'ung tzŭ, ibid.* p. 6*b*.

"The embroidered square collar (刺 方 領 繡 *la fang ling hsiu*), Chin Chüeh's Commentatory [explains], was the lady's straight collar of the present time."—*Kuang Chou wang chuan, ibid.* c. 15, *Kuan fu lei*, p. 11*a*.

"In the Three Dynasties the people wore the *lan shan* (襴衫), lower shirt. . . . In the time of the Emperor Wu of Chou they added the *lan* to the lower end of the coat."—*Kuo ssŭ hua lun, ibid.* c. 16, *Kuan fu lei*, p. 9*b*.

"The *k'u* (袴), trousers, was the lower garment of the ancients. King Wu of Chou made it of cotton cloth, and called it *hsi* (褶), and King Ching made it of pongee, and called it *k'u*; it had no seams, and was the garment of the lower people."—*Ku chin chu, ibid.* c. 18, *Kuan fu lei*, p. 4*b*. And see following Period.

"The *k'un* (褌), trousers, were . . . made by Wên Wang of Chou. When they reached to the knees they were called *pi i* (裨衣)."—*Chung hua Ku chin chu, ibid.* p. 6*b*.

"'Wearing the ordinary garment (祖 *jih*) they played at Court.' The Commentary [says]: 'The ordinary garment is one worn next to the body.'"—*Tso chuan, ibid.* c. 15, *Kuan fu lei*, p. 7*b*.

"The 'perspiration garment' (汗 衣 *han i*) was a garment worn next to the body for absorbing perspiration and dirt. In the Odes it is called 'soaker' or 'sweater' (澤 *tsé*), as it absorbed the moisture of perspiration; sometimes it was called 'despised [for being] bare' (鄙 袒 *pi t'an*) or 'ashamed at being bare' (羞 袒 *hsiu t'an*); it was cut from 6 feet of cloth, and just covered the breast and back, the meaning of the name being that those who felt ashamed or were despised for having their bodies bare, put it on."—*I yu, ibid.* p. 7*b*. *Cf.* previous Period.

"Confucius said: 'In my youth I lived in Lu, and wore a *fêng yeh* (逢 掖) garment.' The Commentary [says]: '*Fêng* means large, and *fêng yeh* was a single garment with large sleeves.'"—*Li chi Ju hsing p'ien, ibid.* p. 7*b*

"Lao Lai-tzŭ served his parents filially. When 70 years old, wearing the five-coloured mottled garment, he frolicked like a baby in order to please his parents."—*Kao shih chuan, ibid.* p. 8*a*.

"The Duke of Chou settled the clothing of the Emperor, the colour of which followed the four seasons" (spring, azure; summer, red, etc.).—*Wu yüan, ibid.* p. 2*b*.

"The ancients wore the fur garment (裘 *ch'iu*) underneath, covering it with a silken fabric one."—[*Wu ching*] *yao i, ibid.* c. 16. *Kuan fu lei*, p. 1*a*.

"The feudal princes, wearing the axe-marked fur garment, took the oath in a field. It was embroidered by mixing lamb-skin and fox-skin to make the axe marks."—*Wu ching yao i, ibid.* p. 1*b*.

"In the Odes of Tai Tung it says: 'The garments of the [fur of the] bear and grisly bear.' From this we see that the fur of the bear and grisly bear were also used as materials for garments. In the Confucian *Analects* it says: 'The white silk garment and young deerskin garment'—showing that garments were also made of young deerskin."—*Ch'ün shu k'ao so, ibid.* p. 2*a*.

"A fur garment made of the fur of the 'heavenly rat' [a kind of rat whose fat cures deafness] was called 'heaven-deer fur garment.'"—*Kuang chih, ibid.* p. 2*b*.

"King Wu was very extravagant; he ordered that only officials wearing marten-fur skirts and bear-skin garments should be admitted to the Court. On this account [a] bear-fur cost 1,000 gold [taels]. Meritorious Ministers used to purchase one for 1,000 *chung* of rice."—*Kuan Tzŭ, ibid.* p. 2*b*.

[The various ceremonial robes, etc., worn by the king are described in *Chou li kuan chu*: see *Gingell*, pp. 13-17.]

[Officers wore sheep-skins and lamb-skins braided with white silk (*Shih ching*, I. ii. VII). In many Courts the garment which was worn uppermost was garnished with cuffs of leopard-skin (I. vii. VI; x. VII). The prince of a State wore a white fox-fur at the Royal Court, and on his return to his own dominions when he announced in his ancestral temple what gifts he had received from the Son of Heaven; after which he no more wore it (I. xi. V). The prince "wearing an embroidered robe over worn at the Court of P'ei by the officers (I. iii. XII). The robes of the feudal princes were generally of embroidered silk (I. xiv. I; IV. i. [iii.] VII). Red was adopted by the kings of Chou for the garments of the princes and officers at their Court (I. xiv. II. i; II. iii. V. 4). The officers at the Courts of the feudal princes wore a red collar to their principal robe (I. x. III. i).]—*Legge, Ch. Class.*, IV. i. 28, 133, 182, 197, 60, 220; ii. 606; i. 221; ii. 289; i. 176.

[One of the feudal princes appears wearing a cap of skin adorned with precious stones (*Shih ching*, I. v. I. 2). Their officers had in summer a cap woven from the straw of the *t'ae* plant, and in winter one of black cotton (II. viii. I. 2). Husbandmen wore, in summer, caps of straw (IV. i. [iii.] VI). These caps were fastened on the heads with strings (I. viii. VI. 2), like those of the Chinese at the present day. A princess of the State of Wei had her upper robe of a green colour, and the under one of yellow (I. iii. II). In a time of mourning the cap and garments were required to be white (I. xiii. II). Beyond the Court, dresses were of various colours, with the exception of red. Caps of spotted deer-skin were worn (I. xiv. III. 2). Girdle-pendants of silk of various colours are mentioned, and men and women who were rich attached to them precious stones (I. vii. IX; I. vi. X. 3; v. V. 3; and see Legge's note to I. vii. VIII. 3).]—*Legge, Ch. Class.*, IV. i. 92; ii. 409, 604; i. 156, 41, 216, 223, 136, 123, 102, 135.

"The ordinary fur garment (褻 裘 *hsieh ch'iu*) was a garment worn on common days or in private. It was made of fox's or badger's fur. As it was used for its warmth, it was longer than any other fur garment, and as it was also used for its convenience in doing work, the right sleeve was short. Children did not wear it, as it was too warm for them."—*Shên chang chü yao, Ko chih ching yüan*, c. 16, *Kuan fu lei*, p. 1*b*.

"The artists of ancient times, drawing men's things, used 4 colours, *viz.*, yellow, white, azure, and purple, for the upper and lower garments, but never green, as that colour was appropriated for women's garments."—*Fei hsüeh lu, ibid.* c. 18, *Kuan fu lei*, p. 21*b*.

"In antiquity, common people when advanced in age might wear silk garments; the rest only wore hempen clothes; so the common people were called 'cotton cloth clothes' (*i.e.*, simple citizens)."—*Fan tzŭ chi jan, ibid.* c. 15, *Kuan fu lei*, p. 9*a*.

"When the prince of the Chêng State entertained the King of Chou, the latter bestowed upon him a mirror-girdle (鑾 鑑 *p'an chien*) belonging to the Empress. The Commentary [says]: . . . 'the *p'an* was a girdle adorned with a mirror.' It is now used by the Tanguts of the West, but was really handed down from ancient times."—*Shih wu yüan shih, ibid.* c. 17, *Kuan fu lei*, p. 6*b*.

"The girdles of the ancients were diverse: 'large girdle,' 'shallow girdle', 'loose girdle,' 'white silk girdle,' 'boiling silk girdle,' 'embroidered silk girdle,' 'fine silk girdle,' and 'diversified girdle.' The *Ta tai li* says: 'The embroidered dress of the Emperor Huang had a large girdle.' Kou Tzŭ said: 'The *fêng* (逢) garment [a wide-sleeved garment] had the shallow girdle.' Chien Pu-i said: 'The *pao* (袍) garment [a long garment] had the loose girdle.' Here the shallow girdle alluded to is the loose girdle."—*Ch'ün shu k'ao so, ibid.* p. 7*a*.

"The girdle ornament for the Emperor was of white jade with a dark-coloured string; for a prince, of *shan hsüan* jade with a red string; for a Great Minister, of *shui ts'ang* jade with a black string; for an Heir Apparent, of fine jade with a variegated string; and for a scholar, of beautiful stone with a purple string. The Commentary [says]: *Shan hsüan* and *shui ts'ang* were the marks of jade. The string was used for tying the girdle ornament. They were attached to each other."—*Li chi, ibid.* p. 10*b*.

"In ancient times there were the 'merit girdle-ornament' (德 佩 *tê p'ei*) and the 'business girdle-ornament' (事 佩 *shih p'ei*): the first had its right and left parts adorned with jade, and the latter its left part adorned with a silk napkin and its right with an archer's thumb ring and the like. The left girdle ornaments were 5 in number, and the right, 6; for the left, representing the male, was an odd number, and the right, representing the female, was an even number. The left ones were small, and the right large, for the left [hand] was not so strong as the right. The 'business girdle-ornament' was adjusted before the 'merit girdle-ornament,' as business was done first and merit came afterwards."—*Ch'ün shu k'ao so, ibid.* p. 11*a*.

"When Confucius departed from Lu he wore as a girdle-ornament an ivory ring 5 inches in circumference."—*Li chi, ibid.* p. 12*a*.

"Tzŭ Ssŭ had a silver girdle-ornament (銀 佩 *yin p'ei*)."—*Yen t'ieh lun, ibid.* p. 12*a*.

"The boy wore a *hsi* (觿) on his girdle. The Commentary [says]: 'The *hsi* was a bodkin made of ivory; it was a girdle ornament for a man and not for a boy only.'"—*Shih wei fêng, ibid.* p. 14*b*.

"On the left girdle ornament was worn the small ivory bodkin (小 觿 *hsiao hsi*), and on the right the large ivory bodkin (大 觿 *ta hsi*)."—*Li nei tsé, ibid.* p. 14*b*.

[Dandies wore at the girdle an ivory pin or spike, used for loosing knots, and they also wore a ring of ivory or archer's thimble (*Shih ching*, I. v. VI).]—*Legge*, IV. i. 103.

[All the feudal princes wore red shoes (*Shih ching*, I. xv. VII; III. iii. VII. 2), embroidered with gold (II. iii. V. 4). In general, shoes made of the fibre of the dolichos plant were worn in summer (I. viii. VI. 2; II. v. IX. 2), and leather shoes in winter.]—*Legge, Ch. Class.*, IV. i. 242; ii. 547, 289; i. 156; ii. 353.

[Ch'un Shên had three thousand retainers with pearl-embroidered shoes (*Giles, Dic.*, No. 6952).]

"The outside of a shoe was made of pink gauze and the inside of leather; the top was adorned with embroidered figures; the seams were covered with embroidered edges, and the two sides of the shoe had strings or laces to bind them on the feet. Sometimes they were made with a single sole."—*Shên chang ts'o yao, Ko chih ching yüan*, c. 18, *Kuan fu lei*, p. 10*b*.

"In the *Ancient and Modern Commentary* (古 今 注 *Ku chin chu*) it says: 'The Emperor Wên of Wei first made silk shoes for his favourite Tuan Ch'iao-hsiao'; but the *Shao I* [part] of the *Book of Rites* says: 'Though the nation were poor the superior man did not put on silk shoes.' From this it is evident that silk shoes were already used in the Chou dynasty."—*Shih wu chi yüan, ibid.* p. 12*a*.

"The *pu chieh* (不 借), 'not borrowed,' were grass shoes. As every one could easily obtain them without the trouble of borrowing they were called 'not borrowed.'"—*Wu tsung chih, ibid.* p. 11*a*.

"Liu Hsi made them [the *pu chieh*] of leather. Yang Hsiung made them of hemp, but in the *Shih wu chi yüan* it says: 'in the Hsia and Shang dynasties they were made of grass; but in the Chou of hemp. . . .' The *Ch'ien fu lun* says they were made of leather."—*Shu wu i ming su, ibid.* p. 11*b*. See also following Period.

"The *li* (履), shoe, . . . in the Chou dynasty [was made of] hemp."—*Shih lu, ibid.* p. 16*a*. See also EARLY FEUDAL PERIOD, DISRUPTION, and RESTORATION OF UNITY.

"Wên Wang of Chou made it [the *chüeh* (屩), grass shoe] of hemp."—*Chung hua Ku chin chu, ibid.* p. 18*a*. See also EARLY FEUDAL PERIOD and ABSOLUTE MONARCHY.

"The wooden shoe originated in the time of Wên Kung of Chin."—*Tung fang shuo so yü, ibid.* p. 12*b*.

"In Ch'ing Ch'i there was a kind of peach tree; at the time of its blooming it had fibres hanging down 2 or 3 feet long, which were gathered and mixed with resin and then woven into shoes. When sent to the capital, the people there did not know what they were."—*Ch'ing chou tsa chi, ibid.* p. 12*b*.

"They collected money to buy provisions and *fei chü* (屝 屨). The Commentary [says]: '*Fei chü* were straw sandals.'"—*Tso chuan, ibid.* p. 14*b*.

"In the Spring and Autumn Annals it says: 'The *kuan chü* (菅 屨) was a sort of straw sandal worn by mourners.'"—*Tsao lin, ibid.* p. 14*b*.

"In Chiang Nan there was *mang* (芒), grass, which was gathered by the poor people to weave into sandals. The ground there was very low and wet, and as this grass was durable, even water-tight, the natives chiefly wove [their shoes out of] it."—*Yü t'ang hsien hua, ibid.* p. 15*a*.

"The *chü* showed the *ch'i* (綦). The Commentary [says]: 'The *ch'i* was the ornament on the top of a sandal, and was thread used in ornamenting the shoe.' Chu Tzŭ said: 'The *ch'i* was the band on the edge of the shoe. In ancient times people used it to tie round their feet, but now it was made more convenient, and the band was only sewn on the shoe like a false band.'"—*Nei tsê, ibid.* p. 15*a*.

"Wood was used for the sole of the shoe on account of the dryness [thus secured for the feet], so that there need be no fear of getting [them] wet. [This shoe was] therefore called *hsi* (舃), wooden soled shoe or slipper."—*Ku chin chu, ibid.* p. 15*a*.

"The shoe with a double sole was called *hsi* (舃), and with a single sole *chü* (屨). The colour matched the colour of the garment. In summer it was made of *dolichos tuberosus*, and in winter, of leather."—*San li t'u, ibid.* p. 15*a*. See also *Shih kuan li, ibid.* p. 14*a*.

"When the King of Ch'u went out he wore a leather cap and leopard *hsi* (舃). Tu Yü's Commentary [says]: 'The leopard *hsi* was the shoe made of leopard-skin.'"—*Tso chuan, ibid.* p. 15*a*

[Women of the ordinary class wore their garments undyed, and a veil or coiffure of a greyish colour (*Shih ching*, I. vii. XIX).]—*Legge, Ch. Class.*, IV. i. 146.

[Princes and dignitaries habitually wore ear-plugs or stoppers, not suspended from the ears, but from a comb in the hair, coming down to cover the ears (*Shih ching*, I. v. I. 2; II. viii. I. 3). The *Shih ching* I. iv. III. criticizes the elaborate toilet of a Chinese lady who wore plates of gold in the braids of her hair, and had six precious stones on each of her ear-pendants. Her comb is of ivory, and her robe is embroidered in silk of various colours. The ode says that she wore no false hair. The toilet of Chinese ladies was made before a mirror which must have been of metal (I. iii. I. 2).]—*Ibid.* IV. i. 92; ii. 410; i. 76, 38.

"The Emperor Huang made the cap and diadem, but the head-dress for women had no ornament attached to it; only in the Chou dynasty was the hairpin added—but nothing more."—*Shih wu yüan shih, Ko chih ching yüan*, c. 13, *Kuan fu lei*, p. 8*a*.

[The wives of dignitaries twisted their hair on the sides of the head, or they curled it (*Shih ching*, II. viii. I. 4). As a sign of sadness, they let it hang loose (II. viii. II. i). Widows cut their hair, preserving a lock on each side of the head (I. iv. I).]—*Legge, Ch. Class.*, IV. ii. 410, 411; i. 74.

[While a boy or young man's parents were alive, his hair was parted into two tufts from the *pia mater*, and brought down as low as the eyebrows on either side of the forehead (*Shih ching*, Bk. IV. Ode i.).] See also below.

[Until children reached their majority their hair was twisted up in two horns on the top of the head (*Shih ching*, I. viii. VII. 3). This bifurcated coiffure is still that of Chinese maid-servants, often designated, because of this peculiarity, by a character which has the form of our Y. At sixteen, boys assumed the cap called *pien* (*ibid.*).]—*Ibid.* IV. i. 158.

[Men and women used pomade for their hair (*Shih ching*, I. v. VIII. 2), and wore at their side an ivory comb. The hair of Chinese children was habitually in a dirty state, and of such a nature as easily to become matted, which produced a disagreeable malady. It was probably to avoid this matting that people in easy circumstances carried about them a comb in the times described in the *Shih ching*.]—*Ibid.* IV. i. 105.

"The two bands belonging to the cap of a young man were tied and made a knot under the chin; it was called neckband, and that which hung from it was called a tassel (綏 *sui*)."—*Li shu, Ko chih ching yüan*, c. 13, *Kuan fu lei*, p. 1*b*.

"The swordsmen wore the *ch'ui* (垂) cap with the *man hu* (曼 胡) throatband. The Commentary says: 'The *ch'ui* cap was not higher than the cap [itself], and was like the present-day kerchief. *Man hu* meant "coarse."'"—*Chuang Tzŭ, ibid.* p. 1*b*.

[The Emperor wore a black cap with black tassel; princes a white cap with white tassel; and great ministers and lesser officials a shining colour cap with shining colour tassel.]—*Wei Liao Tzŭ, ibid.* p. 1*b*.

"That man in the capital wore the *t'ai* (臺) cap [made of leather] and the *tzŭ ts'o* (緇 撮), which, the Commentary says, was a black cloth cap."—*Shih hsiao ya, ibid.* p. 2*a*. See also *Mao shih, ibid.* c. 14, *Kuan fu lei*, p. 18*b*.

"The *kao shan* (高 山) cap was a cap worn by the king of Ch'i. When Ch'in destroyed Ch'i, the king of the former state bestowed upon the herald of court ceremonies the cap of the conquered king."—*Tu tuan, ibid.* p. 4*a*.

"The *hsieh ch'ai* (獬 豸) was a fabulous sheep caught by the king of Ch'u, of whose skin he made caps. When Ch'in

destroyed Ch'u he bestowed these caps upon his judge, prime minister, and censor to be worn by them."—*Yü fu chih, ibid.* p. 4*b*.

"The *wu* (武) cap, otherwise called *fan* (繁) cap, was the *tai* (大) cap of present times. It was an article of military costume. But the caps for the Shih Chung and Chung Ch'ang Shih (titles of eunuchs) had golden locusts and fur tails added for their adornment. In former ages, King Wu Ling of Chao was the first to adorn the cap with marten fur and figures of locusts. When Ch'in destroyed Chao this cap was bestowed upon the Shih Chung."—*T'u tuan, ibid.* p. 5*a*.

"The 'kingfisher cap' (翡冠 *yü kuan*) was made of the plumage of kingfishers."—*Tso chuan chu, ibid.* p. 6*a*.

"When King Ch'êng was going to be capped, Prince Chou sent a man to Ling Ling to find figured bamboos to make a cap of."—*Chou shu, ibid.* p. 6*b*.

"Yüan Hsien wore a cap of birchwood bark,"—*Shih wu yüan shih, ibid.* p. 6*b*.

"There was an officer in charge of the felicitous and mourning costumes of the Emperor. Amongst the felicitous ones were the dragon-robe and crown worn when worshipping previous kings; the pheasant robe and crown for ancestral worship and rites observed before going hunting; the tiger robe and crown for sacrificing to the 4 cardinal points, hills and streams; the embroidered robe and crown for sacrificing to the gods of the land and grain, and for the 5 sacrifices [doorsill in spring, furnace in summer, door in autumn, way in winter, and central chamber in the middle of the year]; and the dark robe and crown for sacrificing to loyal ministers."—*Chou li, ibid.* p. 12*b*.

"The Records say: '[With regard to] the *yü tsao* (玉藻 of the Emperor, the *yü* were the pendant jade [beads] hung on the front and back parts of the crown, and the *tsao* was the variegated silk-thread [used] for stringing the beads. Thus the *tsao* was used to string the *yü* and the *yü* to adorn the *tsao*, and the combination of the two was called *yü tsao*."—*Yün hsien shih lüeh, ibid.* p. 12*b*.

"Tzŭ Yü of Ch'u made a redstone ceremonial cap (瓊弁 *ch'iung pien*) with jade tassel (玉纓 *yü ying*)."—*Tso chuan, ibid.* p. 17*a*.

"The *t'ung mao* (桐帽), paint-tree hat, was really made by the people of Shu; it was made of the wood of the *jatropha curcas* covered with varnish."—*Yen lou yu shih, ibid.* c. 14, *Kuan fu lei*, p. 17*a*.

"The *t'ai li* (臺笠), cyprus bark hat, and black silk cap. The Commentary [says]: *T'ai* was a sort of cyprus."—*Mao shih, ibid.* p. 18*b*.

"In Kuei Chou there were sunflower or hollyhock plants which could be used to make *li* (笠), rain-hats, which were called *k'uei li* (葵笠), 'hollyhock hats.'"—*Kuei Chou t'u ching, ibid.* p. 18*b*.

"There was fine rattan, which was woven into rain-hats (笠 *li*). The area of this hat was 2 feet 4 inches and it was covered with black lustring sewn round the brim to give shelter from wind or sun; it was called 'cloud hat' (雲笠 *yün li*). Another made of bamboo splints, densely covered with the leaves of a shrub, was called 'leaf hat' (葉笠 *yeh li*). Yet another, made of bamboo splints, but covered with stork's feathers, was called 'feather hat' (羽笠 *yü li*). These three were convenient and light, and resembled those customarily worn by the Taoist sect."—*T'u Lung-yu Chü chien, ibid.* p. 18*b*.

"Kuan Tzŭ said: 'The farmer wore on his head a *mao p'u*' (茅蒲), which was a reed rain-hat."—*Shu wu i ming su, ibid.* p. 19*a*.

"Kuan Tzŭ said: 'The farmer wore a *po ch'ih*' (薄襏), which was a cloak woven of leaves for sheltering from the rain. Others called it 'rough durable garment' (麤堅衣 *ts'u chien i*), as it was suitable for doing hard work in."—*Shu wu i ming su, ibid.* c. 15, *Kuan fu lei*, p. 10*b*.

"The Jung viscount Kin-tchi . . . said: '. . . our clothes are . . . different from those of the Flowery States.'"—*Lacouperie, Lang. of China*, p. 18.

[For mourning costume see FUNERAL RITES; and for the dress of different ranks see LAWS OF INT.]

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

"From the Han, Wei, and Six dynasties down to the T'ang, the garments worn in the imperial palace were generally narrow; and were not only convenient for walking and serving, but also economical."—[*Yang*] *Shêng-an Wai chi, Ko chih ching yüan*, c. 15, *Kuan fu lei*, p. 11*b*.

"In the time of Ch'in Shih Huang they used robes of three colours, purple, crimson and green, for the dress of officials of the first three classes, but the common people only wore white."—*Kuo ssŭ hua lun, ibid.* c. 16, *Kuan fu lei*, p. 9*b*; see also *Chung hua Ku chin chu, ibid.* p. 4*b*, where it states that the material in both cases was lustring.

"In Ch'in and Chin times they called clothes without ornamental borders *ch'ung chüeh* (褣裾), and in Kiang and Hsiang they called short-lined clothes *t'ung yin* (筒褖)."—*Yu hsien chüeh tai yü, ibid.* c. 15, *Kuan fu lei*, p. 1*b*.

"*Lai sha* (癩裟) were ragged clothes, and *lang sang* (稂褬), worn-out ones."—*Chi yün, ibid.* p. 1*b*.

[The following articles of clothing are referred to in literature dealing with Ch'in and Han times:—White foxskin garment (*hu pai ch'iu* 狐白裘), in *Shih chi, ibid.* c. 16, *Kuan fu lei*, p. 3*a*; *Han shu K'uang hêng chuan, ibid.* p. 3*a*; yellow *ch'an yü* (襜褕), a single garment with straight skirts, in *Han chien pu i chuan, ibid.* c. 15, *Kuan fu lei*, p. 8*a*; *jang* (禳), the garment worn by a cook, in *Ma Kao Chung hua Ku chin chu, ibid.* p. 8*a*; a garment made of five-coloured hair figured with dragons, in *Han shu, ibid.* p. 10*a*; *chu yü* (諸于), a garment with a large skirt, in *Han shu Yüan Hou chuan, ibid.* p. 11*a*; *chi kuang mao ch'iu* (吉光毛裘), a yellow garment, water- and fire-proof, made of the hair of the "fabulous horse," in *Shih chou chi, ibid.* c. 16, *Kuan fu lei*, p. 3*a*; a similar garment made of *ch'ih êrh* (赤兒) skin, in *Wu lei hsiang kan chih, ibid.* p. 3*a*; garments made of leopard, badger, and bamboo-rat skin, in *Han shu, ibid.* p. 3*a*; *chia sha* (袈裟) [with several aliases], surplice, in *Shuo yüan, ibid.* c. 15, *Kuan fu lei*, p. 13*b*; and various ecclesiastical garments, in *Fa yüan chu lin, ibid.* p. 12*a*; *Hsiang chiao shih pien*, p. 13*b*; long thin rose-coloured satin upper garment (worn by a maid), in *Han Wu Ti nei chuan, ibid.* p. 12*b*; the "5 lower garments," "7 middle garments," the "large garment," and the "upper garment," in *Chieh t'an ching, ibid.* p. 12*b*; "golden *ta shu*" (裕褕), loincloth, a warm single garment surrounding the loins, in *Han Wu Ti nei chuan, ibid.* c. 18, p. 22*a*; silk robes, in *Shih chi, ibid.* c. 16, *Kuan fu lei*, p. 6*b*; satin robe figured with storks, in *Ssŭ wang i shih, ibid.* p. 7*a*; *han ju* (汗襦), "perspiration jacket" [with different names in different places], in *Fang yen, ibid.* p. 12*a*; embroidered vest or cape (霞帔 *hsia p'ei*) [introduced by the Emperor *Ch'in Shih*; the *Shih lin kuang chi, ibid.* p. 15*a*, says the name began to be used in the Chin dynasty], in *Wu yüan, ibid.* p. 15*a*; and garments for animals, in *Shih huo chih, ibid.* c. 15, *Kuan fu lei*, p. 11*a*.]

[A single leather garment was worn as a protection from wind and rain. See *Li ling shu, ibid.* c. 53, *Chü ch'u ch'i wu lei*, p. 22*b*.]

"The gown (襖 *ao*) was made in the shape of the robe (袍 *p'ao*). On the day of the winter equinox the Emperor Wên of the Han dynasty granted leave to the imperial attendants, maids of honour, and all officials to wear a gown mostly made of five-coloured embroidered gauze of variegated silk. This was when the name [*ao*] was first introduced."—*Ku chin chu, ibid.* c. 16, *Kuan fu lei*, p. 8*a*.

"The *Shih lu* says: 'In the Three Dynasties there was no *pei* (帔), but in the Ch'in time there was a silk *p'ei* made of thick lustring, and in the Han dynasty it was made of gauze.'"—*Shih lin kuang chi, ibid.* p. 15*a*. See also PERIOD OF DISRUPTION, RESTORATION OF UNITY, and MANCHU PERIOD.

"[As regards] the shirt or short coat (衫子 *shan tzŭ*) the [legendary] Emperor Huang made the upper and lower garments, but for a woman the upper and lower garments were made in one, as she had only one (her husband) to be honoured. In the first year of the Emperor Shih [of Ch'in] a decree was issued ordering that all imperial maids and attendants should wear the *shan tzŭ*, which was also called the 'half garment' (半衣 *pan i*), for it was in demand for its convenience while attending or serving."—*Ku chin chu, ibid.* p. 9*a*. It was made of cotton. *ibid.* p. 9*a*.

"In the 1st year of Shih Huang he ordered the imperial maids to wear the 5-coloured flowery gauze skirt. Down to the present time women at a banquet still wear the short skirt."—*Chung hua Ku chin chu, ibid.* p. 2*a*.

"In the time of the Emperor Hsien women were fond of wearing the skirt long, but the upper [garment] was very short."—*Wu hsing chih, ibid.* c. 18, *Kuan fu lei*, p. 1*b*.

"The *kun* (褌) were the *k'u* (袴), trousers. Of old, a man's *k'u* had no waistband, but a woman's had. It was made in the time of the Emperor Chao of the Han dynasty, and the Empress-Dowager Shang Kuan ordered that both men and women should wear it."—*I yao, ibid.* p. 5*a*. The *Shih chi, Shih lin kuang chi, ibid.* p. 5*a*, says the word *k'u* was first used at the time when the wife of Chao So concealed the posthumous heir to the throne in her breeches.

"In Ch'i and Lu the *k'u* (袴), trousers, were called *ch'ien* (褰), underclothes; in Kuan Hsi they were called *k'u*; the small *k'u* were commonly called by the people of Ch'u *fu jung shan* (芙蓉衫), '*hibiscus shirt*.'"—*Fang yen, ibid.* p. 5*a*. See also *Han shu, ibid.* pp. 5*a*, 5*b*, and *cf.* previous Period. Embroidered trousers are mentioned in *Han kuan i, ibid.* p. 5*b*. Trousers were tied round the waist: *I ya, ibid.* p. 5*a*.

"The Emperor Chang of Han made [the *k'u*, trousers] of thin satin, and added a lower ornamental border called *k'ou* (口)."—*Ku chin chu, ibid.* p. 4*b*. And see preceding Period.

"In Wei Lo women wore no trousers; they only covered their legs with silk; the middle part was strengthened with coarse silk. It was called *tsun* (鐏). The shape was that of the single garment with the straight skirt."—*Shuo wên, ibid.* p. 6*b*.

"The King of the Chao Wa country, with his hair undressed, wore a gold-leaf cap; from his chest hung a silk-adorned handkerchief, and his waist was girdled with figured silk called 'press-waist' (壓腰 *ya yao*)."—*Ying yai shêng lan, ibid.* p. 22*a*.

[Buddhist priests wore red cloth garments. See ECCLESIASTICAL.]

[Girdles, buckles, etc., were of various kinds. A gold *hsi p'i* (犀毘), girdle-clasp, is mentioned in *Han shu, ibid.* c. 17, *Kuan fu lei*, p. 2*a*; a girdle (繫腰 *hsi yao*) of resonant jade, in *Chieh ch'êng yü, ibid.* c. 18, *Kuan fu lei*, p. 22*a*; long belt worn by women, in *Tan ch'ien tsa lu, ibid.* c. 17, *Kuan fu lei*, p. 2*a*; *li* (離), the belt of a jacket, in *Han shu Pan chieh yü fu, ibid.* p. 2*a*; *p'an* (鞶), leather girdle, in *Shên chang ts'o yao, ibid.* p. 3*a*; this began to be made of silk during the reign of the 2nd Emperor of the Ch'in dynasty; *pei tai* (貝帶), jewelled girdle, in *Shih chi, ibid.* p. 7*a*; *wei* (韋), leather girdle, worn by undergraduates, and changed for the *ko* (革), skin girdle, on becoming graduates, in *Hou Han Chou P'an chuan, ibid.* p. 7*a*; bluestone girdle (青石帶 *ch'ing shih tai*), in *Yü huan wei lüeh, ibid.* p. 10*a*; amber girdle ornament, in *Tung an chi, ibid.* p. 12*a*; and others, in *Wang Mang chuan chu, Pei wang hsiao ch'ao, Shuo wên*, and *Hou Han Li i chih, ibid.* pp. 15*a*–15*b*.]

"The ivory bodkin for the jade girdle ornament of the Han dynasty was marked with sleeping silkworms from tip to tail, but its end was curved and sharp."—*Ni ku lu, ibid.* p. 14*b*.

[Socks or stockings (襪 *wa*) are referred to in *Shuo wên, ibid.* c. 18, *Kuan fu lei*, p. 7*b*; *Wang fu ch'ien fu lun, ibid.* p. 8*a*; *Kao wên hui fu yü Wên hui shu, ibid.* p. 8*a*; *Wu hou ching, ibid.* p. 8*b* (the *yä t'ou wa* 鴉頭襪 "crow's head sock," worn by female agriculturists); etc.]

"In the Ch'in dynasty it [the *chüeh*" (屩), grass shoe] was made of silk, and the imperial maids and attendants were ordered to wear it."—*Chung hua Ku chin chu, ibid.* p. 18*a*. But the *chüeh* worn by Shih Wei-lang in the imperial park were of grass: see *Han Pu shih chuan, ibid.* p. 18*a*. See also EARLY and LATER FEUDAL PERIODS.

"The Emperor Wên of Han when he went to Court wore *pu chieh* shoes."—*Shu wu i ming su, ibid.* p. 11*b*. See preceding Period.

"In ancient times the shoe was made of leather, and covered the foot only. Wu Ling, King of Chao, was fond of the Tartar costume, so he changed the shoe (履 *lü*) into the *ti* (䩜), which reached up the leg—the present boot (靴 *hsüeh*)."—*Ming i k'ao, ibid.* p. 18*b*.

"*Sa* (鞜) were children's shoes; *ti* (鞮), leather shoes; *ts'u* (麤), grass shoes; and *hung* (絇), hempen shoes."—*Shuo wên, ibid.* p. 10*a*.

[Other shoes are mentioned in—*Kuo ssŭ hua lun, ibid.* p. 10*b* (shoes of silk and of leather substituted for grass ones of former times); *Ku i chuan, ibid.* p. 10*b*; *Chan kuo ts'ê, ibid.* p. 11*b* ("pearl shoes"); *Shih i chi, ibid.* p. 11*b* (shoes of red jade); *Tan ch'ien lu, ibid.* p. 13*a* ("embroidered mandarin-duck," *i.e.*, the "couched-tiger-head" shoe embroidered); *Pao P'u Tzŭ, ibid.* p. 15*b* (red jade slippers); *Pi ts'ung, ibid.* p. 17*a* (gilt-tipped shoes); *Fêng su t'ung, ibid.* p. 20*b* (wooden overshoes or pattens, 木屐 *mu chi*).]

"The cap (冠 *kuan*) was the head-dress; it was the generic name applied to the ceremonial bonnet (弁 *pien*) and coronet (冕 *mien*)."—*Shuo wên, ibid.* c. 13, *Kuan fu lei*, p. 1*a*.

"The disposition of the *hsieh chai* (獬豸), a fabulous animal, was to gore dishonest people, so that the high provincial authorities made their caps in imitation of the shape of its horn."—*Han kuan i, ibid.* p. 4*b*.

"Liang Ch'i changed the imperial . . . costume, making the head-band low and the cap narrow."—*Hsü Han shu, ibid.* p. 7*b*.

"The head-dress of foreign or Western countries was made of wool, and called felt hat. It was the same as the felt broad-brimmed hat of the present time. Both the people of Ch'in and Han were fond of wearing it."—*Shih lu, ibid.* c. 14, *Kuan fu lei*, p. 16*b*.

"In the Han dynasty the ladies in the palace and those in the favour of the Emperor first had granted them permission to wear greenish or red-silk *hibiscus matabilis* bonnets."—*Shih wu yüan shih, ibid.* c. 13, *Kuan fu lei*, p. 8*a*; see also *Ts'ui Pao Ku chin chu, ibid.* p. 8*a*.

[Mention is made of caps of various kinds. "The *t'ung t'ien* (通天) cap was the cap for the Emperor" (*K'uei yung tu tuan, ibid.* p. 2*b*); the *ch'üeh fei* (却非) was worn by the *P'u Shê*, or Prime Minister, in the Ch'in dynasty (*Yü fu chih, ibid.* p. 3*b*); another cap worn by high officials was the *ch'üeh ti* (却敵) cap, see *Tu tuan, ibid.* p. 3*b*; the *fang shan* (方山) cap, worn by dancers at religious ceremonies, is mentioned in *Tu tuan, ibid.* p. 4*a*; and in *Shih wu kan chu, ibid.* p. 4*a*; the *tiao shan* (貂蟬), "sable-locust" cap, with figures of locusts and a sable tail for ornament, in *Han kuan i, ibid.* p. 5*a*; the *hu pén* (虎賁) cap, with 2 pheasant's tails stuck in it, in *Han kuan i, ibid.* p. 6*a*; the *ho* (鶡), pheasant, cap, worn by military officers, in *Ch'in ching, ibid.* p. 6*a*; "bamboo-bark cap" (the *ch'iao wei* 鵲尾, "magpie's tail" cap of Manchu times), in *Han shu, ibid.* p. 6*b*; caps shaped like shields (arising out of Fan K'uai's action at Hung Mên), in *Chin shu, ibid.* p. 7*a*; the *chiao jang* (交讓) cap, in *Han chi, ibid.* p. 7*a*; crowns (冕 *mien*), 8 inches broad and 6 inches wide both in ancient and modern times, in *San li t'u, ibid.* p. 13*a*; the "unicorn casque" (麟韋之弁 *lin wei chih pien*), in *Han shu, ibid.* p. 17*a*; leather or skin casque (皮弁 *p'i pien*), made of deerskin and shaped like two hands closing together, in *Yen Shih-ku Han shu chu, ibid.* p. 15*b*; and in *Yü fu chih, ibid.* p. 15*b*, where it is described, and the *wei mao* (委貌) cap, worn by Princes and Great Ministers whilst performing the rites of the chase, referred to.]

[Caps had strings (紘 *hung*) and tassels (纓 *ying*): see *Shuo wên, ibid.* p. 1*b*; *Han shu Chiang ch'ung chuan, ibid.* p. 1*b*.]

"The *Shih ming* [says]: 'The *chin* (巾), kerchief, means to keep, as it was for keeping the position of the four classes (scholar, farmer, workman, and merchant). It is said in the *I Li* that at 20 a boy attains to manhood; if a scholar he [then] wears the cap, and if one of the common people, the kerchief. Thus in ancient times those of or above the rank of scholar wore the cap, but not the kerchief, which was only for the common people. In the Ch'in dynasty the people were called 'black heads,' and in the Han servants were called 'green heads.' It is evident from what the *Han Records* says that the kerchief was the [head] dress of menials. But in subsequent ages it became the common dress both of low and high born, and was called the *yen chin* (燕巾), 'swallow kerchief.'"—*Cho kêng lu, ibid.* c. 14, *Kuan fu lei*, p. 1*a*. The *Chou Ch'i ming i k'ao, ibid.* p. 12*a*, says the people were called "black heads" because they wore black headkerchiefs.

"The headkerchief (幘 *tsê*) of ancient times was an article of attire for those of inferior rank who were not entitled to wear the cap."—*Ying Shao Han kuan i, ibid.* p. 6*a*.

"That which covered the coiffure was called *tsê chin* (幘巾), head-cloth; it was also known as *Ch'êng lu* (承露), a 'dew-catcher,' or *fou chi* (覆髻), 'coiffure-protector'—these were common names in Chao and Wei."—*Yang Hsiung fang yen, ibid.* p. 6*a*.

"In ancient times they had the cap (冠 *kuan*) but no head-cloth (幘 *tsê*); this was made in the Ch'in dynasty as a head-dress for a military officer, and they also made a dark red turban to distinguish the high-born from the low."—*Yü fu chih, ibid.* p. 6*b*. See also *Yü fu tsa shih, ibid.* p. 6*b*, where it is ascribed to the reign Yen Hsi (A.D. 158–167) of the Emperor Huan of the Han dynasty.

"As the Emperor Yüan of Han had plenty of hair on his forehead he did not like it to be seen by others and used a skull-cap or head-band (抹幘 *chin tsê*) to wrap round his head. In ancient times the shell of caps was made hard, and covered the head from the forehead to the top, like the ceremonial cap of the present day. But in subsequent ages they made the cap small, so that it just covered the knot of hair. Putting on the head-band before wearing the cap, and covering with the kerchief after having put on the head-band and cap—this was in imitation of the dress of the Emperor Yüan of Han."—*K'uei yung tu tuan, ibid.* p. 1*a*.

"The headkerchief (頭巾 *t'ou chin*) was not heard of in ancient times, until Wang Mang of Han, who had a bald head, began to wear it, or sometimes used a piece of black gauze to wrap round his head [lit. hair]; whence the fashion arose; but it was different from that of the present time."—*Chu shih yin k'ao, ibid.* p. 1*b*. And see SUNG PERIOD.

"In the time of the Emperor Ling [A.D. 168–190], Chang Chiao collected 160,000 men, who all wore the yellow kerchief or turban (黃巾 *huang chin*)."—*Hou Han shu, ibid.* p. 5*a*.

[A "drying-room" for clothes is mentioned in *Sung Pu Tzŭ Yang yüan yüan su, ibid.* c. 15, *Kuan fu lei*, p. 2*a*. See HABITATIONS.]

Period of Disruption (221 *to* 589).—*Table IV.*

[Clothing generally underwent little if any change. Fur and skin garments are mentioned in *Hsi ching tsa chi, Ko chih ching yüan*, c. 16, *Kuan fu lei*, p. 3*a*; *Ch'i shu, ibid.* p. 3*b*; *Pei shih, ibid.* p. 3*b*; gauze robes of various colours, in *Yü t'an pi chi, ibid.* p. 7*a*; *Yeh chung chi, ibid.* p. 7*a*; a "gold-beast robe" (金獸袍 *chin shou p'ao*), in *Lau I-kung ch'i shih, ibid.* p. 7*a*; "phœnix-tail robe" (鳳尾袍 *fêng wei p'ao*) in *Ch'ing i lu, ibid.* p. 7*b*; robes of silk, pongee, and cloth, in *Nan shih, ibid.* p. 8*b*; *Wai shu, ibid.* p. 7*b*; woven jackets and "duck and drake" jackets, in *Hsi ching tsa chi, ibid.* p. 12*a*; a grass garment, in *Chin shu, ibid.* c. 18, *Kuan fu lei*, p. 1*b*; silk skirt without ornamental borders, in *Ming Tê Ma Huang hou chuan, ibid.* p. 2*b*; embroidered skirts adorned with pearls, in *Chên chu ch'uan, ibid.* p. 3*a*; *Pei shih, ibid.* p. 3*a*; "thousand-fold skirts of red cloud-like gauze," in *Ch'ing i lu, ibid.* p. 4*a*; cotton skirts, in *Hsi ho chi, ibid.* p. 4*a*; *Nan shih, ibid.* c. 15, *Kuan fu lei*, p. 9*a*; gold-thread trousers, in *Yeh chung chi, ibid.* c. 18, *Kuan fu lei*, p. 5*b*; checked trousers, in *Ch'ing i lu, ibid.* p. 6*a*; "lined black-spotted embroidered trousers," in *Pei chiang chi, ibid.* p. 6*a*; "trousers of everlasting harmony" (worn by newly-married couples), in *Mou ch'ên tsa ch'ao, ibid.* p. 6*a*; yellow light gauze trousers, in *Nan shih, ibid.* p. 7*a*; trousers embroidered with gold-thread, in *Hsi ching tsa chi, ibid.* p. 7*b*; a garment made of storks' feathers, in *Shih shuo, ibid.* c. 16, *Kuan fu lei*, p. 3*b*; and a lion-skin riding jacket, worn by the body-guard near the chariot, in *Nan shih, ibid.* c. 18, *Kuan fu lei*, p. 22*b*; *Wên Ch'ang tsa lu, ibid.* p. 23*a*.]

"The Emperor Ming of Wei proposed that the robe adorned with the marks of axes and 黼 of princes and Great Ministers should be much less elaborate than those of the Emperor—for example, for the Emperor embroidered marks should be used, and for the princes and Great Ministers woven marks. When the Chin governed the empire this system was kept unchanged."—*Chin shu, ibid.* c. 15, *Kuan fu lei*, p. 3*a*.

"In the Northern Ch'i State the Emperor wore a crimson robe; a high minister generally a yellow figured-silk robe; and all the officials, scholars, and common people had the same costume."—*Ku chin chu, ibid.* c. 16, *Kuan fu lei*, p. 4*b*.

"The Emperor Wên of Wei bestowed upon the imperial maids crimson-coloured silk drawers; these were the *k'un* (褌) of the present time."—*Chung hua Ku chin chu, ibid.* c. 18, *Kuan fu lei*, p. 6*b*.

"In the reign Yung Chia (A.D. 307–13] of the Chin dynasty they made a *p'ei* (帔), vest or cape, of dark rose colour."—*Shih lin kuang chi, ibid.* c. 16, *Kuan fu lei*, p. 15*a*. See also ABSOLUTE MONARCHY, RESTORATION OF UNITY, and MANCHU PERIOD.

"The eunuch Ma Chou sent a memorial to the throne requesting that on the day of the winter equinox an extra small and short gown should be allowed to be worn. His request was granted by decree, and it became established as a permanent custom."—*Chung hua Ku chin chu, ibid.* p. 8*a*.

"Formerly the common people as well as officials used a piece of square silk cloth in front of their chests, called *chia liang* (裌兩)."—*Ch'i pên chi, ibid.* c. 18, *Kuan fu lei*, p. 22*a*; see also *Tz'ŭ lin hai ts'o, ibid.* p. 22*b*.

[Girdles and girdle ornaments are frequently mentioned; see *Ch'ing i lu, ibid.* c. 17, *Kuan fu lei*, p. 2*a*; *Chin shu, ibid.* p. 3*a*; *Pei shih, ibid.* p. 7*b*; *Wei lüeh, ibid.* p. 10*a*; *Nan shih, ibid.* p. 10*a*; *Chih Yü-chüeh i chu, ibid.* p. 12*b*; *Huan fêng chuan, ibid.* p. 12*b*; etc.]

[Hemp stockings are mentioned in *Chin Hui Ti ch'i chü chu, ibid.* c. 18, *Kuan fu lei*, p. 8*a*; jade shoes, in *Nan shih, ibid.* p. 11*b*; leather and silk shoes, in *Yen t'ieh lun, ibid.* p. 11*b*; *Wei Wu nei shih ling, ibid.* p. 12*a*; *Nan shih, ibid.* p. 12*a*; grass shoes, in *Ku chin chu, ibid.* p. 13*a*; *Chih Ku Tzŭ, ibid.* p. 13*b*; *Ch'ing i lu, ibid.* p. 13*b*; *Yen lou yu shih, ibid.* p. 16*b*; *Cho kêng lu, ibid.* p. 16*b*; boots, skin and other, in *Nan shih, ibid.* p. 18*b*; *Ch'ün shu k'ao so, ibid.* p. 19*a*; wooden shoes, in *Chin shu, ibid.* p. 20*b*; *Pi ts'ung, ibid.* p. 20*b*; *Chiao chou chi, ibid.* p. 21*a*; and spiked shoes, in *Chin shou, ibid.* p. 20*b*; p. 21*a*.]

"The *lü* (履), shoe, . . . in the reign Yung Chia of the Chin dynasty . . . was made of silk."—*Shih lu, ibid.* p. 16*a*. See also EARLY and LATER FEUDAL PERIODS and RESTORATION OF UNITY.

"The shoes of the Six dynasties [A.D. 420–589] were mostly made of grass."—*Pi ts'ung, ibid.* p. 12*b*.

[A large variety of hats and caps were worn. The *wei mao* (委貌), a ceremonial cap made of black silk, is mentioned in *Chin shu, ibid.* c. 13, *Kuan fu lei*, p. 2*a*; the *yüan yu* (遠遊) cap, worn by an heir apparent, in *Chin shu, ibid.* p. 3*a*; *Liang shu, ibid.* p. 3*a*; cap or hat of otter's fur, in *Nan shih, ibid.* p. 6*b*; hats made of silver, in *Ch'ing i lu, ibid.* p. 7*b*; *t'o yo* (橐籥), the cap worn by a Taoist priest, in *Ch'ing i lu, ibid.* p. 11*a*; crowns (冕 *mien*), sometimes very elaborately adorned, in *San li t'u, ibid.* p. 11*b*; *Chin shu, ibid.* p. 13*b*; *T'ung tien, ibid.* p. 13*b*; casques (弁 *pien*) of skin, etc. (which now were adorned with the hairpin in addition to the tassel), in *Hui yüan hsiang chu, ibid.* p. 16*a*; *Chin shu, ibid.* p. 15*b*; p. 16*b*; *Yeh chung chi, ibid.* p. 17*a*; *Hsi ching tsa chi, ibid.* c. 14, *Kuan fu lei*, p. 12*b*; *Chung hua Ku chin chu, ibid.* p. 12*b*; *Sung shu, ibid.* p. 13*a*; yellow silk-thread hat (黃綸帽 *huang lun mao*), in *Nan shih, ibid.* p. 14*a*; *wên mao* (溫帽), "warm hat," adapted from the mountaineer's hat and worn at the winter solstice, in *Chung hua Ku chin chu, ibid.* p. 14*a*; "lotus-leaf hat" (蓮葉帽 *lien yeh mao*), worn by grey-haired carriers, in *Pei shih, ibid.* p. 14*a*; "dragon-fly hat" (蜻蜓帽 *ching t'ing mao*), in *Chuang lou chi, ibid.* p. 15*a*; light gauze hat, in *Ch'ing i lu, ibid.* p. 15*b*; ceremonial and other caps, in *Yün shu, ibid.* p. 17*b*; *Pei shih, ibid.* p. 18*a*; *li tzŭ* (笠子), broad-brimmed hat, in *Shih lin kuang chi, ibid.* p. 18*b*; etc.]

"The tail of the marten or of the yellow rat was hung on the imperial attendants' head-cloths."—*Liu Chên-ta Wei Wên Ti chien, ibid.* p. 7*a*.

[Kerchiefs (巾 *chin*) and headkerchiefs (幘 *tsê*) are frequently mentioned: see *Chin shu, ibid.* p. 3*b*; *Nan shih, ibid.* p. 4*a*; *Yü Chang chi, ibid.* p. 4*a*; *Lei ch'ing jih cha, ibid.* p. 4*b*; *Yü fu chih, ibid.* p. 6*b*; *Wu tsa tsu, ibid.* p. 7*a*; *Nan shih, ibid.* p. 7*a*; and for felt turbans, *Chin shu, ibid.* p. 12*a*.]

From the Restoration of Unity to the End of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

[Fur garments are mentioned in *K'ung liu t'ieh, Ko chih ching yüan*, c. 16, *Kuan fu lei*, p. 3*b*; *Ming huang tsa lu, ibid.* p. 3*b*; *Li Po Wan yüeh chin ling shih hsü, ibid.* p. 4*a*; light gauze seamless garments, in *K'ung liu t'ieh, ibid.* c. 15, *Kuan fu lei*, p. 11*b*; light "dragon" silk garment, in *Tu Yang tsa pien, ibid.* p. 11*b*; surplice of gold-foil, in *Chao yeh ch'ien tsai, ibid.* p. 14*a*; *pien shan* (褊衫), "narrow" or "petty" garment, to cover the arms, in *Shuo yüan, ibid.* p. 14*b*; *k'uan i* (寬衣), "loose garment," embroidered with silk, in *Yüan shih pi shu, ibid.* p. 14*b*; garments woven out of cotton, with figures of hills and streams, in *Ch'i hsiu lei kao, ibid.* p. 15*a*; *na i* (衲衣), cassock, in *Chih tu lun, ibid.* p. 15*a*: garment embroidered with gold thread, in *Pei shih, ibid.* c. 16, *Kuan fu lei*, p. 7*a*; a robe with characters on it in gold and silver, in *Chi chih chi, ibid.* p. 7*a*; purple robe adorned with gold characters, in *T'ang shu, ibid.* p. 7*a*; embroidered robes adorned with bank notes, in *T'ang ch'ê fu chih, ibid.* p. 7*a*; "gold" (金 *chin*) and "black" (烏 *wu*) robes, in *Li shih chuan, ibid.* p. 7*b*; *lan shan* (襴衫), dress worn by graduates (originated at this time), in *Shih wu yüan shih, ibid.* p. 10*a*; *pan pei* (半臂), "half-arm," called *ch'o tzŭ* (綽子), in Chiang and Huai (introduced in the Sui dynasty as a garment for scholars), in *Shih lu, ibid.* p. 13*b*; *p'ei* (帔), mantle worn by women after marriage, in *Shih wu yüan shih, ibid.* p. 15*b*; *mei* (袂), a woman's waist-garment, in *Tan ch'ien tsung lu, ibid.* p. 16*a*; *pi* (韠畢), knee-cover, or knee-pad (the 韍 *fu* of the *Shuo wên*), in *Kuo Chih -hsüan T'ang yün, ibid.* c. 17, *Kuan fu lei*, p. 15*b*; *Ch'ün shu k'ao so, ibid.* p. 15*b*; *fu* (韍), a leather *pi*, in *Shên chang ts'o yao, ibid.* p. 16*a*: network gauze skirts, in *Chung hua Ku chin chu, ibid.* c. 18, *Kuan fu lei*, p. 3*a*; skirts made of birds' feathers, which appeared to be of different colours from different sides, in *Wu hsing chih, ibid.* p. 3*b*; trousers with knitted figures on them, in *Sou shên chi, ibid.* p. 5*b*; silk trousers, in *Hai mo hui yen, ibid.* p. 6*a*; violet "flower-grass" trousers, in *Chieh ch'êng yü, ibid.* p. 7*a*; crimson silk trousers, in *Tz'ŭ lin hai ts'o, ibid.* p. 7*a*; and painted waterproof garments, in *T'ang shu Tu Ya chuan, ibid.* c. 15, *Kuan fu lei*, p. 10*b*.]

"The Chinese grown-up people and children dress in silk, summer and winter. . . . In winter, men cover themselves with two, three, four, or five pairs of drawers, or even more, according to their means. Their object is only to keep the lower part of the body warm, because of the great moisture of the climate. . . . But in summer they wear a single tunic of silk, or something of the same kind. They do not wear turbans."—*Reinaud, Relation des Voyages, etc.*, i. 21–2.

"The *Pi t'an* says: 'Chinese clothing, from the Northern Dynasty onwards, followed that of the Tartars, having narrow sleeves, and the colours most in demand being crimson and green. In the reigns Wu Tê [618–27] and Chêng Kuan [627–50] it was kept unchanged, but in the K'ai Yüan period [713–42] it was somewhat extended.' The *T'ung tien* says: 'Chou Yü-wên was the first to add the undershirt (襕 *lan*) inside the lower part of the Court dress. From that time it became the fashion [to wear this underskirt].'"—*Shih wu yüan shih, Ko chih ching yüan*, c. 16, *Kuan fu lei*, p. 4*b*.

Wên Ti "set an example of simplicity and economy in . . . dress."—*Giles, Bio. Dic.*, p. 898.

"The Emperor Wên of Sui first fixed yellow as the particular colour of the Emperor's clothes."—*Wu yüan, Ko chih ching yüan*, c. 15, *Kuan fu lei*, p. 3*a*.

"The Emperor Yang fixed the colour of the clothes for all the ranks of officials. Those of the 3rd degree wore purple; of the 5th, vermilion; of the 6th and lower degrees, green; a clerk, azure; the common people, white; and merchants, black."—*Hsüan lan, ibid.* p. 3*a*.

The same emperor "made long sleeves [in women's costume]."—*Wu yüan, ibid.* c. 16, *Kuan fu lei*, p. 12*b*. For the introduction of wide sleeves see EARLY FEUDAL PERIOD.

"The costumes of the Empresses of the T'ang dynasty were of 3 kinds: the first was called *wei i* (褘衣), embroidered robe, worn when attending Court; the second, *chü i* (鞠衣), worn when rearing silkworms; and the third *li i* (禮衣), worn at meetings or at dinner parties. The present dynasty preserved the names only of garments formerly worn [called] dragon, phœnix, pearl, and beautiful-plumage garments and embroidered vest."—*Ch'ün shu k'ao so, ibid.* c. 15, *Kuan fu lei*, p. 5*b*.

"Chang Yün of T'ang, otherwise known as Mr. Hung Yai, used to wear garments made of the fibre of the red plantain. When he was walking in the street people could not tell his age."—*Tung Ch'i chi shih, ibid.* p. 10*a*.

"The *tai wei* (an officer in charge of military affairs) Chang Sun Wu Chi, proposed [for consideration of the Throne] that anyone wearing the robe (袍 *p'ao*) should add to it the underskirt (襴 *lan*). Crimson, purple and green colours [should] follow the rank, white being appropriated to the common people."—*T'ang ch'ê fu chih, ibid.* c. 16, *Kuan fu lei*, p. 5*a*.

"Li Tê-yü, Magistrate of Huai Nan Province, ordered that all the women within his locality should make the four-feet sleeves 1 foot 5 inches wider, and that the skirts, which trailed along the ground 4 or 5 inches, should be decreased to 3 inches."—*Hsin chih, ibid.* c. 18, *Kuan fu lei*, p. 2*a*.

"For the skirt of a woman not more than 5 rolls [of material] should be used, and the train should not be longer than 3 inches."—*T'ang kuan fu chih, ibid.* p. 2*a*.

"The *kao* (縞) was a white-coloured [silk] garment worn by men; the *ch'i* (縩) was an azure and mugwort-coloured garment worn by women."—*Shih chu, ibid.* p. 21*a*.

"A piece of ox-skin, painted with vermilion varnish, for covering the neck was called 'neck-protector' (固項 *ku hsiang*)."—*Ch'i man ts'ung hsiao, ibid.* p. 22*a*.

"In the *Song of the Frontier*, written by a T'ang poet, it says: 'The gold-adorned girdle is heavy; the embroidered silk-sewn ear-cover (耳衣 *êrh i*) is cold.' The ear-cover or ear-cap was the same as the ear-warmer (暖耳 *nuan êrh*) of the present time."—*Tan ch'ien lu, ibid.* p. 22*a*.

"In the reign K'ai Yüan [713–42] an order was issued that concubines of princes and those of lower rank might wear the *p'ei* (帔) on ordinary occasions."—*Shih lin kuang chi, ibid.* c. 16, *Kuan fu lei*, p. 15*a*. See also ABSOLUTE MONARCHY, PERIOD OF DISRUPTION, and MANCHU PERIOD.

[Girdles and belts continued to be worn. Various kinds are mentioned in *T'ang chiu shih, ibid.* c. 17, *Kuan fu lei*, p. 1*a*; *Sui shu, ibid.* p. 2*a*; p. 3*b*; *Pei shih, ibid.* p. 3*b*: *Chung hua Ku chin lu, ibid.* p. 3*b*; p. 4*a*; *Chü fu chih, ibid.* p. 3*b*; *Yu Yang tsa tsu, ibid.* p. 7*b*; *Ming huang tsa lu, ibid.* p. 7*b*; *Tu yang pien, ibid.* p. 8*a*; *Lung chiang mêng yü lu, ibid.* p. 9*b*; *T'ang po kuan chih, ibid.* p. 14*a*; etc.]

[References occur to hats, caps, and headkerchiefs of numerous kinds. The *t'ung t'ien* (通天) cap continued to be used by the Emperor on ceremonial occasions: see *T'ang shu, ibid.* c. 13, *Kuan fu lei*, p. 2*b*; the gauze hat is mentioned in *Chung hua Ku chin chu, ibid.* c. 14, *Kuan fu lei*, p. 14*b*; hat of black wool, in *Chao yeh ch'ien tsai, ibid.* p. 15*a*; "mat-hat," afterwards changed into a felt hat, in *Li Chi-wêng Tzŭ hsia lu, ibid.* p. 15*a*; "jade leaf bonnet," in *Ming huang tsa chi, ibid.* c. 13, *Kuan fu lei*, p. 8*a*; hat in the shape of a stork made of gold wire and adorned with pearls (worn by singing girls), in *Su Ê Tu yang pien, ibid.* p. 8*a*; cap of black bear-skin, in *K'ung liu t'ieh, ibid.* p. 10*b*; crown hung with white beads, in *T'ung tien, ibid.* p. 13*b*; kerchiefs, in *Chao yeh ch'ien tsai, ibid.* c. 14, *Kuan fu lei*, p. 2*a*; *Ch'in tsai ssŭ chi i, ibid.* p. 2*a*; *K'ung liu t'ieh, ibid.* p. 2*b*; *fu yu chin* (拂油巾), "anti-grease kerchief," in *Huan hua lü ti chih, ibid.* p. 4*a*; white gauze kerchiefs (接羅 *chieh li*), in *Yen fan lu, ibid.* p. 4*b*; green headkerchiefs (worn by criminals), in *T'ang shih, ibid.* p. 5*a*; red headkerchiefs, in *T'ung tien, ibid.* p. 7*b*; deer-skin headkerchief, in *K'ung liu t'ieh, ibid.* p. 8*a*; cowl (幞頭 *po t'ou*) (round, square, with soft or hard "feet," *i.e.*, the cloth folded into the shape of a horn), in *Shên chang chü yao, ibid.* p. 8*b*; the same with the "feet" adorned with pearl beads strung on silver wire, in *Lo chung chi i, ibid.* p. 10*a*; *chieh li* (嚇蘿), a cap made out of herons' plumes and called *lu kun* (鷺緄), "heron dress," in *Êrh ya chu, ibid.* p. 17*b*.]

[Suleyman says that the Chinese women go out with their heads uncovered, but the men wear a kind of cap.]—*Reinaud, Relation des Voyages, etc.*, pp. 23, 24, 47.

"Ma Chou proposed that in binding [the head-cloth on] both sides of the head 3 folds should be made to represent the three powers (Heaven, Earth and Man), and 2 folds on the front 'feet' to represent the dual principles (*yin* and *yang*). This was granted by a decree."—*T'ang shih, Ko chih ching yüan*, c. 14, *Kuan fu lei*, p. 9*a*.

[Stockings, socks, shoes, boots, leggings, etc., were worn. Stockings with the leg embroidered are mentioned in *Chung hua Ku chin chu, ibid.* c. 18, *Kuan fu lei*, p. 8*a*; *Chih hsü ko tsa tsu, ibid.* p. 8*b* (stockings were now commonly called "knee trousers"); *T'ai chên wai chuan, ibid.* p. 8*a*; "thousand thickness" stockings, in *Ch'ing i lu, ibid.* p. 8*a*; knee-caps and leg-guards, in *Yü tung hsü lu, ibid.* p. 8*b*; gaiters (偪 *pi*), in *I ya, ibid.* p. 9*a*; puttees (縢 *t'êng*), in *Ming i k'ao, ibid.* p. 9*a*; silk "gold-thread" shoes, in *Ch'ing i lu, ibid.* p. 12*a*; leather shoes and cotton shoes, in *Ts'ui Shih Ssŭ min yüeh ling, ibid.* p. 12*a*; a "bird's-head shoe," adorned with pearls and with sandal-wood sole, in *Lang hsüan chi, ibid.* p. 14*a*; "figured shoe" (文履 *wên li*), in *Tsao lin, ibid.* p. 14*b*; *Ch'ün shu k'ao so, ibid.* p. 17*b*; ornamented sleeping shoes, containing aromatic powders, in *Ts'ai lan tsa chih, ibid.* p. 17*b*; sheepskin boots with the bandage ornament (on the shoe the string or lace was dropped, remaining only as an ornament), in *Chi yüan, ibid.* p. 19*a*; leather boots, in *Shu wu i ming su, ibid.* p. 20*a*; deerskin boots, in *T'ang shu, ibid.* p. 19*a*; rush-boots, in *T'ung chih, ibid.* p. 20*a*; water-proof boots, in *Shih wu yüan shih, ibid.* p. 20*a*; and pattens, in *Lei ch'ing jih cha, ibid.* p. 21*a*; *I ya, ibid.* p. 21*a*.]

"Some said that Ma Chou [A.D. 601–48] first made it [the *lü* (履), shoe,] of hemp and called it *hsieh* (鞋)."—*Shih lu, ibid.* p. 16*a*. See also EARLY and LATER FEUDAL PERIODS and PERIOD OF DISRUPTION.

[The *Pi ts'ung, ibid.* p. 17*a*, says that the four kinds of shoes, *lü, hsi, hsi*, and *chi* were nearly alike, and were worn by both men and women, but when the practice of foot-binding (see BODILY MUTILATIONS) was introduced were appropriated to men.]

907–960.

"The costumes of the Empresses of the Later Chou dynasty [were as follows]: when gathering cocoons they wore the 'golden pheasant' garment (鷩衣 *pieh i*); when hearing instructions, the 'silver pheasant' garment (鶡衣 *chao i*); and when visiting their parents, the 'bird garment' (翟衣 *tz'ŭ i*)."—*Tan yen lu, Ko chih ching yüan*, c. 15, *Kuan fu lei*, p. 5*b*.

[Garments painted to represent clouds and red mist are mentioned in *Wu Tai shih, ibid.* p. 11*b*.]

"In the later years of Wang Yen of Shu most people wore small hats which only just covered the crowns of their heads; when they stooped down the hats forthwith fell off; they were called 'brain-hurting hats.' On account of this bad name Wang Yen forbade it to be worn. He himself was fond of wearing a large hat."—*Wu Tai shih, ibid.* c. 14, *Kuan fu lei*, p. 15*b*.

"The ancients used 3 feet of black gauze to wind round their heads and called it 'head-cloth' (頭巾 *t'ou chin*). The common people used a cheap black silk-gauze to wrap up their hair in; this was also the head-dress of the military class. Later on [the Emperor] Wu Ti of the Later Chou cut it down to the *po t'ou* (襆頭), hood, or cowl."—*Erh i shih lu, ibid.* p. 8*b*.

Sung Period (960 *to* 1280).—*Table VI.*

[Upper classes wore garments made of sable or skin of the silver rat; lower classes of "sheep-rat" and "sand-fox"; see *Yeh lung liao chih, Ko chih ching yüan*, c. 16, *Kuan fu lei*, p. 2*b*. Garments were adorned differently to suit the seasons: see *Shih i chi, ibid.* c. 15, *Kuan fu lei*, p. 9*b*, and *cf.* DECORATION OF PRODUCTS.]

"At night, if one wore lambskin garments, the cold would pierce through by the 2nd watch; if fox-skin garments, one

could bear the cold till the 3rd watch; if marten-fur garments, to the 4th watch—this was frequently proved by the people of the North."—*Chieh an man pi, ibid.* c. 16, *Kuan fu lei*, p. 2*b*.

"When the Emperor retired from the Court to his private hall he wore a gauze hat and vest, [so] it is evident that the latter had already been introduced at the beginning of the dynasty."—*Chu tzŭ yü lu, ibid.* p. 14*a*.

"The upper and lower garments of the imperial maids of the Emperor Hui Tsung of the Sung dynasty were musk coloured and made of gold gauze."—*Chiao shih lei lin, ibid.* c. 15, *Kuan fu lei*, p. 11*b*.

"The yellow gauze upper garment (黃 羅 襬 *huang lo lo*) was the dress of a nurse."—*Sung shu, ibid.* p. 11*b*.

"The *chü* (袪) was the cuff of the present time, and the *mei* (袂) the sleeve."—*Ssŭ-ma Wên Kung shu i chu, ibid.* c. 16. *Kuan fu lei*, p. 12*b*.

[For girdles, etc., see *Ko ku yao lun, ibid.* c. 17, *Kuan fu lei*, p. 4*b*; *Hsü wén chien chin lu, ibid.* p. 4*b*; etc.]

"T'ai Tsu of the Sung dynasty arranged the costumes of all his officers. To the censors and judges' caps he added the *hsieh ch'ai* (獬 豸). On the 1st day of the 1st moon or at the winter solstice, when going to attend court, the censor rode on horseback, wearing uniform, and capped with the black *ch'ai* cap."—*K'ung liu t'ieh, ibid.* c. 13, *Kuan fu lei*, p. 4*b*. *Cf.* LATER FEUDAL PERIOD.

"The bonnet of the ancients was made of varnished gauze, adorned with gold, silver, pearls, feathers, or variously coloured flowers—but there was no fixed rule. In Jên Tsung's time [1023–64] the bonnet and comb [worn] in the palace were changed to those made of white horn: the former was 3 feet long and sometimes reached down to the shoulder, whilst the latter was one foot long. Someone remarked that this was contrary to usage, and Jên Tsung also disliked it as being too wasteful. In the 10th moon of the 1st year of the reign Huang Yu [1049], a decree was issued that neither inside the palace nor outside should the bonnet and comb be made of horn, that the bonnet should not be broader than one foot, nor longer than four inches, and that the comb should not be broader than four inches. Accordingly no one dared to transgress this rule throughout [the Emperor's] lifetime. Afterwards, however, extravagance became general [again]: the bonnet was not only made of white horn but also of fish-skulls, and the comb also of ivory and tortoise shell."—*Yen i i mou lu, ibid.* p. 8*b*.

"In the 12th intercalary moon in the first year of Ch'ien Tê [963] a decree was issued that in the equipage of the Emperor no pearls or jade should be used to adorn the crown."—*Ch'ang pien, ibid.* p. 14*a*.

"At the beginning of the present dynasty scholars wore deerskin caps, made after the skin casque, and without a kerchief. Afterwards the topless headkerchief made of purple gauze was seen—it was called *é tzŭ* (額 子), 'forehead'; and later on *chü jén* graduates began to use long-topped headkerchiefs of thin purple silk hanging down to the back, in order to distinguish the official dress from that of the common people. At the present time scholars also wear the 'flower-top' headkerchief of the common people. By degrees, *fu* (幅), 'roll of cloth,' and *hsiao yao* (逍 遙), 'roaming far,' kerchiefs came to be made."—*Mi Fei Hua shih, ibid.* c. 14, *Kuan fu lei*, p. 2*b*.

"The *t'ung ting* (桶 頂), square-topped hat, was the [head] dress of a retired officer."—*Chu tzŭ yü lu, ibid.* p. 16*a*.

[For hats made of white gauze see *Yen fan lu, ibid.* p. 13*a*; and for a "golden dragon" hat see *Shan t'ang ssŭ k'ao, ibid.* c. 13, *Kuan fu lei*, p. 8*a*.]

"Later [see ABSOLUTE MONARCHY] the Sung dynasty began to make various kinds [of headkerchiefs], such as round ones representing heaven, and square ones representing earth."—*Chu shih yin k'ao, ibid.* c. 14, *Kuan fu lei*, p. 1*b*.

"The *pu lan* (不 闌) band was a band worn by the girls of Man to tie their hair. It was like a band of thread; *pu lan* meant variegated."—*Ch'i man ts'ung hsiao, ibid.* c. 17, *Kuan fu lei*, p. 14*a*.

"The way of binding the head-cloth (幞 頭 *po t'ou*) was to cut a piece of gauze [large enough] to cover the head with all the hair, and to bind two 'feet' [horns] on the back of the head."—*Yen fan lu, ibid.* c. 14, *Kuan fu lei*, p. 9*a*.

"In ancient times there were the *hsi* (舃), *lü* (履), and *chü* (屨), but no boot; so the word boot (靴 *hsüeh*) is never seen in the Classics. Wu Ling-wang changed the shoe into the boot, and it is worn to the present day. During the current dynasty in the reigns Chêng Ho (1111–18) and Hsüan Ho (1119–26) of Hui Tsung they changed the boot back into the shoe, but in the time of Kao Tsung the mistake of the Chêng Hsüan reigns was rectified, and the shoe again changed into the boot."—*Hsüeh ch'ai chan pi, ibid.* c. 18, *Kuan fu lei*, p. 18*b*.

"At the close of the reign Hsüan Ho [1119–26] the soles of women's shoes were pointed; they were made of two colours of silk cloth and called 'variegated to the bottom.'"—*Lao hsüeh an pi chi, ibid.* p. 17*b*.

"Kao Tsu of the Sung dynasty was fond of wearing the toothed wooden shoe. It is recorded in the *Southern History* that it was the same as the wooden shoe [without heel] of the present time."—*Lei ch'ing jih cha, ibid.* p. 12*b*.

[For embroidered boots, etc., see *Wei Wu yü Yang piao shu, ibid.* p. 18*b*; *Mu jung huang yü Ko ho shu, ibid.* p. 18*b*.]

[Women's shoes became smaller in conformity with the deformed foot. *Cf.* previous Period.]

LIAO AND KIN.

"Like the later Mantchus, the Kin required their Chinese subjects, under penalty of death, to shave their heads and wear Tartar dress."—*Simcox*, ii. 174.

[The wearing of clothing made of gold thread was forbidden.]—*Hsü t'ung tien ch'i yao*, c. 20, *Hsing*, p. 7*b*. *Cf.* LAWS OF INT.

"By the custom of Liao there was made a cover for the shoulders and back called *ku ha* (賈 哈); its two ends were pointed and its shape like a winnowing fan. Those which hung down to both shoulders were made of embroidered silk or marten fur."—*Hsü pi chi, Ko chih ching yüan*, c. 18, *Kuan fu lei*, p. 22*a*.

"By the custom of the Chin [Kin] dynasty women wore a lower garment called 'embroidered skirt' (錦 裙 *chin ch'ün*); the left and right sides were left open for a space 2 feet wide; this was encircled by iron wire bound with variegated silks. Over it was worn the single skirt."—*Chêng tzŭ t'ung, ibid.* p. 4*a*.

"When the ruler entered the court he wore a head-cloth (幞 頭 *po t'ou*) of thin embroidered gauze."—*Chin chih, ibid.* c. 14, *Kuan fu lei*, p. 11*a*.

"By the custom of the Chin [Kin] dynasty the people of both the upper and lower classes wore boots with pointed toes."—*Chou hsien fei yüan lu, ibid.* p. 10*a*.

Mongol Period (1280 *to* 1368).—*Table VII.*

"Sumptuary regulations were . . . introduced, distinguishing the dress of officials and literati from that of the common people—a measure which may have been connected with . . . other attempts to obliterate the sharp distinction between Mongols and Chinese."—*Simcox*, ii. 230. See LAWS OF INTERCOURSE.

"The costumes of the female attendants of the Empress and of the concubines were regulated by a fixed rule. For the Empress there were 280 attendants wearing embroidered robes with marks of flying wild geese or beasts; for a [superior] concubine, 200 attendants wearing red pongee robes with marks of clouds on the shoulder; and for a concubine of the 4th rank, 80 attendants wearing green silk robes adorned with gold thread. These were called *k'ung luan chao yi* (控 鸞 昭 儀) 'manifesting grace and beauty.'"—*T'ao Tsung-i Yüan shih yeh t'ing chi, Ko chih ching yüan*, c. 16, *Kuan fu lei*, p. 6*a*.

"In Han and Wei times men who had entered the priesthood wore the red cloth *chia li* (迦 梨) garment and all kinds of Mu Ling Buddhist garments, whose colour, in imitation of [the dress of] the Indian priests, was black. In the later Chou dynasty the emperor, disliking the bad omen of black garments, prohibited the wearing of all kinds of black clothes, but allowed yellow ones to be worn. Queen Wu of the T'ang dynasty was the first to bestow upon the Buddhist priest Fa Lang a purple *chia so*. Further, Wên Tsung of the Yüan dynasty, had a favourite Buddhist priest Hsin Hsiao, and bestowed upon him a yellow garment. Hence all his acolytes wore yellow. But the costume of the present time was as follows: The *Shan* priest wore grey; a preaching priest, red; and a *yü chia* (瑜 伽) priest, white onion colour. The *yü chia* was the priest of the present time who receives guests."—*Shan t'ang ssŭ k'ao, ibid.* c. 15, *Kuan fu lei*, p. 15*a*.

[A Buddhist priest who wore paper clothes is mentioned in *Pien i chih, ibid.* p. 15*a*.]

[The Emperor Ming Tsung wore plain felt garments.—*Ch'ing i lu, ibid.* c. 16, *Kuan fu lei*, p. 8*b*.]

[The "flower-bud" lower garment (花 蕊 之 裳 *hua jui chih shang*) is mentioned in *Yüan shih Yeh t'ing chi, ibid.* p. 4*a*.]

"In the Yüan dynasty on a certain occasion all the officials were entertained in the Ch'ang Ch'un palace; and a eunuch who was serving the banquet had a bad cough; as the emperor disliked him being dirty he ordered him to cover his face with a piece of gold gauze, only his two eyes being allowed to be exposed; it hung down to the chest. From that time it became the rule for waiters at banquets to wear it."—*Chieh ch'êng yü, ibid.* c. 18, *Kuan fu lei*, p. 22*b*.

"The secondary consort of the Yüan dynasty and the wife of a Great Minister wore the *ku ku* (姑 姑), 'paternal aunt,' bonnet, and those next in rank the fur bonnet (皮 帽 *p'i mao*). The *ku ku* being more than two feet high and made of red gauze was [evidently] an imitation of the *chin pu yao* (金 步 搖) bonnet of the T'ang dynasty."—*Ts'ao mu tzŭ, ibid.* c. 13, *Kuan fu lei*, p. 9*a*.

"The *ku ku* (顧 姑) bonnet was plaited of iron wire. . . . For a lady (wife of a high official) it was more than 3 feet long, and made of red or green embroidered silk, sometimes adorned with pearls and jade."—*Hu Shih Chên chu ch'uan, ibid.* p. 9*a*.

"The senior Taoist priest of Ch'ing Chêng wore the *kai t'ien* (蓋 天), 'heaven-covering,' cap."—*Wu yü t'u, ibid.* p. 11*a*.

"The round hat (圓 帽 *yüan mao*). Shih Tsu of Yüan went out hunting; and as he disliked the sun's rays shining in his eyes, he put the leaf of a tree in front of his Tartar hat. Later Yung Ku-la put 2 pieces of felt in front and behind the hat, which is the one now called 'large eave' (大 簷 *ta yen*) hat."—*Shih wu kan chu, ibid.* c. 14, *Kuan fu lei*, p. 16*a*.

"In the *Yü fu chih*, 'History of Clothing,' it says: 'Officers as well as the people wore the hat whose brim was round, or round in front and square behind, or the *lou tzŭ* (樓 子), "tower hat" or "top hat," which were made after the fashion of the ancient helmet. The *lou tzŭ* was the same as the five-coloured hat or gold-thread hat worn by village children in the South at the present time. It was [an imitation of] the custom of the Yüan dynasty.'"—*Lei ch'ing jih cha, ibid.* p. 16*a*.

Ming Period (Restoration of Chinese Supremacy) (1368 *to* 1644).—*Table VIII.*

T'ai Tsu "restored the dress of the T'ang dynasty."—*Giles, Bio. Dic.*, p. 193.

"In the 3rd moon of the 23rd year of the reign Hung Wu, the Emperor noticed that the uniforms of all the ministers who attended the Court were very handy and daily becoming shorter and narrower, which was contrary to the ancient system, so he ordered Li Yüan-ming, President of the Board of Rites, to consult so as to make them according to the present form but to keep the ancient style. He reported that all garments worn by officials from the collar to the lower border of the garment should reach to within one foot from the ground and the sleeves should be so much longer over the hand as to be able to fold back to the elbow; the width was [to be] one foot, and the cuff 9 inches. The garments for princes and husbands of an imperial princess were [to be] the same; and for old people and licentiates [also] the same, but the length of the sleeve so as not to fold back to the elbow by 3 inches; for the common people, the garment reached to 5 inches from the ground; for military officers also to 5 inches from the ground, but the sleeves were [to be] longer than the hand by 7 inches; their width was to be 1 foot, and the cuffs just large enough to admit the fist; for soldiers the garment was to reach to 7 inches from the ground, the sleeves longer than the hand by 5 inches; the width of the sleeve 7 inches, and the cuffs just large enough to admit the fist. These rules were published throughout the Empire."—*Ch'i hsin lei kao, Ko chih ching yüan*, c. 15, *Kuan fu lei*, p. 4*a*.

"The present dynasty ordered women to wear a wide-sleeved coat of red colour. Those worn by the 5th and higher ranks were made of hempen cloth, silk, thin satin, and gauze; and of the 6th rank and under, thin satin gauze, pongee, and cheap thin silk."—*Shih wu kan chu, ibid.* c. 16, *Kuan fu lei*, p. 11*a*.

"The Taoist priests used to wear black ecclesiastical garments (青 法 衣 朝 服 *ch'ing fa i ch'ao fu*). The officer of a Taoist priest and a Taoist priest writer wore the garments with green ribbons and gold ornaments."—*Shih wu kan chu, ibid.* c. 15, *Kuan fu lei*, p. 15*b*.

[Girdles of various kinds are mentioned in *Shih wu kan chu, ibid.* c. 17, *Kuan fu lei*, pp. 6*a*, 13*a*.]

"For the black cloth cap they afterwards used black gauze and varnish; it had 5 peaks on its left side to represent the 5 constant virtues."—*Shih wu kan chu, ibid.* c. 13, *Kuan fu lei*, p. 2*b*.

"The *hsieh ch'ai* (獬 豸) cap of the present dynasty was different from that of ancient times. The cap for censors and provincial judges was the *Liang* (樑) cap adorned with gold *hsieh ch'ai*."—*Shih wu kan chu, ibid.* p. 4*b*.

"The crown of the empresses of the present dynasty was a round frame covered with beautiful feathers—it was adorned with 9 dragons, 4 phœnixes, and 12 plants in blossom, and the broader part on each side with 12 golden flowers."—*Shih wu kan chu, ibid.* p. 9*b*.

"The custom of the people in Yünnan was to carry on their heads a *tz'u kung* (次 工), which was made like a fisherman's rain hat (笠 *li*), [but] covered with black felt. When relatives or friends took leave before long absence they did not kneel down—the only ceremony they performed was to wear the *hsien kung*."—*Shu wu i ming su, ibid.* c. 14, *Kuan fu lei*, p. 19*a*.

[The rain-hat (笠 *li*) was worn: see *Shih wu kan chu, ibid.* p. 18*b*. For headkerchiefs of various kinds see *Shên wén ch'u chêng chi, ibid.* p. 3*a*; *Ch'i hsiu lei kao, ibid.* p. 3*a*; *Wang Ta-chiao Kung chiu shih, ibid.* p. 3*a*; *Lei ch'ing jih cha, ibid.* p. 3*b*; *Lü yün t'ing tsa yen, ibid.* p. 8*a*; *Shih wu kan chu, ibid.* p. 11*b*; and for the comb (笏 *hsiao*), also called *mo t'ou* (陌 頭) and *yen* (帨), *I ya, ibid.* p. 11*b*.]

Manchu Period (1644 *to* —).—*Table IX.*

"Dress, like other things, undergoes its changes in China, and fashions alter there as well as elsewhere, but they are not as rapid or as striking as among European nations. The full costume of both sexes is, in general terms, commodious and graceful, combining all the purposes of warmth, beauty, and ease which could be desired, excepting always the shaven crown and braided queue of the men and the crippled feet of the women, in both of which fashions they have not less outraged nature than deformed themselves. . . . The Chinese dress has remained, in its general style, the same for centuries; and garments of fur or silk are handed down from parent to child without fear of attracting attention by their antique shapes. [See also *Davis, Chinese*, i. 352.] The fabrics most worn are silk, cotton, and grass-cloth for summer, with the addition of furs and skins in winter; woollen is used sparingly, and almost wholly of foreign manufacture."—*Williams, Midd. King.*, 759.

"The adaptability of the Chinese dress to the season and ever-varying changes of temperature is remarkable."—*Dudgeon, Diet, Dress, etc.*, p. 142; and see pp. 142–3.

"The men's dress is . . . becoming and comfortable. The hands, feet, and front of the chest are specially well protected. . . . The long robes and over-trousers give ample protection to the abdomen and lower extremities—parts left to a great extent exposed and uncared for in our costume. The Chinese never require cholera belts in summer, prophylactic measures adopted by Europeans in the East against diarrhœa and dysentery. Their dress supplies their place. What is perhaps wanted to make the Chinese dress perfect is some woollen jacket for internal wear. Foreign cast-off flannels are much esteemed by the servants of foreigners, who at the ports may frequently be found wearing them. . . . Tight short clothes are an abomination to the Chinese."—*Ibid.* pp. 147–9.

"The universal colour among the common people for their cotton fabrics is blue. Their inner garments and their stockings are of white cotton. So are their handkerchiefs, which they invariably carry up their sleeves. . . . Harmony of colours is a striking feature of the Chinese dress. In the dresses of the upper classes a rich variety of colour prevails. Great harmony in the selection and arrangement of colours is shown."—*Ibid.* p. 148.

"Pink and green, two colours often worn by women, are confined exclusively to them, and never seen on men."—*Davis, Chinese*, i. 359.

"Length of garments is the first thing that is remarked about Chinese dress. They are clothed with long flowing garments down to the feet. No part of the body except the face is exposed. They look upon nude figures, whether they be paintings or statuary, as barbarous. . . . The Chinese dress covers the hands and just reaches to the foot without touching the ground. It exposes no part of the body to the vulgar gaze. It is so with men, women, and children in China."—*Dudgeon, Diet, Dress, etc.*, pp. 151–2.

"After length, the *looseness* of the Chinese dress is perhaps its next characteristic, concealing the figure and form of the body. Chinese garments are adapted to every movement of the body, and do not interfere with its development." "The looseness of Chinese dress adds to its warmth, for besides the air in the textures themselves, they enclose a large portion of air between the clothes and the body; and moreover, being loose, they permit a certain amount of friction on the skin. . . . The loose furs worn so extensively in winter in the cold north contain a large quantity of air in their bulk, and thus not only bar the passage of heat from the body, but absorb and retain what they receive from the body."—*Ibid.* p. 152.

"Another characteristic of the dress is its *plainness* and *simplicity*. There is little art or tailoring required in making it, so much so that every woman can cut out her own clothes and those required in the family." "Combined with this simplicity is *cheapness* and *economy*, in at least the dress of the common people." "The Chinese dress is also well adapted *to the station in society of the individual and his calling*."—*Ibid.* pp. 152–3.

"The principal articles of dress are inner and outer tunics of various lengths, made of cotton or silk, reaching below the loins or to the feet; the lapel on the right side folds over the breast and fits close about the neck, which is left uncovered. The sleeves are much wider and longer than the arms, have no cuffs or facings, and in common cases serve for pockets. A Chinese, instead of saying 'he pocketed the book,' would say 'he sleeved

it.' In robes of ceremony the end of the sleeve resembles a horse's hoof, and good breeding requires the hand to be kept in a position to exhibit the cuff when sitting. In warm weather one upper garment is deemed sufficient; in winter a dozen can be put on without discommodity, and this number is sometimes actually seen upon persons engaged in sedentary employments .... Latterly, underwear of flannel has become common among the better dressed, who like the knitted fabric so close-fitting and warm. The lower limbs are comparatively slightly protected; a pair of loose trousers, covered to the knee by cloth stockings is the usual summer garment; tight leggings are pulled over both in winter and attached to the girdle by loops; and as the trousers are rather voluminous and the tunic short, the excess shows behind from under these leggings in a rather unpleasant manner. Gentlemen and officers always wear a robe with the skirt opened at the sides, which conceals this intermission of the under apparel. The colours preferred for outer garments are various hues of buff, purple or blue."—*Williams, Midd. King.*, i. 759–61.

"The summer garment of the better classes is a long loose gown of light silk, gauze, or linen, hanging free at ordinary times, but on occasions of dress gathered in round the middle by a girdle of strong wrought silk, which is fastened in front by a clasp of agate, or of the *jade*, which the Chinese call *yu*. In an oppressive climate, when the thermometer is at 80° or 90°, there is much ease and comfort in the loose sleeves, and the freedom from restraint about the neck, by which this dress is distinguished. . . . To the girdle are fastened . . . the fan-case, tobacco-pouch, flint and steel, and sometimes a sheath with a small knife and pair of chopsticks. They are very proud of displaying a watch, which is inserted in an embroidered silk case or pouch."—*Davis, Chinese*, i. 348–9.

"The winter dress, being nearly as loose as that of summer, is less calculated to promote warmth and comfort than the European costume, and at the same time more unfavourable to bodily activity and exertion. Over a longer dress of silk or crape, which reaches to the ankles, they wear a large-sleeved spencer, called *ma-kwa* (or riding-coat), which does not descend below the hips. This is often entirely of fur, but sometimes of silk or broad-cloth, lined with skins. The neck, which in summer is left quite bare, is protected in winter with a narrow collar of silk or fur; their loose dresses always fold over to the right breast, where they are fastened from top to bottom, at intervals of a few inches, by gilt or crystal buttons (the latter in mourning) with loops."—*Ibid.* p. 349.

"Buttons in China mostly consist of a double cord made by rolling up a shred of the material of the garment; this double cord is sewed upon the edge, and ends in a knot or small metal globule that serves as a button. On the opposite edge of the garment a similar double cord ends in a loop serving for a button-hole."—*De Groot, Rel. Syst.*, i. i. 49.

"The trousers, which are worn by both sexes, are fastened round the waist; only children's are fastened by the shoulders. Round the waist the men wear a girdle, which serves to tighten the long robes and increase the warmth by preventing the escape of the heat generated in the body, and it secondarily subserves the purpose of forming a large breast pocket into which things are placed, and at the same time affords an attachment for the numerous articles of daily use, and for pockets which the long robes render inconvenient." "The trousers, overtrousers, and stockings are brought together by a band at the ankle, which serves the purpose of strengthening, and adds neatness and warmth to the leg, and does not seem to interfere with the return of blood by the veins. . . . Although the Chinese women wear trousers . . . over them, in public and among the upper classes, they always wear long robes and skirts, thus concealing the lower extremities, as in the West. . . . The Chinese ladies' skirts are . . . divided into four parts, closely plaited; but over the division between each two parts hangs a broad piece of embroidered silk or satin, of the same colour as the rest of the skirt, with a black satin border, at the corners of which are butterflies cut out in outline, discovering some bright colour beneath. Although with their narrow skirts the divisions may facilitate walking, sitting or getting into sedan chairs, there is no approach to a divided skirt in the sense in which this term is usually understood."—*Dudgeon, Diet, Dress, etc.*, pp. 155–7.

"The Chinese cannot be said to have any underclothing, except the inner garments be so considered; and these, as a rule, are not often changed."—*Ibid.* p. 159.

"The great sin of the Chinese costume is the paucity of white linen, and consequently of washing."—*Davis, Chinese*, i. 351.

"The common people wear cotton instead of coarse silk and linen."—*North-China Daily News*, Dec. 15th, 1885.

"Only in the present dynasty was the embroidered vest (褶衣 *hsia p'ei*) allowed to be worn if it had been bestowed as an act of grace by the Emperor, but the straight *p'ei* was generally worn by the common people."—*Shih lin kuang chi, Ko chih ching yüan*, c. 16, *Kuan fu lei*, p. 15*a*. See also ABSOLUTE MONARCHY, PERIOD OF DISRUPTION, and RESTORATION OF UNITY.

"The ordinary dress of men among the labouring classes is extremely well suited to give full play to the body: it consists in summer of only a pair of loose cotton trousers tied round the middle, and a shirt or smock, equally loose, hanging over it. In very hot weather the smock is thrown off altogether, and only the trousers retained. They defend the head from the sun by a very broad umbrella-shaped hat of bamboo slips interwoven, which in winter is exchanged for a felt cap; and in rainy weather they have cloaks of a species of flags or reeds, from which the water runs as from a pent-house. A large portion of the peasantry wear no shoes, but some are furnished, particularly those who carry heavy burthens, with sandals of straw to protect the feet."—*Davis, Chinese*, i. 359–60.

"The cost of a cotton suit need not exceed five dollars, and a complete silken one, of the gayest colours and best materials, can easily be procured for twenty-five or thirty. Quilted cotton garments are exceedingly common, and are so made as to protect the whole person from the cold and obviate the need of fires. In the north, dressed sheepskin robes furnish bedding as well as garments, and their durability will long make them more desirable than woven fabrics."—*Williams, Midd. King.*, i. 761.

"Sheep are reared in the north by Mohammedans, who prepare the fleeces for garments by careful tanning."—*Ibid.* i. 321.

"The furs of all these [weasel, otter, etc.], and also the sea-otter, are prepared for garments, especially collars and neck-wraps."—*Ibid.* i. 326.

Squirrels' skins "are prepared for the furriers, and women wear winter robes lined with them."—*Ibid.* i. 327.

"The long dense fur of the *Pteromys alborufous* makes beautiful dresses, the white tips of the hair contrasting prettily with the red ground."—*Ibid.* i. 327–8. For other furs and skins used, see *Dudgeon, Diet, Dress, etc.*, p. 138.

"The leaves [of the bamboo] are sewed into rain-cloaks for farmers and sailors."—*Williams, Midd. King.*, i. 359.

"At the present day, the coir, fibres of the cocoanut, bamboo leaves, and reeds are made into various articles of dress among the lower classes, and especially among fishermen. In wet weather many of the agriculturists wear a cape of these instead of umbrellas, to protect the head and shoulders, and throw the rain off the body. Hats are made of bamboo and straw, sandals of straw, largely worn . . . and summer clothes of grass cloth. Bamboo clothing is made from the finest branches of the tree, worn in summer next the skin to keep the light cotton shirt or inner jacket from irritating the skin when moist from perspiration; sometimes worn without the upper cotton garment over the upper part of the body. . . . Straw braid, made from a bright yellow straw, and of which there is a large trade in the north, is used in the manufacture of hats."—*Dudgeon, Diet, Dress, etc.*, p. 137.

Felt "is made of the wool and hair of various animals, and manufactured into . . . hats, caps, shoes, socks, stockings, for the lining of boots. . . . Cows', goats', horses', and camels' hair and wool are extensively used in the preparation of these articles of dress. . . . A fabric is now manufactured from camels' wool from Mongolia, where the Bactrian camel abounds, which a few years ago was utterly useless for anything, save in the preparations of felt, on account of the absence in Europe of proper machinery for separating the wool from the hair of the fleece. A large trade is now carried on in this article from the port of Tientsin."—*Ibid.* pp. 138–9.

"Woollen clothing has never been manufactured in China. . . . It is now being somewhat largely used, and a native factory for its manufacture was established some years ago in Kansuh. Considerable quantities are imported from Russia, and called *kala*, in imitation of the sound of the first three letters of the word cloth. The difficulty and trouble of protecting it against moths, which swarm in China, and particularly its enhanced price over cotton, will always militate against its extensive use by the common people."—*Ibid.* p. 139.

"Cotton appears to have been introduced into China; it is now extensively grown. Large quantities are used in the manufacture of fabrics of this substance. The summer and winter garments of the common people are made entirely of it. In winter their cotton clothes are wadded with cotton wool placed in thin layers between the outer and inner layers which go to make up their garments, and then stitched to keep it in position. The clothes of the people being roomy, permit of this addition. It gives, of course, an unnatural size to their persons, but is extremely warm and comfortable, and takes the place of fur among the better classes. . . . Clothes of all sorts, bedding, etc., are made of cotton cloth and padded."—*Ibid.* pp. 139–40.

"Silks, satins, crapes, and gauzes form the rich material of the dresses of the wealthy, literary, and official classes. From the black satin skull-cap and the velvet collar, worn by all classes of the Chinese, down to the satin boots, which may be worn by all classes, but which are obligatory on all mandarins when on duty, paying visits of ceremony, etc., the dress of the upper classes may be said to be entirely of the cocoons of the silk-worm."—*Ibid.* p. 142.

"Dresses of ceremony are exceedingly rich and handsome."—*Davis, Chinese*, i. 350. For full description, see *De Groot, Rel. Syst.*, i. i. 53–4.

The *t'ao p'ao* (套袍) "constitutes the true sacerdotal attire of the *pater familias* in his quality of high priest of the family." It consists of two parts, a *nei tao* (內套), or "inner cloak," and a *wai t'ao* (外套), or "outer cloak." There was a special one for winter and another for summer.—*De Groot, Rel. Syst.*, i. i. 49; for description and for the hat and silk boots worn with the *t'ao p'ao*, see *ibid.* pp. 49–50.

"He [a general] wore a long satin coat with embroidered breastplate, and a similar square of embroidery on the back, with the horseshoe cuffs, forced upon the Chinese by the Manchus when the present dynasty came to the throne, falling over his hands. High official boots, an amber necklace of very large beads reaching to his waist, and aureole-shaped official cap with large red tassel, completed his costume."—*Little (Mrs. A.), Int. Ch.*, pp. 273–4.

"The ancient Chinese wore the hair long, bound upon the top of the head, somewhat after the style of the Lewchewans; and taking pride in its glossy black, called themselves the *black-haired race.* [This is an error.] But in 1627 the Manchus, then in possession of only Liautung, issued an order that all Chinese under them should adopt their coiffure as a sign of allegiance, on penalty of death; the fashion thus begun by compulsion is now followed from choice. [A turban (*p'a*) was at first worn to conceal this objectionable badge of loyalty (*Giles, Dic.*, No. 8540).] The fore part of the head is shaved to the crown and the hair braided in a single plait behind. Labourers often wind it about the head or knot it into a ball out of the way when bare-backed or at work. The size of the queue can be enlarged by permitting an additional line of hair to grow . . . . The people are vain of a long thick queue, . . . nothing irritates them more than to cut it off. Men and women oftener go bare-headed than covered, warding off the sun by means of a fan; in winter felt or skin skull-caps, hoods, and furs protect them from cold."—*Williams, Midd. King.*, i. 761–3.

"The hats, caps and shoes are also in strict accordance with variations of temperature. In summer straw, in winter felt, are the materials of which the head coverings are made."—*Dudgeon, Diet, Dress, etc.*, p. 144.

"The summer cap is a cone of finely-woven filaments of bamboo, or a substance resembling chip, and surmounted, in persons of any rank, by a red, blue, white, or gilded ball at the apex or point of the cone. From the insertion of this ornamental ball descends all around, over the cap, a fringe, or rather bunch of crimson silk or of red horse-hair; in front of the cap is sometimes worn a single large pearl." "The winter cap, instead of being a cone, fits closer to the shape of the head, and has a brim, turned sharply up all round, of black velvet or fur, and rising a little higher in front and behind than at the sides. The dome-shaped top is surmounted by the same ball as in the other case, denoting the rank of the wearer; and from the point of insertion descends a bunch of fine crimson silk, just covering the dome. On the commencement of the cold or hot weather, the first person in each province, as the Tsoong-tŏ, or Viceroy, assumes his winter or summer cap; the circumstance is noticed in the official gazette, or court circular, and this is the signal for every man under his government to make the same change. . . . Within-doors they usually wear in cold weather a small skull-cap, either plain or ornamented."—*Davis, Chinese*, i. 346.

"Wonderful straw hats from Chengtu, two yards in circumference; and with the straw braid so fine in the centre of the crown that it has all to be sewn together standing edgewise, not flat, as is usual with hats."—*Little (Mrs. A.), Int. Ch.*, pp. 259–60.

"Stockings of cotton or silk, wove and not knit, are worn by all who can afford them; and, in winter, persons of a certain rank wear boots of cloth, satin or velvet, with the usual thick white sole, which is kept clean by *whiting* instead of *blacking.*"—*Davis, Chinese*, i. 349–50.

"The shoes are made of silk or cotton, usually embroidered for women's wear in red and other colours. The soles are of felt, sometimes of paper inside a rim of felt, and defended on the bottom by hide. These shoes keep the feet dry and unchilled on the tiles or ground. . . . The thick soles render it necessary for ease in walking to round up their ends, which constrains the toes into an elevated position so irksome that all go slipshod who conveniently can do so."—*Williams, Midd. King.*, i. 761. See also *Dudgeon, Diet, Dress, etc.*, pp. 142–3, 144.

"The shoes worn by foot-binding women of the present time being made of silk was in imitation of the system of the Liang period. Those made of sheepskin and gold foil were an imitation of the designs of the Three Dynasties [Hsia, etc.]. They were very fashionable and artful. Those made of rushes and of hemp were common to both ancient and modern times."—*Lei ch'ing jih cha, Ko chih ching yüan*, c. 18, *Kuan fu lei*, p. 17*a*.

"In wet weather leather boots are worn."—*Dudgeon, Diet, Dress, etc.*, p. 138.

"The poorer classes in the south of China never wear shoes; chair-coolies, however, and weight-carriers in general usually have sandals to protect their feet from the stones."—*Giles, Historic China*, p. 218.

"The Chinese ladies' dress hangs gracefully from the shoulders. The human figure is quite concealed. There is no tightening at the waist. There is no exposure of the neck, breast, shoulders, and arms. The dress is exceedingly graceful, comfortable, and convenient. . . . The Chinese [women] wear a broad band [called *wei yao*] wadded in cold weather, which encircles the waist and lower part of the chest, and supports, and to some extent also gently compresses, the breasts."—*Dudgeon, Diet, Dress, etc.*, p. 146; see also pp. 155–7.

The Manchu women have preserved their feet the natural size. "In other respects . . . they dress nearly as the Chinese, and paint their faces white and red in the same style."—*Davis, Chinese*, i. 359.

"The dress of women is likewise liable to few fluctuations, and all ranks can be sure that the fashion will last as long as the gown. The garments of both sexes among the common people resemble each other more than in Western Asia. The tunic or short gown is open in front, buttoning around the neck and under the arm, reaching to the knee, like a smock-frock in its general shape. The trousers among the lower orders are usually worn over the stockings, both being covered, on ceremonial occasions, by a petticoat reaching to the feet."—*Williams, Midd. King.*, i. 763–4. For dress of gentlewomen see *ibid.* p. 765, and *De Groot, Rel. Syst.*, i. i. 53–4.

"The head-dress of married females is becoming and even elegant. The copious black hair is bound upon the head in an oval-formed knot, which is secured in its place and shape by a broad pin placed lengthwise on it, and fastened by a shorter one thrust across and under the bow. The hair is drawn back from the forehead into the knot, and elevated a little in front by combing it over the finger; in order to make it lie smooth the locks are drawn through resinous shavings moistened in warm water, which also adds an extra gloss, at the cost, however, of injury to the hair. In front of the knot a tube is often inserted, in which flowers can be placed. The custom of wearing them is nearly universal, fresh blossoms being preferred when obtainable, and artificial at other times. Having no covering on the head, there is more opportunity than in the west to display pretty devices in arranging the hair. A widow is known by her white flowers, a maiden by one or two plaits instead of a knot, and so on; in their endless variety of form and ornament, Chinese women's head-dresses furnish a source of constant study."—*Williams, Midd. King.*, i. 764.

"Matrons wear an embroidered fillet on the forehead, an inch or more wide, pointed between the eyebrows, and covering the front of the hair though not concealing the baldness which often comes on early from the resinous bandoline used. This fillet is embroidered, or adorned with pearls, a favourite ornament with Chinese ladies. The women along the Yangtsz' River wear a band of fur around the head, which relieves their colourless complexions. A substitute for bonnets is common in summer, consisting of a flat piece of straw trimmed with a fringe of blue cloth. The hair of children is unbound, but girls more advanced allow the side locks to reach to the waist and plait a tress down the neck; their coarse hair does not curl, and the beautiful luxuriance of curls and ringlets seen in Europe is entirely unknown. False hair is made use of by both sexes, the men being particularly found of eking out their queues to the fullest length. Gloves are not worn, the long sleeves being adequate for warmth; in the north the ears are protected from freezing by ear-tabs lined with fur, and often furnished with a tiny looking-glass on the outside."—*Ibid.* i. 764–5.

A writer in a recent number of the *North China Herald* describes the dress worn by a Chinese lady at her wedding, of which he was a witness, as follows:—"At length we were admitted to inspect the bride, whose four hours' toilette was just completed, and a marvellous spectacle truly was the figure, seated motionless in the centre of the room. Gorgeously elaborate was her array from head to foot, the former crowned with a helmet-like erection of a material resembling turquoise-enamel, wrought into the finest filigree work, from which projected glittering artificial beetles and butterflies, and other quaint rich ornaments, the whole surmounted by three large round tufts of crimson silk, arranged tiara-wise. From the brim of this headgear fell all round strings of pearl and ruby beads, about half a yard in length. Just visible through these, at the back, were broad loops of jet black hair, stiff and solid as polished ebony, and decorated with artificial pink roses. Her principal vestment was a long tunic, whose foundation fabric of crimson satin was scarcely discernible amidst its embroidery of gold; a corner turned back, lined with emerald satin, revealed an underskirt panelled in brilliant red and blue silk, this also profusely trimmed with gold embroidery. A belt of scarlet satin, studded with

tablets of white cornelian, crossed the waist behind. From the front edge of her head-dress a red silk veil fell almost to the ground, adding much to her preter-human aspect."

"No people are, perhaps, more given to decorating their clothes and their persons than the Chinese. Among all classes ornamentation is aimed at and highly appreciated. Among the poor people a flower in the hair, a butterfly on the shoe, a little narrow printed edging round their skirts or openings of their jackets or sleeves, will often suffice. . . . As we ascend in the social scale we find a corresponding richness and elaborateness of all kinds of embroidery, the work of the skilful Chinese women. . . . Every part of a woman's dress is highly and tastefully embroidered, particularly the collar of the dress, the breast and side openings, along the bottom of the skirt, and the sleeves and shoes. The silks are themselves most ornamentally wrought with medallions of dragons, butterflies, characters for longevity, etc. Gold and silver thread enters largely into these embroideries. Every part of the dress and the person is honoured by having some distinctive decoration. Upon the head is bestowed an amount of decoration beyond the mere style of putting it up, and consisting of natural and artificial flowers, gold, silver, pearls, jade, glassware, imitation jade, and precious stones."—*Dudgeon, Diet, Dress, etc.*, p. 149. See also DECORATION OF PRODUCTS.

"The Chinese wear no nightclothes, but sleep in a nude condition. The very poorest have no bedding, and sleep on the mat in their clothes, with a brick for their pillow. A little higher in the scale the people possess a mattress and use their clothes for coverlet. . . . Higher still, there are wadded cotton or woollen coverlets as well as mattresses."—*Ibid.* p. 186. The usual custom is to take off the outer garments only.

"Nor will it readily be accepted by some of our oldest sinologues that in some part of China, as is contended by ladies from certain parts, women slaves are obliged to dress as men, a fact which throws some light on that intense curiosity shown on some occasions to ascertain whether European ladies are in reality men or women."—*N. C. Herald*, Dec. 5th, 1900.

"After twenty years' experience and practice among the Chinese I can safely assert that I have found no diseases resulting from errors in clothing except such as were dependent upon incorrect and superstitious notions of the people, and which ought not to be attributed to wrong principles of dress. . . . The only tight place in the costume, always excepting the small foot, is at the ankle, where the garter binds the trousers and socks together. But even from this tightening I have not seen varicose veins or ulcerous sores result. These affections are found, but they are more the results of constitutional weakness and the trades followed than the effect of binding the leg. In Peking the Shantung water-carriers tie a bandage round the calf of the leg, called *kwo t'ui*, for support."—*Ibid.* pp. 159–60.

The costume composed of the *shêng shan* (生衫) and *shêng mao* (生帽), said to have been the "usual dress for boys of fashionable families" in the Chou dynasty, is now "no more worn, except on the stage, in historical plays, and by young children on special festive occasions, such as New Year's day."—*De Groot, Rel. Syst.*, i. i. 59.

[For illustrations of Chinese costume, see *Alexander, Costume of China; Picturesque Representations of the Dress and Manners of the Chinese; Chambers, Designs of Chinese Buildings*, Plates xix., xx., xxi.; *Mason, Costume of China*; etc.]

[For official dress of Chinese ladies, see *N. and Q. on C. and J.*, i. 76, 107, 143.]

[For descriptions of the separate articles of dress, see *Dudgeon, Diet, Dress, etc.*, pp. 160–186.]

[For sumptuary laws relating to clothing, see also LAWS OF INTERCOURSE.]

IMPLEMENTS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

[The invention of a very large number of implements is ascribed to mythical and legendary rulers, and this ascription obscures the real date of their invention. See *Wu yüan, Shih wu kan chu, Shih wu yüan shih, Ku shih k'ao, Shih pên, Pai shih lei pien, Shih i chi*, and a large number of extracts given in *Ko chih ching yüan*, cc. 28-9, 48-58.]

Household Utensils, Furniture, etc.—"Yao of T'ang made the stove."—*Wu yüan, Ko chih ching yüan*, c. 49, *Jih yung ch'i wu lei*, p. 14*a*.

"The lampstand was made by the Emperor Yao."—*Wu yüan, ibid.* c. 50, *Jih yung ch'i wu lei*, p. 13*b*.

[The lantern (燈籠 *têng lung*), also called 篝 *kou*, originated in the Hsia dynasty.]—*Shih wu yüan shih, ibid.* p. 14*b*.

[The invention of the wax candle is attributed to Ch'êng T'ang, founder of the Shang dynasty, 1766-1753 B.C.]—*Wu yüan, ibid.* p. 15*a*.

"Shun of Yü, to make eating implements, cut wood from the hills, and the material thus obtained he sawed up and cut into shape, and then blackened them with varnish. He then offered them to the palace as eating implements."—*Han Fei Tzŭ, ibid.* p. 12*b*.

Chou Hsin "was the first, we are told, to use ivory chopsticks." His Minister remonstrated, saying that these would be followed by "cups of gem," etc.—*Legge, Ch. Class.*, III. i. 269, note.

"In the time of the Shang dynasty there was a *chin péng tsun* (金鵬尊), golden Rukh vase or goblet, with four hornless dragons coiled all around it. Its dark green colour was superior to that of any other vessel. It was a rare piece of work."—*Ni ku lu, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 20*a*.

"The *hu* (壺), 'vase,' was a round implement [used by] K'un Wu."—*Shuo wên, ibid.* c. 74, *Ch'i yung pu*, p. 8*b*.

"The vase of the Emperor Huang's time was preserved until the time of [the Emperor] Yao. It was used for keeping agate stones."—*Yün fu, ibid.* p. 11*a*.

"The men of the Hsia dynasty used jade wine-cups."—*Yün hui, Ko chih ching yüan*, c. 51, *Jih yung ch'i wu lei*, p. 10*b*.

"When Yü made wine-vases, he coloured them black outside and red inside."—*Han Fei Tzŭ, ibid.* p. 12*a*.

"For drinking there must be [drinking] implements—this was the custom from of old. In the earliest times and most undeveloped parts of the world people have always known how to dig up clay to make cups for drinking purposes, and as time went on there were various kinds [of drinking cups], such as *tsun* (樽), a vase for libations, *lei* (彝), a porcelain wine vase, *chan* (醆), a goblet, *chia* (斝), a three-legged goblet with an ear, and the like; made of jade, or gold, or wood, and painted with figures of birds or beasts, or engraved with representations of clouds or thunder. . . . They were of different shapes and sizes. The *ssŭ kuang* (兕觥), goblet made of rhinoceros horn, was a goblet used for drinking wine forfeits. In more recent times, [the style of these cups] was very extravagant; some were made of vitreous substance, some of amber; some of lotus-nuts, or banana-leaves, to represent phœnixes and parrots. The difference in their names was due to the different ways of making them. When compared with those of ancient times they were far more elaborate."—*Ch'i min tsung jao, ibid.* p. 12*a*.

"During the Hsia dynasty they used the *chan* (琖), wine-cup; during the Shang, the *chia* (斝), goblet; and during the Chou, the *chio* (爵), wine-cup."—*Ming T'ang wei, ibid.* p. 12*b*.

"The large drinking vessel was called *wu* (武), and the small one, *wên* (文)."—*Tsui hsiang jih yüeh, ibid.* p. 12*b*.

[Gourds as drinking vessels are mentioned in *I shih chuan, ibid.* c. 52, *Jih yung ch'i wu lei*, p. 23*b*; and see next extract.]

[Duke Liu, the ancestor of the kings of Chou, who lived in the 18th century before our era, . . . drank from a hollow gourd (*Shih ching*, III. ii. VI. 4).]

"The steamer (甑 *tsêng*) was an implement for steaming rice. In ancient times the steamer was made of earthenware by a potter, but now was of wood, after the method of later generations—very handy for holding things and conveying them."—*Ch'i yung chih kuei, Ko chih ching yüan*, c. 52, *Jih yung ch'i wu lei*, p. 1*a*.

"In the Shang dynasty there were the *kêng wu* (庚午) caldron, and the *ju yi* (父巳) caldron."—*Shêng An wai chi, ibid.* p. 3*b*. See also LATER FEUDAL PERIOD.

"They [Yao, Shun, etc.] cut wood to make pestles and dug earth to make mortars, which articles were a real benefit to the people."—*I chi tz'ŭ, ibid.* p. 7*b*. See also *Shih wu yüan shih, ibid.* p. 7*b*, where it is said that mortars were now made of wood and stone.

"Dishes were already made in the Hsia dynasty, and T'ang [founder of the Shang dynasty] first engraved them with characters."—*Pai shih lei pien, ibid.* p. 11*b*.

"*Kuan p'an* (盥盤), a shallow wash-basin," is described in *Ch'ün shu k'ao so, ibid.* p. 12*a*.

"In the *Annals of Lü Shih* it says: 'Yao gave orders to beat the drum,' which was made of material obtained from deerskin stretched upon a *yao* (缶), earthenware vessel. From this it may be seen that crockery was introduced as early as the time of Yao."—*Pai shih lei pien, ibid.* p. 17*b*.

"The large bells and drums fill the ear."—*Shih ching*, IV. iii. i.

"Yü of Hsia made the *an* (案), table."—*Wu yüan, Ko chih ching yüan*, c. 53, *Chü ch'u ch'i wu lei*, p. 3*a*. They sat on mats spread on the ground and leaned on low tables; see following Period.

"Yü of Hsia made the screen (扆 *p'ing*)."—*Wu yüan, ibid.* p. 10*a*.

"When Han destroyed Liang I he obtained a jade 'tiger-head' pillow. It was said to have been offered as tribute by the Tan Ch'ih country. Under its edge were seal characters, saying: 'Pillow of the Emperor Hsin.' It was a pillow used by the Emperor and Han Chi. It was a 'precious thing' handed down from the Yin dynasty."—*Shih i chi, ibid.* c. 54, *Chü ch'u ch'i wu lei*, p. 3*a*.

"Yao made the hair-rug (毯 *t'an*)."—*Wu yüan, ibid.* p. 14*a*.

"Yü of Hsia made a mat of *yin chiang* (茵蔣), an aquatic plant."—*Han Tzŭ, ibid.* p. 8*b*.

"Sui Jên invented the *chi* (笄), hairpin. The daughter of Nü Wa made the *chi* of Honan bush or bamboo to pin up the hair. In Yao's time it was made of copper to put through the hair crosswise, but Shun made it of ivory or tortoiseshell."—*Shih lu, ibid.* c. 55, *Hsiang lien ch'i wu lei*, p. 2*a*.

"In the *Explanation of the Odes* it says: 'The elephant-bone for scratching the head was used for a head-dress, and called *t'i* (揥), that which secures the hair.' In the *Yü tien k'ao* it says: 'The ivory *t'i* was like the small comb of the present time'; but on reading in the *Wei Fêng* [a chap. in the *Book of Odes*], 'wearing the ivory *t'i*', one learns that it was commonly worn on the body by men and women for scratching the dirt from the hair."—*Shu wu i ming su, ibid.* p. 16*a*.

"Yi Yin made the oil-brush (油刷 *yu shua*), and Shao K'ang the *lüeh tzŭ* (掠子), a kind of brush."—*Wu yüan, ibid.* p. 16*a*.

"In the *Record of Hsüan Chung* it says: 'Yin Shou, a minister of Yao, made the looking-glass (鏡 *ching*).'"—*Pai shih lei pien, ibid.* c. 56, *Hsiang lien ch'i wu lei*, p. 1*a*.

"Hu Tsêng said: 'The ancient mirrors were daubed with gold-paste and rubbed with pearl-powder. If the sun was reflected in them the rays could shoot through a wall or partition. Also, if heated with gold smoke, cleansed with gem water, or kept in mud, they would not become obscure.'"—*Wang Tu-ku Ching chi, ibid.* p. 1*a*.

"Fans are recorded as having been used to keep the dust from the wheels of the chariots as far back as . . . 1106 B.C. Ivory fans were invented by the Chinese 991 B.C."—*Little (Mrs. A.), Int. Ch.*, p. 441.

"Shun . . . made 5 'bright fans' (明扇 *ming shan*). Kao Tsung of Shang . . . made a 'pheasant-tail fan', (雉尾扇 *chih wei shan*)."—*Ts'ui Pao Ku chin chu, Ko chih ching yüan*, c. 58, *Yen shang ch'i wu lei*, p. 10*b*.

"Shuo K'ang of the Hsia dynasty made the dustpan and broom (箕帚 *chi chou*)."—*Ku pên, ibid.* p. 25*a*.

"The *t'o* (柝), watchman's stick," is mentioned in *Chêng ssŭ nung chu, ibid.* c. 49, *Jih yung ch'i wu lei*, p. 10*a*.

[For the flat iron used by Chou Hsin as an instrument of torture, see *Pai shih lei pien, ibid.* p. 13*a*.]

[For targets, see *Pai pien, ibid.* c. 41, *Wu pei lei*, p. 23*b*.]

"Chang Pu said: 'Respecting the target, the centre of it was called *ku* (鵠), bull's-eye; the centre of the *ku*, *chêng* (正); and the centre of the *chêng*, *chi* (槷). The area of the target was 4 square feet; of the *ku*, 2 square feet; of the *chêng*, 4 square inches; and of the *chi*, 2 square inches.'"—*Liu jih ch'ing cha, ibid.* p. 25*a*.

[For the dimensions and colouring of the king's target, see *Wên kung yü lu, ibid.* p. 25*a*.]

"The *kêng* (綆), otherwise called *yü* (縆), was a well-rope. In the ancient books it is written *kêng* (絙)."—*Shih wu kan chu, ibid.* c. 49, *Jih yung ch'i wu lei*, p. 8*b*.

"The *ch'iang* (繈) was an implement for stringing cash, and the *min* (緡) was a fine cord used for the same purpose."—*Shih wu kan chu, ibid.* p. 8*b*.

[Round bamboo baskets (篚 *fei*) were used to send manufactured fabrics from Yen Chou province to the capital.]—*Legge, Ch. Class.*, III. i. 99, and 102, note. *Cf.* DISTRIBUTION.

[The invention of varnish is ascribed to Shun.]—*Wu yüan, Ko chih ching yüan*, c. 50, *Jih yung ch'i wu lei*, p. 25*b*.

"Hsien yüan [Huang Ti] was the inventor of the clepsydra (刻漏 *k'o lou*); and Chou Kung of its division into [five] watches."—*Lo Ch'i Wu yüan, ibid.* c. 1, *Kan hsiang lei*, p. 11*b*.

Writing Implements.—"In the time of the Three Dynasties (Hsia, Shang, and Chou) people used varnish to write on slips of bamboo. It was inexpressibly inconvenient and difficult."—*Pi ts'ung, ibid.* c. 39, *Wên chu lei san*, p. 1*a*. See also ABSOLUTE MONARCHY.

"Shun of Yü made a pen, and by using varnish wrote on slips of square bamboo."—*Wu Yüan, ibid.* c. 37, p. 1.

Boats, Carriages, etc.—"The ancients, seeing the falling leaves, learnt how to make boats."—*Shih pên, ibid.* c. 28, *Chou chü lei*, p. 1*a*.

"Yü of Hsia wished to make a 'single-log boat' (獨木船 *tu mu ch'uan*) [or 'dug-out'], and cut down a tree for that purpose."—*Shu chi, ibid.* p. 6*a*.

"Seeing the tail of the hawk, they made the rudder (柁 *to*) in imitation of it."—*Ming wu k'ao, ibid.* p. 14*b*.

"Yü of Hsia made the rudder (舵 *to*), and added the bamboo boat-cover (篷 *p'êng*), stone anchor (碇 *ting*), sail (帆 *fan*), and mast (檣 *ch'iang*)."—*Wu yüan, ibid.* p. 14*b*.

"Yao [first] made the painter [of a boat] (維牽 *wei ch'ien*)."—*Wu yüan, ibid.* p. 15*a*.

"In Yü's time Hsi Chung harnessed horses to carriages."—*Ch'iao Chou Ku shih k'ao, ibid.* c. 29, *Chou chü lei*, p. 1*a*.

"Wang Su said: 'In ancient times the carriage had one yoke (for a horse); the men of Hsia harnessed two horses to it and called it *li* (驪); the Yin added one young horse and called it *ts'an* (驂); and the Chou added still another horse and called it *ssŭ* (駟), a team of 4 horses.'"—*Kuang po wu chih, ibid.* p. 1*b*.

"The ancient sages, seeing the sail whirling, knew how to make a wheel. As a running wheel could convey things, so they also made the body of the cart. The cart and wheel fitted together could travel interminably; it could carry heavy loads and go a long distance; so all the people of the world shared in the advantages it gave."—*Hou Han Chü fu chih, ibid.* p. 1*b*.

"Ch'i Kung could make 'flying carts' which could travel far by wind. In the time of T'ang the west wind blew Ch'i Kung's cart to Yü Chou, where T'ang destroyed his cart and would not let the people know [? how to make it]. After ten years, when there was an east wind, T'ang made another for him and sent him back with a reward."—*Ti Wang shih chi, ibid.* p. 2*a*.

"Hsia Hou on the same plan as the 'phœnix carriage' (鸞車 *luan ch'ê*) made the 'hooked carriage' (鉤車 *kou ch'ê*); and Hsi Chung made the Hsia carriage, on which were erected the flag and banner with dragon and tortoise marks on it, by which to distinguish between high rank and low."—*T'ung tien, ibid.* p. 8*b*.

"The phœnix carriage was the *lo* of Yu Yü Shih; the hooked carriage, the *lu* of Hsia Hou Shih; the *ta lu*, the chariot of the Yin; and the *chêng lu*, the chariot of the Chou. The Commentary [says]: 'The phœnix carriage was a carriage having bells and a phœnix; the hooked carriage was a carriage having a *chü yü*:—*chü* meant a railing in front of the carriage, and *yü* referred to the body of the carriage.'"—*Li chi, ibid.* p. 13*b*.

"Yü of Hsia invented the hand-carriage (輦 *nien*)."—*Wu yüan, ibid.* p. 30*a*.

"At the close of the [reign of] Hsia [Hou Shih (= Yü)] the hand-carriage was invented. The 'Regulations of the Board of War' says: 'The hand-carriage of Hsia was borne by 20 men; of Shang, by 18; and of Chou, by 15.'"—*Ch'ün shu k'ao so, ibid.* p. 30*a*.

"The hand-carriage for the Queen had a small cover made of feathers for giving shelter from the sun."—*T'ung tien, ibid.* p. 30*a*.

"The Shang dynasty on the same system as the 'hooked carriage' made the *ta lu* (大輅), 'large chariot.'"—*T'ung tien, ibid.* p. 8*b*.

"With the naves of their wheels bound with leather, and their ornamented yokes,
With the eight bells at their horses' bits all tinkling,
[The princes] come and assist at the offerings."—
Shih ching, IV. iii. ii.

"Yü of Hsia when passing over mountains sat in a *ch'iao*

(轎), sedan. The Prince of Nan Ao sat in a sedan when passing over mountains. Hung Ching-lu called it a carriage for travelling in mountainous country which could also be used on level ground. . . . There is no doubt that the *ch'iao* was a sedan." But the word seems also to have indicated a small wooden sledge used to cross mud.—*Shan chia ch'ing shih, Ko chih ching yüan*, c. 29, *Chou chü lei*, p. 34*a*.

Agricultural Implements.—"The *Book of Chou* says: 'In the time of Shên Nung it rained rice-seeds. These were sown by the Emperor [Shên Nung], who then made the hoe and spade in order to clear the fields of weeds. The five kinds of grain were then produced. The hoe (鋤 *ch'u*) also was made by Shên Nung.'"—*Shih wu chi yüan, ibid.* c. 48, *Kêng chih ch'i wu lei*, p. 4*b*.

"In the time of Yü, the great flood spread over the world. Yü took the *pén* (畚), bin or earth-basket, and *ch'a* (臿), beetle or rammer, and taught the people [the work of drainage]."—*Huai-nan Tzŭ, ibid.* p. 5*b*.

"When I Yin began earth-work, the long-legged men were sent to tread the *hua* (鍤), spade."—*Huai-nan Tzŭ, ibid.* p. 6*a*.

"The *hua* (鍤), two-pronged spade, differed somewhat from the *ch'an* (鑱), pick. The latter was narrow but thick, and could only be used straight, whereas the *hua* was broad and thin, and could be used in any way. A farmer of old used to say: 'In opening up uncultivated land the pick should be used, but in turning the soil of cultivated land it is better to use the spade.'"—*Wang Chi San ts'ai t'u hui, ibid.* p. 6*a*.

"Kung Liu [first] made the *hu tou* (斛斗),"—a bucket used for baling, having a rope at each side, the ends of which are held by two men; it is also used for baling out boats.—*Wu yüan, ibid.* p. 8*b*.

"The hu (斛 or 瓠) was a small bucket made of wood. To its sides were attached two cords. People used it for baling water, so it was called *hu t'ung* (斛桶), 'baling bucket.'"—*Shih wu yüan shih, ibid.* p. 8*b*.

[Locks are mentioned in *Li chi, Yüeh ling, Ko chih ching yüan*, c. 49. *Jih yung ch'i wu lei*, p. 9*a*.]

"The *ling* (鈴), bell, was hung on a flag. A movement of the latter caused it to make a sound."—*Tso chuan chu, ibid.* p. 10*b*.

"'A girl should have a needle and a *su*.' The Commentary explains: '*Su* was a long needle.'"—*Kuan Tzŭ, ibid.* p. 11*b*.

[Stone needles are said to have been in use. See *ibid.* p. 12*b*.]

"The bellows were made by Chou Kung. The handle of the wooden blower was just the same as the stick for blowing the fire called 'fire cane.'"—*Shih wu kan chu, ibid.* p. 14*a*.

"Shih Yi (a censor) made a fire-blower (a bellows made of wicker)."—*Wu yüan, ibid.* p. 14*a*.

"In the Book of Rites it says: 'All the people in the palace had their bedrooms provided with charcoal stoves. The stove was made after the pattern of [that used in] the 3 dynasties (Hsia, Shang, and Chou)."—*Shih wu yüan shih, ibid.* p. 14*a*.

"Kung Liu made beeswax, or yellow wax (黃蠟 *huang la*)."—*Shih wu kan chu, ibid.* p. 22*a*.

"Deer-glue was of a light green colour; the glue of the white horse, red; of the white ox, flame-red; of the rat, cake-colour; and of the rhinoceros, yellow."—*K'ao kung chi, ibid.* p. 24*a*.

"All goblets holding one pint were called *chio* (爵); two pints, *ku* (觚); three pints, *chih* (觶); four pints, *chio* (角); five pints, *sa* (散); one *shih*, *hu* (壺); and five pecks, *wu* (甒)."—*Li Ch'i chu, ibid.* c. 51, *Jih yung ch'i wu lei*, p. 12*b*.

"Prince Huan of the Ch'i State once invited all his ministers to drink wine, and gave an order saying: 'Anyone coming late must drink as a forfeit a *ching ch'êng* (經程) of wine.' The Commentary says: 'The large wine vessel was called *ching ch'êng*.'"—*Han Shih wai chuan, ibid.* p. 12*b*.

"Amongst articles made by the potter was a *ching* (經) for wine. The people of Chin An (Shansi and Shensi) put wine into a vase made like an earthen jar; its neck was small and its muzzle round. The body being small could only contain one peck. It was used for holding wine."—*Hou ching lu, ibid.* p. 12*b*.

"The potter made the *hsien* (甗), a steamer without a bottom, which could hold 2 *hu* (1 *hu* = 6 pecks 4 pints); it was half an inch thick and its rim one inch."—*K'ao kung chi, ibid.* c. 52, *Jih yung ch'i wu lei*, p. 1*b*. See also *Tso chuan, ibid.* p. 1*b*.

"In the Chou dynasty there were the *nai tzŭ* (乃子), *kuo shu* (虢叔), *chu lü* (諸旅), *tou tê* (竇德), and *yü yüan* (聿遠) caldrons."—*Shêng An wai chi, ibid.* p. 3*b*. See also previous Period.

"The cauldron with legs was called *i* (鉹), and that without legs *fu* (釜), pan."—*Shih chuan, ibid.* p. 3*b*.

"The implement called *wei* (磑) was made of bamboo and plastered over with mud, and was used for hulling rice from grain. The implement called *mo* (磨), mill, was cut out of pieces of stone (an upper and a nether one), and was used for grinding rice or wheat to make flour. These two were first used in the Chou dynasty."—*Shih wu yüan shih, ibid.* p. 7*a*.

"Yung Fu made the pestle and mortar."—*Shih pên, ibid.* p. 7*b*. But see previous Period.

"The *i* (匜) was a vessel holding water for washing the hands; it resembled a peck [measure], but its handle had a loop."—*Li chi Ch'i wu t'u, ibid.* p. 12*a*.

"Ropes, crockery, and 'water implements.'"—*Tso chuan, ibid.* p. 17*b*.

[A jasper jar is mentioned in *Tso chuan, ibid.* p. 18*a*.]

"The name *p'ing fêng* (屏風), door-screen, was invented in the Chou dynasty."—*San li t'u, ibid.* p. 10*a*. But see previous Period. Other screens are mentioned in *Li chi, ibid.* p. 10*a*, and *Shih chi chu, ibid.* p. 10*b*.

"The duke of Chou made the curtain (簾 *lien*) of bamboo splints."—*Wu yüan, ibid.* p. 14*b*. Numerous other curtains are mentioned.

"A curtain enclosing on 4 sides like a room was called *wu* (幄); it was a tent occupied by the king."—*Chou li chu, ibid.* p. 21*b*.

"*Man* (幔), awning, means *man* (漫), to spread; it was made in the Chou dynasty."—*Shih wu kan chu, ibid.* p. 22*a*.

"The *ch'in i* (寢衣), bed cover, was the modern quilt (被 *pei*)."—*K'ung chu, ibid.* c. 54, *Chü ch'u ch'i wu lei*, p. 1*a*.

"The large quilt was called *ch'in* (衾); the single one, *ch'ou* (裯). People sometimes made the quilt of embroidered silk or white silk or mulberry-bark cloth."—*Shên chang ts'o yao, ibid.* p. 1*a*.

"'The quilt, made of beautiful plumage and pearls, had a brightness equal to [sun] light.' Wang I's Commentary [says]: 'The meaning here is that the bed-quilt was adorned with feathers of the male and female kingfisher and with pearls and gems in the shape of flowers which were as bright as [sun] light.'"—*Ch'u tz'ŭ, ibid.* p. 1*a*.

"The *ju* (茵), otherwise called *tzŭ* (茲), was . . . a mat made of rushes."—*Hsing su, ibid.* p. 8*a*.

[For the dragon's beard mat (龍茲 *lung tzŭ*) see *Shu wu i ming su, ibid.* p. 8*a*; the 筵 *yén*, mat (spread on a table), 席 *hsi* (spread on the floor), *Chou li, ibid.* p. 10*b*, where it says: "the ancients sat on mats, sometimes three-fold, sometimes twofold"; 浦筵 *p'u yen*, rush mat, *San li t'u, ibid.* p. 10*b*; 竫 *tien*, bamboo mat, *Wu yüan, ibid.* p. 10*b*.]

"A clothes horse made of bamboo poles was called *yi* (箷). The *Ch'ü li* says: 'The *yi chia* (箷枷), which the sexes must not use together'—alluding to the [same] *yi*."—*Hsing su, ibid.* p. 16*b*; see also *Li Nei tsê, ibid.* p. 16*b*.

"The *p'an* (槃) [a bag hung at the girdle for holding a napkin and handkerchief] for men was made of leather, and for women of silk."—*Chou li, ibid.* p. 17*a*.

"The padded mat (縵帛 *man po*) was made of plain silk"—*Han Fei Tzŭ, ibid.* p. 13*b*.

[Spirits were kept in vases or bottles of baked earth (*Shih ching*, III. ii. VII. 2).]

[Common people drank from horns, either unpolished or carved (*Ibid.* II. vii. I. 4; I. xv. I. 8). Princes used cups formed of a precious stone (III. i. V. 2). Wooden and earthenware stands for meats are mentioned (III. ii. I. 8; IV. ii. IV. 4).]

[Spits, stew-pans, and wooden spoons, used in cooking, are mentioned in *ibid.* III. ii. I. 7; II. 2; I. xiii. IV. 3; II. 5, IX. 7; i.]

[A metal-bound coffer used as a receptacle for important archives is mentioned in *Shu ching*, Pt. V. Bk. VI.]

[Keys were used to lock apartments, chests, etc.]—*Ibid.* Pt. V. Bk. VI. 9.

[Tortoise-shell hairpins (玳瑁簪 *tai mei tsan*) are mentioned in *Shih chi, Ko chih ching yüan*, c. 55, *Hsiang lien ch'i wu lei*, p. 1*a*; "broad hairpins" (叙子 *ch'ai tzŭ*), made in imitation of the *chi* (笄) (see following extract and following Period), first of ivory and then of tortoiseshell, in *Chung hua Ku chin chu, ibid.* p. 3*a*; jade ear-rings (玉珥 *yü êrh*), in *Chou shu, ibid.* p. 8*b*; earrings made of gold wire and of pearls, in *Sung mo chi wên, ibid.* p. 9*a*; face-powder (粉 *fén*), in *Ku chin chu, ibid.* p. 11*b* [the first use of face-powder is placed by some in the Ch'in dynasty: see *I yao, ibid.* p. 12*a*]; rouge (燕脂 *yen chih*; also called 紅藍 *hung lan*), in *Ku chin chu, ibid.* p. 13*a*; comb (櫛 *chieh* and 樟櫛 *chan chieh*), in *Yü tsao, ibid.* p. 14*b*; ditto (梳 *shu*), in *Êrh i shih lu, ibid.* p. 15*a*; comb-case (梳匣 *shu hsia*), in *Shih wu kan chu, ibid.* p. 16*a*; dish-cloths and hand-towels (紛 *fén* and 帨 *tui*), in *Li Nei tsê, ibid.* p. 17*a*; bath-towels (絺 *ch'ih* and 綌 *ch'i*), in *Li Yü tsao, ibid.* p. 17*b*; stone mirror (石鏡 *shih ching*), also called "moon mirror" (月鏡 *yüeh ching*), in *Shih i chi, ibid.* c. 56, *Hsiang lien ch'i wu lei*, p. 12*a*; fans, in *Shih pên, ibid.* c. 58, *Yen shang ch'i wu lei*, p. 10*b*; *Shih i chi, ibid.* p. 11*a*; and a toothed staff (齒杖 *ch'ih chang*), in *Chou li, ibid.* p. 16*a*.]

"The *Yu-hsüo*, or Child's Guide to Knowledge, tells us that to the Emperor Hsien Yüan, who came to the throne B.C. 2697, we are indebted for" the invention of the fan; "while the *Kuang-shih-lei-fu*, a well-known cyclopædia of antitheses, defers the invention to the reign of Wu-wang, the first ruler of the Chou dynasty, or more than a thousand years later. Other authorities declare for the Emperor Shun, B.C. 2255."—*Giles, Historic China*, pp. 296–7. See previous Period.

"... possessed such other material luxuries as fans, mirrors of metal, flat-irons, and bath-tubs. But it is often difficult to separate truth from falsehood in the statements of Chinese writers with regard to their early history."—*Ibid.* p. 12.

[Umbrellas and banners are mentioned by Min Sun, one of Confucius' disciples, in conversation with Tzŭ-kung. See *Legge, Ch. Class.*, i. Prol. p. 115.]

[Bowstring rings, girdle ornaments, women's ear-rings and pearls are referred to in connection with the mourning for Tzŭ-ch'an. See *ibid.* i. Prol. p. 118.]

[Mats, drums, boilers, earthenware pans, bamboo-cup, bowls and cups of willow-wood, axes, bills, etc., are mentioned in the works of *Mencius*.]

"The *chi* (笄), hairpin, was not only for the head-dress of a girl, but in ancient times was also used by young men. It is said in the *San li t'u* that for a scholar it was made of bone, for an official of ivory, and was the same as the hairpin of the present time. In the *Chronicles of Tso* it says: 'Fan Wu-tzŭ once was angry with Wên Tzŭ and struck him with a cane, breaking his *chi*. At that time Wên-tzŭ was still a boy and had not yet reached manhood.'"—*Wu tsa tsu, ibid.* p. 2*b*.

"When Tzŭ Kung [Tuan-Mu Tz'ŭ] was passing through Yin he saw there an old man engaged in the vegetable gardens and field allotments, where he had dug an underground passage to a well, from which he filled his jar and brought it up to water them. With great labour he produced but little effect. Tzŭ Kung remarked: 'There is a contrivance called a *hsieh* (械), water-raising machine, with which you could water a hundred allotments in a day. It is made of wood, the after part being heavy and the fore part light, and it could raise water like a pump, and the process is as quick as [that indicated by the bubbles rising in] boiling water. Its [common] name is *chieh kao* (桔槔), well-sweep.'"—*Chuang Tzŭ, ibid.* p. 7*a*.

"A *chieh kao* (桔槔), well-sweep, was an implement for drawing water."—*T'ung su wên, ibid.* p. 7*a*.

"In sacrificing the *chên* (縝) was attached to the ox or cow The Commentary says: Chêng Ssŭ-ming says: 'The *chên* was a nose-string for leading the ox.'"—*Chou li Ti kuan Fêng jên, K'ang Hsi Tzŭ tien, Ssŭ pu*, p. 22*b*.

[After referring to the use of the target and arrow in Yao and Shun's time, the *Pai pien* says: "By the Chou dynasty there were targets of bear, tiger, deer, and jackal-skin, and 3 or 5 *chêng*. In subsequent ages it was made simpler, and had only the bull's-eye." (See *Ko chih ching yüan*, c. 41, p. 23*b*.)]

[The invention of the abacus is ascribed to the Duke of Chou: see *Liu Fêng Shih shih, ibid.* c. 49, *Jih yung ch'i wu lei*, p. 7*b*.]

[The gnomon, plummet-line, mason's rule, mats for laying out buildings, measuring-rod, *etc.*, are mentioned in the *Chou li*.]

"The compass was made by the Duke of Chou. At first he had governed well, and the Yüeh Shang country [Tongking] sent messengers from afar to offer tribute of a white pheasant, two black pheasants, and an ivory tusk. As the Ambassador missed his way home, the Duke of Chou bestowed upon him 2 rolls of figured variegated silk and 5 *pien* (輧) carriages, made so as always to point to the south, and ordered him to drive to the South."—*Hou Han Hêng chien chiu chi, Ko chih ching yüan*, c. 29, *Chou chü lei*, p. 24*a*. This is, however, regarded by many authorities as a fable.

Writing Implements.—"In the days of Confucius, pieces of bamboo pared thin, palm leaves, and reeds, were all used for writing upon with a sharp stick or stile."—*Williams, Midd. King.*, i. 599–600.

[The writing-knife (削 *hsüeh*) for scratching characters on slips of bamboo, is mentioned in *K'ao kung chi t'ung*, c. 1, p. 44*b*. Its efficiency and durability are also referred to.]

"Even several centuries subsequent to Confucius slips of bamboo were still used, on which the characters were scratched or engraved. These were gradually superseded by the silk texture."—*Wylie, Ch. Researches*, p. 208.

"About the third century before Christ, silk and cloth were employed, and hair pencils made for writing."—*Williams, Midd. King.*, i. 600.

[Ink is mentioned in *Wu yüan, Ko chih ching yüan*, c. 37, p. 20*a*; and the inkstone, in *Wu yüan, ibid.* c. 38, *Wên chü pu êrh*, p. 1*a* (but see *I shih chi shih*, p. 692); *Wu chi chih Ts'ung chêng chi, ibid.* p. 2*a*; *etc.*]

Carriages.—[Carriages are referred to in *Wu yüan, ibid.* c. 29, *Chou chü lei*, p. 1*b*; *Tso chuan, ibid.* p. 15*b*; *Chou shu yü hui, ibid.* p. 2*a*; *Chou li, ibid.* p. 2*b*; p. 5*a*; *Yen fan lu, ibid.* p. 6*a* (where it is stated that the ancients stood in their carriages instead of sitting in them); *Po ku t'u, ibid.* p. 6*a*; *Ch'ün shu k'ao so, ibid.* p. 6*b*; *Shih pên, ibid.* p. 7*a*; *Shêng An wai chi, ibid.* p. 7*b*; *Chou li chu, ibid.* p. 22*b*; *Tso chuan, ibid.* p. 8*a*; *T'ung tien, ibid.* p. 8*b*; *Shi i chih, ibid.* p. 22*b*; *Tso*

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Furniture, Utensils, etc.—[They slept on couches or stands raised from the ground. The mats spread on the ground or floor served as tables, where the meal was set out.]—*Legge, Ch. Class.*, IV. ii. 305, and i. Prol. p. 147, note.

[The "chair," in early works, was probably the small, low table 几 which was placed on a mat on the ground and could be used as a table or as a chair—but was really a table. The character used in early books is this 几, which used to be read *i*, the same sound as the word 椅 now used for "chair." People ordinarily sat, or squatted, on mats, in the way that the Japanese do in modern times.]

"They took their places on the mats and leaned on the stools."—*Shih ching*, Pt. III, Book II, Ode vi. 4.

[The *chi* (几), low table, is mentioned in *Ch'u li, Ko chih ching yüan*, c. 53, *Chü ch'u ch'i wu lei*, p. 1*a*.]

"The *chi* (几), low table, was of the same class as the *an* (案), stand or bench. It was 5 feet long, 1 foot 2 inches high, and 1 foot broad; both ends were [coloured] red, but the middle part was black. In ancient times, when people sat down [on the ground] a *chi* was placed for them—this was an article for leaning on. It was not, however, provided for any but nobles, to whom it was given as a mark of respect. It had been handed down from ancient times. Moreover, the stool for a man was placed on the right, whilst that for a spirit was placed on the left—a distinction which must not be overlooked."—*Ch'i wu ts'ung t'an, ibid.* p. 1*a*.

"Duke Chao made the chair (椅 *i*)."—*Wu yüan, ibid.* p. 4*a*. But see previous extracts.

"There were no chairs in those days."—*Journ. N.-C. B.R.A.S.*, N.S. xxiv. 258.

"Halls were matted. . . . there were low tables."—*Ibid.* p. 262.

"Mêng Ch'ang once went on a tour through the Five States. On reaching Ch'u he was offered an ivory bed."—*Chan kuo ts'ê, Ko chih ching yüan*, c. 53, *Chü ch'u ch'i wu lei*, p. 6*b*.

'Lao Lai-tzŭ, when his parents were dead, lived on the south of Mêng Shan as a hermit, where he made a bed of *ch'i* (杞), willow-wood."—*Kao shih chuan, ibid.* p. 8*a*.

"Lu Wang made the *t'a* (榻), a long narrow bedstead."—*Wu yüan, ibid.* p. 9*b*.

"旌 is the name of a peculiar kind of flag, used among other purposes to mark out places or paths."—*Legge, Ch. Class.*, III. ii. 573, note.

[The "dragon's fat lamp," whose "light extended 100 *li*," is mentioned in *Shih i chi, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 11*b*.]

"The Emperor Mu of the Chou dynasty made a lamp called 'Longevity' (*i.e.*, which never went out) to light him [to longevity], and set candles made of *fan* (蟠), woodlice, fat throughout the palace."—*Shih i chi, ibid.* p. 12*a*.

"In eating broth with vegetables in it, the *chia* (梜) was used; if without vegetables, no *chia* was used. The Commentary says: 'The *chia* is a chopstick, and was otherwise called *chia t'i* (梜提).'"—*Chou li* [*chi*], *ibid.* p. 17*a*.

"The people of the Ch'u State took for sale to those of Chêng pearls contained in a chest made of *mu lan* wood [a tree bearing yellowish seed-like flowers] perfumed with cinnamon and pepper, variegated with pearls and jewels (or jade), ornamented with red jasper, and regularly covered with kingfishers' feathers. The people of Chêng bought the chest, but returned the pearls."—*Han Tzŭ, ibid.* 26*b*.

"The *hu* (壺), vase, was used in two rites in the Chou dynasty—the *yen li* and the *tai she*. [These were rites used on electing a great minister or scholar.] If [it was the rite for electing] a great minister, a square vase was used, which indicated that a minister should be upright; if for a scholar, then a round vase was used, which indicated that an official ought to be obedient."—*Ch'ien ch'io lei shu, ibid.* c. 74, *Ch'i yung pu*, p. 8*b*.

"The *hsi hu* (洗壺), 'washing-vase,' contained one *huo* (斛), or ten pecks; its mouth was one foot wide, and the height of its neck 5 inches." "The *fang hu* (方壺), 'square vase,' [also] contained one *huo*; its body was round, but its feet and mouth were square." "The *yüan hu* (圜壺), 'round vase,' [also] contained one *huo*; its body was square, its legs and mouth round."—*San li t'u, ibid.* p. 9*a*. A gold vase is mentioned in *Yen Tzŭ, ibid.* p. 9*b*.

chuan, ibid. p. 23*a*; *Shih wu yüan shih, ibid.* p. 35*a* (where the origin of the bamboo screen, 簟 *p'ing*, used on carriages to keep out the dust is recorded); *Wei tzŭ Wêng tu shu tsa ch'ao, ibid.* p. 35*a* (where horse-cloths are also mentioned); reins (轡 *p'ei*) in *Shih ming, ibid.* p. 35*b*; etc.]

[田 車, hunting chariots, constructed with a view to special lightness and rapidity, are mentioned in the commentary of the *Shih Ching* and on the Stone Drums of the Chou dynasty. Black bows were used for shooting game. See *Journ. N.-C.B.R.A.S.*, N.S. viii. 150.]

[Light carriages, called "auxiliary carriages," were used in driving and keeping the game together in hunting.]—*Li Chi*, iii. ii. 24; *Legge, Lî Kî*, i. 221, note 1.

"An 'easy carriage' was small. Its occupant sat in it, and did not stand."—*Legge, Lî Kî*, i. 66, note.

Duke Ch'ao "put a carriage and a pair of horses at Confucius' disposal" for his expedition to the Court of Chou.—*Legge, Ch. Class.*, i. Prol. p. 64.

[Various carriages and chariots are described in *Chou li kuan chu:* see *Gingell*, pp. 18–24, and *Shih ching*, I. ii. i; x. i; II. viii. iii; etc. Wheel-aids are mentioned in *ibid.* II. iv. VIII. 9, 10, and an ornamented yoke in *ibid.* III. iii. VII. 2.]

Boats.—[The habit of fishing had made them construct boats which they directed with oars (*Shih ching*, II. v. I. 6). The boats were of cypress-wood (I. iii. I. 1; iv. I. 1), of willow (II. iii. II. 4), and of pine (I. v. V. 4). III. i. II. 5 mentions a bridge of boats, made by king Wên to pass the river Wei in Shen Si.]—*Legge, Ch. Class.*, IV. ii. 333; i. 38, 73; ii. 280; i. 102; ii. 435. For propulsion of boats by oars see also *Journ. N.-C.B.R.A.S.*, N.S. viii. 151, 154.]

[Boats and racing boats are mentioned in *Yüeh ti chuan, Ko chih ching yüan*, c. 28, *Chou chü lei*, p. 5*a*; *Hsing Ch'u Sui shih chi, ibid.* p. 5*a*; *Tu ch'êng chi shêng* (various kinds described), *ibid.* p. 5*a*; *Ch'ing po tsa chih, ibid.* p. 5*b*; *Yü lin, ibid.* p. 6*a*; *Mu T'ien tzŭ chuan, ibid.* p. 6*a*; *Shih wu kan chu, ibid.* p. 6*a*; *Kuang po wu chih, ibid.* p. 6*a*; *Jên Fang Shu i chi, ibid.* p. 6*a*; *etc.*]

Agricultural Implements.—[The principal instruments of cultivation, the plough with its share, the hoe or spade, the scythe or sickle, are mentioned in *Shih ching*, II. vi. VIII; IV. i. [ii.] I; [iii.] V. and VI.]—*Legge, Ch. Class.*, IV. ii. 380, 583, 600, 603.

"In Kwan-Chung's work, which is ascribed to the 7th century before Christ, but bears marks in it of later authorship, we find mentioned a large variety of iron implements used in the house and on the farm. They are such as plough, rake, spade, sickle, needle, lancet, wheel tire, nail, *etc.*"—*Journ. P.O.S.*, i. 2-3.

"Shu Chün [first] made the long-tooth harrow (耖 *ch'ao*) and the harrow (耙 *p'a*)."—*Lo Ch'i Wu yüan, Shih lei t'ung pien*, c. 17, *Jên shih pu*, p. 1*a*. (Litho. edit. of 17th year of Kuang Hsü.)

"The people of Ch'i and Lu called the four-tooth harrow *ch'ü* (耰 a kind of plough)."—*Liu Hsi Shih ming, ibid.* p. 1*b*.

"The harrow (耙 *p'a*) was made square or in the shape of the character 人; it resembled the plough, and was also drawn by an ox, only the cross-piece was broad, with many teeth. It was used after the plough [had been used]. The plough being used for furrowing up the earth, its merit lay in the depth it reached; and the harrow being used for breaking up the clods its merit lay in its shallowness."—*Nung chêng ch'üan shu, K'ang Hsi Tzŭ tien*, c. 18, *P'a tzŭ*, p. 111*b* (2nd edit. of 7th year of Tao Kuang).

"Lo Hsi set in order [invented] the *pên chü* (畚 挶), basket for carrying soil. The Commentary says: 'The *pên* was a *k'uei lung* (簣 籠), bamboo basket.'" The name was also applied to a grain-bin.—*Tso chuan, Ko chih ching yüan*, c. 48, *Kêng chih ch'i wu lei*, p. 12*b*.

"The hoe (鋤 *ch'u*) means 'to assist,'—it cleared away the weeds, and so assisted the corn to grow. The people of the Ch'i State called the handle of the hoe *chiang* (橿) [a kind of durable wood used for hoe-handles], it being both durable and straight; its head was called *hao* (鶴), 'crane,' it being like the head of a crane."—*Liu Hsi I ya, ibid.* p. 4*b*.

"The *ch'ien* (僉), a kind of flail, was used for threshing corn. By the people living in Sung and Wei it was called a *nieh shu* (攝 戈), a frame for threshing grain, but was also called *tu* (度), pole. In the west of Kuan [Shensi] it was called *pang* (梆), or *p'u* (枹), flail. In Ch'i, Ch'u, Chiang, and Hui, it was called *yin* (柣), pole, or *po* (桲), flail."—*Fang yen, ibid.* p. 9*a*.

"The *t'ien tang* (田 盪), field-leveller, was an instrument used for equalizing the soil. Its handle was made of a forked piece of wood, and was 6 feet long. At the lower end it was crossed by a horizontal bar more than 5 feet long. When a field had been ploughed and harrowed and the soil was still uneven, it was necessary to use this instrument, which was [drawn] evenly over the field so as, by agitating the soil, to cause the earth and water to combine and make the concave and convex parts of the same level, so that the blades of grain might easily grow up."—*San ts'ai t'u hui, ibid.* p. 11*a*.

"The *p'ing pan* (平 板), levelling-board, was an implement for smoothing the ground so as to give a surface to the field before transplanting [into it] the young [rice] shoots. . . . Its length and breadth were equal, and on it were two bolts, from which cords connected it with the yoke of the ox. Sometimes it was dragged by a man to smooth ground which required levelling before it was fitted to receive the seed. The farmers, instead of this, sometimes used an inverted bench."—*San ts'ai t'u hui, ibid.* p. 11*a*.

"The *fêng* (鋒) was an agricultural implement. Its iron head was narrower than those of the plough or pick, but sharper. Its handle was similar to that of a plough, and its point as sharp as a spear. Therefore it was called *fêng*—a name derived from its sharpness. If the ground was hard and dry, it was used before ploughing, so as to save the strength of the ox. An old agricultural rule says: 'In *fêng*-ing [breaking up] the ground [merely for ploughing purposes] one should *fêng* deeply, but in *fêng*-ing it for [planting] paddy-sprouts, one should not *fêng* deeply.'"—*Wang Ch'i San ts'ai t'u hui, ibid.* p. 10*b*.

"In Chêng's Commentary it says: 'The *kou lien* (鉤 鐮), reaping-hook, was [an implement] held close to the ground whilst in use.'"—*Chou li, ibid.* p. 6*b*.

"The *ku shan*, grain-scythe, was smaller than the ploughshare—one man could hold it. It was used after the ploughing had been done and could be used where the plough and ploughshare could not reach."—*Kuan* [*Chung-*] *tzŭ Hsiao k'uang chu, ibid.* p. 1*b*.

"The *chia* (枷), flail, derives its name from *chia* (加), 'to add,' because [it was made by] adding a head to the club. It was used for thrashing the ears of corn to get out the grain."—*I ya, ibid.* p. 8*b*.

"Chou Kung-chin said: 'The farmers of the present time use the *chia* (枷), flail, for threshing grain.' This implement was called *p'u* (桴) in ancient times."—*Tz'ŭ lin hai ts'o, ibid.* p. 9*a*.

"[There was] an instrument used for threshing corn [which] the people of Wu called *lien chia* (連 枷), flail, but the people of Ch'u called it *tiao hua* (掉 花), ear-shaker."—*Yü tung tsŭ lu, ibid.* p. 9*a*.

"The method of making the *lien chia* was by using four poles tied with hide and three feet long by four inches broad; sometimes it was made of a single club only—this had a long wooden handle to which was fitted a wheel, and by turning the latter the grain could be beaten out."—*Nung sang t'ung chüeh, ibid.* p. 9*a*.

"The sickle (鐮 刀 *lien tao*) was an implement effective in cutting down thick grass."—*Fêng su t'ung, ibid.* p. 6*b*.

"The sickle or reaping hook (刈 鉤 *i kou*) to the eastward of Kuan (Shensi) was called *lien* (鐮); it was otherwise called *ch'ieh* (鍥)."—*Fang yen, ibid.* p. 6*b*.

"The *chih* (鉣), sickle or reaping-hook, was a short sickle (鐮 *lien*) used for reaping grain."—*Shou wên, ibid.* p. 6*b*.

"The *ch'ieh* (鍥), sickle, was like a sword, but its upper part was curved, and also like a sickle (鐮 *lien*), but its lower part was straight. The back of the *ch'ieh* was as thick as a finger, and its blade was about one foot long; its handle was two palm-breadths long. It was also called 'curved sword' (彎 刀 *wan tao*). It was used for cutting grass or growing grain, sometimes for chopping fuel or bamboos, and was a useful implement to the farmer."—*San ts'ai t'u hui, ibid.* p. 6*b*.

"The ploughshare was 5 inches broad. Two ploughshares made a double colter." The Commentary says: "The ploughshare was the iron at the end of a plough; the iron was 5 inches in breadth." The explanation says: "The ploughshare was the prong, as it broke things like a prong."—*Chou li Tung kuan K'ao kung chi Chiang jên, K'ang Hsi Tzŭ tien, Lei tzŭ pu*, c. 18, p. 111*b*. [Ed. of 7th year of Tao Kuang.]

"The cart-maker made a plough (*lei*); the *tzŭ*, or wooden part to which the share was fastened, was one foot one inch long, the straight middle part was 3 feet 3 inches, and its upper hooked part was 2 feet 2 inches." The Commentary says: "The *lei* is the agricultural plough; the *tz'ŭ* is the fork at the lower end of the plough."—*Chou li Tung kuan K'ao kung chi Chü jên, ibid.* p. 110*a*. [Ed. of 7th year of Tao Kuang.]

"A handle made of bent wood was called a *lei*, plough; and a plough with a point attached to it was called a *ssŭ*, ploughshare."—*Tsêng yün, Ko chih ching yüan*, c. 48, *Kêng chih ch'i wu lei*, p. 1*a*.

Sericultural Implements.—"The *ts'an k'uang* (蠶 筐), silkworm basket, was circular but rather long and shallow, and had an edge. It was so finely made that it could confine ants. It was used when silkworms were being separated, when it was put into a bamboo framework, so that it was easy to take it out and feed them."—*San ts'ai t'u hui, ibid.* p. 12*b*.

"The *tsu po* (簇 箔), frame on which silkworms spin their cocoons, was a support made of pine boards, 6 feet long and 3 feet wide. Thin bamboos were used to make a 'horse-eye' frame, into [the meshes of] which bundles of reeds were stuck at intervals, neither densely nor too sparsely. Small leafless bamboos were also used to construct a cross-frame, on the under side of which the reed screen was placed, bamboo laths being made to pierce its surface, and the two tied together—so that the silkworms could crawl on the reeds and not come to harm if they fell."—*T's'an shu, ibid.* p. 13*a*.

Fishing, Fowling, and Hunting Implements.—"The *Shih ku wên* (石 鼓 文), *Written Account of the Stone Drums*, says: 'Of what kind were the fish?' 'They were the tench and the carp.' 'How did we pack them?' 'With the poplar and the willow.' *T'o* (橐) means to pack up. The fishermen of the present time commonly use poplar leaves or the leaves of the broad-leaved bamboo to pack their fish for market. This is what the *Book of Changes* refers to when it says: 'There are the fish in the pack.' In Tung P'o's *Song of the Stone Drums*, it says: 'The fish is a bream, strung on a willow [twig].' Here [*i.e.*, in the quotation from *Account of the Stone Drums*] to pack is used instead of to string, but to string fish and to pack them were not the same, and should not be taken to mean the same thing."—*I tan yüan tsung lu, ibid.* p. 23*a*.

"The stakes (椮 *shên*) set up to catch fish were called *ts'ên* (涔). The Commentary says: 'At the present time people make these traps by piling up wooden logs in the water. The fish, feeling cold, take shelter under them, and are caught by means of a bamboo screen.'"—*Êrh ya, ibid.* p. 23*b*.

"As regards *ch'ien* (栫), the *Shuo wên* says: 'It means to close up water by piling wooden logs.' In the *Poem of the River*, also, it is stated: To close up water with wooden logs [he made] a *ts'ên* (涔), pile, and completed the enclosure with a net and fish-trap—all these were fishing implements. Thus in Shu [one of the Three Kingdoms] they had the name *yü ch'ien* (魚 栫), fishing barricade."—*Tz'ŭ lin hai ts'o, ibid.* p. 23*b*.

"The *ti ti chu kan* (簹 籊 竹 竿), long tapering bamboo fishing-rod, was used for river fishing in Honan [*lit.*, in the Ch'i, a tributary of the R. Wei in Honan]."—*Shih wei fêng, ibid.* p. 21*b*.

"The *ssŭ min* (絲 緡), silken cord, was a fishing-line."—*Shih chuan, ibid.* p. 21*b*.

"The people of the Lu State were fond of fishing. They used cinnamon bark for bait, forged gold to make hooks, which were variegated with silver or green colours, and used a fishing-line ornamented with feathers of the turquoise kingfisher [or, a line stained with red or green colours]."—*Ch'üeh Tzŭ, ibid.* p. 22*a*.

"The fishermen [were in the habit of] putting the hair of the small monkey on the four corners of their nets—by which means they succeeded in taking large numbers of fish. It is said that the fish, seeing this [hair] were attracted to it as a man is attracted towards embroidery."—*Wên ch'ang tsa lu, ibid.* p. 21*a*.

"[After the season at which] the wild dove transformed itself into the falcon, the *wei lo* (鮠 羅) was set. The Commentary says: 'The *wei* was a fowling-net.'"—*Li chi, Wang chih, ibid.* p. 20*a*.

"A small net with a long handle was called *pi* (畢)."—[*Li chi*], *Yüeh ling chu, ibid.* p. 20*a*.

"The net for catching birds was called *lo* (羅), for catching hares, *chüeh* (罝), for catching deer, *méng* (罟), for catching wild boar or pigs, *luan* (羉). The *pi* (畢), [also a fishing-net], was a kind of *ch'ung* (罿), bird-trap; the *ch'ung* was a *cho* (罦), bird-snare; and the *cho* was a *fu* (罦), which was a kind of spring-net for catching birds."—*Êrh ya, Shih ch'i ti liu, Chüan chung*, p. 8*a*.

"The *ku hua* (罟 擭), snare, was used for shutting in and capturing birds and beasts. At the present time it is called a *k'ou wang* (扣 網), running-noose net."—*Ming wu k'ao, Ko chih ching yüan*, c. 48, *Kêng chih ch'i wu lei*, p. 20*a*.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

Furniture.—Chairs "were first used in China in the Buddhist period."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 258.

"The *an* (案) was a kind of table, and the *hsüan* (檈) was a round *an*."—*Shuo wên, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 23*b*.

"The people of the Ch'ên, Ch'u, Sung, and Wei States called the *an* (案), table, *hsieh* (梫)."—*Fang yen, ibid.* p. 23*b*.

"The Emperor Wu of Han first imitated the northern foreigner in making the sofa (交 椅 *chiao i*)."—*Wu yüan, Ko chih ching yüan*, c. 53, *Chü ch'u ch'i wu lei*, p. 4*a*.

"The Emperor Wu made a *ch'i pao* (七 寶), 'seven precious things,' bed, and a *tsa pao* (雜 寶), 'variegated precious things,' table."—*Hsi ching tsa chi, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 23*b*.

"Shih Hu . . . used a jade table on which to transact official correspondence."—*Yeh chung chi, ibid.* p. 23*b*.

"In the Pai Chang Mountain there was a stone chamber, in which there was a stone table with two stone books on it."—*Liu Ching-shu I yüan, ibid.* p. 23*b*.

"Under the Han system the Emperor used the jade *chi* (几), bench; in winter it was covered with embroidered silk and was called 'silk bench' (綈 几 *t'i chi*). The benches for all the princes was made of bamboo or wood, covered in winter with carpets for them to lean on, but they had no right to use the embroidered silk cushion."—*Hsi ching tsa chi, Ko chih ching yüan*, c. 53, *Chü ch'u ch'i wu lei*, p. 2*a*.

"Ts'ao Ts'ao made the inclined bench (欹 案 *wo an*), leaning on which he perused his books."—*San kuo chih, ibid.* p. 3*b*.

"The *Sou shên chi* says: 'The *hu* (胡) seat was an article of furniture of the Turfan tribes.' But the *Fêng su t'ung* says: 'King Wu Ling was fond of the Turfan costumes; he made the *hu* seat, which was then originated.' It was the present sofa (交 椅 *chiao i*)."—*Pai shih lei pien, ibid.* p. 4*a*.

"A board large enough for one person to sit on was called *p'ing* (枰), stool, and one 8 feet long, *ch'uang* (牀), bed."—*Fu ch'ien t'ung su wên, ibid.* p. 6*a*.

"The Emperor [Wu of Han] made a bed of coral."—*Han wu nei, ibid.* p. 6*b*. Also one of Huo Ch'i pearls: *Tung an chi, ibid.* p. 6*b*.

"A bedstead 3 feet 5 inches high was called a *t'a* (榻)."—*Fu ch'ien t'ung su wên, ibid.* p. 9*b*.

[Other bedsteads are mentioned in *Shih i chi, ibid.* p. 7*b*: *Hsieh Ch'êng Han shu, ibid.* p. 9*b*.]

"'To set the *fu i* (黼 依).' Shih Ku's Commentary says: 'Figures of axes painted in black and white were called *fu*; and *i* (依), read *i* (扆), was [an article] shaped like a screen, but curved, and painted with the *fu* markings or figures. It was set by a window."—*Han Yen Chu chuan, ibid.* p. 10*a*.

[Screens of various kinds are mentioned in *Han Wu ku shih, ibid.* p. 10*b*; *Kuo Tzŭ-hêng Tung ming chi, ibid.* p. 10*b*; *Hsieh Ch'êng Hou Han shu, ibid.* p. 11*a*; curtains, in *Yang Hsiung Fang yen, ibid.* p. 14*b*; *Tung ming chi, ibid.* p. 15*b*; *Hsi ching tsa chi, ibid.* p. 15*b*; *San ch'in chi, ibid.* p. 15*b*; *Shih chi, ibid.* p. 16*a*; *Wang Shên Wei shu, ibid.* p. 16*b*; *Fêng su t'ung, ibid.* p. 16*b*; *Han shu, ibid.* p. 17*a*; *P'ei Ching-jên Ch'ien Ch'in chi, ibid.* p. 22*a*; quilts and pillows, in *Kung Sun-hung chuan, ibid.* c. 54, *Chü ch'u ch'i wu lei*, p. 1*b*; *Tung ming chi, ibid.* p. 3*a*; *Lo Shên fu chu, ibid.* p. 3*a*; *Hu yuan, ibid.* p. 5*a*; mattresses, in *Fêng su t'ung, ibid.* p. 14*b*; *Shên i ching, ibid.* p. 13*a*; *Pi han lu, ibid.* p. 13*a*; p. 13*b*; *Wu lei hsiang kan chih, ibid.* p. 13*b*; steps (to get into bed by), in *Fu ch'ien t'ung su wên, ibid.* p. 15*a*; *Tung fang shuo chuan, ibid.* p. 12*b*; mats of different kinds, in *Shih i chi, ibid.* p. 8*b*; *Han shu, ibid.* p. 8*b*; *Han Wu ku shih, ibid.* p. 10*b*; *Tung ming chi, ibid.* p. 11*a*; napkin-box and embroidered bag, in *Han Wu nei chuan, ibid.* p. 17*a*; stone spittoon, in *Tung ming chi, ibid.* c. 58, *Yen shang Ch'i wu lei*, p. 7*b*; and [gold spittoon and silver-rimmed spittoons, in *Wei Wu shang tsa wu su, ibid.* p. 7*b*.]

Household Utensils, etc.—"In the time of Wang Mang there was a curious man named Chü-Wu Pa. When he slept he used a drum as a pillow, and when he ate he used iron chopsticks."—*Hou Han shu, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 18*a*.

"There were 50 lacquered spoons and 100 pairs of lacquered chopsticks."—*Tung kung chiu shih, ibid.* p. 18*b*.

"Liu Piao had 3 wine vessels. The largest was called *po ya* (伯 雅), 'elder beauty,' the next, *chung ya* (仲 雅), 'middle beauty,' and the last, *chi ya* (季 雅), 'younger beauty.'"—*Tien lun, ibid.* p. 20*a*.

"When Ch'ên, king of Ho Chien, entertained his royal relatives, he displayed [many] precious implements, amongst which was a red jade goblet. There was none like it in the central kingdoms, and it was said to have come from the West."—*Chia lan chi, ibid.* p. 20*b*.

"In the Ch'ang Lo palace there was a wine-pond, whereon the Han Emperor Wu sailed his boat. To the north of the pond there was a high terrace, on which he showed off [his power and wealth] before the western tribes, giving them wine to drink out of an iron cup, which was so heavy it could not be lifted"—and thus mocking them.—*San p'u huang t'u, ibid.* p. 20*b*.

"[Miss Chao] Ho-tê presented [her sister Miss Chao] Fei-yen with a goblet made from a scented univalve, which was a product of the Southern Seas."—*Hsi ching tsa chi, ibid.* p. 20*b*.

"Wang Yen-ch'ing, king of the Min rebel state, spent a whole night drinking. He used a thin silver plate, which was very

soft, just like a slice of pumpkin, to make a cup, so the name given to it was *tsui ju ni* (醉如泥), 'so drunk as to be like a clod' [*i.e.*, unconscious]."—*Wu kuo ku shih, ibid.* p. 22*b*.

[Wine-bottles, wine vessels, goblets, etc., are mentioned in *Li Chi Wéng tzŭ hsia lu, Ko chih ching yüan*, c. 51, *Jih yung ch'i wu lei*, p. 4*a*; *Shan chia ch'ing shih, ibid.* p. 4*a*; *Yen Shih-ku Han shu chu, ibid.* p. 4*a*; *Yang Hsiung Chiu chén, ibid.* p. 4*b*; *Han shu Wén San-wang chuan, ibid.* p. 5*a*; *Tz'ŭ lin hai ts'o, ibid.* p. 6*a*; *Shén i ching, ibid.* p. 6*a*; *Han shu Kao Ti chi, ibid.* p. 6*a*; *Lei ch'ing jih cha, ibid.* p. 8*a*; *Ko ku yao lun, ibid.* p. 8*a* (coconut cups); *Pai shih lei pien, ibid.* p. 8*b*; *etc.*]

[Basins, bowls, jars, etc., are mentioned in *Shuo wén, ibid.* p. 16*a*; *Ch'in chia ch'i yü chia shu, ibid.* p. 16*b*; *Ch'ieh lan chi, ibid.* p. 19*a*; *Shih wu yüan shih, ibid.* c. 52, *Jih yung ch'i wu lei*, p. 13*b*; *I shih chi, ibid.* p. 14*b*; *Po ku t'u, ibid.* p. 15*a*; *Han wu hsing chih, ibid.* p. 17*b*; *Ch'ün sui lu, ibid.* p. 19*b*; *Han hsin chuan, ibid.* p. 20*a*; *Han Su Wu chuan, ibid.* p. 20*b*; *Shih wu yüan shih, ibid.* p. 21*a*; steamers, cauldrons, pans, *etc.*, in *Fang yen, ibid.* p. 1*b*; *Po ku t'u, ibid.* p. 1*b*; *Shih wu yüan shih, ibid.* p. 2*b*; *Shuo wén, ibid.* p. 3*b*; *Han shu chu, ibid.* p. 4*a*; *Féng shih Chien wén lu, ibid.* p. 4*a*; *Pai shih lei pien, ibid.* p. 4*b*; grain-roller, in *Pai shih lei pien, ibid.* p. 7*b*; pestle and mortar, in *Lü Shih Ch'un ch'iu, ibid.* p. 7*b*; grain-hamper, in *Fang yen, ibid.* p. 9*a*; bamboo peck-measure, in *Lei ch'ing jih cha, ibid.* p. 9*a*; and chamber-pots, in *Yen shih ku Han shu chu, ibid.* p. 24*a*; *Kuang po wu chih, ibid.* p. 24*a*.]

"On the south side of the altar dedicated to the sacrifices *fêng* and *shan* there was a white jade plate, in the middle of which was a jade tortoise."—*Han Kuan i, Shih lei t'ung pien*, c. 74, *Ch'i yung pu*, p. 5*a*.

"In the fourth year of the reign T'ai K'ang the prefect T'ao Huang sent to the throne, accompanied by a memorial, the [pair of] crystal plates, one white and the other purple, offered [as tribute] by Wang Fan-hsiung of the Lin country."—*Chiao Chou tsa shih, ibid.* p. 5*a*.

"Vitreous, amber, and ivory plates."—*Ku yüeh fu, ibid.* p. 5*a*.

"[In possession of] one of the foreign tribes lying to the north-west there was a silver plate 50 *chang* broad."—*Shén i ching, ibid.* p. 5*a*.

"The Han emperor Ming Ti used a plate of red jade to hold red cherries, which he bestowed on his ministers. On seeing them in the moonlight, the red cherries and the plate being the same colour, they thought the plate was empty."—*I wên lei chü, ibid.* p. 6*a*.

[A copper plate is mentioned in *Shih chi, ibid.* p. 6*b*.]

"In the Hsiao Yao palace at Ch'ang An there was a washing-basin, 1 *chang*, 2 *ch'ih* in area."—*Shu chêng chi, ibid.* p. 8*a*.

"The [modern] water-basin was the *hsi* (洗), earthenware basin, of ancient times. It was 3 feet high and the diameter of its mouth 1 foot 5 inches."—*San li t'u, ibid.* p. 8*a*.

"Wang Tzŭ-p'ing had 12 jade vases."—*Yün fu, ibid.* p. 9*a*.

"To the question: Why is an entertainment called 'bamboo-mat' (筵 席 *yen hsi*), *i.e.*, 'bamboo-mat' (*yen*) and 'mat' (*hsi*), the reply is: In ancient times people sat on mats spread on the ground; when they ate and drank [had an entertainment], if they did sit on a mat they must sit on a bamboo-mat [they did not use the *hsi* but the *yen*]. Though the people of subsequent ages had tables and chairs, they retained the names *yen* and *hsi* [for an entertainment]."—*Chia li ta ch'êng*, c. 1, *Ming li t'ou la*, p. 17*b*.

[Jars, vases, etc., are mentioned in *Hua yen kuo chih, Shih lei t'ung pien*, c. 74, *Ch'i yung pu*, p. 11*b*; *Shih shuo, ibid.* p. 12*a*; *Ch'ieh lan chi, Ko chih ching yüan*, c. 49, *Jih yung ch'i wu lei*, p. 8*a*.]

"The Emperor Shih of the Ch'in dynasty added a phœnix head of gold and silver at the end [of the 釵 *ch'ai*, broad hairpin: see previous Period] and made the handle of tortoise-shell. It was called the 'phœnix broad hairpin' (鳳 釵 *fêng ch'ai*)."—*Chung hua Ku chin chu, ibid.* c. 55, *Hsiang lien ch'i wu lei*, p. 3*a*.

[Other hairpins are described in *Shuo wén, ibid.* p. 1*b*; *Tung ming chi, ibid.* p. 3*a*; artificial flowers, in *Wu yüan, ibid.* p. 7*a*; *Hsü Han shu Yü fu chih, ibid.* p. 7*a*; finger-rings, in *Han chiu i, ibid.* p. 9*b*; bracelets, in *Hsü Chü Shih wu yüan shih, ibid.* p. 10*a*; "eyebrow black," in *Chuang t'ai chi, ibid.* p. 12*b*; and cosmetics, in *Yen fan lu, ibid.* p. 13*a*.]

"The end of the ivory bodkin was sharp, and could be used for loosening a knot."—*Shuo wén, ibid.* c. 17, *Kuan fu lei*, p. 14*b*.

[Handkerchiefs, napkins, etc., are mentioned in *Shih wu yüan shih, ibid.* c. 55, *Hsiang lien ch'i wu lei*, p. 17*b*; *Chih kuai, ibid.* p. 17*b*; mirrors, in *Shén i ching, ibid.* c. 56, *Hsiang lien ch'i wu lei*, p. 2*a*; *Hou shan t'an ts'ung, ibid.* p. 2*a*; *Ch'ien ch'io lei shu, ibid.* p. 4*b*; *Yu yang tsa tsu, ibid.* p. 7*b*; *Liang Ssŭ kung chi, ibid.* p. 8*a*; p. 10*b*; *P'ao P'u Tzŭ, ibid.* p. 8*b*; *Tung ming chi, ibid.* p. 9*b*; *Shih i chi, ibid.* p. 10*b*; *Ssŭ kung chi, ibid.* p. 10*b*; and a mirror on stand, in *Wu yüan, ibid.* p. 12*b*.]

[For fans of various sorts see *Hsieh Tzŭ Mou ch'ên ch'ao, ibid.* c. 58, *Yen shang ch'i wu lei*, p. 11*a*; *Sou shên chi, ibid.* p. 12*b*; *Ts'ui Pao Ku chin chu, ibid.* p. 14*a*; *etc.*]

[Staffs are mentioned in *Han K'ung Kuang chuan, ibid.* p. 17*b*; *I sou, ibid.* p. 17*b*; *Shih chi, ibid.* p. 17*b*; *Han Ch'ang I Wang chuan, ibid.* p. 17*b*; *Shu tu fu chu, ibid.* p. 18*a*; *Pei hu lu, ibid.* p. 18*a*; *Ko ku yao lun, ibid.* p. 19*a*; *Wu Tang Shan chi, ibid.* p. 19*b*; *Fa hsien chi, ibid.* p. 19*b*; fly brushes, in *Tung ming chi, ibid.* p. 24*a*; and besoms, in *Han Kao chi, ibid.* p. 25*a*; *Hsi yü chuan, ibid.* p. 25*a*; etc.]

"The *lou* (漏), clepsydra, was made of copper to contain water, and a bamboo was divided into 100 *k'ê* (刻), [15 minutes], for measuring the length of the day and night."—*Shuo wén, ibid.* c. 1, *Kan hsiang lei*, p. 11*b*.

"When evening came, in the palace of the Han dynasty candles were distributed."—*Han I shih, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 12*b*. Some were made from the oil of the *cassia lignea* (China cinnamon): see *Shih i chi, ibid.* p. 12*a*; and of the fat of the man-fish: see *Shih chi, Ko chih ching yüan*, c. 50, *Jih yung ch'i wu lei*, p. 21*b*.

"In the imperial park of the emperor Hsüan of the Han dynasty there was a beautifully-made 'goose-foot' lamp [stand]."—*Lei shu, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 11*b*.

"Ting Huan, a clever workman of Ch'ang An, made an 'ever full' lamp, engraved with 9 dragons and 5 phœnixes, varied with the *hibiscus mutabilis*, lotus, lotus-root, and the like."—*Hsi ching tsa chi, ibid.* p. 11*b*.

"In the Nine Classics there is the word *chu* (燭), 'candle,' such as 'when walking at night take a candle,' 'grasping a candle and sitting in a corner,' and 'do not burn a candle down to the handle,' but there is not the word 'lamp,' *têng* (燈). In the Han dynasty the 太 乙 *t'ai i* (name of a lamp) was lit from evening until daybreak, and there were 7-branch, 100-branch lamps, and the like."—*Hsüeh ch'i chan pi, Ko chih ching yüan*, c. 59, *Jih yung ch'i wu lei*, p. 8*a*.

[Lanterns of many kinds are named: see *Han Wu nei chuan, ibid.* p. 10*b*; *Hsi ching tsa chi, ibid.* p. 11*a*; *Ho pi shih lei, ibid.* p. 10*b*; *Sui shih tsa chi, ibid.* p. 11*b*; *Tung ming chi, ibid.* p. 12*a*; p. 19*a*; *Po ku t'u, ibid.* p. 18*a*. Oil is mentioned in *Ko ku yao lun, ibid.* p. 19*a*; p. 21*a*; white wax, in *Shih wu kan chu, ibid.* p. 22*a*; beeswax, in *P'i ya, ibid.* p. 22*a*; *Hua i niao shou k'ao, ibid.* p. 22*b*; *Sui shih chi, ibid.* p. 24*a*; *Mêng hua lu, ibid.* p. 24*a*; glue and varnish, in *Shih chou chi, ibid.* p. 24*a*; *Tung ming chi, ibid.* p. 24*b*; *Han shu Chao Hou chuan, ibid.* p. 25*b*; *Huai-nan Tzŭ, ibid.* p. 25*b*; *Yu huan chi wên, ibid.* p. 25*b*; *Ch'ün fang p'u, ibid.* p. 25*b*; *Shih i chi, ibid.* p. 26*a* (*bis*).]

"The *lü* (旅) was a round basket for rice, but in the Ch'in dynasty it was called *shao* (稍), 'a basket for holding rice when steaming it.'"—*Shuo wên, Shih lei t'ung pien*, c. 74, *Ch'i yung pu*, p. 1*a*.

"The *k'uang* (筐), square open basket, was made of bamboo; it was 3 feet long, 1 foot broad, 6 inches deep, and 3 inches high (*sic*). It was an implement used in sacrificing."—*San li chiu t'u, ibid.* p. 1*a*.

[Baskets of different kinds are referred to in *Fêng su t'ung, Ko chih ching yüan*, c. 54, *Chü ch'u Ch'i wu lei*, p. 21*a*; "drying frame" or clothes-horse (簨 *kou*), in *Shih wu yüan shih, ibid.* c. 58, *Yen shang ch'i wu lei*, p. 6*a*; p. 6*b* (where it is stated that it originated in the Ch'in dynasty); *Fang yen, ibid.* p. 6*b*; and *huo lung* (火 籠), "fire-frame," in *Hsi ching tsa chi, ibid.* p. 6*b*.]

"When carrying things they did not use the shoulder, but a piece of wood like a half cangue (枷 *chia*) tied round the neck by a band, or sometimes a strip of leather was used to bind it round the forehead. The name was *pei lung* (背 籠), 'back-frame.'"—*Chi man ts'ung hsiao, ibid.* p. 21*a*.

[Locks are mentioned in *Hou Han shu, ibid.* c. 49, *Jih yung ch'i wu lei*, p. 9*b*; ladders, in *Shih chi chu, ibid.* p. 10*a*; watchman's clapper, in *Shuo wên, ibid.* p. 10*a*; *Tz'ŭ lin hai ts'o, ibid.* p. 10*b*; ditto and gong, in *Wên hsüan, ibid.* p. 10*b*; sleigh-bells, in *Shih i chi, ibid.* p. 10*b*; needle, in *Chuang Tzŭ, ibid.* p. 11*b*; needle and thread, in *Po hu t'ung, ibid.* p. 11*b*; *Hsi ching tsa chi, ibid.* p. 11*b*; *Hsing ch'u sui shih chi, ibid.* p. 11*b*; *Shih i chi, ibid.* p. 12*a* (*bis*); *Wu chih, ibid.* p. 12*b*; thread, cord, rope, and wire, in *Po hu t'ung, ibid.* p. 8*a*; *Yün fu, ibid.* p. 8*a*; *Chuang Tzŭ, ibid.* p. 9*a*; *Hsi ching tsa chi, ibid.* p. 13*a*; *Hsing Ch'u sui shih chi, ibid.* p. 13*a*; flat-iron, in *Tan ch'ien tsung lu, ibid.* p. 13*b*; water-pump and water-pipes, in *Hou huan kuan chuan, ibid.* p. 15*a*; money-box, in *Tsou Chang-ch'ien yü Kung Sun-hung shu, ibid.* p. 15*b*; "water-guide," in *Chih ku tzŭ, ibid.* p. 15*b*; the latter, also called "thirsty hare" (渴 兔 *k'o t'u*), was a suction-pipe used with the *fan ch'ê* (翻 車), or irrigating machine, in agriculture: see *Chang Jang chuan, ibid.* c. 29, *Chou chü lei*, p. 29*b*.]

Writing Implements.—"By the time of the Ch'in and Han dynasties they had become well acquainted with the advantages to be derived from the use of paper and ink for copying and writing. [The materials] were much lighter and easier [to write with] than those previously used."—*Pi ts'ung, ibid.* c. 39, *Wên chu lei san*, p. 1*a*.

"Under the First Emperor, if we can believe tradition, the materials of writing had undergone a radical change. A general, named Mêng T'ien, added to the triumphs of the sword the invention of the camel's-hair brush, which the Chinese use as a pen. The clumsy bamboo tablet and stylus were discarded, and strips of cloth or silk came into general use, and were so employed until the first century A.D., when paper was invented by Ts'ai Lun. Some say that brickdust and water did duty at first for ink."—*Giles, Hist. of Ch. Lit.*, p. 80.

"When Mêng T'ien made the pencil, he used mulberry wood for the handle, deer's hair for the centre, and wool for the outside."—*Ma Kao Chung hua Ku chin chu, Ko chih ching yüan*, c. 37, p. 1.

"In the beginning of the second century of our era paper was invented, the pencil having already been brought to a considerable degree of perfection."—*Wylie, Ch. Researches*, p. 208.

"The pencil used in writing was then perfected."—*Journ. P.O.S.*, ii. 148–9.

"Curiously enough, it was during the reign of this uncompromising enemy to literature [Shih Huang-ti] that the brush pencil as at present used in China for writing purposes was invented, an invention which implies that about this time a substitute was found for the bamboo tablets which had up to that period served the purposes of paper. At first this new material was a kind of closely woven silk."—*Douglas, Lang. and Lit.*, p. 81.

"This was soon found to be as unsuitable for general purposes, from its expense, as the tablets had been from the cumbrousness; and shortly after the establishment of the Han dynasty, when the decrees of Shih Hwang-ti were reversed, and every encouragement was given by the State to men of letters, the Marquis Tsae 'invented the manufacture of paper from the inner bark of trees, ends of hemp, old rags, and fishing nets.'"—*Ibid.* pp. 81–2. It is said to have been identical with the papyrus of Egypt (*Boulger, Short Hist.*, p. 18). Cotton paper may have been brought from India, where it was in use more than a hundred years before (*Williams, Midd. King.*, i. 600).

"In ancient times all books and deeds were recorded on slips of bamboo, and when silk was used it was called paper. Both were inconvenient—the latter was too dear and the former was too heavy. It occurred to Ts'ai Lun, whose *tzŭ*, style, was Ching Chung, whilst he was magistrate of Shang Fang, to use bark, hemp-root, rags, and nets to make paper."—*Hou Han Huan chê chuan, ibid.* c. 37, p. 8.

"Works were then [Western Han] written on scrolls, and continued to be so down to the tenth or eleventh century, when printing came into general use."—*Wylie, Ch. Researches*, p. 209.

"Under the fashions in vogue during the Han dynasty the pens used by the Emperor were tipped with various precious stones."—*Hsi ching tsa chi, Ko chih ching yüan*, c. 37, p. 3.

"Ts'ao Pao put a blue metal pen in his bosom when sleeping, and recited from a book when walking."—*Tung kuan han shih, P'ei wên yün fu*, c. 93, *Ssŭ chih yün*.

"When Wên shu was sent by his father to pasture the sheep, he pulled flags out of the marsh and cut them into sheets for writing."—*Han shu Lu Wên-shu chuan, ibid.* c. 16, *I hsien yün, Pien tzŭ pu*.

"The people of Shu (Ssŭch'uan) made paper of hemp; the people of Min (Fukien), of a small bamboo; the people of the North, of mulberry bark; the people of Yen Chi (a district of Chekiang), of rattan; the people near the sea, of sea moss; the people of Chê, of wheat stalks or rice straws; the people of Wu (Kiangsu), of cocoons; and the people of Ch'u (Hunan and Hupeh), of the mulberry tree (*Broussonetia papyrifera*)."—*Su I-chien Chih p'u, Ko chih ching yüan*, c. 37, *Wên chü pu*, p. 11.

"Everywhere throughout the Empire paper was made of bark, but the people of Shu only used the method of Ts'ai Lun. Of note-papers there were the *yü-pan, kung-yü, ching-hsieh*, and *piao-kuang* [kinds]. The *yü-pan* and *kung-yü* were made of old rags, worn-out shoes, and twisted hemp, but the *ching-hsieh* and *piao-kuang* were only made of twisted hemp."—*Fei Chu-chien Chih p'u, ibid.* p. 12*b*.

"According to the system of the Han dynasty, the bamboo writing-tablet was 3 feet long: the shorter one was half this length; so that the small bamboo tablet was called a 'foot-tablet.'"—*Yang Shen wai chi, ibid.* p. 18*b*.

"In the time of Wu Ti of the Han dynasty Chih Chih offered [to the Emperor] a *ma-kan* stone suitable for making an inkslab. It was shiny. If the white hairs [of a pen] were rubbed on it they turned quite black."—*Tung p'o shih chu, ibid.* p. 8*a*.

"When one of my forefathers was at Yen he obtained two tile-inkslabs: the larger one was a foot and a half in length and 8 inches in breadth; the middle was shaped like a calabash; its back was raised a little (humped up a little); and it had 6 seal characters on it, which said: 'Made in the 15th year of of the reign Chien An.' The smaller one had in the centre several small round flowers; its back also had 6 seal characters on it, which said: 'Made in the reign Hsing Ho of the Great Wei State.'"—*Jung Chai hsü pi, ibid.* p. 8*b*.

"At the close of the Han dynasty there was a pen-box engraved from pure gold and ornamented with gems [selected by the connoisseur] Ho, and alternating pearls [selected by the connoisseur] Sui, and figured with the feathers of the male and female kingfisher."—*Ho kung Hsi ching tsa chi, Shih lei t'ung pien*, c. 12, *Wén chü tsung pu*, p. 21*a*.

Carriages.—[Carriages were of many kinds; there were now both "sitting" and "standing" carriages: see *Lei ch'ing jih cha, Ko chih ching yüan*, c. 29, *Chou chü lei*, p. 35*a*; the *chin kên* (金 根), Emperor's carriage, is mentioned in *Tung Pa Yü fu chih, ibid.* p. 16*a*; *Ch'ün shu k'ao so, ibid.* p. 16*a*; *Sung shu li chih, ibid.* p. 16*a* (where it says this was the "mulberry root" carriage of the Yin dynasty adopted by the Ch'in and Han); *Hsü kuang chü fu ja, ibid.* p. 16*b*; see also *Fêng su t'ung, ibid.* p. 6*b*; "phœnix-flag" carriage, in *T'ung tien, ibid.* p. 17*a*; *Ch'ün shu k'ao so, ibid.* p. 17*a* (and cf. Restoration of Unity); "skin-hood" carriage, in *T'ung tien, ibid.* p. 17*a*; ditto and *tao* (道) and *yu* (游) carriages, in *Shang lin fu, ibid.* p. 17*a*; "evil-averting" carriage, in *Ku chin chu, ibid.* p. 17*b*; carriages with dust-guards [distinguished according to rank of owner: see Laws of Intercourse], in *Han shu, ibid.* p. 5*a*; and covers, in *Han shu Ch'ên Tsun chuan, ibid.* p. 22*b*; *ta chia* (大 駕), 81 in number, and *fa chia* (法 駕), 36 in number, imperial travelling carriages, in *Ch'ün shu k'ao so, ibid.* p. 8*b* (*bis*); p. 9*a*; *hsiang ch'ê* (象 車), "elephant carriage," in *Hsi ching tsa chi, ibid.* p. 15*b*; "large carriage" (大 車 *ta ch'ê*) or "ox carriage" (牛 車 *niu ch'ê*), used on marshy ground, "juniper carriage" (柏 車 *po ch'ê*), used in hilly country, and "sheep carriage" (羊 車 *yang ch'ê*), used in the palace grounds, in *Ch'ün shu k'ao so, ibid.* p. 25*b*; "deer carriage" (鹿 車 *lu ch'ê*), in *Fêng su t'ung, ibid.* p. 26*b*; "bamboo carriage" (笨 *pên*), of which the inner part was constructed of bamboo, in *Tz'ŭ lin hai ts'o, ibid.* p. 26*b*; "flying-cloud carriage" (飛 雲 車 *fei yün ch'ê*), in *Chü lei tsou shu, ibid.* p. 27*b*; "shoulder-carriage" (肩 輿 *pei yü*), or palanquin, in *K'ung shih tsa shuo, ibid.* p. 32*a*; "travelling-cart" (步 輿 *pu yü*), in *Chou Ch'ien Yü fu tsa shih, ibid.* p. 32*b*; bamboo helmet-shaped barrow or cart (竹 兜 *chu tou*), in *Wu yüan, ibid.* p. 32*b*; sedan-chair (轎 *chiao*) [attributed to the Emperor Ch'in Shih], in *Wu yüan, ibid.* p. 33*b*; bridles, trappings, etc., in *Han shu Po kuan piao, ibid.* p. 35*a*; *K'uei Yung Tu tuan, ibid.* p. 35*b*; *Shan t'ang ssŭ k'ao, ibid.* p. 35*b*; and saddle (鞍 *an*), in *Shuo wên, ibid.* p. 36*a*.]

"In ancient times there was a carriage whose crossbar was attached to a horse for travelling; after this there was the hand carriage, which was fitted with poles borne on men's shoulders; as Huang Fu-mi says: 'Chieh [end of Hsia dynasty] was a tyrant, as he harnessed men to the carriage. This was when the hand carriage originated.' Having the hand carriage, people made the barrow of bamboo. Improvements commenced after this. An, prince of Huai-nan, said: 'Passing over the mountain in a sedan.' The name sedan was then introduced."—*Yên fan lu, ibid.* p. 34*a*.

Boats, etc.—[Boats of various sorts are frequently referred to: in *Han shu, ibid.* p. 2*a*; *Huai-nan Tzŭ, ibid.* p. 2*a* (dragon-boat with head of *i*, aquatic bird, on bow); *Shan hai ching, ibid.* p. 2*b*; *Shuo wén, ibid.* p. 3*b* (航 *fang*, barge); *Han shu chu, ibid.* p. 4*b* (armed ship and turret ship); *Shih i chi, ibid.* p. 6*b* (螺 舟 *lo chou* or 淪 波 舟 *lun po chou*, apparently a submarine); *Shu i chi, ibid.* p. 6*b*; *Fei Yen wai chuan, ibid.* p. 6*b*: *Huai-nan Tzŭ, ibid.* p. 12*a* (iron ships); *Hua shan chi, ibid.* p. 12*a* (ditto); *Hou Han shu, ibid.* p. 12*b* (skin-boats); *T'ai p'ing ch'ing hua, ibid.* p. 12*b*; sculls, in *Tung ming chi, ibid.* p. 13*a*; tow-ropes, in *Shih ming, ibid.* p. 15*a*; *Tsuan wên, ibid.* p. 15*b*; weather-cocks (綄 *wan*), in *Huai-nan Tzŭ, ibid.* p. 16*a*; mooring-stakes, in *Yen Shih-ku Han shu chu, ibid.* p. 16*a*; and rafts, in *Lei ch'ing jih cha, ibid.* p. 16*b*.

"The large galley used on rivers and lakes was called *ko* (艐); the small *ko* was called *ch'a* (艖), skiff; the small *ch'a*, *mao* (艚); the small *mao*, *t'ing* (艇); the long and narrow boat [with 2 masts], *t'ai* (艓); the short and deep boat, *ho* (舸); the small and deep boat, *mao* (艗); and the square boat, *huang* (艎)."—*Yu hsien chüeh tai yü, ibid.* p. 4*a*.

Fishing, Hunting, and Fowling Implements.—"The pith of the *ti* (荻), aquatic reed, tied half-way up the fishing line (*lit.*, hook line) was called a *fu tzu* (浮 子), float. On seeing it sink, the fishermen knew that there was a fish on the hook"—*Chi lê p'ien, ibid.* c. 48, *Kêng chih ch'i wu lei*, p. 21*b*.

"By making a fishing-line of cocoon silk, a hook of a sharp needle, a rod of a branch of bramble or of the dwarf bamboo, and using a grain of cooked rice as bait, one can catch a whole cartload of fish."—*Lieh Tzŭ, ibid.* p. 22*a*.

"The emperor Wu of the Han dynasty once towards the end of autumn sailed (or floated) in a *ling yi* (靈 鵝 *lit.*, spiritual fish-hawk) boat on the Lin Pond. He used a hook made of pure gold, a fishing-line made of white silk, and red carp for bait."—*Han Wu ku shih, ibid.* p. 22*a*.

"The *tsung ku* (緵 罟), drag-net, was called *chiu yü* (九 罶), net with nine bags or compartments—which was a fishing-net. The Commentary says: 'At the present time the hundred-bag *ku* is also called *lei* (罍). The people of Kiang Tung now call it *tsung* (緵).'"—*Êrh ya, Shih ch'i ti liu, Chüan chung,* p. 8*a*.

"'Spreading the *chu lu* (罣 罳).' The Commentary says: '[This was] a fishing-net.'"—*Chang Héng Hsi ching fu, Ko chih ching yüan,* c. 48, *Kêng chih ch'i wu lei,* p. 20*b*.

"The *wang* (罔) was a *ku chi* (罟 屬), which was a net [made of hair] for catching fish."—*Chang I Kuang ya, ibid.* p. 20*a*.

"A *chao* (罩), coop, was an implement used for catching [mud-] fish [by covering them with it]."—*Shuo wên, ibid.* p. 21*b*.

"The *min* (罠) was a net for catching stags, and the *ti* (罤) a net for catching hares."—*Tso ssŭ fu chu, ibid.* p. 20*a*.

"The *yu ssŭ tsêng* (遊 絲 罾), 'flying silk dart' [a dart or arrow with a silk cord to pull it back after it had been shot from the bow], was also called a *han* (罕), bird-net, which was a net used for catching birds [by bringing it down] from above. The *hai* (罳) was a small net for catching [small] birds."—*Shih wu kan chu, ibid.* p. 2*b*.

Agricultural Implements.—"Chao Kuo [2nd century B.C.] first used the ox-plough. It was much better than using the plough and plough-share [used formerly]."—*Ch'i min yao shu, ibid.* p. 2*a*. See also LATER FEUDAL PERIOD.

"Huang Fu-lung was Prefect of Tun Huang. The people there did not understand agriculture, so he taught them to make a *lou li*, sowing-plough, which saved them half their labour."—*Wei lüeh, Ko chih ching yüan, ib'd.* p. 2*a*. See also *Giles, Bio. Dic.*, No. 7348, and following extracts.

"The *lou ch'ê*, sowing-machine, was in shape like a plough with three legs; on the top was fixed the *lou tou*, sowing vessel (or basket). It was drawn by an ox. One man held the *lou* and shook it as he walked, causing the seeds to fall down."—*Ch'i min yao shu, Ko chih ching yüan,* c. 48, *Kêng chih ch'i wu lei,* p. 2*a*.

"The *t'a* (撻), sweeper, was a field-besom (耨 *sui*). It was used after the sowing machine (耬 *lou*) to spread the soil evenly, so that the paddy could easily sprout."—*Nung sang t'ung chüeh, Shih lei t'ung pien,* c. 17, *Jên shih pu,* p. 1*b*.

"The *kuei* fork (挂 爻 *kuei ch'a*) was used for separating wheat. It was used in the country to the north of the Yellow River (*ho nei*)."—*Shuo wên, Ko chih ching yüan,* c. 48, *Kêng chih ch'i wu lei,* p. 9*b*. For the explanation of *ho nei*, v. *Mencius*, Bk. I, Pt. I, ch. 3, i.

"The *ch'ui* (箠), bin, was of split bamboos placed so as to form a circular enclosure for holding grain."—*Shuo wên, Ko chih ching yüan,* c. 48, *Kêng chih ch'i wu lei,* p. 10*a*.

"The *hua* (鐷) is a two-pronged *ch'a* (鍤), spade."—*Hsü Shih shuo wên, ibid.* p. 6*a*.

"The Han emperor Ling ordered Pi Lan to make a revolving machine which was tied on to an instrument to draw water for the purpose of irrigating the north and south land outside the city. So it might also be said that Pi Lan was the inventor [as well as Ma Chün: see following period.]"—*Pai shih lei pien, ibid.* p. 7*b*.

"The people of Chêkiang gave to the water-raising machine the name of 'dragon-bone machine' (龍 骨 車 *lung ku ch'ê*)."—*Wang Fêng lu Ming wu t'ung, ibid.* p. 7*b*.

"The system of making the *fan ch'ê* (翻 車), water-mill, was as follows: Besides the *ya lan mu* (壓 欄 木), or resting-rail, and *lieh hsien chuang* (列 檻 樁), or upright poles supporting it, the body of the machine was a trough made of *shu* (枝) [wood], about 2 *chang* in length, and in breadth varying from 4 to 7 inches, its height being about one foot. In the trough a passage-plank (行 道 板 *hsing tao pan*) was fitted, which was the same width as the trough, but one foot shorter at each end [so as to admit of the insertion of] a large and a small wheel. The 'dragon-bone' shutters travelled all round over the passage-plank and the two wheels. On the river-bank was placed a wooden frame, to which was fitted a large axle with four handles on both sides. The men irrigating the fields leaned on this frame, their feet treading upon the handles, and as the 'dragon-bone' shutters were constantly passing along the passage-plank, the water was thus raised up to the top of the bank."—*San ts'ai t'u hui, ibid.* p. 8*a*.

"The water-mill (水 轉 翻 車 *shui chuan fan ch'ê*) resembled in general the water tread-mill (人 踏 翻 車 *jên t'a fan ch'ê*), though it differed in details. Where it was to be used, the strength and general condition of the water had to be taken into consideration. It worked continuously night and day, and was thus a great improvement on the tread-mill. There was also a kind of water-mill worked by an ox, which was double as powerful as the tread-mill."—*San ts'ai t'u hu, ibid.* p. 8*a*.

Sericultural Implements.—"The *huo* (矍) was an instrument for reeling silk."—*Shuo wên, ibid.* p. 16*a*.

"The *ching chia* (經 架), throwing-frame, was an implement for drawing silk. Winding-reels (*huo*) were first placed in the upper and lower frames, and on a horizontal bamboo pole rings were arranged to guide all the silk threads through the 'raft-frame' (簟 *p'ai*), which was in front of the throwing-frame. An operator walked up and down guiding the threads into a single strand [on the hooks of an upright stranding-frame] From this they were removed to the shuttle (機 杼 *chi chu*)."—*San ts'ai t'u hui, ibid.* p. 16*a*.

"The *wei ch'ê* (緯 車), 'woofing machine' [worked by foot], was called by the people of the Chao and Wei States the *li lu ch'e* (轣 轆 車), 'groove (concave edge) pulley machine,' but in Eastern Ch'i and Hai Tai it was called *tao kuei* (道 軌), 'grooved wheel.'"—*Fang yen, ibid.* p. 16*a*.

"The *Shuo wên* explains *t'ing* (綎) [as follows]: 'To *sui* (繐) silk is to *kuan* (莞) it. The *kuan* is a *fu* (莩).' This shows that the *fu* machine was a spinning machine. The silk was placed in the *t'ing*, and the *t'ing* on the *fu* (spinning) machine; it was turned by treading and [the process] was called spinning."—*Liu shu ku, ibid.* p. 16*a*. The *t'ing* was an iron tube set in a bamboo tube, which revolved as the spinning wheel revolved.

"The way to make a *nien mien chou* (撚 綿 軸), 'axle or roller for twisting floss silk' [was as follows]:—A small roller was made of wood or stone, a small axle about a foot in length being fixed to it. The floss silk was then first hung to a crotch, and the crotch held in the left hand, whilst with the right the silk was guided on to the roller, which being suspended in the air, the floss silk was twisted into a thread, and then wound round the axle. After this it could be used on the warping cylinder as silk thread. It could be used by women and girls, taking the place of their skilled labour in weaving and spinning."—*San ts'ai t'u hui, ibid.* p. 16*b*.

"The *mien chü* (綿 矩), floss-silk square frame, was made of a wooden frame a little more than a foot square. It was used for spreading out the floss-silk, and so was called a *mien chü*. It could also be made by bending a bamboo into a curve—this was the kind chiefly used in the south. The floss-silk [when on the frame] being hollow and having a round outside surface, was called *chu tu mien* (豬 肚 綿), 'pig's belly silk.' Another kind made on a large tube of bamboo was called *t'ung tzŭ mien* (筒 子 綿), 'tube-silk.' In the north the people used tiles of various sizes, but these did not equal the wooden frame for convenience."—*San ts'ai t'u hui, ibid.* p. 16*b*.

"The *hu tzŭ* (笎 子), winding-reel, was a weaving implement. The *Shuo wên* says: 'The winding-reel was used for receiving the thread.'"—*Kan chu, ibid.* p. 19*a*.

"The *k'ou* (篧), healds (of a loom), were implements used in weaving." They were made of bamboo-splints.—*Shuo wên, ibid.* p. 19*a*.

Period of Disruption (221 to 589).—*Table IV.*

Furniture, Household Utensils, etc.—"'The *chi* (几), stool, sat on by Shih Hu.' From this we see that the *chi* was [now] a thing for sitting on, and was not of the same family as the *an* (案), table or bench."—*T's'ung chung chi, Ko chih ching yüan,* c. 50, *Chü ch'u ch'i wu lei,* p. 1*a*; see also *San chia ch'ing shih, ibid.* p. 2*b*, where it is stated that the *chi* was the ancient *yang ho* (養 和). For carving and decoration of the *chi*, see DECORATION OF PRODUCTS.

"The Heir Apparent, at his marriage, on worshipping [Heaven] for the first time had a lacquered memorial table with gilt feet."—*Tung kung chiu shih, Shih lei t'ung pien,* c. 73, *Ch'i yung pu,* p. 23*b*.

"Amongst the implements used by the Emperor was a lacquered and painted table."—*Wei Wu-shih Tsa wu su, ibid.* p. 23*b*.

[Beds and bedsteads of different styles and materials are referred to in *Hou Wei shu, Ko chih ching yüan,* c. 53, *Chü ch'u ch'i wu shih,* p. 6*b*; *Hsi ching tsa chi, ibid.* p. 7*a*; *Chin Tung kung chiu shih, ibid.* p. 8*a*; *Nan shih, ibid.* p. 8*a*; quilts, in *Hsi ching tsa chi, ibid.* c. 54, *Chü ch'u ch'i wu lei,* p. 1*b*; *Tung kung chiu shih, ibid.* p. 1*b*; *Ch'êng chai tsa chi, ibid.* p. 1*b*; *Nan shih, ibid.* p. 1*b*; pillows, in *Hsi ching tsa chi, ibid.* p. 3*a*; *Yün fu, ibid.* p. 3*b*; *Wei Wu shang tsa wu su, ibid.* p. 5*a*; *Chin Tung kung chiu shih, ibid.* p. 5*a*; *Pei shih, ibid.* p. 5*b* (salt pillows); *Ch'ing i lu, ibid.* p. 7*a*; and mattresses, in *Hsi ching tsa chi, ibid.* p. 12*b*; *Lo fu tsa lu, ibid.* p. 13*a*; etc.]

[Screens of various sorts, some constructed of costly materials and very elaborately ornamented, are mentioned in *Hsi ching tsa chi, ibid.* p. 10*b* (*bis*); *Wei chih, ibid.* p. 11*a*; *Chi shih chu, ibid.* p. 11*a*; *Chin Tung kung chiu shih, ibid.* p. 11*b*; p. 15*a*; *Chin shu, ibid.* p. 11*b*; *Nan shih, ibid.* p. 11*b*; *Ch'ing i lu, ibid.* p. 12*a*; *Ts'ung chung chi, ibid.* p. 13*a*; light-screens (幌 *huang*), in *Pei t'ang shu ch'ao, ibid.* p. 23*a*; *Ts'ung chung chi, ibid.* p. 23*a*; partition-screens, in *Chin shu, ibid.* p. 23*a*; *Lieh nü chuan, ibid.* p. 23*a*; curtains of different sorts and materials, in *Nan shih, ibid.* p. 15*a*; *Wei lüeh, ibid.* p. 17*a*; *Nan shih, ibid.* p. 17*b*; *Ch'ing i lu, ibid.* p. 19*a*; *Tso ssŭ wu tu fu, ibid.* p. 20*a*; *Ts'ung chung chi, ibid.* p. 20*a*; *Wang Tzŭ-nien Shih i chi, ibid.* p. 21*a*; *Chin shu, ibid.* p. 21*a*; *Tung kung chiu shih, ibid.* p. 21*b*; curtain hooks, in *Tsao lin, ibid.* p. 20*b*; *Hsi ching tsa chi, ibid.* p. 20*b*; curtain poles, in *Nan shih, ibid.* p. 20*b*; mosquito curtains, in *Nan shih, ibid.* p. 20*b*; and mats and rugs, in *Nan shih, ibid.* c. 54, *Chü ch'u ch'i wu lei,* p. 14*b*; *Wei lüeh, ibid.* p. 15*a* (氈 罽 *t'a têng*); *I yüan, ibid.* p. 15*a*; *Sung chiang chih, ibid.* p. 15*a*; *Shên hsien chuan, ibid.* p. 8*b*; *Hsi ching tsa chi, ibid.* p. 8*b*; p. 11*a* (*bis*); *Wang Yin Chin shu, ibid.* p. 11*a*; *Nan shih, ibid.* p. 11*b*; *Pei hu lu, ibid.* p. 11*b*; *Ti li chih, ibid.* p. 11*b*; *Chu ching chao yeh chi, ibid.* p. 11*b*.]

[Boxes and chests are mentioned in *Nan shih, ibid.* p. 16*b* (thrice); *San yü t'ieh, ibid.* p. 16*b*; bags, in *Chin chung ching pu, ibid.* p. 17*a*; *Yu Yang tsa tsu, ibid.* p. 17*b*; *Hsü Ch'i hsieh chi, ibid.* p. 17*b*; *Po wu chih, ibid.* p. 18*b*; *Hsieh shih shih yüan, ibid.* p. 18*b*; and purses, in *Chin shu, ibid.* p. 19*a*; *Ming i k'ao, ibid.* p. 19*b*.]

"When the heir apparent married a wife, he had a clothes-trunk [made of bamboo] with lacquered pattern and mounted with gold."—*Tung kung chin shih, Shih lei t'ung pien,* c. 73, *Ch'i yung pu,* p. 26*b*.

"On the night of the 15th of the 1st moon a *chiu hua* lantern (九 華 燈) was lit; its light could be seen for more than 100 *li*."—*Hsi ching tsa chi, ibid.* p. 11*b*.

[Bells are mentioned in *Ch'i shu, Ko chih ching yüan,* c. 49, *Jih yung ch'i wu lei,* p. 10*b*; *Chin shu, ibid.* p. 10*b*; locks, in *I yüan, ibid.* p. 9*b*; needles, in *Ch'ing i lu, ibid.* p. 12*a*; *Liang shu, ibid.* p. 12*b*; *Pai shih lei pien, ibid,* p. 12*b*; flat iron, in *Tung kung chiu shih, ibid.* p. 13*b*; *Kuang yün tsao, ibid.* p. 13*b*; stoves, in *Li chi wêng tzŭ hsia lu, ibid.* p. 14*a*; *Nan shih, ibid.* p. 14*b* (*bis*); candles, in *Hsi ching tsa chi,* c. 50, *Jih yung ch'i wu lei,* p. 16*b*; *Tung kung chiu shih, ibid.* p. 16*b*; *Yang K'an chuan, ibid.* p. 16*b*; *Pi shu man ch'ao, ibid.* p. 17*b*; wicks, in *Fu wên lu, ibid.* p. 17*b*; oil, in *Po wu chih, ibid.* p. 19*a*; *Pei shih, ibid.* p. 12*a*; *Ch'ing i lu, ibid.* p. 12*b*; *Ch'ün fang p'u, ibid.* p. 20*b*; *Wan shu chi, ibid.* p. 30*a*; copper pincers, in *Nan k'ang chi, ibid.* c. 58, *Yen shang ch'i wu lei,* p. 23*a*; ear-pick, in *Ch'ing i lu, ibid.* p. 23*a*; tooth-pick, in *Pai shih lei pien, ibid.* p. 23*b*; deer's-tail brush (held by Buddhist preachers), in *Shih ts'ang chih kuei, ibid.* p. 23*b*; *Chin shu. ibid.* p. 23*b*; hemp-cord flick (麻 繩 拂 *ma shêng fu*), in *Nan shih Sung Wu Ti chi,* p. 24*b*; 'dragon's-beard flick' (龍 鬚 拂 *lung jan fu*), in *Wu lei hsiang kan chih, ibid.* p. 24*b*; and brooms, in *I yüan, ibid.* p. 25*a*.]

[Wine goblets, drinking cups, etc., were of various kinds and materials: see *Liang chou chi, Ko chih ching yüan,* c. 51, *Jih yung ch'i wu lei,* p. 4*b*: *Pei shih, ibid.* p. 4*b*; *Ch'ing i lu, ibid.* p. 4*b*; p. 14*b*; *Chiu p'u, ibid.* p. 15*b* (made out of bamboo roots); *Lei ch'ing jih cha, ibid.* p. 15*b*; *Ho pi shih lei, ibid.* p. 16*a*; *Ch'iung shên pi yüan, ibid.* p. 16*b*.]

"The *ti ch'iao pei* (抵 鵲 杯), 'magpie cup,' was an implement belonging to Yüan Tzŭ-ch'êng, Magistrate of Fang Chou."—*T'ao Ku Ch'ing i lu, Shih lei t'ung piao,* c. 73, *Ch'i yung pu,* p. 19*b*.

"In the Chi Pin country there was a *chao shih pei* (照 世 杯), magic cup, which was transparent. On looking into it one could know all that was happening in the empire."—*Wu hsüeh p'ien, ibid.* p. 19*b*.

[The *chin p'o lo* (金 叵 羅), a kind of gold cup, is mentioned in *Pei shih, ibid.* p. 19*b*.]

[A wine-cup made of jade from the K'un Lun Mountains is mentioned in *Ch'ing Chou tsa chi, ibid.* p. 20*a*.]

["A golden wine-goblet of two pints capacity" is mentioned as having been hung up by the Emperor Hsiao Wu in the Hua Lin Park as a prize for archers, in *Pei shih, ibid.* p. 20*b*.]

"Cups were made from spiral univalve shells. Owing to their spiral shape they were capable of holding [a large quantity of] wine. There was one which could hold more than three cups of wine, which was called the 'nine-spiral cup' (九 曲 螺 杯 *chiu ch'ü lo pei*)."—*Ch'ing i lu, ibid.* p. 21*a*.

"To the north of Nan Ssŭ Chou, on the Kan hill, was a phœnix's nest. Once, during a terrible storm, a young phœnix fell from the nest, whereupon the people of the South cut off the beak to make a cup, which was called the 'phœnix cup' (鳳 凰 杯 *fêng huang pei*)."—*Ch'in ching, ibid.* p. 21*b*.

"[A vessel] as large as a *tou*, peck, was used by the fishermen to contain (*lit.*, pour) wine; it was called the 'crab cup' (蟹 杯 *hsieh pei*)."—*Fu Kung Hsieh pu, ibid.* p. 21*b*.

"Ko Hung cut down a *Gleditschia sinensis* tree to make a wine-cup."—*Shên hsien chuan, ibid.* p. 22*b*.

[Chopsticks (箸 *chu*) are mentioned in *Chin shu, ibid.* p. 17*a*.]

"The emperor T'ai Wu made twelve plates (or dishes) of yellow gold, which were inlaid with white silver and ornamented with red jasper, pearls, and jade."—*Hou Wei shu. ibid.* c. 74, *Ch'i yung pu,* p. 5*a*. Liu Mu-chih served betel-nut on a gold plate: *Man shih, ibid.* p. 6*a*.

"Anyone who ate food contained in a plate made of red gold would live for ever."—*Pao-p'u Tzŭ, ibid.* p. 5*a*.

"Tung Yen used a crystal plate to hold ice."—*San fu huang t'u, ibid.* p. 5*b*.

"When Shên Yi was introduced by somebody in the audience with Lao Chün (Lao Tzŭ), [the latter] presented him with a gold bowl and jade plate."—*Shên hsien chuan, ibid.* p. 6*a*.

"Among the imperial implements there was a pure silver plate and also a wash-basin of 5-gallons (石 *shih*) capacity."—*Wei wu shih tsa wu su tsao, ibid.* p. 8*a*.

[A gold wash-basin and a vitreous bowl containing beans used for cleansing purposes are mentioned in *Shih shuo, ibid.* p. 8*a*.]

"The tea-pot made of earthenware was best; that made of tin next best."—*Fêng K'o pin chieh ch'a chien, Ko chih ching yüan,* c. 51, *Jih yung ch'i wu lei,* p. 3*b*. Other tea-pots are mentioned in *Hsü T'z'ŭ-shu Ch'a su, ibid.* p. 3*b*.

[Dishes, bowls, pitchers, plates, etc., are referred to in *Pai shih lei pien, ibid.* p. 18*a*; *Fou t'u têng chuan, ibid.* p. 18*b*; *Pei shih, ibid.* p. 19*b*; *Nan shih, ibid.* p. 20*b*; *Ch'ing i lu, ibid.* p. 17*a*; *Po ku t'u, ibid.* p. 16*a*; *Shên i ching, ibid.* c. 52, *Jih yung ch'i wu lei,* p. 9*b*; *Ssŭ wang i shih, ibid.* p. 13*b*; *Nan shih, ibid.* p. 13*b*; p. 14*a*; p. 15*b*; p. 20*b*; *Pei shih, ibid.* p. 21*b*; strainers, steamers, and wine-warmers, in *Shih wu yüan shih, ibid.* p. 1*b*; *Wên chuan, ibid.* p. 1*a*; *Ch'ing i lu, ibid.* p. 1*a*; *Ch'i shu, ibid.* c. 51, *Jih yung ch'i wu lei,* p. 14*b*; pans, saucepans, etc., in *Pai shih lei pien, ibid.* c. 52, *Jih yung ch'i wu lei,* p. 4*b*; *Wu hou ching, ibid.* p. 4*b*; *Po ku t'u, ibid.* p. 4*b*; *Pei shih, ibid.* p. 5*a*; p. 6*a*; pestles and mortars and pestles for beating clothes, in *Lieh hsien chuan, ibid.* p. 8*b*; *Yen chiao chi wên, ibid.* p. 8*b*; *Tan ch'ien tsung lu, ibid.* p. 8*b*; *Wu hsing chi, ibid.* p. 8*b*; *Tung kung chiu shih, ibid.* p. 8*b*; *Ching Chou chi, ibid.* p. 8*b*; spittoons (唾 壺 *t'o hu*) (of jade, crystal, etc.), in *Shih wu yüan shih, ibid.* c. 58, *Yen shang ch'i wu lei,* p. 7*b*; *Chiao Chou chi, ibid.* p. 8*a*; *Nan shih, ibid.* p. 8*a*.]

"The 'chopstick vase' (筯 瓶 *chu p'ing*) in Wu was now made with a short neck and small hole, which just admitted a chopstick. The old copper vase was good, but those made at the Kuan Ko Ting kiln were impossible for daily use."—*T'u lung hsiang chien, ibid.* p. 7*b*.

[Mirrors made of various materials in various styles and sizes are mentioned in *Wei shu, ibid.* c. 56, *Hsiang lien ch'i wu lei,* p. 5*a*; *Ch'ing i lu, ibid.* p. 2*b*; *Lung chi yü ti yün shu, ibid.* p. 5*a*; *Chin Tung Kung chiu shih, ibid.* p. 5*a*; *Ts'ung chung chi, ibid.* p. 5*a*; *Nan shih, ibid.* p. 5*a*; p. 8*b*; *Hsi ching tsa chi, ibid.* p. 7*b*; *Ku chin chu, ibid.* p. 10*b*; *Wei Wu shang tsa wu su, ibid.* p. 11*a*; and mirror-stands and cases, in *Chin Tung Kung chiu shih, ibid.* p. 12*b*; *Shih shuo, ibid.* p. 12*b*; *Ch'ing i lu, ibid.* p. 13*a*.]

"The emperor Hsüan put away the *shên tu* (身 毒) precious mirror [a mirror which detected poison in things reflected in it] in an amber case."—*Hsi ching tsa chi, Shih lei t'ung pien,* c. 73, *Ch'i yung pu,* p. 26*b*.

"Umbrellas of some sort were first mentioned in Chinese writings about A.D. 300. They came into use in the 6th century."—*Cycle,* 1st series, p. 257. They are said to have been first of silk, and to have come into use after canopies. "Silk umbrellas gave way in the latter part of the fourth century A.D. to those made of paper."—*Journ. N.-C.B.R.A.S.*, N.S. xxi. 179, note.

[Hairpins are mentioned in *Chin ching tsa chi, Ko chih ching yüan,* c. 55, *Hsiang lien ch'i wu lei,* p. 1*a*; *Fei yen wai chuan, ibid.* p. 1*a*; *Chiang piao chuan, ibid.* p. 1*b* (rhinoceros hairpin); *Ch'ing i lu, ibid.* p. 1*b*.; *Chuang t'ai chi, ibid.* p. 2*a*; *Hsi ching tsa chi, ibid.* p. 3*a*; *Chin ling, ibid.* p. 3*b*; artificial flowers, in *Tung kung chin shih, ibid.* p. 5*b*; *Tan ch'ien lu, ibid.* p. 5*b*; *Ts'ai lan tsa chih, ibid.* p. 6*a* (made into a woman's head-dress called 步 搖 *pu yao*, "walking-shake"); gold ornament, in *Chin chung hsing shu,* ibid. p. 7*b*: finger-rings, in *Hsi ching tsa chi, ibid.* p. 9*b* (*bis*); *Nan shih, ibid.* p. 9*b* (diamond and gold); *Hu su chuan, ibid.* p. 10*a*; *Pai shih lei pien, ibid.* p. 10*a* (inlaid with agate); bracelets, in *Nan Ch'i shu, ibid.* p. 10*b* (amber); face-powder, in *Fei Yen wai chuan, ibid.* p. 12*a*; *Ti li chih, ibid.* p. 12*a*; *Ching Chou chi, ibid.* p. 12*a*; rouge, in *Niang hsüan chi, ibid.* p. 13*b*; ointment, in *Liang shu, ibid.* p. 14*a*; fragrant oil, in *Hsiang p'u, ibid.* p. 14*b*; oil of roses, in *Chi t'an lu, ibid.* p. 14*b*; herb-oil, in *Chuan fang lüeh chi, ibid.* p. 14*b*; salve, in *Wên ch'ang tsa lu, ibid.* p. 14*b*; combs (tortoiseshell, ivory, etc.), in *Chin Tung kung chin shih, ibid.* p. 15*a*; *Ch'ing i lu, ibid.* p. 15*b* (*bis*); p. 16*a*; comb-cleaner, in *Kuang po wu chih,*

ibid. p. 15*b*; perfume bags, in *Nan shih, ibid.* p. 16*b*; *Chin shu, ibid.* p. 16*b*; *Ts'ung chung chi, ibid.* p. 16*b*; handkerchiefs, in *Nan shih, ibid.* p. 18*a*; *Tung kung chiu shih, ibid.* p. 18*a* *Li Chao Han lin chih, ibid.* p. 18*a*; fans, in *P'ei ch'i yü lin, ibid.* c. 58, *Yên shang ch'i wu lei*, p. 11*a*; *Chin shu, ibid.* p. 11*b* *Nan shih, ibid.* p. 11*b*; *Ling piao lu i, ibid.* p. 11*b* (peacock-feather fans) (*bis*); *Hsi ching tsa chi, ibid.* p. 11*b*; *Chin shu, ibid.* p. 12; *Kuang po wu chih, ibid.* p. 12*a*; *Ch'i shu, ibid.* p. 12*b* (palm leaf fans); *Ts'ung chung chi, ibid.* p. 13*a*; *Ch'ing i lu. ibid.* p. 13*b*; *Mêng hua lu, ibid.* p. 13*b*; *Lei ch'ing jih cha, ibid.* p. 14*a*; *Nan shih, ibid.* p. 15*a* (picture fan); *Ch'i shu, ibid.* p. 15*a*; *Liu Yüan-ch'ing Hsien i pien, ibid.* p. 15*b*; walking-sticks and staffs, in *Lieh nü chuan, ibid.* p. 19*a*; *Nan shih, ibid.* p. 20*a*; and cord (silk and other), in *Yu Yang tsa tsu, ibid.* c. 49, *Jih yung ch'i wu lei*, p. 8*a*; *Shuo hu, ibid.* p. 8*b*.]

"In the first year of the reign I Hsi [405] the use of cheap silk gauze fans was forbidden."—*Chin shu, Ko chih ching yüan*, c. 58, *Yen shang ch'i wu lei*, p. 12*a*.

"Of the history of fans in China, and their gradual development from the primitive bird's wing or unelaborated leaf, there is positively nothing to record, unless perhaps it be the publication by the Emperor Ngan Ti, of the Chin dynasty (A.D. 405), of a strange enactment against the use of silk in the manufacture of these articles." "Hsieh Ling-yün credits this enactment to the Emperor Hsiao Wu of the same dynasty, who reigned from A.D. 373–397. The date given is taken from the *Kuang-shih-lei-fu*."—*Giles, Historic China*, p. 279.

[Drying frames of various sizes (for handkerchiefs, clothes, quilts, etc.) are mentioned in *Tung kung chiu shih, Ko chih ching yüan*, c. 58, *Yen shang ch'i wu lei*, p. 6*b*; *Nan shih ibid.* p. 6*b*; incense-urns, in *Hsi ching tsa chi, ibid.* p. 1*a*; *Chin Tung Kung chiu shih, ibid.* p. 1*b*; *Hsi ching tsa chi, ibid.* p. 1*b*; *Wang yen ming hsiang chi, ibid.* p. 2*a*; *Wei Wu shang tsa wu su, ibid.* p. 2*a* (gold, silver, and brass); *Hsü yüan chia i, ibid.* p. 2*b*; *Ts'ung chung chi, ibid.* p. 2*b*; *Hsiang p'u, ibid.* p. 2*b* ("incense-beast," 香獸 *hsiang shou*); *Ch'ing i lu, ibid.* p. 3*a*; *Yü t'ang hsien hua, ibid.* p. 3*a*; *Pai shih lei pien, ibid.* p. 3*b*; two-handled tripod stove (兩耳彝爐 *liang érh i lu* or 敦 *tun*), in *Yün yen kuo yen lu, ibid.* p. 3*b*; incense-spoon, in *Ch'ing i lu, ibid.* p. 6*a*; sceptres (如意 *ju i*), in *Ch'i wu tsung lun, ibid.* p. 8*a*; *T'u lung wên fang chü ch'ien, ibid.* p. 8*a*; *Ts'ai lan tsa chih, ibid.* p. 8*b*; *Hu tsung pieh chuan, ibid.* p. 8*b*; *Shih ch'ung pen shih. ibid.* p. 9*a*; *Nan shih, ibid.* p. 9*a*; *Kai wên chi, ibid.* p. 9*a*.]

Writing Implements.—[Pens made of various materials are mentioned in *Shih i chi, ibid.* c. 37, *Wén chü pu*, p. 3; *Shih shuo, Shih lei t'ung pien*, c. 12, *Wên hsüeh pu*, p. 22*b* (rats' whiskers); *Ko Hung Hsi ching tsa chi, ibid.* c. 12, *Wén chü tsung pu*, p. 21*a*; *Lung chi yü ti shu, ibid.* c. 37, p. 1 (vitreous substance); *Liang shu, ibid.* p. 3; writing-paper, in *Shih shuo, ibid.* p. 9 (made of silkworm cocoons); *Wên fang ssŭ p'u. ibid.* p. 8 (of mulberry roots); *Nan fang ts'ao mu chuang, P'ei wên yün fu*, c. 34. *Ssŭ chih yün, Chih tzŭ pu* (of bark and leaves of honey-tree); *Wén fang ssŭ p'u. Yün fu shih i*, c. 31, *Ssŭ chih yün, Chih tzŭ pu* (fancy note-paper); *Shih i chi, Ko chih ching yüan*, c. 37, *Wén chü pu*, p. 8 ("seaweed paper"); *Ch'ing i lu, ibid.* p. 17*b* (made of aloe-wood and water-marked with figures of hills, flowers, etc.); *Tan yang chi, ibid.* p. 9 ("silver-bright" or "frosty and bright"); ink, in *Tung t'ien ch'ing lu, ibid.* p. 20*a* (made of varnish-black mixed with pine-soot); *Po chia shih chu, ibid.* p. 21*b*; *Chao Shih mo ching, ibid.* p. 20*a*; inkslabs, in *Yen chien, ibid.* c. 38, *Wén chü pu ch'i*, p. 10*a*; *Yen fan lu, ibid.* p. 1*b*; *Liang shu, Kuang shih lei fu*, c. 15, *Tsa wu pu*, p. 7*b*; *Pei shih, Shih lei t'ung pien*, c. 20, *Wén hsüeh pu*, p. 25*b*; (in Wei and Chin times the inkstones were mostly concave, as being more suitable for grinding the liquid ink: see *Tung t'ien ch'ing lu, Ko chih ching yüan*, c. 37, *Wên chü pu*, p. 20*a*).]

"In the time of the Wei and Chin dynasties the ashes of burnt millet was mixed with the black of [burnt] pine to make ink."—*Hsi ching tsa chi, K'ang Hsi tzŭ tien*, c. 5, *Ch'ou chi chung, Mo tzŭ*, p. 36*b*. Reprint of 7th year of Tao Kuang.

"筆 *pi*, 'bamboo stylus,' pen, was sometimes written 毛 (bamboo combined with hair)."—*Chi yün, K'ang Hsi tzŭ tien*, c. 17, *Chü pu*, p. 13*a*.

Carriages.—[Carriages are mentioned in *Chin shu yü fu chih, Ko chih ching yüan*, c. 29, *Chou chü lei*, p. 15*b*; *Chin shu, ibid*, p. 16*b* (*bis*); *I ya, ibid.* p. 17*b* ("balustrade carriage," 檻車 *hsien ch'ê*); *Chin shu, ibid.* p. 17*b* (hunting carriage 獵車 *lieh ch'ê*); *Wei shou hou Wei shu, ibid.* p. 18*b*; *Chin shu, ibid.* p. 18*b* ("sitting" and "standing" carriages; the latter, the military carriage of ancient times, being now most used) (*bis*); *I ya, ibid.* p. 20*a* (travelling carriage, with place for sleeping); *Chin hsien ts'an i, ibid.* p. 20*b*; *Yüan Tzŭ Chêng shu, ibid.* p. 20*b* ("mother-of-pearl carriage," 雲母車 *yün mu ch'ê*, also called "calf carriage," 犢車 *tu ch'ê*); *Shih chi, ibid.* p. 20*b*; *Chin shu, ibid.* p. 20*b*; *Nan shih ibid.* p. 20*b* ("black-wheeled" or "dark-wheeled" carriage, 早輪車 *tsao lun ch'ê*); *Nan shih, ibid.* p. 21*a* (varnished-wheel carriage, 漆輪車 *ch'i lun ch'ê*); *Chin shu, ibid.* p. 21*a* ("azure-covered carriage," 青蓋車 *Ch'ing kai ch'ê*); *Chin shu, ibid.* p. 21*a* (*ditto*); *Shu wu i ming su*, ibid. p. 21*a* (*ditto*); *Pi Ling-yün chuan, ibid.* p. 8*a*; *Shih wu kan chu, ibid.* p. 8*a* ("long-eaved" carriage, 長簷車 *ch'ang yen ch'ê*, made in the Liang dynasty); *Ch'ün shu k'ao so, ibid.* p. 9*a* (various carriages used on various occasions); *Pei Ch'i shu, ibid.* p. 12*b* (hand-cart or carriage, 挽車 *wan ch'ê*); *Chin shu, ibid.* p. 22*b* ("completely-screened" carriage, 通幔車 *t'ung man ch'ê*, drawn by an ox—the "calf-carriage" but with a screen); *Pei shih, ibid.* p. 23*a*; *Nan shih, ibid.* p. 24*b* ("compass carriage" or "guide-carriage," 指南車 *chih nan ch'ê*); *Shu chêng chi, ibid.* p. 24*b* (*ditto*); *Chin shu, ibid.* p. 25*a* ("drum-carriage registering distances," 記里鼓車 *chi li ku ch'ê*—a wooden man struck the drum at the end of each *li*); *Chin shu, ibid.* p. 26*a* ("sheep-carriage," 羊車 *yang ch'ê*); *Shu chih, ibid.* p. 26*a* ("mule carriage," 騾車 *lo ch'ê*); *Chu-ko Liang chi, ibid.* p. 29*a* ("wooden ox," 木牛 *mu niu*, a carriage shaped in front like an ox's head, pushed by one man); *Hou shan t'an ts'ung, ibid.* p. 29*a* ("flowing horse," 流馬 *liu ma*, a large carriage pushed by 4 men); *Chin shu, ibid.* p. 30*b*; *Ts'ung chung chi, ibid.* p. 30*b* (hunting carriage with revolving top); *Ch'ing i lu, ibid.* p. 31*b* ("shooting-star chariot" 流星輦 *liu hsing nien*, with 20 wheels); *Chin shu, ibid.* p. 33*a* (barrow); *Wei Wên Ti chao, ibid.* p. 16*b* (carriage cover); tortoiseshell harness is mentioned in *Nan shih, ibid.* p. 35*a*; harness made of embroidered silk, in *Nan shih, ibid.* p. 35*a*; leather breast-plate, girths, cuirass, and mirror on horse's forehead, in *Pai pien, ibid.* p. 35*a*; reins, in *Hsi ching tsa chi, ibid.* p. 36*a*; bridle, head-strap, tether, and traces, in *Cho shih tsao lin, ibid.* p. 36*a*; halter, in *Hsi ching tsa chi, ibid.* p. 36*a*; saddles (sometimes elaborately decorated), in *Hsi ching tsa chi, ibid.* p. 36*a*; *Chung hua ku chin chu, ibid.* p. 36*b*; *Yung ch'ang chi, ibid.* p. 36*b*; *Ch'ing i lu, ibid.* p. 37*a*; mudguard, in *Shêng an wai chi, ibid.* p. 38*a*; *Pei shih, ibid.* p. 38*a*; whips, in *Hsiao Fang têng San shih kuo ch'un ch'iu, ibid.* p. 38*b*; and *Shih shuo, ibid.* p. 38*b*; *Ching Chou chi, ibid.* p. 39*a*.]

Boats, etc.—[Boats and junks of different kinds are mentioned or described in *Hsi nang chü yu, ibid.* c. 28, *Chou chü lei*, p. 2*b*; *San fu huang t'u, ibid.* p. 7*a*; *Ma Kao chung hua ku chin chu, ibid.* p. 7*b* ("red dragon," 赤龍 *ch'ih lung*, and "galloping horse," 馳馬 *ch'ih ma*); *Nan shih, ibid.* p. 8*a* ("thousand *li*," 千里 *ch'ien li*, junk); *I hsi Ch'i chü chu, ibid.* p. 7*b* (four-deckers); *Nan shih, ibid.* p. 8*a* ("bream-boat"); *Liang shih, ibid.* p. 8*a* ("black-dragon," 青龍 *ch'ing lung*, and "white tiger," 白虎 *pai hu*, junks, covered with ox-skin); *Wu chih, ibid.* p. 10*a* (flat-bottomed boat); punting-poles, in *Ching chou chi, ibid.* p. 14*a*; sails and halyards, in *T'an yüan t'i hu, ibid.* p. 15*a*; *Wu Shih wai kuo chuan, ibid.* p. 15*a*; *Nan yüeh chih*, ibid. p. 15*a*; hawser, in *Nan shih Chu Ch'ao-shih chuan, ibid.* p. 15*b*; anchors, in *Chiao Hung-su Shu k'an wu, ibid.* p. 16*a*; *Lei ch'ing jih cha, ibid.* p. 16*a*; weather-cock, in *Wên hsüan, ibid.* p. 16*a*; and raft, in *Tz'ŭ lin hai ts'o, ibid.* p. 17*a*.]

Agricultural Implements.—"The *su* (鉓) is a long pick (鑐 *ch'an*); and the pick is an instrument for breaking up the earth."—*Ch'ên Mou-jên Shu wu i ming su, ibid.* c. 48, *Kêng chih ch'i wu lei*, p. 3*a*.

"The long pick (長鑐 *ch'ang ch'an*) was narrower than the plough-share (犁鑐 *li ch'an*). It was made with a long handle, and was accordingly named 'long pick.' The long pick had a curved handle pointing downwards, on the upper part of which was a wooden cross-piece resembling a staff, which was held in both hands, the foot being used to tread on the pick [and so press it into the earth]. The handle, following the sharp point of the pick, entered the soil, and being drawn back again the earth was broken up. In ancient times this was called *ch'i hua* (蹊鏵), a large foot-spade, but now it is called *t'a li* (踏犁), 'treading (foot) plough.'"—*Wang Ch'i San ts'ai t'u hui, ibid.* p. 3*a*.

"In the States of Sung and Wei the harrow (耙 *p'a*) was called *ch'ü na* (渠拏) whilst others called it *ch'ü su* (渠疏)." *Fang yen, Shih lei t'ung pien*, c. 17, *Jên shih pu*, p. *ib*.

"The *ch'ien* (杕), crowbar, belonged to the spade class (i.e., digging implements)."—*Yü p'ien, Ko chih ching yüan*, c. 48, *Kêng chih ch'i wu lei*, p. 6*a*.

"The *ch'ien* (杕), was made either of iron or wood, and was used for digging sand or soil. In the *Fang yen* [it is stated that]: 'When made of iron it was called *t'iao ch'ien* (跳杕), 'prizing crowbar'; when of wood, *ch'ien pu* (杕部 = 棓), 'flail.'"—*Hsü Chü Shih wu yüan shih, ibid.* p. 6*a*.

"When the head of the *ch'ien* was made of smelted iron, it was called *t'ieh ch'ien* (鐵杕), 'iron crowbar,' and was used only for digging earth; when it was made of pointed wood, it was called *mu ch'ien* (木杕), 'wooden pole,' and was used for lifting corn. Besides these there was a wooden *ch'ien* with an iron blade, used for making mounds or dykes in a field. Another was made of bamboo, and was called by the people of Huai *chu yang ch'ien* (竹揚杕), 'bamboo lifting-*ch'ien*.' [This was a long pointed pole, which was stuck into bundles of grain-stalks, which were shaken on the point of the pole, the grain falling down and the chaff being blown away.] This differed slightly from the *yang lan* (颺籃), carrying-basket [pole] of Chekiang."—*Wang Ch'i San ts'ai t'u hui, ibid.* p. 6*b*.

"Ma Chün was the most skilful official in the world. He lived in the capital [of the Wei state] where there were many places suitable for making gardens, but no water to water them, Consequently he made a 'turning wheel' (翻車 *jan ch'ê*). and got children to turn it; the water [thus raised] could pour out by itself [on the fields or gardens] in a continuous stream. It was a hundred times better than the ones commonly in use."—*Wei lüeh, ibid.* p. 7*a*.

Weaving Implements.—"The ancient looms which had 50 thread-holders had 50 treadles, and those which had 60 thread-holders, 60 treadles. There was a man named Ma, who, regretting the waste of time and labour, changed [the system of the loom] so that it worked with 12 treadles only. At the present time the weaving-girls weave pongee using only 2 treadles—and thus save much labour."—*Fu tzŭ, ibid.* p. 18*b*.

Hunting and Fishing Implements.—"The wooden enclosure or trap (槎椏 *ch'a chih*) was an implement used to catch beasts. It had been in use since the time when the emperor Wên of the Wei State used to go hunting. On the wooden stakes being pulled up the deer was liberated [for the chase]."—*Shu wu i ming su, ibid.* p. 24*a*.

"The *k'ung hou* (空喉) was an implement for catching dogs." It was used when taking a dog to sell for food.—*Hou ch'ing lu, ibid. p.* 24*a*.

"In the time of the Chin dynasty the people of Ch'ien T'ang made a *hung* (泓), or bamboo dam. With it they could catch a million fish in a year, so it was called the *wan chiang hung* (萬匠泓), or 'million-worker dam.'"—*Yu yang tsa tsu, ibid.* p. 23*a*.

"Sun Hung-i said: 'A piece of straight wood placed crosswise and fitted with two feet (legs) that is a *chi* (几), stool to lean on.'"—*Yü lin, Ko chih ching yüan*, c. 53, *Chü ch'u ch'i wu lei*, p. 1*b*.

"In the south of Ying Chou (Chih li) there was the Chin Luan Monastery where was a 'precious' bench (几 *chi*) covered with white unfigured sarcenet."—*Shih i chi, ibid.* p. 2*b*.

"The cord seat (繩牀 *shêng chuang*) was a seat woven out of cords—this was what was commonly called a sofa (交椅 *chiao i*)."—*Hsüeh lin, ibid.* p. 4*a*.

[Lanterns are referred to in *T'ien Pao i shu, ibid.* c. 50, *Jih yung ch'i wu lei*, p. 16*a*; lampwicks, in *T'ang shu, ibid.* p. 15*a*; candles, in *Chin T'ang shu, ibid.* p. 16*a*; *K'ai Yüan i shih, ibid.* p. 10*b*; *Tu Yang tsa pien, ibid.* p. 17*a* (fragrant wax candle); sandal-wood candlesticks, in *T'ien Pao i shih, ibid.* p. 18*b*; oil, in *Tso mêng lu, ibid.* p. 19*a*; glue, in *Shih i chi, ibid.* p. 24*b*; *Shui ching chu, ibid.* p. 24*b*; *Pên ts'ao kang mu, ibid.* p. 24*b*; *Tz'ŭ lin hai ts'o, ibid.* p. 24*b*; charcoal, in *T'ien Pao i shu, ibid.* p. 27*b*; *Tê Tsung chi, ibid.* p. 27*b*; *Lao hsüeh an pi chi, ibid.* p. 27*b*; *K'ai Yüan i shih, ibid.* p. 28*a*; *Ch'ing po tsa chih, ibid.* p. 28*a*; *Sui shih chi, ibid.* p. 28*a*; *Yu Yang tsa tsu, ibid.* p. 28*b*; *Ch'i hsiu lei kao, ibid.* p. 28*b*.]

"At the festival of the 15th day of the first moon the Emperor Jui Tsung . . . made a lantern covered with variegated silk; the disk of the lantern was 20 *chang* in height; and under it Imperial maids danced and sang."—*Ch'ao yeh ch'ien tsai, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 11*a*.

"By placing a lantern lit with the fat of the venomous serpent under the water all the sea creatures could be seen."—*Hai lu sui shih, ibid.* p. 11*a*.

"The 'lantern of the genii' was a kind of tree resembling the *sterculia platanifolia*, which could be lit like a candle—[its light] lasting for several *k'o*," *i.e.*, perhaps an hour in all.—*Hai lu sui shih. ibid.* p. 11*a*.

"In a monastery in the Kiang-ning district there was an 'inextinguishable lamp' (長明燈 *ch'ang ming têng*) of the Chin dynasty. After years had elapsed, its flame became light-green, but gave no heat. When the Sui subdued the Ch'ên, the light was still unextinguished."—*Sui T'ang chia hua, ibid.* p. 11*b*.

[A lamp made from fish-oil, called the "greedyfish lamp" (*ch'an yü têng* 饞魚燈) is mentioned in *K'ai Yüan i shih, Ko chih ching yüan*, c. 50, *Jih yung ch'i wu lei*, p. 12*a*.]

"Lady Han Kuo made a candelabrum with a hundred branches; it was 80 *chang* high and spread its rays for a distance of several tens of *li* around."—*T'ien pao i shu, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 12*a*.

[Beds and bedsteads are mentioned in *Shih ming, Ko chih ching yüan*, c. 53, *Chü ch'u ch'i wu lei*, p. 5*b*; *Chêng tzŭ t'ung, ibid.* p. 6*a* (炕 *k'ang*, "stove-bed" of N. China); *K'ai Yüan i shih, ibid.* p. 7*a* (agate bed); *K'ung liu t'ieh, ibid.* p. 7*a* (crystal bedstead inlaid with gold and silver); *Ho pi shih lei, ibid.* p. 7*a*; *Yu Yang tsa tsu, ibid.* p. 7*a* (made of sandalwood inlaid with figures of flowers); *T'ang shu, ibid.* p. 7*b*; *Nan Yo chi, ibid.* p. 7*b* (white-jade bedstead); *Yu Yang tsa tsu, ibid.* p. 8*b*; quilts (embroidered, etc.), in *Tu Yang tsa pien, ibid.* c. 54, *Chü ch'u ch'i wu lei*, p. 1*b*; p. 2*a*; *Ch'ing i lu, ibid.* p. 2*a*; pillows, in *I ya, ibid.* p. 3*a*; *Ming huang tsa lu, ibid.* p. 3*b*; *Yu Yang tsa tsu, ibid.* p. 4*a*; p. 4*b*; *Ou Yang-hsiu shih hsü, ibid.* p. 4*b* (greenstone pillow); *Fêng ning chuan, ibid.* p. 4*b* (loadstone pillow); *Ou kung shih pi, ibid.* p. 6*a*; *Shan chia ch'ing shih, ibid.* p. 6*a*; *K'ai Yüan i shih, ibid.* p. 6*b* (*bis*) ("night-shining pillow," 夜明枕 *yeh ming chên*); mattresses, in *Hou shan t'an ts'ung, ibid.* p. 13*a*; *Tu Yang pien, ibid.* p. 13*a* (dust-proof mattress); carpets, rugs, etc., in *Hsi shang fu t'an, ibid.* p. 14*a*; *Shih wu yüan shih, ibid.* p. 14*a*; *Yu Yang tsa tsu, ibid.* p. 14*b*; *I wu chih, ibid.* p. 14*b*; *Yu Yang tsa tsu, ibid.* p. 14*b*; *Su Ê Tu Yang tsa pien, ibid.* p. 15*b*; *K'ung liu t'ieh, ibid.* p. 9*b*; *Hsiang Tung pei lu, ibid.* p. 9*b*; *Chang Ao-chao Yeh ch'ien tsai, ibid.* p. 9*b*; *Shih i chi, ibid.* p. 10*a*; bags, in *Sui T'ang chia hua, ibid.* p. 18*a*; *Ch'ing i lu, ibid.* p. 18*b*; *Li Ho chuan, ibid.* p. 18*b*; *Chên chu ch'uan, ibid.* p. 19*b*; boxes of various kinds, in *P'ei hsing chuan, ibid.* c. 52, *Jih yung ch'i wu lei*, p. 11*a*; *Pai shih lei pien, ibid.* p. 11*a*; *Tu Yang tsa pien, ibid.* c. 54, *Chü ch'u ch'i wu lei*, p. 20*b* (agate chest 3 feet square); *Shih wu yüan shih, ibid.* p. 21*a*; *Tu Yang tsa pien, ibid.* p. 21*b*; screens, in *Shih wu kan chu, ibid.* c. 53, *Chü ch'u ch'i wu lei*, p. 11*b*; *Yu Yang tsa tsu, ibid.* p. 11*b*; *Tu Yang pien, ibid.* p. 12*a*; *Yüan shih Yeh t'ing chi, ibid.* p. 12*b*; *Shih wu yüan shih, ibid.* p. 12*b*; *T'ang shu, ibid.* p. 13*a*; *Tan ch'ien tsung lu, ibid.* p. 13*b*; curtains, in *Shan t'ang ssŭ k'ao, ibid.* p. 15*a*; *Ts'ai lan tsa chih, ibid.* p. 15*b*; *Tu Yang tsa pien, ibid.* p. 16*a*; *Shih i chi, ibid.* p. 17*a*; *Sui i lu, ibid.* p. 17*b*; *T'ang shu, ibid.* p. 18*a*; *Ming t'ang tsa lu, ibid.* p. 18*a*; *Yen fan lu, ibid.* p. 18*b*; *Fêng ch'uang hsiao tu, ibid.* p. 19*a*; *Hu yüan, ibid.* p. 19*a*; *K'ung liu t'ieh, ibid.* p. 19*a*; *Ch'i chü ch'i fu chien, ibid.* p. 19*b*; and curtain-hooks in *Sui shih, ibid.* p. 20*b*; *Tu Yang tsa pien, ibid.* p. 22*b*.]

[Locks are mentioned in *T'ang shu, ibid.* c. 49, *Jih yung ch'i wu lei*, p. 9*a*; *Hsien i pien, ibid.* p. 9*b* (locks now made square); *Yu Yang tsa tsu, ibid.* p. 9*b* (*bis*); *K'ung liu t'ieh, ibid.* p. 9*b*; *Lu i chi, ibid.* p. 9*b*; ladders, in *Chêng tzŭ t'ung, ibid.* p. 10*a*; bells, in *Kuang yün, ibid.* p. 10*b*; *K'ai Yüan i shih, ibid.* p. 10*b*; *Chi i chih, ibid.* p. 11*a*; needles, in *T'ang po kuan chih, ibid.* p. 12*a*; and money-box (also used as letter-box) (鈁后 *hsüan*) in *Shih ku chu, ibid.* p. 15*a*.]

From the Restoration of Unity to the End of the Five Dynasties (589 to 960).—*Table V.*

589–907.

Furniture and Household Utensils.—"In the days when Chang Chiu-ling had not yet obtained his literary degree, he built a house on the Kuei Hill, in which all the benches and tables were carved out of white stone."—*Kuang yü chi, Shih lei t'ung pien*, c. 73, *Ch'i yung pu*, p. 23*b*.

[A wealthy brother of the empress Kuang Wu had furniture made of gold.]—*Shih i chi, ibid.* c. 58, *Jên shih lei pu*, p. 2*a*.

"The Princess T'ung Ch'ang cut and polished numerous precious things (precious stones and metals) to make a round table."—*Tu-yang p'ien, ibid.* p. 24*a*.

ch'i wu lei, p. 2*a*; *Chêng tzŭ t'ung, ibid.* p. 2*b*; *Ku ching chi, ibid.* p. 3*a*; *Chao yeh ch'ien tsai, ibid.* p. 5*b*; *Yu Yang tsa tsu, ibid.* p. 6*a*; *Liu Su Sui T'ang chia hua, ibid.* p. 2*a*; *T'ien Pao i shih, ibid.* p. 11*b*; *P'in wu lei chü, ibid.* p. 13*a*; *Li Chao Han Lin chih, ibid.* p. 13*a* (brass mirrors and varnished toilet-boxes); incense-urns, in *K'ai Yüan i shih, ibid. c.* 58, *Yen shang ch'i wu lei*, p. 1*b*; *Chao yeh ch'ien tsai, ibid.* p. 2*b*; sceptres, in *Yang Fei wai chuan, ibid.* p. 9*b*; *Yu Yang tsa tsu, ibid.* p. 9*b*; rosaries, in *Shang shu ku shih, ibid.* p. 10*a*; fans, in *K'ai Yüan i shih, ibid.* p. 13*b*; *T'ang hui yao, ibid.* p. 14*b*; sticks and staffs, in *K'ai Yüan i shih, ibid.* p. 21*b*; *Yu Yang tsa tsu, ibid.* p. 21*b*; *Shan t'ang ssŭ k'ao, ibid. p.* 21*b*; spectacles, in *Pai shih lei pien, ibid.* p. 22*a*; *Ming wu t'ung, ibid.* p. 22*b*; telescope from Europe, in *Chêng tzŭ t'ung, ibid.* p. 22*b*; flicks and fly-brushes, in *Yu Yang tsa tsu, ibid.* p. 25*a*; and striking clock, in *Hsieh Chao Shuan wu tsa tsu, ibid. c.* 1, *Kan hsiang lei*, p. 15*a*.]

"The Emperor Yüan Tsung bestowed upon Sung Ching a pair of gold chopsticks of his own use, and said: 'I do not mean to bestow upon you the gold, but the chopsticks—my intention being to indicate that you are as straight as chopsticks.'"—*P'ao-P'u tzŭ, Shih lei t'ung pien, c.* 73, *Ch'i yung pu*, p. 17*a*. See also *Shih i chi, ibid. c.* 58, *Jên shih pu*, p. 2*b*.

"The T'ang [Emperor Hsüan Tsung] bestowed upon An Lu-shan a spoon and chopsticks of rhinoceros-horn."—*Yu Yang tsa tsu, ibid.* p. 18*b*.

"The Emperor Kao Tsu of the Later Shu, for Queen Li's sake, treated the children of T'ang Chuang Tsung very kindly. He gave them a bowl made of naturally-scented aloe-wood and a spoon and chopsticks of putchuck."—*Liu kuo ch'un ch'iu, ibid.* p. 18*b*.

"Glass [? vitreous] plates are mentioned as having been sent from Canton to the Chinese Emperor in the year 778 A.D. They were highly esteemed, and were said to have come from 大秦."—*Ch. Rev.*, xvii. 114.

"In the imperial treasury of the T'ang dynasty there was a plate of yellow colour, 3 feet 4 inches in circumference. All around it were figures of various objects, such as the fifth of the horary signs, with a figure of the dragon sporting in the grass; on turning it round to the 6th sign, [one saw] a figure of the serpent; to the 7th, the horse, etc. It was called the 'plate of the twelve horary signs.'"—*Ch'ien ch'üeh lei shu, Shih lei t'ung pien, c.* 74, *Ch'i yung pu*, p. 5*b*.

"In the time of the emperor Tai Tsung, a vitreous dish, one foot in diameter, was found on the spot where Yüan Tsai's family had been destroyed."—*T'ang shu, ibid.* p. 5*a*.

[Dishes are mentioned in *T'ang shu, Ko chih ching yüan, c.* 52, *Jih yung ch'i wu lei*, p. 10*a* (agate); basins, in *T'ang hui yao, ibid.* p. 15*a*; *Hua i k'ao, ibid.* p. 15*b*; *Pei mêng so yen, ibid.* p. 15*b* (gold wash-basin); *Tu Yang pien, ibid.* p. 15*b* (*bis*); *T'ang wang chin chuan, ibid.* p. 17*a*; jars, bottles, etc., in *T'ang Ch'in ch'iung chuan, ibid.* p. 21*b*; tubs, buckets, casks, etc., in *Chi chiu chang chu, ibid.* p. 24*a*; *Shih wu yüan shih, ibid.* p. 24*a*; *Tung Ch'i chi shih, ibid.* p. 24*a*.]

"Among the eating implements used in the Hsin Lo country was a willow cup."—*Chiu T'ang shu, Shih lei t'ung pien, c.* 73, *Ch'i yung pu*, p. 19*b*.

"In the summer months Li Tsung-min made a cup out of a lotus-leaf."—*Wang T'ang T'ang yü lin, ibid.* p. 19*b*.

"The *Pên Ts'ao* says: Glass was first written 頗黎, the name of a country. An extract from a miscellany shows that in Li Poh's time grape wine was drunk at Court out of glass vessels. One of his poems contains the modern words 玻瓈杯."—*Ch. Rev.*, xviii. 196.

"In the beginning of the reign *K'ai yüan* the Sa Wei Chien country offered a crystal cup as tribute."—*T'ang shu hsi yü chuan, Shih lei t'ung pien, c.* 73, *Ch'i yung pu*, p. 19*b*.

"In the Imperial Treasury of the T'ang dynasty there was a wine cup; its colour was that of light green jade; its markings resembled the appearance of twisted silk; it was as thin as paper; and on it was engraved in letters of gold: 'A cup which of itself warms [wine].' The Emperor accordingly ordered wine to be poured into it, whereupon it gradually gave forth steam and in a short while was like boiling water."—*T'ien pao i shu, ibid.* p. 19*b*.

"The people of T'ang made the *lien tzŭ pei* 蓮子杯), lotus-seed cups, [used either for eating lotus-seeds out of or for drinking wine]."—*Tou Tzŭ-yeh Chiu p'u, ibid.* p. 19*b*.

"Li Shih-chih had a *P'êng Lai chan* (蓬萊琖) *P'êng Lai* wine-cup [*P'êng Lai Shan*, one of the *San Shên Shan*, Three Isles of the Blest, in the Eastern Sea], in which there stood up 3 hills like 3 islands. When wine was poured into it the limit was reached when the hills were covered."—*Fêng yüan chi, ibid.* p. 19*b*.

"The form of the 'parrot conch' (鸚鵡螺 *ying wu lo*) was like the *hsia* (霞) cup, but its shape resembled a bird's head. If one looked at its body (*lit.*, stomach) it seemed like a parrot—hence its name."—*I wu chih, ibid.* p. 20*a*.

"The bill of the rhinoceros hornbill was large, with a hook one foot long. Its colour was reddish-yellow. It could contain two pints. The people of the South used it as a wine-cup."—*Yu Yang tsa chu, ibid.* p. 20*a*.

"In the 2nd year of the reign of Wu Tê, the Chi Pin country sent a minister to offer a crystal cup as tribute."—*T'ang shu, ibid.* p. 20*b*.

"The emperor Chao Tsung of the T'ang dynasty bestowed upon Chuang Tsung a *ch'i ch'i* (鵨鶃 an aquatic bird with variegated plumage) wine goblet."—*So yen, ibid.* p. 20*b*.

"The 'wine-cup creeper' (酒杯藤 *chiu pei t'êng*) was produced in Western countries. It was as thick as a man's arm. The leaf resembled that of the *Dolichos Tuberosus* (or *Pueraria Thunbergiana*), and the fruit that of the dryandra. [The wood] was suitable to make wine-cups of. Drinking out of these cups could cure the effects of the previous night's excess."—*Hsü po wu chih, ibid.* p. 21*b*.

"Chêng Kung-ch'io took a large lotus-leaf to put wine into, and used a hairpin to prick [a channel] through the lotus and the stalk in order to suck up the wine through it [and so enjoy the fragrance of both tastes]. He named it the 'green-tube cup.'"—*Shên hsien chuan, ibid.* p. 22*b*.

[Other goblets, etc., are mentioned in *K'ai Yüan chuan hsin chi, Ko chih ching yüan, c.* 51, *Jih yung ch'i wu lei*, p. 4*b*; *Pai lo t'ien shih, ibid.* p. 11*a*; cup-stands, in *Yen fan lu, ibid.* p. 11*b*; bowls, in *Shih wu yüan shih, ibid.* p. 16*b*; *Li Chao Han lin chih, ibid.* p. 16*b*; *Yu Yang tsa tsu, ibid.* p. 16*b*; *Chiu kuo chih, ibid.* p. 16*b*; *Hai mo wei yen, ibid.* p. 19*b*; steamers, stew-pans, etc., in *Pai liu t'ieh, ibid. c.* 52, *Jih yung ch'i wu lei*, p. 1*a*; *T'ang yü lin, ibid.* p. 1*a*; *T'ieh wei shan ts'ung t'an, ibid.* p. 6*a*; "ladle-pestle," or hydraulic-rammer, in *Chêng tzŭ t'ung, ibid.* p. 7*a*; and mechanical mortar or hydraulic-mill, in *Yün fu, ibid.* p. 7*a*.]

"The hydraulic-pestle was a hundred times better than the treadle pestle."—*Shih wu yüan shih, ibid.* p. 6*b*.

Writing Implements.—"When T'ao Hung-ching was about 4 or 5 years old, he made a pen out of an *artemisia* reed, with which he wrote in the ashes for practice."—*Nan shih, ibid. c.* 37, *Wên chü pu*, p. 7.

"Ou-Yang T'ung, the son of Hsün, made a pen out of ivory and rhinoceros horn, using the hair of the wild cat for the centre of the brush and the fine hair of the autumn rabbit for the outside."—*Chao yeh ch'ien tsai, ibid.* p. 2.

"Ch'i Chou [a district of the P'ei province] offered as tribute pens made of deer's hair."—*Ti li chih, ibid.* p. 2.

"In the K'ai yüan period there was a penmaker, who was able to colour pen-shafts (or handles) to imitate jade, but this art was not handed down [to posterity]."—*Yu Yang tsa tsu, ibid.* p. 3.

[One of the 7 good points ascribed to the persimmon was that its leaves being large and thick, could be used for writing on.]—*Yu Yang tsa tsu, Shih lei t'ung pien, Kuo pu, c.* 84, p. 4*a*.

"During the period 618–906 it is certain that books of secondary importance were 'printed upon paper' from 'wooden blocks,' and 'sold in the book-shops.'"—*Asiat. Quart. Rev.*, Oct., 1908.

[By an imperial order of the 2nd year of the reign Shang Yüan (762) paper was to be used generally for writing on. See *Yüeh Ya T'ang T's'ung shu, Nan pu hsin shu hsin*, p. 5*a*.]

"Ou Yang-T'ung, son of Hsün, was a clever writer. He used musk paper, which had to be durable, thin, white, and smooth before he would write on it."—*Ch'ao yeh hsien tsai, Ko chih ching yüan, c.* 37, p. 9.

"Corean paper was made of a mixture of cotton and silk. In colour it was white like [thin] damask or silk cloth, and, like silk, it was durable though flexible. When used for writing on it took the ink very nicely."—*Fêng t'u chi, P'ei wên yün fu, c.* 34, *Ssŭ chih yün, Chih tzŭ pu.*

"The State of Lin Yi made paper of leaves."—*Nan shih, I mo chuan, ibid.*

"The people of the T'ang dynasty had '*chüan*' (glowworm) paper which was made bright and smooth by using paste or flour or the like."—*Yang Shên wai chi, Ko chih ching yüan, c.* 37, *Wên chü pu*, p. 9.

"In the early part of the reign Yüan Ho of the T'ang dynasty there was a singing-girl named Hsüeh T'ao of Shu (Ssŭch'uan) who was fond of making small poems. She feared that a roll of paper was too large, and did not wish to waste so large a piece. So she cut it into small sheets. The people [of that time], finding it convenient [adopted it] and called it Hsüeh T'ao's note paper."—*Nan pu hsin shu, ibid.* p. 9.

"The people of the T'ang dynasty had 'raw' paper and 'ripe,' or 'finished,' paper. The latter was fine and smooth, the former was not used unless [the user was] in mourning."—*Shao shih Hou lu, ibid.* p. 9.

"The State of Hua made paper of sheepskin."—*Nan shih, ibid.* p. 11.

"When the moss [found] in water was used for making paper the latter was called moss-paper. Its colour was dark yellow."—*Mu ts'ao chu, ibid.* p. 17*b*.

"One who had just taken a doctor's degree used paper sprinkled or speckled with gold dust to write a card, enclosing it in a home letter informing his family that he had gained a degree. [This custom lasted] until the reign of Wên Tsung [827–41] when it was abolished [by that emperor]."—*K'ai yüan i shih, ibid.* p. 19*b*.

"The men of ancient times used pongee or silk for writing on. According as the communication was long or short, they cut off pieces to suit their purpose. The name used was *fan chih*—'banner paper.'"—*Hsü chien ch'u hsüeh chi, Shih lei t'ung pien, c.* 12, *Wên hsüeh pu*, p. 28*a*.

"India ink was manufactured by [*i.e.*, before the beginning of] the seventh century."—*Williams, Midd. King.*, i. 600.

"Ink was first made in the time of Huang Ti. Others say that T'ien Chên [6th century A.D.] made ink."—*Kuang po wu chih, Ko chih ching yüan, c.* 37, *Wên chü pu*, p. 20*a*.

"At the close of the T'ang dynasty the inkmaker Hsi Ch'ao with his son T'ing-kuei removed his family from Yi Shui, and crossing the river, settled in Hsi Chou. The Emperor of the S. T'ang bestowed upon them the surname Li. Father and son made large quantities of ink, also using the soot of [burnt] pine. So that age had Hsi T'ing-kuei's inks."—*Cho kêng lu, P'ei wên yün fu, c.* 102, *Shih san chih yün, Mo tzŭ pu*, p. 323*b*.

"In the T'ang dynasty Corea sent an annual tribute of ink made from the soot of [burnt] pine-wood. The most used was soot from pine-wood several years old mixed with 'deer-glue.'"—*Cho kêng lu, ibid.* p. 324*b*.

"In the time of the Emperor Kao Tsung of the T'ang dynasty there was a slab of ink which was kept in the Imperial Treasury. It was over 2 catties in weight and was as hard as jade. The inscription on it was: 'The 2nd year of the reign of Yung Hui. Ink for the Imperial Treasury.'"—*Ch'un chu chi wên, Ko chih ching yüan, c.* 37, *Wên chü pu*, p. 21*a*.

"The Emperor Yüan Tsung of the T'ang dynasty made the imperial ink of the juice of the *hibiscus mutabilis* mixed with scented powder."—*Wang hsiang chin fang ch'ün pu, Shih lei t'ung pien, c.* 12, *Wên hsüeh pu*, p. 29*b*.

"In the cuttle-fish's belly there was a black fluid, which was now used in making ink."—*T'ao yin chü pên ts'ao chu, Ko chih ching yüan, c.* 37, *Wên chü pu*, p. 29*b*.

"Before the middle of the T'ang dynasty the inkstone was not always made of stone. The liquid ink was generally kept in any kind of brass or iron vessel."—*Pi shu lu, ibid. c.* 38, *Wên chü pu êrh*, p. 1*b*.

"The Dragon-tail Hill was to the S.E. of Wu Yüan. In the K'ai Yüan period there was a hunter, Mr. Yeh. Whilst chasing an animal he came to Ch'ang Ch'êng, where he saw a heap of smooth, clear stones. On his return home he made them into inkslabs, which were smoother than those of Tuan Chi."—*Hsin an chih, ibid.* p. 10*b*.

"Before the T'ang dynasty [inkslabs made of] tile were generally used. But now, though inkslabs made of stone are used all over the empire, yet the name of 'tile inkslabs' is commonly retained."—*Yen fan lu, ibid.* p. 1*b*.

"The bricks from the temple of King Ch'u were suitable for making inkslabs."—*Han ch'ang Li i ch'êng i chi, ibid.* p. 9*b*.

"The men of the T'ang dynasty classified the pure clay of Kuo Chou as first rate material [for making] inkslabs. But the people of the present day seldom use it."—*Ou p'u, ibid.* p. 9*b*.

"In the 2nd year of the K'ai Yüan period [714], the Prime Minister had bestowed upon him a *Lung-lin-yüeh* inkslab. The marks on the stone resembled a dragon's scales, and the shape was that of the moon. It was a product of Hsi [Chou]."—*Ch'ing i lu, ibid.* p. 10*b*.

[Inkstones are further mentioned in *Liu kung ch'üan lun yen, Shih lei t'ung pien, c.* 20, *Wên hsüeh pu*, p. 25*a*; *Ch'êng Ch'i tsa chi, P'ei wên yün fu, c.* 76, *Yen tzŭ pu*, p. 386*a*; *T'ang lu, Ko chih ching yüan, c.* 38, *Wên chü pu êrh*, p. 16*a*; p. 20*b*; *Li Chi Wêng Tzŭ hsia lu, Kuang shih lei fu, c.* 15, *Tsa wu pu*, p. 8*a*; *Ou kung shih pi, Ko chih ching yüan, c.* 38, *Wên chü pu êrh*, p. 10*b*; and penracks in *Wang Tê-nien K'ai Yüan i shih, Shih lei t'ung pien, c.* 12, *Wên chü tsung pu*, p. 21*a*.]

Carriages.—[Carriages are referred to in *T'ung tien, Ko chih ching yüan, c.* 29, *Chou chü lei*, p. 7*a*; *Shih ming, ibid.* p. 19*b*; *Po liu t'ieh, ibid.* p. 19*b*; *Ch'ün shu k'ao so, ibid.* p. 9*a* (*bis*); *Sui i lu, ibid.* p. 23*a*; *Chao yeh ch'ien tsai, ibid.* p. 25*a*; *T'ien Pao i shih, ibid.* p. 33*a*; *T'ang shu, ibid.* p. 33*a*; *Pai pien, ibid.* p. 33*b*; saddles, in *T'ien Pao i shih, ibid.* p. 37*a* (*bis*); stirrups, in *Kuang yün tsao, ibid.* p. 38*b*; *Fang shu, ibid.* p. 38*b*; and horsewhips in *Ch'u hsüeh chi, ibid.* p. 38*b* (bamboo substituted for leather); *Tu Yang pien, ibid.* p. 39*a* (*bis*); *Chih Hsü-ko tsa tsu, ibid.* p. 39*a*; and *Chao yeh ch'ien tsai, ibid.* p. 39*a*.]

Boats, etc.—[Ships and boats are mentioned in *Shih i chi, ibid. c.* 28, *Chou chü lei*, p. 2*b*; *Sui chih, ibid.* p. 8*a* ("dragon-boat" and "phœnix galley"); *P'i jih hsiu wu huang shih hsü, ibid.* p. 8*a* (五瀉 *wu hsieh*, a fishing-boat with bamboo-mat coverings); *Shu i chi, ibid.* p. 12*a* (ships made of tiles and iron); *Shan hai ching, ibid.* p. 12*b*; oars, in *Sui i lu, ibid.* p. 13*a*; *I ya, ibid.* p. 13*b*; sails, in *I ya, ibid.* p. 14*b*; *Fêng t'u chi, ibid.* p. 14*b*; *Po liu t'ieh, ibid.* p. 15*a* (silk sails); and gangway in *Chêng tzŭ t'ung, ibid.* p. 16*a*.]

"Above the deck of a ship was built a room called *lu* (艫); and a double chamber called *fei* (飛) *lu* 'flying *lu*'; above which, again, was built a double chamber called *ch'iao shih* (雀室), 'lark's nest,' which was placed in the middle of the ship for a look-out just as the lark looked out from its nest."—*Shih ming, ibid.* p. 2*a*.

"The *p'ien ch'a* (艑艖) was a flat-bottomed boat."—*T'ung ya, ibid.* p. 4*b*.

"The large flat-bottomed boats (大艑 *ta p'ien*) of Hsiang Chou and its seven districts could hold 10,000 piculs of cargo."—*Ching Chou chi, ibid.* p. 4*b*.

"The *cha mêng* (蚱蜢), cicada, was an insect pointed at both ends which lived in the grass. The small boats or skiffs of the present time being like it in shape were called *cha mêng*."—*Lei ch'ing jih cha, ibid.* p. 4*b*; see also *Lin hai chi, ibid.* p. 12*b*.

"The tribute commissioner of the Jan [Yang] Ch'iu country crossed over the bubbling sea to the capital. He covered his ship's bottom with copper plates, so that the dragon-boa and dragon dared not approach."—*Shih i chi, ibid.* p. 12*a*.

[Hsien Tsung (806–21) is said to have established the right way to make the compass invented in ancient times; see *Tzŭ chih t'ung chien kang mu, Shou pien, c.* i. p. 9.]

Agricultural Implements.—"The toothless harrow was called *pa* (耙), but the harrow with teeth was called *p'a* (耙); both were used for collecting or gathering stalks of grain and corn."—*Yen Shih-ku Chi chiu chang chu, Ko chih ching yüan, c.* 48, *Kêng chih ch'i wu lei*, p. 3*b*.

"The long-toothed harrow (耖 *ch'ao*) is an instrument used for loosening the earth of a field. At its top there was a cross handle and under it there were teeth; it was held in both hands, and in front drawn by animal power. One long-toothed harrow required a man and an ox. The double long-toothed harrow required two men and two oxen, and was made on purpose for use in a large field, as it could do the work faster. It was used after the ground had been treated with the plough (耕 *kêng*) and the [short-toothed] harrow (耙 *p'a*)."—*Nung sang t'ung chüeh, ibid.* p. 4*a*.

"The *lao* (耮) is a harrow (耙 *p'a*) without teeth."—*Wang Ch'i San ts'ai t'u hui, ibid.* p. 4*a*. Stated in K'ang Hsi's Dictionary to be used for smoothing the ground.

"The *tun* (𥳑 or 笅 or 囤) and *ch'ui* (窀) were implements for holding rice and grain. If made of fine bamboo matting plastered with mud it was called *tun*, which meant *t'un* (屯), store, as it was used for collecting and storing things. If it was made by weaving grass it was called *ch'ui*."—*Chi chiu chang chu, ibid.* p. 10*a*.

"The *yu* (櫌), rake, was made of wood, with nails fixed on the under side. It was used for scratching the field in order to remove [loose] grass."—*Shih wu yüan shih, ibid.* p. 11*a*.

"The *shu* (鐲) was one of the *tzŭ chi* (鎡基 or 錤), hoes with long narrow blades. In the Commentary on the *Chi chiu* it says: 'The hoe (鉏 *ch'u*) is an implement for clearing weeds; it is also called *tzŭ chi*.'"—*Shu wu i ming su, ibid.* p. 5*a*.

"The *nou* (耨), spade, was something like a *ch'an* (鏟), shovel, but its handle was 3 feet long and its blade 2 inches broad. It was used for digging the ground and clearing weeds."—*Tsuan wên, ibid.* p. 4*b*.

"The pickaxe (斫 *chê*) was also called *cho* (鐲), large hoe; but Kuo [P'o] said: 'It was a mattock (钁 *kuo*).' The *Shuo wên* says: 'The mattock was a large hoe (鋤 *ch'u*).'"—*Erh ya su, ibid.* p. 5*a*.

"The *ch'ü chu* (劬斤 鬻斤) spade (*lit.*, to hoe and dig), was also called *ting* (定); but Kuo [P'o] said: 'It was a hoe (鋤 *ch'u*).'"—*Erh ya su, ibid.* p. 5*a*.

"The *fan* (鐇) shovel, and *kuo* (钁), mattock, were hoes (鋤 *ch'u* with broad blades)."—*Kuang I-chêng Shih wu kan chu, ibid.* p. 5*a*.

"The iron hoe or rake (搭 *ta*), with either 4 or 6 teeth, resembled the harrow (耙 *p'a*), but was not quite the same. As it could break up the earth like a hoe it was called an iron hoe. It had an eye-hole for receiving a straight (or perpendicular, handle, which was 4 feet long. A farmer who had no ox to plough his field used it for ploughing or tilling, as it could break the clods as well as the heavy hoe or mattock."—*Nung sang t'ung chüeh, ibid.* p. 5*a*.

"The iron hoe (搭 *ta*) was an implement for breaking earth; its head (blade) was one foot broad. It was more useful than the ploughshare (耜 *ssŭ*)."—*Liao Wên-ying Chêng tzŭ t'ung, ibid.* p. 5*b*.

"The *fêng* (鋒) was a field implement of the same class as the ploughshare (耦 *chiang*). It was now generally made with

a forked head."—*Wang Ch'i San ts'ai t'u hui, Shih lei t'ung pien, c.* 17, *Jén shih pu*, p. *ib.*

"The *pén* (畚), dust-pan or earth-basket, and *chü* (掬), barrow, were implements for carrying earth."—*Ch'én Mou-jén Shu wu i ming wu, ibid.* p. *ib.*

"*Ch'a* (鍤), a spade, meant 'to pry up' (插 *ch'a*), for it was used to pry up the clods from the ground. It was otherwise called *hsiao* (銷), which meant 'to cut' (削 *hsiao*), as it was able to cut through [the ground]. Some called it *hua* (鏵), which meant 'to hollow out' (剜 *k'u*), as it was used for hollowing out pits in the earth. A board attached to it was called *yeh* (葉), leaf, as it was like the leaf of a tree."—*I ya, Ko chih ching yüan, c.* 48, *Kéng chih ch'i wu lei*, p. 5*b*.

"In the *Fang yen* it says: 'In the north-east of Yen and in the Lieh Shui region of Corea it (the 鍤 *ch'a*) was called *ch'iao* (刷); but in Sung and Wei it was called *hua* (鏵), and also *wei* (鍏); in Kiang Huai and Southern Ch'u (Honan and An Hui) it was called *ch'a* (臿); and in Chao and Wei, *sao* (梢),—all alluded to the present spade (鍬 *ch'iao*)."—*Êrh ya su, ibid.* p. 5*b*.

"The *ch'a* (鍤) is a two-headed (*i.e.*, pointed at each end) iron-pointed pole (銳 *jui*) used for carrying sheaves."—*Huang T'-chêng Shih wu kan chu, ibid.* p. 5*b*.

"The *hua* (鏵) is a kind of spade (鍤 *ch'a*) used for prying up the soil."—*Liu Hsi Shih ming, Shih lei t'ung pien, c.* 17, *Jén shih pu*, p. *ib.*

"Li Ch'i-wu, when Department Magistrate of Shan Chou, in the beginning of the reign of T'ien Pao, whilst breaking into a precipice at Ti Chu found embedded in the hardstone an ancient iron plough with the two words *p'ing lu* (平陸), 'leveller of ground,' on it. Because of this he changed the name of the district Ho Pei to P'ing Lu."—*K'ai t'ien ch'uan hsin chi, Ko chih ching yüan, c.* 48, *Kéng chih ch'i wu lei*, p. 6*a*.

"On the after part of the harrow there were a roller (磟磱 *u tu*) and a grass-clearer (礰礋 *li tsé*). From the harrow down to the grass-clearer there were teeth all the way. The roller was angular and made of wood, which was best when both hard and heavy."—*Lu Kuei-mêng Lei ssŭ ching, ibid.* p. 4*a*.

Sericultural Implements.—"The *lo ch'e* (絡車), 'silk-winding frame,' was used for turning the *huo* (簨)," a four- or six-sided reel for winding silk.—*Kuo P'u Chu, ibid.* p. 15*b*.

"The *lo ch'ê* (絡車), 'silk-winding frame,' was used for re-winding the silk taken from the spinning-wheel. It [the skein of silk] was placed on the peg-frame. Above [on a swing-arm] was fastened a hook, guiding the threads from the peg-frame over [the wheel of] the silk-winding-frame. The method of making this frame [was as follows]: A small axle must be used and passed through the *huo* (簨), or reel, to the middle of the two vertical supports on the frame of the machine. One support was higher [than the other] and an opening was made in it to admit the upper end of the axle of the *huo*, the lower support receiving its nether end. When the operator turned the axle by means of a cord (or rope), the *huo*, or spinning-reel, revolved with the axle and the silk was wound into the reel. The above describes the silk-reeling machine used in the North, but the people of the South accustomed themselves to use only the *huo* for reeling the silk—which was, however, unequal to the *lo ch'ê* for ease and rapidity."—*Nung sang t'ung chüeh, ibid.* p. 15*b*.

"Each stand was divided into 3 parts—upper, middle, and lower. In each part was placed one silkworm frame (箔 *po*). The upper part was for protection against dust; the lower for keeping out the damp; and the middle for placing out or separating the silkworms."—*Nung sang chih shuo, ibid.* p. 14*a*.

"The *so* (梭), shuttle, was sometimes called *ch'ih ch'u* (踟躕), the 'undecided' or 'vacillating' [implement]."—*Kuang po wu chih, ibid.* p. 19*a*

"The *feng so* (鳳梭), 'phœnix shuttle,' and *chin so* (金梭), 'gold shuttle,' were shuttles used by fairies."—*Yün fu, ibid.* p. 19*a*.

"T'ao K'an often went a-fishing. Once he fished up a weaving shuttle, and on returning home hung it up on the wall. No sooner had he done this than immediately there was a loud clap of thunder and heavy rain, and the shuttle was transformed into a red dragon and flew away from the house."—*I yün, ibid.* p. 19*a*.

"The *ta fang ch'ê* (大紡車), large spinning-wheel, was over 2 *chang* in length and about 5 feet in width."—*Nung sang chih chüeh, ibid.* p. 17*a*.

"The *jén ch'e* (紉車), thread-wheel, was an implement used in making thread."—*San ts'ai t'u hui, ibid.* p. 17*a*.

"The *hsiao fang ch'ê* (小紡車), 'small spinning wheel,' was used for all kinds of flax and hemp." "The *p'an ch'ê* (蟠車), 'binding wheel,' was an implement used for binding hempen thread. It was also called *po ch'ê* (撥車), 'winding wheel.' In the south the people called it *po fu* (撥拂), 'winding staff,' and also *ch'ê fu* (車拂), 'wheel staff.'"—*Nung sang t'ung chüeh, ibid.* p. 17*a*.

Fishing Implements.—"The name generally applied to fishing implements was *ling ching* (罾箸), 'basket traps.'"—*Ta T'ang hsin yü, ibid.* p. 23*a*.

"The articles required for fishing were:—*tiao* (約), hook; *wang* (網), net; *ku* (罟), snaring-net; *ch'üan* (筌), trap; *ku* (罛), large drag-net; *liu* (罶), fishing stakes or traps (also a large net like a seine); *chao* (罩), mud-fish basket trap; *ch'ing* (罾), 'drive' or 'sweep,' an erection of wooden stakes into which fish were driven; *kou* (笱), bamboo-trap; *sao* (搔), fishing with the hands (said by some to be a kind of claw-hook for stirring fish out of the mud); *liang* (梁), dam; *yen* (罨), mullet-net; *pei* (算), basket-trap; *li* (貍), mud bank to impede fish; *hsien* (銛), harpoon; and the like."—*Shih Tzŭ, ibid.* p. 23*a*.

"The *yen* (罨) was a net for catching mullet; the *pei* (算) was a bamboo cage for catching shrimps; the *li* (貍), a crab-basket for catching crabs [貍 is, however, not to be found in K'ang Hsi's *Dict.*, but 貍 is there given as a mud bank to impede fish]; and the *hsien* (銛), a spear for digging out the sea turtle and iguana. In Ho Ch'eng-t'ien's *Tsuan wên*, it says: 'The hsien was an iron instrument having a cockspur fitted at the end of a bamboo pole, and was used for spearing the tortoise and iguana."—*Ch'u hsüeh chi, ibid.* p. 23*a*.

"In the odes of Lu Lu-Wang [Lu Kuei-mêng] it says: 'In the result we are seeking the wherewithal for fishing near the banks of the river, so weave a bamboo dam of great length [lit., 10,000 feet long], and place it in the flowing water.'" "The *hung* was a dam for catching fish."—*Tz'ŭ lin hai ts'o, ibid.* p. 23*a*.

"Li Hsün said: 'The *chao* (罩) was a fishing basket plaited of fine bamboo [twigs]. In places where there was no bamboo they used brambles [of the *Vitex incisa*], and it was called *ch'u kuo* (楚簻), twig basket.'"—*Êrh ya su, ibid.* p. 21*b*.

"The *chua* (罨) was the present *ch'ai liao ku* (柴撩罟), small net of wickerwork, for taking up fish out of a large net."—*Kuo P'u chu, ibid.* p. 20*b*.

"There were various kinds of fishing nets, each being adapted to the uses for which it was required. There were the *t'ang wang* (塘網), pool net, *chu wang* (注網), running water net, *sa wang* (撒網), throwing net, *chang ssŭ wang* (張絲網), spreading-net, *ch'o wang* (綽網), large net, *tang wang* (攩網), enclosing net, *kan wang* (趕網) driving net, *ch'a wang* (扠網), sticking or dabbing-net, and *nien wang* (艌網), cord net let down from cross-bamboos fixed on a boat. The running-water net was specially adapted to running water, being made with a small mouth and large body, so that it could catch a large number of fish."—*San ts'ai t'u hui, ibid.* p. 20*b*.

"The *tséng* (罾) was a fishing net. In shape it was like an inverted canopy. It was spread out [under the water] and then raised."—*Shih ku chu, ibid.* p. 21*a*.

"The *tséng* (罾), lifting net, was hung upon four upright poles, which were raised and lowered by means of a water-wheel."—*Ch'u hsüeh chi, ibid.* p. 21*a*. "There were the *p'an tséng* (扳罾), drag net, *tso tséng* (坐罾) fixed net, and *t'i tséng* (提罾), hand-net; these three were nearly alike, but the *tso tsêng* was somewhat larger than the others. The word *tso*, resting, means to remain in a fixed position."—*San ts'ai t'u hui, ibid.*

907–960.

[Candles are mentioned in *Nan T'ang chin shih, Ko chih ching yüan, c.* 50, *Jih yung ch'i wu lei*, p. 17*a*; *Hsü shih shuo, ibid.* p. 17*b*; oil, in *Wu Tai shih, ibid.* p. 19*a*; double-eyed needle, in *T'i yao lu, ibid. c.* 49, *Jih yung ch'i wu lei*, p. 12*a*; mirrors, in *Chên chu ch'uan, ibid. c.* 5*b*, *Hsiang lien ch'i wu lei*, p. 6*b*; *Shih wu kan chu, ibid.* p. 8*b*; rosary, in *Ch'ing i lu, ibid. c.* 58, *Yen shang ch'i wu lei*, p. 10*a*; dishes, in *Wu Tai shih, ibid. c.* 52, *Jih yung ch'i wu lei*, p. 10*b*; chopsticks and bottle, in *Wu Tai shih, ibid. p.* 21*b*; *Wu Tai Sang Wei-han chuan, P'ei wén yün fu, c.* 76, *Yen tzŭ pu*, p. 385*a*; inkslab, in *Ssŭ p'u, Ko chih ching yüan, c.* 38, *Wên chü pu êrh*, p. 8*b*; and carriage in *Wu Tai shih, ibid. c.* 29, *Chou chü lei*, p. 20*a*.]

"Curiously enough, it was a Turkish Emperor ruling in North China to whom officially belongs the honour of printing the Confucian classics for the first time in 932."—*Asiat. Quart. Rev.*, Oct., 1908.

Sung Period (960 *to* 1280).—*Table VI.*

Furniture, Household Utensils, etc.—"The *chi* (几) was an article for sitting on. It was made of wood to suit the form of the body."—*Yen fan lu, Ko chih ching yüan, c.* 53, *Chü ch'u ch'i wu lei*, p. 1*a*.

[The sofa or "cord seat" is mentioned in *T'ung hua lu, ibid.* p. 4*b*; stone bedstead, in *Sung shu, ibid.* p. 8*a*; pillows, in *Sung Wu Ti pén chi, ibid. c.* 54, *Chü ch'u ch'i wu lei*, p. 3*a* (amber); *Chang Tu Hsüan shih chih, ibid.* p. 3*b*; *Ch'ün shu k'ao so, ibid.* p. 3*b* (jade); *Shao Shih Wén chien lu, ibid.* p. 3*b* (crystal); *Chiao Shih Lei lin, ibid.* p. 5*a* (deer-horn); *Fan Tsu Yü chi, ibid.* p. 6*a* (wood); carpet, in *I Fêng T'ang Man shu, ibid.* p. 15*b*; bamboo mats, in *Pi chu, ibid.* p. 15*b*; and bamboo basket in *Shan t'ang ssŭ k'ao, ibid.* p. 16*a*.]

"The concubine of T'ai Tsu offered to Shih Tsu a spoon and chopsticks of engraved gold, as well as a soup tureen and soup ladle. But the emperor bestowed them on Shên Ch'ing-chih, saying: 'Your labour and diligence were not small, and you should equally enjoy the use of these articles.'"—*Sung shu, Shih lei t'ung pien, c.* 73, *Ch'i yung pu*, p. 18*b*.

"Sun Han-yang, following an ancient pattern, cut a *san ya* (三雅) cup out of purple sandalwood, with seal characters of the Han dynasty inlaid in silver wire."—*T'ai p'ing ch'ing hua, ibid.* p. 20*a*.

"Têng Ching of Hui Chi had a *tzŭ hsia* (紫霞) 'purple cloud,' cup, the method of making which had been handed down from the reign Hsüan Ho (A.D. 1119). The emperor Hui Tsung had given it the name *t'ai i* (太乙), 'Great Monad,' Cup."—*Pai shih lei pien, ibid.* p. 21*a*.

"The prime minister Chao Hsiung went to Court to present a memorial, when the Emperor invited him to drink, and ordered his attendant eunuch to serve wine in the *yü hai* (玉海) [a cup made of jade] (a gift presented by Shih Chung-hui), which could hold three pints."—*Sung shih, ibid.* p. 22*a*.

"The *kuang* (觥) [made of rhinoceros horn] was a large cup (杯 *pei*) and more capacious than the *chüeh* (爵). It was used for drinking wine forfeits, but was not an implement confined to this use alone."—*Shih wu yüan shih, Ko chih ching yüan, c.* 51, *Jih yung ch'i wu lei*, p. 14*a*.

"The *shang* (觴), goblet, was like a *chüeh* (爵), but had only two legs."—*Shih wu yüan shih, ibid.* p. 14*a*.

"'Drink a *yü shang* (羽觴) of wine to dispel sadness.' Mêng K'ang's Commentary explains: 'The *yü shang* was a *chüeh* (爵) made in the shape of the live bird with a head, tail, feathers, and wings.' Others said: '[It was] a cup adorned with feathers, and easily brought on intoxication.'"—*Pan chieh hao fu, ibid.* p. 14*a*.

"A basin of white metal resembling silver" is mentioned in *Sung shih, Shih lei t'ung pien, c.* 74, *Ch'i yung pu*, p. 8*b*.

[Hairpins are referred to in *Yen fan lu, Ko chih ching yüan, c.* 55, *Hsiang lien ch'i wu lei*, p. 4*a*; *P'ei Yüan Kuang chou chi, ibid.* p. 4*b*; *Hua yang kuo chih, ibid.* p. 4*b*; handkerchiefs, in *Liu shu ku, ibid.* p. 18*a*; mirrors, in *Sung shih, ibid. c.* 56, *Hsiang lien ch'i wu lei*, p. 6*b*; *T'ai p'ing ch'ing hua, ibid.* p. 6*b*; *Méng chi pi t'an, ibid.* p. 6*b*; *T'an Tzŭ-hua shu, ibid.* p. 7*a* (enlarging, diminishing, natural size, and inverting); *T'an yüan, ibid.* p. 8*a*; mirror-stands, in *Sung Yüan chia ch'i chü chu, ibid.* p. 12*b*; *Huang lan, ibid.* p. 12*b*; fans (now made mostly of paper), in *Ch'i wu tsung lun, ibid. c.* 58, *Yen shang ch'i wu lei*, p. 10*b*; *Hsiao hsia lu, ibid.* p. 11*a* (white jade and scented amber); *Sung ch'ao hui yao, ibid.* p. 14*a* ("vermilion round fan," *i.e.*, the "long-handled fan" of the Han dynasty); fly-brush, in *T'an yüan, ibid.* p. 25*a*; incense-urns, in *Shih wu yüan shih, ibid.* p. 2*a* ("magpie-tail incense-urn," *i.e.*, "long handled incense-urn" of later times); *Yen fan lu, ibid.* p. 2*b*; *Chên wan k'ao, ibid.* p. 2*b*; and rosaries in *Yüan Fêng Chiu yü chih, ibid.* p. 10*a*.]

Writing Implements.—[Pens (writing-brushes) are mentioned in *Sung shih Ch'in-kuo K'ang I'chang kung chu chuan, P'ei wên yün fu, c.* 93, *Ssŭ chih yün* (pen with jade shaft); *Shih shuo, Kuang shih lei fu, c.* 16, p. 5*a* (plant-stalk used as pen).]

"Betel-nut paper was like bark, but thinner. It was bright and smooth and bright green in colour. In the time of the Sung dynasty it was offered as tribute for use in writing memorials [to the Throne]."—*Hui yüan hsiang chu, Yün fu shih i, c.* 31, *Ssŭ chih yün, Chih tzŭ pu.*

"Lin Ch'uan paper was made of cloth-ends, cloth which remained on the loom, or warp-thread not suitable for woof-thread. It was called 'cloth-ends paper' and was the most famous paper in the Empire."—*Tung p'o chih, Shih lei t'ung pien, Wên hsüeh pu*, p. 27*b*.

[Ink made from lamp-black mixed with musk is mentioned in *Hsi ching tsa chi, K'ang Hsi tzŭ tien, c.* 5, *Ch'ou chi chung*, p. 36*b*; of pine-soot, in *Mo chi, Yün fu shih i, c.* 90, *Shih sun chih yün, Mo tzŭ pu*, p. 198*a*; of gold and cinnabar, in *Tung p'o Ch'ou ch'ih pi chi, Shih lei t'ung pien, c.* 12, *Wén hsüeh pu*, p. 29*b*; inkstones, in *Yang chên wai chi, Ko chih ching yüan, c.* 38, *Wén chü pu êrh*, p. 9*a*; *Sung shih, Shih lei t'ung pien, c.* 20, *Wén hsüeh pu*, p. 26*a* (gold); *Sung Kao Tsung Han mo chih, Ko chih ching yüan, c.* 38, *Wén chü pu êrh*, p. 16*a* (resembling amethyst, from Tuan Hsi [modern Tê Ch'ing], Kuang Tung); *Yü t'ang lu, ibid.* p. 20*a* (jade); *Wén fang ssŭ p'u, Kuang shih lei fu, c.* 15, *Tsa wu pu*, p. 7*a* (round and raised in centre); and calculating-cords in *Hsiao êrh ya, Ko chih ching yüan, c.* 49, *Jih yung ch'i wu lei*, p. 8*a*.]

Carriages, etc.—[The sitting carriage (進賢 *chin hsien*, *i.e.*, the 安車 *an ch'ê* of ancient times) is mentioned in *Sung ch'ao hui yao, ibid. c.* 29, *Chou chü lei*, p. 18*b*; the "far-seeing" carriage, *i.e.*, the "look-out" carriage of ancient times, then drawn by an ox, now by 4 horses, in *Sung ch'ao hui yao, ibid.* p. 21*b*; the "virtue-reverencing" carriage (崇德車 *ch'ung tê ch'ê*, *i.e.*, the "evil-shunning" carriage, 辟惡車 *pi o ch'ê*, of the Ch'in), in *Sung ch'ao hui yao, ibid.* p. 17*b*; "yellow halberd carriage" (黃鉞車 *huang yüeh ch'ê*—from Han times), in *Sung ch'ao hui yao, ibid.* p. 17*b*; Emperor's carriage with purple cover, in *Shan t'ang ssŭ k'ao, ibid.* p. 7*b*; *Ch'ün shu k'ao so, ibid.* p. 9*a*; storeyed drum-carriage (see PER. OF DISR.), in *Shan t'ang ssŭ k'ao, ibid.* p. 25*a*; mourning-carriage, in *Tz'ŭ lin hai ts'o, ibid.* p. 28*b*; hearse, in *Lung Shih-Hêng shih chu, ibid.* p. 28*b*; bridle and head-gear, in *Shan t'ang ssŭ k'ao, ibid.* p. 36*a*; saddles, in *Chieh ch'êng yü, ibid.* p. 37*a*; stirrups (inlaid with silver), in *Sung chih, ibid.* p. 38*b*; wooden saddle with leather cushion, in *Ch'ang pien, ibid.* p. 37*b*; *Wu hsing chih, ibid.* p. 38*a*; saddle-cushion stuffed with feathers, in *Shih wu kan chu, ibid.* p. 38*a*; whip, in *T'ai p'ing kuang chi, ibid.* p. 39*a*; and mud-guard in *Shih shuo, ibid.* p. 38*a*.]

Boats, etc.—[Boats of various kinds are mentioned in *Yeh lung liao chih, Ko chih ching yüan, c.* 28, *Chou chü lei*, p. 4*b* ("shuttle-boat," 梭船 *so ch'uan*); *Pai pien, ibid.* p. 9*a* (junks of 10,000 *huo*); *Pu ta t'ung pei wo chi, ibid.* p. 11*a* ("sword-fish boats"); *Sung shih, ibid.* p. 11*a* (with 4 paddle-wheels); *Chiao chou chi, ibid.* p. 11*b* (copper); and sails in *Kuang ya, ibid.* p. 14*b*.]

Agricultural and Spinning Implements.—"In the 5th year of the reign Shun Hua, Wu Yün-ch'êng offered a 蹈犂 *t'a li*, 'treading plough,' which did not require an ox, but was turned by human power. This was an imitation of the method of Chao Kuo, who had instructed the people to use the plough by dragging it."—*Sung shih, ibid. c.* 48, *Kêng chih ch'i wu lei*, p. 2*a*.

"The *ts'ung* (摠 or 稷) was a pointed carrying stick (or pole)."—*Chi yün, ibid.* p. 9*b*.

"The carrying-pole (擔 *tan*) was an instrument used for carrying grain; its length was 5 feet 5 inches. When the wood was shaved off so as to make it oval, it was called a *juan* (輭), 'pliant' carrying-pole; when it was cut round, it was called a *ts'ung* (摠), 'pointed' carrying-pole. The former was suitable for carrying [heavy] utensils and goods, the latter for carrying fuel and grain. After the crops had been collected, it was a

convenient instrument to use for collecting the aftermath of the harvest on ridges and in ditches for storage in granaries."—*Nung sang t'ung chüeh, ibid.* p. 9*b*.

"The *tun* (囤 or 圌), grain-bin, was an article for holding grain."—*Chi yün, ibid.* p. 10*a*.

"*Tun* (囤) was sometimes written *tun* (圌 or 䉼). In the North it was made of the stems of the *vitex incisa*, or of willow branches, or herbs and grasses (plaited), and was of circular shape; in the South it was made of split bamboos tied with grass or sometimes of bamboo matting. It was placed so as to form a hollow enclosure for holding grain. In the South the people commonly called it a *tun* (囤)."—*San ts'ai t'u hui, ibid.* p. 10*a*. *Cf.* previous Period.

"The *shan* (鏟) was a long sickle (鐮 *lien*), and the *p'o* 鑿 was a two-edged knife for cutting grass."—*Sung Ch'i Chi yün, Shih lei t'ung pien, c.* 17, *Jén shih pu*, p. 1*a*.

"The *hua* (鏵), spade, is an implement for tilling the ground."—*Sung Ch'i Chi yün, Ko chih ching yüan, c.* 48, *Kêng chih ch'i wu lei*, p. 6*a*.

"When the natives gathered cotton, they used an iron roller (鐵 挺 *t'ieh t'ing*) to crack out the kernels from the seeds."—*Shih Chao Shih wên, ibid.* p. 18*a*.

"[To make] the *chiao ch'ê* (攪 車), 'stirring-machine,' they used 4 wooden poles to make a square frame; on this 2 pillars were erected [each] about 1 foot 5 inches in height; on the pillars was a square piece of wood keeping them in place. Each upright pillar was pierced for an axle, to which was attached a turning handle, but at the other end of the axles the sockets did not pierce the pillars. Two men turned the axles, and one man fed [the machine] with the raw cotton. As the two axles turned [*lit.*, crushed] on each other the kernels of the seeds fell in and the cotton came out."—*San ts'ai t'u hui, ibid.* p. 18*a*.

"The *hsiao kung* (小 弓), 'small bow,' was made of bamboo, and was about 1 foot 4 or 5 inches long. A bowstring was set upon it in order to bow the cotton, and so render it even and fine. It [the cotton] was then rolled up to make a hollow cylinder, and brought to the machine to be spun."—*Shih wén, ibid.* p. 18*a*.

"At the present time the bow made for [bowing] raw cotton was 5 to 6 feet long, and had a string made of sheepgut. When it was sprung (or struck) its sound was like a clap of thunder in fine weather."—*Shêng An wai chi, ibid.* p. 18*a*.

"The *t'an kung* (弓 彈), bow, was made of bamboo and was about four feet in length. Its upper part was somewhat longer than the lower, shorter, and stronger part. It was strung with a [cowgut] cord covered with string, and was used for bowing raw cotton. The process was the same as [that used in] bowing wool for felt. It disclosed the hard parts and loosened the tight ones."—*Nung sang t'ung chüeh, ibid.* p. 18*a*.

"The people of Huai made the bamboo cylinder by rolling the stalks of the oleander or of millet, using [for that purpose] those which were long and smooth. At the present time the people of other places made it instead of jointless bamboo slips. The process was: first a piece of raw cotton was laid on a table, then the cylinder rolled over it so as to make the cotton into a hollow cylinder, at the same time drawing the *t'ing* out again. Spinning [in this way] from each cylinder it was easy to make [the silk thread] even and fine."—*San ts'ai t'u hui, ibid.* p. 18*a*.

"The *mu mien fang ch'ê* (木 棉 紡 車), 'cotton-spinning machine,' was made smaller than the *ma chu fang ch'ê* (麻 苧 紡 車), 'flax-spinning machine.' When the wheel moved and the string revolved, the cylinders [to the ends of which the thread was hooked] followed. The spinner held the cotton cylinder in his left hand and gradually drew out [the cotton] into long threads without breaking it."—*San ts'ai t'u hui, ibid.* p. 18*b*.

Fishing Implements.—"The *ch'üan* (筌), 'bamboo trap,' was a fishing trap made of bamboo. The mouth had inverted [twigs of bamboo like] whiskers which allowed the fish to enter but not to come out."—*Yen fan lu, ibid.* p. 22*b*.

"The *tuan* (簖), bamboo fence for catching fish, comes from *tuan* (斷), to impede. It was plaited of bamboo like a curved screen—as it made a curve in the water so as to impede the fish or crabs. On this account it was called *hsieh tuan* (蟹 簖), 'crab fence,' but it was not used only for catching crabs."—*San ts'ai t'u hui, ibid.* p. 22*b*.

"The fishermen of the present time shut off the reaches or rapids of a river or stream with a semi-circular bamboo screen called *tuan* (斷). But as in ponds, dykes, ditches, and streams [the fish] lived in the holes, marshy ground, or bogs [at the bottom], the natives of these places melted black metal [iron] into the shape of a hook, which was fitted at the end of a bamboo rod and used for catching [the fish]. At night they kindled a fire to make a reflection, [and the fish] immediately came out as soon as they saw it."—*Fu Kung Hsieh p'u, ibid.* p. 22*b*.

KIN.

[A boat made without glue, with the ends fastened with bent iron, is mentioned in *Chin shih, ibid. c.* 28, *Chou chü lei*, p. 9*b*.]

Mongol Period (1280 *to* 1368).—*Table VII.*

Household Utensils, Carriages, Boats, etc.—[Calabashes used for drinking purposes as well as for holding food were offered as tribute by the Ma Pa Êrh State [?Turkestan ?Maarbar]: see *Chieh ch'êng yü, Ko chih ching yüan, c.* 52, *Jih yung ch'i wu lei*, p. 23*b*; quilts are referred to in *Yüan shih yeh t'ing chi, ibid. c.* 54, *Chü ch'u ch'i wu lei*, p. 2*a*; *Ling piao lu, ibid.* p. 2*b*; *Chu Fu-chi Man ts'ung hsiao, ibid.* p. 2*b*; mats, in *Yüan shih yeh t'ing chi, ibid.* p. 10*a*; bracelets, in *Yüan shih yeh t'ing chi, ibid. c.* 55, *Hsiang lien ch'i wu lei*, p. 11*a*; mirrors, in *Liao Jung chung chiang hsing tsa lu, ibid. c.* 56, *Hsiang lien ch'i wu lei*, p. 6*a*; *Ch'iao mu hsien t'an, ibid.* p. 6*b*; sceptres, in *Yüan shih Yeh t'ing chu, ibid. c.* 58, *Yen shang ch'i wu lei*, p. 9*b*; jade staff, in *Ch'én Chi-ju T'ai p'ing ch'ing hua, ibid.* p. 19*b*; staffs, in *Ling piao lu i, ibid.* p. 20*a*; clepsydra, in *Tao Tsung-i Yüan shih yeh t'ing chi, ibid. c.* 1, *Kan hsiang lei*, p. 14*a*; imperial chariot with willow wheels, in *Yüan chih, ibid. c.* 29, *Chou chü lei*, p. 15*b*; dog-sleigh and "wooden horse," used for travelling over ice or snow, in *Yüan chih, ibid.* p. 29*b*; milk-cart, in *Shu wu i ming su, ibid.* p. 29*b*; and dragon boat (propelled by its scales and tail), in *Ch'üan hêng kêng shên wai shih, ibid. c.* 28, *Chou chü lei*, p. 9*b*.]

Writing Implements.—"Mr. Li of the Yüan dynasty had a piece of old paper more than two *chang* long, and very bright and smooth. It had descended to him through four generations. One day he requested Chao Wên-Min to write something on it, but Wên-Min did not presume to put his pen [to such fine paper]."—*Ni ku lu, ibid. c.* 37, *Wên chü lei*, p. 11*a*.

Agricultural Implements.—"The *ch'a* (叉), pitchfork, was an instrument for raking the cut grain. It was made of bent wood. Its full length was 5 feet; at the upper end two prongs were placed about 2 feet in length, one somewhat shorter than the other. In shape they were like curved horns, and were used for raking together the cut grain stalks." "Another, whose handle was made of wood with two iron prongs at the end, was like a spear or halberd; being used for collecting grain in bundles it was called 'iron grain-fork' (鐵 禾 叉 *t'ieh ho ch'a*)."—*San ts'ai t'u hui, ibid. c.* 48, *Kêng chih ch'i wu lei*, p. 9*b*.

Sericultural Implements.—"The silkworm-frame (蠶 架 *ts'an chia*) was an implement for placing silkworm baskets on in tiers. It was built up of four small logs; its height was about 8 or 9 feet, with cross beams throughout so as to form ten storeys, on each of which were placed the silkworm trays or baskets, according to size. For the basket a small shelf would be used; for the tray a large one. The people of the South used the frame for resting the silkworm trays and baskets on, just as those of the North used a stand on which to rest the cross pieces of wood supporting the silkworm-frame."—*San ts'ai t'u hui, ibid.* p. 13*b*.

"The silkworm-net (蠶 網 *ts'an wang*) was an implement for moving silkworms. It was made of knotted cords, in the same way as a fishing-net, but in size was so constructed as to conform to the dimensions of the silkworm-tray. It was coated with varnish [-oil], and was both bright and tightly strung, not easily destructible. It was strung with cord, and very handy. In moving (or changing) silkworms, the net was first spread out and mulberry leaves strowed on it. When the silkworms smelt the odour of the leaves, they immediately passed on to the net and fed on them. When they had all come on to the net, the attendant, holding the net with both hands, placed them on another tray. Of course, the remainder (*i.e.*, those which did not crawl on to the net) had to be picked up. This method was much easier than removing them all by hand. It was generally used in the South, and in the North, where the silkworms were smaller, it was also found convenient to use it."—*San ts'ai t'u hui, ibid.* p. 11*a*.

"When the day of the Corn Ram (one of the 24 solar terms) came, stands were erected by using 4 poles, each higher than the pillar and beam. These stands were erected so as to correspond to the size of the rooms. The outside edge of the upright poles was serrated like the teeth of a saw, but longer. On each pole were hung loops made of cord plaited from the fibre of the mulberry tree. [In these] at the four corners rested two long beams or sticks (placed crosswise), on which a silkworm-tray made of reeds was placed horizontally. The ends of the cross-sticks were fastened [to the loops] by means of cords. Each stand contained ten of these, the distance between each being 9 inches—in which space the trays [rested]. When it was desired to remove or feed them, [the trays] could be shifted up or down [as required]."—*Wu pén chih yen, ibid.* p. 14*a*.

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

Furniture, Household Utensils, etc.—[Seats of different kinds are mentioned—the folding chair (used in travelling) in *Shih wu kan chu, Ko chih ching yüan, c.* 53, *Chü ch'u ch'i wu lei*, p. 5*a*; small seat or stool (杌 *wu*), in *Shih wu kan chu, ibid.* p. 5*b*; three-legged wooden seat, in *Lei ch'ing jih cha, ibid.* p. 5*b*; a "vitreous" bedstead is referred to in *Shih wu kan chu, ibid.* p. 7*a*; *mêng yu* (夢 友), "dream-friend," couch, in *Shih wu kan chu, ibid.* p. 9*b*; *t'a* (榻), couch (which was 4 feet 6 inches long and 9 inches high, with woodwork on 3 sides), in *Ch'i chü ch'i fu chien, ibid.* p. 9*b*; door-screen, in *Ch'i wu ts'ung t'an, ibid.* p. 9*b*; folding-screen (introduced from Japan), in *Ch'i hsiu lei kao, ibid.* p. 12*b*; *i* (扆), screen 8 feet high and 8 feet long (sometimes used in audience chamber), in *San li t'u, ibid.* p. 13*a*; pillows, quilts, curtains, etc., in *Shan t'ang ssŭ k'ao, ibid.* p. 13*b*; *Shih wu kan chu, ibid.* p. 22*b*; *Ch'én Chi-ju Ch'ün sui lu, ibid. c.* 54, *Chü ch'u ch'i wu lei*, p. 1*a*; *Yang Chên wai chi, ibid.* p. 4*a*; *I yüan, ibid.* p. 4*a*; *Shih wu kan chu, ibid.* p. 6*a*; *Ming huang tsa lu, ibid. c.* 55, *Hsiang lien ch'i wu lei*, p. 11*a*.]

"Ch'iu Ch'ang-ch'un had a cup made of walnut."—*Ni ku lu, Shih lei t'ung pien, c.* 73, *Ch'i yung pu*, p. 20*b*.

"Kuo Chi-chou had a *chan ching* (占 景), 'usurping the view,' plate, in the copper bottom of which were several tens of small tubes, which if periodically filled with water caused flowers stuck in them to keep fresh for ten days."—*Ch'ien ch'üeh lei shu, ibid. c.* 74, *Ch'i yung pu*, p. 5*b*.

[Basins, dishes, jars, vases, etc., are referred to in *Chieh an man pi, Ko chih ching yüan, c.* 52, *Jih yung ch'i wu lei*, p. 16*a*; *Hui yüan hsiang chu, ibid.* p. 16*b*; *Shih wu kan chu, ibid.* p. 17*b*; *Shih wu kan chu, ibid.* p. 19*b* (領 *ling*, amphora with perforated ears for cord); *Ming t'ung chi, Shih lei t'ung pien, c.* 74, *Ch'i yung pu*, p. 13*a*; lanterns, in *Hu Ying-lin Chia i shêng yen, Ko chih ching yüan, c.* 50, *Jih yung ch'i wu lei*, p. 11*b*; *Shih wu kan chu, ibid.* p. 12*a* (gauze-lined); lamp-stands, in *Pai shih lei pien, ibid.* p. 14*b*; *Shih wu kan chu, ibid.* p. 14*b*; candles and torches, in *Pai shih lei pien, ibid.* p. 15*b*; oil of different kinds, in *Shih wu kan chu, ibid.* p. 19*b*; p. 20*a*; *Wang shih-mou Min pu su, ibid.* p. 20*a*; *Shêng an wai chi, ibid.* p. 21*a*; *Yang k'o man pi, ibid.* p. 21*a*; *Shih wu kan chu, ibid.* p. 21*a*; *T'u ching, ibid.* p. 21*b*; and charcoal in *Shêng An wai chi, ibid.* p. 29*a*.]

"In China there was originally no folding fan (摺 扇 *chê shan*), but mention of it occurs in the Chien Chi (聞 記) of Wang Chiu (王 秋). In the beginning of the Yüan dynasty the Commissioner of the South East Barbarians used a *chü t'ou* (聚 頭), fan; at that time people laughed at him. In the beginning of the reign Yung Lo [1403–25] of the present dynasty they first used it; but it was only borne by servants, runners, and people of the lower classes, as it was very convenient when serving another. When the Wo country (Japan) offered them as tribute T'ai Tsung distributed them to all his ministers. Further, the Imperial Works Office had to supply them for bestowing as rewards or presenting as gifts. Then the whole Empire used them and round fans were discarded."—*Chang Tung Lai chi, ibid. c.* 58, *Yen shang ch'i wu lei*, p. 15*b*.

"The folding fan is said by one authority (the *Ch'ien-ch'o-lei-shu*, an encyclopædia published in 1632) not to be a Chinese invention at all, but to have been introduced into China by the Coreans, who sent a quantity of them to the Emperor Yung Lo of the Ming dynasty, amongst the other articles offered as tribute by the Vassal State. The Emperor is further stated to have been so pleased with the novelty that orders were issued for their imitation by Chinese workmen."—*Giles, Historic China*, p. 311.

"It was not till the fifteenth century the folding-fan, long before invented by the Japanese, found its way into China."—*Little* (*Mrs. A.*), *Int. Ch.*, p. 441.

["Double-dragon fans" are mentioned in *Shih wu kan chu, Ko chih ching yüan, c.* 58, *Yen shang ch'i wu lei*, p. 14*b*.]

[Spectacles are mentioned in *Shu wu i ming su, ibid.* p. 22*b*; rouge, in *Shêng An wai chi, ibid. c.* 55, *Hsiang lien ch'i wu lei*, p. 13*a*; *Wu tsa tsu, ibid.* p. 13*b*; incense-dishes and urns, in *Shih wu kan chu, ibid. c.* 58, *Yen shang ch'i wu lei*, p. 3*b*; *Po wu yao lan, ibid.* p. 3*b*; *Ni ku lu, ibid.* p. 5*a*; canes and staffs, in *Shuo wên, ibid.* p. 16*a*; *Shih wu kan chu, ibid.* p. 17*a*; ships, in *Pai pien, ibid. c.* 28, *Chou chü lei*, p. 2*a*; *Shih wu kan chu, ibid.* p. 5*a*; and "skin-boats" in *Chêng tzŭ t'ung, ibid.* p. 13*a*.]

Writing Implements.—[Pens are referred to in *Wang Yu Wên fang lun, ibid. c.* 37, *Wên chü lei*, p. 3 (hogshair); and inkstones in *Wang Yu Yen chi, ibid. c.* 38, *Wén chü pu êrh*, p. 9*b*.]

"The Minister Fan had preserved [as a curio] a slab of ink on the front of which was written: 'Manufactured by the Wu Chien T'ang'; and on the back: 'The best soot of T'ien Kuan.'"—*Ch'ên Chi-ju Pi chi, ibid. c.* 37, *Wên chü lei*, p. 24*a*.

Agricultural, Spinning, etc., Implements.—"The *yu* (耘) was a field implement. After the seed had been sown it was used for scratching and filling up the irregular parts of the ground so as to cover the seed. At the present time, in the north, after the seed is sown, they use a *po* (薄 = 箔), a kind of mat plaited of willow branches or twigs; a man stands on it whilst it is drawn by an ox, so as to make the soil cover [the seed] evenly. This is a kind of *yu*."—*Shu wu i ming su, ibid. c.* 48, *Kêng chih ch'i wu lei*, p. 11*a*.

"The *tsu* (簇), frame of straws on which silkworms spin, was made of rice-straws. These were peeled before being used, since if they were not clean the silkworms would not spin their cocoons, and they had moreover to be closely tied together [in bundles]. The peelings from the straws served both to keep off the dampness of the ground and also to catch the silkworms if they fell. It was not advisable to use aquatic plants [for this purpose], as it caused the thread to become tangled and the cocoon to be poorer."—*Huang Shêng-tsêng Tsan ching, ibid.* p. 13*a*.

"The *ts'an po* (蠶 箔) [circular] silkworm mat [without edge], was an implement for receiving the silkworms. Sericulturists in the north often used the background of farm houses or places in gardens to plant rushes and reeds as material for making these mats. At the end of the autumn they were reaped, gathered up, and woven together. The area of the mat was 4 feet; it was placed upon two beams which rested on stands. When the silkworms were taken out to be separated, or when the frame was taken away, the mat could easily be opened out or rolled up [as desired]."—*Nung sang t'ung chüeh, ibid.* p. 13*a*.

"The *ch'ien t'ing* (牽 綎) was a treading machine for the loom, and the *nieh* (蘗) was the under part of a loom which was trod (or worked) by the feet. It was of the same class of implement as the *ch'ien t'ing*."—*Shu wu i ming su, ibid.* p. 19*a*.

"The *chu* (杼), shuttle, was an implement for holding the thread of the woof, and the *chu* (柚), warp cylinder, was an instrument for receiving the thread of the warp."—*Shan t'ang ssŭ k'ao, ibid.* p. 19*a*.

"The *so* (梭), shuttle, was a weaving implement used for passing the thread of the woof."—*T'ung su wên, ibid.* p. 19*a*.

Fishing Implements.—"The *Chronicles of the Elders of Hsiang Yang* says: 'In the Han river there were many fine bream, which it had always been forbidden [the public] to catch. So a fence (for this reason called "bream fence") was put to bank up the water.' The explanation says: 'The fence used to stop the water' is the same as what in Lu Kuei-mêng's *History* is called *wei hsiao*, which was set up in flowing water to intercept [the fish]. Its name was taken from the kind of fence used to catch crabs."—*Shu wu i ming su, ibid.* p. 23*b*.

"The *yü* (籞) of a pond was a plaited fence of bamboo which was set up in a pond and used for rearing fish."—*Shan t'ang ssŭ k'ao, ibid.* p. 23*b*.

"The *mêng sou* (艋 艘) was a basket plaited of small bamboos; the cover of its mouth was woven of bamboo splints; there were hairy or bristling bamboos fixed to it, and it gradually decreased in size from the mouth of the basket down to [the junction with] the hairy bamboos, so preventing the fish from going out after they had got in."—*Shan t'ang ssŭ k'ao, ibid.* p. 23*b*.

"The *mang chou* (芒 帚) was in shape like a sieve. When the water became cold the fish hid themselves in it. It was used for fishing."—*Ibid.* p. 23*b*.

"The *ch'u kuo* (楚 簻), twig basket, was a kind of bamboo basket without a bottom used for catching fish."—*Su wu i ming shu, ibid.* p. 21*b*.

"The *chao* (罩) was made of bamboo plaited into a large basket which had neither top nor bottom. It was used to enclose water so as to catch the fish."—*San ts'ai t'u hui, ibid.* p. 21*b*.

"The *chao* (罩) was an inverted *ts'êng* (罾). When the fish swam into it it was hauled up. The advantages and disadvantages of the two implements were about the same."—*Huai-nan Tzŭ, ibid.* p. 21*b*.

"The *ko kai* (or *hai*) (鴿 揩) was the net commonly called *kai tou* (揩 兜), *lit.*, 'striking-bag.' It was an implement for taking up fish out of a large net. [The *kai tou* was brought down with force on to the large net near the fish, which was thus made to rebound into it.] The larger ones could also be used for catching birds."—*Shu wu i ming su, ibid.* p. 20*b*.

"The glutinous rod (黐 竿 *ch'ih kan*) was an implement used for catching birds; and the *p'an* (矰) was an arrow used for shooting them."—*Shih wu kan chu, ibid.* p. 24*a*.

Manchu Period (1644 *to* —).—*Table IX.*

Furniture, Household Utensils, etc.—"The best furniture is made of a heavy wood stained to resemble ebony; camphor, elm, pine, aspen, and melia woods furnish cheaper material. Ornamental articles, porcelain vases, copper tripods or pots, stone screens, book shelves, flowers in pots, etc., show the national taste. Ink sketches of landscapes, gay scrolls inscribed with sentences suspended from the walls, and pretty lanterns relieve the baldness of the room; their combined effect is not destitute of variety and elegance, though there is a lack of *comfort*. Partitions are sometimes fancifully made of lattice work, with openings neatly arranged for the reception of boxes containing books. . . . A massive bedstead of costly woods, elaborately carved, and supporting a tester for the silk curtains and mosquito-bars, is often shown as the family pride and heirloom; a scroll of fine writing adorns its fringe or valance. Mattresses or feather beds are not used, and the pillow is a hollow square frame of rattan or bamboo. The bed, wardrobe and toilet usually complete the furniture of the sleeping apartments of the Chinese; but if this is also the sitting-room, the bed is rolled up so as often to furnish seats on its boards."—*Williams, Midd. King.*, i. 734.

"There is no commoner object in any house in China . . . than the feather-brush. . . . It was made generally of actual feathers, and this kind was, and is now, used for dusting furniture. Other sorts, however, were made of horsehair."—*Balfour, Leaves*, pp. 164–5.

"Just as the dragon is the symbol of power and the national emblem of the Chinese people, so is the fan the characteristic accompaniment to the everyday life of the ordinary Chinaman. . . . A fan of some sort or other is part and parcel of every man's summer equipment."—*Fraser's Magazine*, N.S. xix. 548. For descriptions of the various kinds of fans, see pp. 549–53.

"Almost every large city of China, and certainly every important division of the Empire, has its own characteristic fan; or else there is something peculiar in the make, colour or ornamentation of the common 'folding' fan as seen in that particular district by which it may be distinguished from its ubiquitous congener."—*Giles, Historic China*, pp. 297–8.

"The *Autobiographic Recollections of George Pryme, M.A.*, contains the following paragraph: 'The early umbrellas were very clumsy. They were made of oiled cloth, and were very flat, being carried by a ring fastened to the top, so that the handle often got dirty.' Chinese umbrellas exactly answer to this description as made in Hupeh and Hunan. From motives of cheapness the brass ring is often omitted, but the Chinaman invariably carries his umbrella by the top, whereas the foreigner handles his highly-wrought means of defence against the rain as if it were a dirk. The Chinese article, made of oiled or varnished paper instead of cloth which was formerly used, is a very useful article and very cheap. An umbrella can be purchased in Hankow for eighty cash, but two hundred or three hundred cash may be expended in order to secure the brass ring. Fast young Chinamen, especially military cadets, may be seen with umbrellas made upon a foreign model with red oiled cloth, which throws an excellent tint upon the faces of these swells. It is the handiness of the material furnished by the light and strong bamboo, of which the Chinese umbrella is almost entirely made, which enables almost every Chinaman, woman and child to carry something in the way of a parapluie."—*Cycle*, 1st Series, p. 257.

"The large umbrella of Chinese officials is called 羅傘, *lo-san*, or 日照, *jih-cháu*, and is of a red colour for all mandarins but those below the sixth rank, who have to be content with a blue ensign. The 遮陽, *ché-yang*, is a large leaf-shaped shade carried before officers and idols. The 萬民傘, *wan-min-san*, is a presentation umbrella, covered all over its deep red fringes with the names of the donors in gold letters. They are given to worthy officers, but are very often raised, like testimonials at home, by a few busy persons rather than by a 'myriad people,' as the Chinese word means literally. . . . It is likely enough that the broad-brimmed rain-hats of Chinese coolies, called 笠傘, *lih-san*, gave rise to the idea of the umbrella, which is made of much the same materials, paper being substituted for the leaves of the reeds of the Yangtsze or other rivers, with which the rain-hats are commonly lined. The number of ribs was formerly much less than at present."—*Ibid.* p. 257.

"The Chinese put their umbrella into a bag, and sling it under the arm and over the back. It is a very common sight to see a Chinese soldier armed with only this weapon of defence against the dreaded weather!"—*Ibid.* p. 257.

"Small umbrellas answering to parasols are made to carry in the large sleeve of the Chinese robe or jacket. These are called 繡傘, *siú-san*."—*Ibid.* p. 257.

"Its [Shantung] manufactures supply the common clothing and utensils of its people: silk fabrics, strawbraid woven from a kind of wheat, glass, cheap earthenware, and rugs of every pattern."—*Williams, Midd. King.*, i. 93.

[Wei-hai-wei and Chefoo in 1837] . . . "neither table, chair, nor floor, nor any article of furniture could be seen in the houses of the poorest."—*Ibid.* i. 93.

"The grass (*Phragmites*) raised along the river banks is carefully cut and dried, to be woven into floor-matting."—*Ibid.* i. 357.

[The following is a list of implements and tools received at the Sheffield Public Museum from H.M. Consul at Canton in 1890:—Tailor's scissors, stevedore's knife, medicine knife, paper knife, bookbinder's knife, deerhorn knife, pocket knife, peel cutter, fancy paper knife, opium knife, scaffolding knife, razor, shoemaker's knife, pork butcher's knife, melon knife, paper-cutter, slicer, firewood chopper, chopper, bamboo knife, knife sharpener, plane, chisels, feather extractor, fruit knife, medicine knife, ear cleaner, cinnamon cutter, silver shears, betel-nut slice, scissors, pincers, cooper's knife, hand-saw, hair extractor, melon slice, corn knife, knife for cutting skins, scissors for lamps, silver chisel, ivory scraper, grass-cutting knife, file, nail-extractor, axe hammer, cocoanut knife, leather-cutting knife, pitchfork, spade, hoe, pestle and mortar, drill.]

Writing Implements.—"The articles used in writing, collectively called *wan fang sz' pao*, or 'four precious things of the library,' are the pencil, ink, paper, and ink stone. . . . The ink, usually known as India ink, is made from the soot of burning oil, pine, fir, and other substances, mixed with glue or isinglass, and scented. It is formed into oblong cakes or cylinders, inscribed with the maker's name, the best kinds being put up in a very tasteful manner."—*Williams, Midd. King.*, i. 599.

Carriages.—"Of the wood (Eu-mu) for making carts, the best kind comes from Cho-chow, 140 *li* from Peking; the k'wuy-moo is used for making spokes of cart-wheels, and chiefly comes from Tai-yuen-foo, 1,600 *li* from Peking. The iron tires round the wheels are made of iron from Shanse, 900 *li* south of Tai-yuen-foo. The best kind of iron from Loh-yu-foo sells for fully 12 taels per 100 catties in Peking . . . 12 taels worth of silver is used in inlaying the iron with silver on a good Peking cart. The prices of good carts vary from 50 to 200 taels each; the best kind being lined with satin. . . . Regarding the Chao-tze or chairs . . . a green cloth chair complete—with satin pillows, cushions, etc., a small looking-glass inside, a small *tau-tze* for brushing away the dust from the boots, a small vase for flowers, and some iron inlaid with silver on the corners around the edges of the chair and the ends of the poles on which the chair is borne—costs 200 taels."—*N. and Q. on C. and J.*, ii. 38.

"The harness of draught horses is very similar to that which is used in Great Britain. The curb-chain, however, which consists of cord, is placed, not under the chin, but between the upper lip and the nose. The harness of the horses or mules employed to draw the carts of members of the Imperial Family is covered with yellow cloth; and that of the gentry is sometimes mounted with silver rings and buckles. When wealthy families are in mourning, the harness of the horses and mules is invariably covered with white cloth."—*Gray, China*, ii. 178.

Boats, etc.—"Every river in China has its own peculiar class of boat, and . . . the junks frequenting any one seaport differ in marked characteristics from those of all other places. In method of rigging alone does an approach to uniformity prevail."—*N. and Q. on C. and J.*, i. 170.

"It is unnecessary to particularize the various sorts of lighters or *chop-boats* found along the southern coast—the passenger boats plying from town to town along the hundreds of streams, and the smacks, revenue cutters, and fishing craft to be seen in all waters except to call attention to their remarkable adaptation for the ends in view. The best sorts are made in the southern provinces; those seen at Tientsin or Niuchwang suffer by comparison for cleanliness, safety, and speed, owing partly to the high price of wood and the less use made of them for dwellings. On the head waters of the river Kan the boats are of a peculiarly light construction, with upper works entirely of matting, and the hull like a crescent, well fitted to encounter the rapids and rocks which beset their course."—*Williams, Midd. King.*, i. 751–2.

[The vessels to be seen on the Canton River comprise 7 kinds of sea-going craft; of river craft, 9 kinds of passenger boats, and 5 kinds of cargo boats, 3 kinds of government vessels, 4 kinds of small river boats, and 6 kinds of miscellaneous craft.]—*N. and Q. on C. and J.*, i. 170–3.

On the Pearl River, "caravel junks, in which Columbus might have sailed; 'slipper-boats' and 'snake-boats,' 'dug-outs' and 'duck-boats,' 'flower-boats' and 'salt-boats,' 'mud-boats' and 'silk-boats,' 'sampans,' 'stern-wheelers,' and rafts—each kind easily distinguishable by its special build."—*Michie, Hors D'œuvre*, p. 77.

"Besides the various kinds, the revenue service employs a narrow, sharp-built boat, propelled by forty or fifty rowers, armed with swivels, spears, boarding-hooks, and pikes, and lined on the sides with a menacing array of rattan shields painted with tigers' heads. Smugglers have similarly made boats, and now and then imitate the government boats in their appearance, which, on their part, often compete with them in smuggling. In 1863 the imperial government was induced to adopt a national flag for all its own vessels, which will no doubt gradually extend to merchant craft. It is triangular in shape and has a dragon with the head looking upward. It is usual for naval officers to exhibit long yellow flags with their official titles at full length; the vessels under them are distinguished by various pennons. Junks carry a great assortment of flags, triangular and square, of white, red, and other colours, most of them bearing inscriptions. The number of governmental boats and war junks, and those used for transporting the revenue and salt, is proportionately very small; but if all the craft found on the rivers and coasts of China be included, their united tonnage perhaps equals that of all other nations put together."—*Williams, Midd. King.*, i. 752.

"Minute regulations exist in the Provincial statute-books with reference to the description of build, rigging, and dimensions of junks, but these, it is needless to say, are sedulously ignored in practice. The only vessels which are subject to any kind of Government control are the passage-boats, which receive licenses from the Prefect of Kwang-chow-fu at Canton on payment of a moderate annual fee. Licenses to carry an armament should be issued by the sub-prefect of the Bogue."—*N. and Q. on C. and J.*, i. 170.

"At Canton and the neighbouring boat-building places, the wood of the China pine is the staple of construction, hardwood such as teak, lychee, etc., being sparingly used for exposed beams and knees and braces. The fastenings are invariably of iron, these being driven into the wood to a sufficient depth to allow a caulking of chunam (shell-lime cement) to interpose between the head of the bolt and the water-washed surface. Seams are also caulked with chunam. Masts are of pine, secured when necessary by stays of coir rope, and guards are usually formed of a single stout bamboo, to which the broad butterfly-wing sail is permanently attached. The sails are manufactured from broad strips of grass-matting, strengthened by transverse strips of bamboo from six to eight feet apart, and are instantaneously reefed or furled from on deck by lowering the yard to any requisite degree. A mat sail is presumed to last in wear about six months, and costs from 30 to 50 dollars according to size. A remarkable feature in Chinese junk architecture is the huge rudder, projecting far beyond the perpendicular of the stern, and perforated in order to move more easily against the pressure of the water, whilst when not in use it can be hoisted up in a manner similar to the screw of a steamer. Equally remarkable is the powerful scull which forms the universal means of propulsion for river-craft, and which works freely on an iron pin projecting upwards from the stern-board. Large cargo boats and other craft are propelled by two enormous sculls, working each over one of the quarters. In addition to the scull, Chinese river boats make use, according to circumstances, of oars, bamboo poles and tow-lines. The tow-line is usually a rope of twisted bamboo-shavings, and is made fast to the summit of the mast. The towpaths adjacent to the rivers and canals are kept in order by the villages, the lands adjacent to which they skirt. Six or eight sturdy boatmen will tow a heavily-laden barge for days consecutively. Chinese anchors are clumsy contrivances of wood, resembling in shape the Queen's 'broad arrow,' the flukes being rudely clamped to the shaft by a band of iron. Native hawsers are unwieldy cables of bamboo rope, which possess, however, the virtue of durability, in consequence of the silicious casing with which the bamboo is endowed. Where a mechanical contrivance for raising an anchor is necessary, the old-fashioned principle of the winch is usually seen in force; but the foreign capstan is gradually gaining ground in this respect."—*Ibid.* i. 170.

Most of the boats at Canton "are constructed of fir or pine and smeared with wood oil; the seams are caulked with rattan shavings and paid over with a cement of oil and gypsum. The sailing craft are usually flat-bottomed, sharp forward, and guided by an enormous rudder which can be hoisted through the open stern sheets when in shallow waters. The teak-wood anchors have iron-bound flukes, held by coir or bamboo hawsers—now often replaced by iron chain and grapnel."—*Williams, Midd. King.*, i. 752.

"The junks of to-day, unaltered as they are from designs dating centuries back, will compare favourably with the coasting craft of some Western countries now, and those in existence nearly three hundred years ago must have equalled in most respects and surpassed in many the barques, pinnaces and caravals which sailed under the successors of Magellan and Andrade."—*United Service*, ii. 382.

"The old picturesque junk, with its bulging hull, high stern, and great eyes on the bow, is rapidly disappearing before steamers. Its original model is said to be a huge sea monster; the teeth at the cutwater and top of the bow define its mouth, the long boards on each side of the bow form the armature of the head, the eyes being painted on them, the masts and sails are the fins, and the high stern is the tail frisking aloft. The cabins look more like niches in a sepulchre than the accommodation for a live passenger. The crew live upon deck most of the time, and are usually interested in the trade of the vessel or an adventure of their own. The hold is divided into water-tight compartments, a contrivance that has its advantages when the vessel strikes a rock, but prevents her carrying a cargo comparable to her size. The great number of passengers which have been stowed in these vessels entailed a frightful loss of life when they were wrecked."—*Williams, Midd. King.*, i. 753.

Agricultural Implements.—"The agricultural implements which are in use among the Chinese include the ordinary kinds, and are very simple. They consist of the plough, the harrow, the spade, the hoe, the flail, the reaping hook, the winnowing machine, and various appliances in connection with irrigation."—*Gray, China*, ii. 114.

One of the halls in the Temple of Agriculture at Peking "was used for the storage of the gilded and lacquered specimens of agricultural implements: the plough, the seed-drill, the harrow, the brush-harrow, the spade, the broom, the pitch-fork, and smaller utensils such as baskets and broad hats."—*N.-C. Herald*, Oct. 3, 1900, p. 725.

"Their agricultural utensils are few and simple, and are probably now made similar to those used centuries ago. The broad hoe is used in soft land more than any other tool; the weight of its large wooden blade, which is edged with iron, adds impetus to the blow Spades, rakes, and mattocks are employed in kitchen gardening, and the plough and harrow in rice cultivation. The plough is made of wood, except the iron-edged share, which lies flat and penetrates the soil about five inches. The whole implement is so simple and rude that one would think the inventor of it was a labourer, who, tired of the toil of spading, called the ox to his aid and tied his shovel to a rail; fastening the animal at one end and guiding the other, he was so pleased with the relief that he never thought of improving it much further than to sharpen the spade to a coulter and bend the rail to a beam and handle. The harrow is a heavy stick armed with a single row of stout wooden teeth, and furnished with a framework to guide it; or a triangular machine, with rows of iron teeth, on which the driver rides to sink it in the ooze."—*Williams, Midd. King.*, ii. 3.

"The utensils of the Chinese farmer are very few and simple," for the most part made of wood and very light. "The object of most of them is merely to direct manual labour and not to reduce it. The plough is without a coulter, and has only one handle. The share is made of iron, and attached to the handle by a withe of bamboo. . . . The form of the share is much like that of a spade. There are also other kinds; one is a light implement used in making furrows in the beds of gardens, and is drawn by hand; there is another employed in stirring up the soil in flooded fields, which is carried in nearly a vertical position, and drawn by a chain fastened near the share. To perform most of his operations in gardening or farming, the Chinese employs the hoe; and by practice he has learned to apply it to almost as many uses as there are separate instruments in other countries. . . . It is usually about a foot long and five or six inches broad, and trimmed with iron; for turning over the soil to mix with the manure, it is often divided into three or four prongs. The common harrow of the Chinese is similar to a large rake; it is drawn by buffaloes, who are directed by a man sitting over the teeth; there is also another one with several rows of teeth."—*Ch. Repos.*, iii. 126–7. See also *Davis, Chinese*, ii. 397–8.

"But the ploughs and hoes, the water-wheels and well-sweeps, the tools of artisans, mud huts, junks, carts, chairs, tables, chopsticks, etc., etc., which we still see in China, are doubtless approximately those of more than 2,000 years ago."—*Giles, Historic China*, p. 79.

[Flails similar to those in Western countries, fanning mills, cylindrical stones, trip-hammers, etc., were used in preparing grain.]—*Ch. Repos.*, iii. 127.

[For descriptions and illustrations of the plough, harrow, hoe, rake, bill-hook, flail, and water-wheel, see *ibid.* v. 485–94.]

Fishing, Fowling, and Hunting Implements.—Fish "are killed with the spear, caught with the hook, scraped up by the dredge, ensnared by traps, and captured by nets; they are decoyed to jump into boats by painted boards, and frightened into nets by noisy ones, taken out of the water by lifting nets and dived for by birds—for the cormorant seizes what his owner could not easily reach. In short, every possible way of catching . . . fish is practised in one part of the country or another."—*Williams, Midd. King.*, i. 779–80. See also *Gray, China*, ii. 293–301.

[Animals were shot with arrows, sometimes with muskets, killed with pikes, or with bamboo poles, caught with nets, or trapped in various ways. See *Davis, Chinese*, i. 340; *Gray, China*, i. 396; *Henry, Ling Nam*, p. 416; etc., and *cf.* ARTS.]

[For implements used in punishment, see LAWS.]

WEAPONS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

Offensive.—[The invention of a large number of weapons is ascribed to the legendary kings and other prehistoric personages—especially to Ch'ih Yu, the enemy of Huang Ti. See *Ku shih k'ao, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 1*a* ; *Êrh i shih lu, ibid.* p. 1*a* ; *Tung ming chi, ibid.* p. 1*a* ; *Kuan Tzŭ, ibid.* p. 7*a* ; *c.* 41, *Wu pei lei*, p. 3*a* ; p. 1*a* ; *Shih i chi. ibid. c.* 42, p. 11*a* ; p. 25*b* ; *Shih wu chi yüan, ibid.* p. 19*a* ; *Êrh i shih lu ibid.* p. 20*b* ; *Pai shih lei pien, ibid.* p. 21*b* ; *c.* 41, p. 1*a* ; *Lü Shih Ch'un ch'iu, ibid.* p. 1*a* ; p. 23*a* ; *Wu yüan, ibid.* p. 1*b* ; *T'ai po yin ching, ibid.* p. 1*a* ; p. 2*a* ; p. 6*a* ; *Shan hai ching, ibid.* p. 6*a* ; p. 17*a* ; *Sun ch'ing tzŭ, ibid.* p. 6*b* ; *Ku shih k'ao, ibid.* p. 13*a* ; *Lung yü ho t'u, ibid.* p. 13*a* ; *Yüan pan ch'ien i chüeh, ibid.* p. 17*a* ; *Shih pen, ibid.* p. 2*a* ; p. 17*a* ; *Ch'un ch'iu yüan ming pao, ibid. c.* 42, p. 25*b* ; *Huang Ti nei chuan, ibid. c.* 41, p. 2*a* ; *Mo Tzŭ, ibid.* p. 6*b*, and *Wu yüan, ibid. c.* 42, p. 27*a*.]

"In Yü's time weapons were made of copper."—*Yüeh chi, ibid. c.* 41, *Wu pei lei*, p. 1*a*.

[Two-edged swords (made of copper) are mentioned in *Tao chien lu, ibid. c.* 42, *Wu pei lei*, p. 9*a* (3 feet 9 inches long) ; p. 11*a* ; and p. 11*b*.]

"The dagger was a kind of two-edged sword. When Wang Mang of the Han dynasty escaped from a conflagration into the *hsüan* chamber he held in his hand a dagger of the Emperor Yü—so that in Yao and Shun's time it had already been introduced."—*T'ung su wên, ibid.* p. 18*b*.

[Battle-axe, lances, shields, spears, are mentioned in the *Shu ching*, Pt. V. Bk. II. 1–4.]

[King Wu's battle-axe was ornamented with gold.]—*Legge, Ch. Class.*, III. ii. 300–1, note.

[The black *yüeh* (鉞), halberd, was used in the Hsia dynasty ; the white *ch'i* (戚), pole-axe, in the Shang.]—*Po ku t'u, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 19*b* ; see also LATER FEUDAL PERIOD.

"The *ch'i pi* (鏚 柲) was an axe-handle."—*Wu hou ching, ibid.* p. 19*b*.

"The *fu ts'o* (鈇 莝) was a cutting weapon ; the *yüeh* (鉞) was an axe with a long handle ; and the *huang* (黃), or yellow *yüeh*, was [a *yüeh*] ornamented with gold."—*Shuo yüan, ibid.* p. 19*b*.

"The gold axe (金 斧) *chin fu*) was [the same as] the *yellow yüeh* ; the iron axe (鐵 斧 *t'ieh fu*), as the *black yüeh* (玄 鉞 *hsüan yüeh*). These were commonly used in the time of the three dynasties [Hsia, Shang, and Chou] for cutting or killing."—*Chung hua ku chin chu, ibid.* p. 19*b*.

"The 'straight or right-cutting axe' (剈 正 斧 *p'i chêng fu*) was made by grinding chalcedony ; it was 2 feet odd long and its breadth half its length ; the markings all over it were clear and beautiful. It had been handed down from the Yin dynasty." The name meant that by it dishonest people would be punished or turned to right.—*Cho kêng lu, ibid.* p. 20*a*.

"There were three weapons of the nature of spears or lances, differing in the forms of their points . . . but principally distinguished by their lengths,—the 戈, the 戟 and the 矛. According to Wang Ts'ëaou, the handle of the 戈 was 6 feet 6 inches long ; that of the 戟 16 feet ; and of the 矛 21 feet, . . . The 干 or 'shield' was long and comparatively narrow, so as to cover most of the body."—*Legge, Ch. Class.*, III. ii. 302, note.

"In the Hsia dynasty the weapon called *chi* (戟) had already been invented. It was like a lance with two sharp-pointed prongs."—*Shih lu, ibid.* p. 21*b*.

"They [Huang Ti, Yao, and Shun] bent wood by means of string so as to form bows, and sharpened wood so as to make arrows. This gave the benefit of bows and arrows, and served to produce everywhere a feeling of awe."—*I ching*, App. III., Sect. II., ch. 2, 20, *Legge, Yî King*, p. 384 ; see also *I chi tz'ŭ, Ko chih ching yüan, c.* 41, *Wu pei lei*, p. 6*a*.

"Shun made the bow case (弓 袋 *kung tai*)."—*Wu yüan, ibid.* p. 12*a*.

"The cover for the bow was called *tu* (韣), *t'o* (櫜), *t'ao* (弢), or *chang chien* (弮 韔)."—*Ch'i wu tsung lun, ibid.* p. 12*a*.

"Shun made the *shu lu* (轐蔌 鹿) arrow-tube."—*Wu yüan, ibid.* p. 23*a*.

". . . the cross-bow especially being a favourite weapon either on the battle-field or in the chase."—*Giles, Historic China*, p. 4.

Defensive.—[Shields are mentioned in *Shan hai ching, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 25*b* ; *Ch'un ch'iu yüan ming pao, ibid.* p. 25*b*, etc.]

"The shield was a weapon of war appropriate to a war-dance."—*Legge, Ch. Class.*, III. i. 67, note.

[The coat of mail (甲 *ch'ia*), helmet (胄 *chou*), shield (干 *kan*), and spear (戈 *ko*), are mentioned in the *Shu ching*, Pt. IV. Bk. VIII. Pt. ii. 4.]

"In the three dynasties and down to the Ch'in and Han, troops chiefly used leather mail which was what was called *hsi sŭ* (犀 兕)."—*Yen fan lu, ibid.* p. 3*a*. See also *Êrh i shih lu, ibid.* p. 2*a*.

"The mail of Ch'üeh Kung was worn by [King] Wu when he conquered the Shang."—*Tso chuan, ibid.* p. 4*b*.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Offensive.—[Arms and instruments of iron are mentioned everywhere in the *Shih ching*.]

[Swords were of various kinds. Those of Chou Mu Wang were regarded as the best. The *ch'ih tao* (赤 刀), "red sword," is mentioned in *Po wu chih, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 3*b* ; the *ko tao* (剖 刀), "cutting sword," and *luan tao* (鸞 刀), "phœnix sword," in *Li ch'i, ibid.* p. 3*b* ; a "gem-cutting" sword (割 玉 刀 *ko yü tao*), which could cut a gem as easily as clay, offered as tribute by the Western Mongols, in *Shih chou chi, ibid.* p. 3*b* ; inlaid swords, in *Ku liang chuan, ibid.* p. 4*a* ; measurements and weights of the two-edged swords, in *Chou li, ibid.* p. 7*a* ; silk or grass tied round the hilt, in *Ming i k'ao, ibid.* p. 7*b* ; scabbards, in *Tz'ŭ lin hai ts'o, ibid.* p. 8*a* ; ornamented swords, in *Wu Yüeh ch'un ch'iu, ibid.* p. 9*a* ; *Hai lu sui, ibid.* p. 11*b* ; *Tao chien lu, ibid.* p. 11*b* ; various famous swords of ancient times, in *Hsün Tzŭ, ibid.* p. 11*b* ; *Wu Yüeh ch'un ch'iu, ibid.* p. 13*a* ; *Shih i chi, ibid.* p. 14*a* ; and dagger in *Wu yüan, ibid.* p. 18*b*.]

[The regular warriors had two lances (or spears) and two bows (*Shih ching*, I. vii. V. 2 ; IV. ii. IV. 5). The spear and bow-case were carried in the chariot. The scabbards of the chiefs' swords were adorned with precious stones (III. ii. VI. 2), or with other ornaments (II. vi. IX. 2). The spears were of three kinds : the *mao*, which was 4 *mètres* long (20 Chou cubits) ; and the *chi*, 16 cubits (I. xi. VIII. 2). They were set up in the war chariots (*ibid.*). The javelin *ko* (*ibid.*) was 6 cubits 6 inches long, and was carried by the foot-soldiers. (These lengths are given by the Commentary from the *Li chi.*) All the lances had red pendants or streamers (I. vii. V. i.).]

"Kuan Tzŭ [the philosopher] states that when opening the Yung Hu Hill for water, metal was found from which the 'three-pointed lance of Jung Hu was cast'—this was how it originated."—*Pai shih lei pien, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 21*b*.

"The three-pointed lance . . . was one and a half inches broad ; the guard was three times this breadth ; the *hu* four times, and the *yüan* five times."—*Chou li, ibid.* p. 21*b*.

"This *chi*, lance, had three sharp points : the *fêng* going straight forward ; the *hu* in the middle slightly bent downwards ; and the *yüan* bent upwards at right angles to it."—*Li shu, ibid.* p. 21*b*.

[Other 3-pointed lances are mentioned in *Chou shu, ibid.* p. 22*a*.]

"The two *mao* (矛) lances had two *ying* (英), red ornamental feathers. The Commentary says : 'The two *mao* were the *yi* (夷) *mao* and *yu* (酋) *mao* ; the former was 2 *chang* 4 feet long, and the latter 2 *chang*.'"—*Shih kuo fêng, ibid.* p. 23*a*.

[The *shu* (殳), long spear, was one *hsin* (8 feet) 4 feet long (old measurement ; *i.e.*, one *chang* 2 feet long).]—*K'ao kung chi, ibid.* p. 22*b*. See also *infra*.

"Two men wearing helmets held *hui* (惠) standing inside the inner gate. The Commentary says : 'The *hui* was a spear with 3 prongs at the tip' ; but Kou's Explanation says : 'The sharp parts were angular.' Mr. Chêng Yüan said the shape of the *hui* was like a sloping edge suitable for cutting grass."—*Chou shu, ibid.* p. 23*a*.

"The *ch'iu mao* (酋 矛) is explained in the Commentary as being a two- [? three] edged spear."—*Shih ching, ibid.* p. 23*a*.

"The halberd . . . was 2 inches broad ; its *nei* (內), guard, was double ; its *hu* (胡), hooked part, treble ; and its *yüan* (援), upright edge, quadruple."—*Chou li, ibid.* p. 20*b*.

"The halberd with side prongs (or prongs sticking out sideways) was called *kou chieh* (句 子) and also *hu chieh* (胡 子)."—*Yü hai, ibid.* p. 21*a*.

"Of the five kinds of weapons the halberd was the most handy ; its handle was short ; its hook and upright edge broad and easily [able to] pierce—it could thrust, cut, slash, or hook."—*Li shu, ibid.* p. 21*a*.

"The yellow *yüeh* (鉞), halberd, was used in the Chou. Though their colours [*i.e.*, the black and white ones of the previous Period with this] were different the axes were the same."—*Po ku t'u, ibid.* p. 19*b*.

"The handle of the halberd was 6 feet 6 inches ; of the long spear, one *hsün* (尋 = 8 feet) 4 feet ; of the 3-pointed lance for the chariot, one *ch'ang* (16 feet) ; of the *chiu* spear, 1 *ch'ang*, 4 feet ; and of the *yi*, hooked lance, 3 *hsün*."—*K'ao kung chi t'ung, c.* 2, p. 31*b*. See also *Chou li, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 21*a*.

[The mailed warriors had battle-axes with handles of wood (*Shih ching*, I. xv. IV. ; III. ii. VI. 1). The foot-soldiers were usually armed only with javelins and spears (I. xv. IV.).]

"Prepare your bows and arrows ; temper your lances and spears ; sharpen your pointed and edged weapons ; presume not to have any of these but in good condition."—*Shu ching*, Pt. V. Bk. XXIX. 2, *Legge, Ch. Class.*, III. ii. 622.

[Like the hunting bows, those used in war were of wood adorned with green bands (*Shih ching*, IV. ii. IV. 5). An instrument of bamboo (閉) was strapped to the bow when unstrung, to keep it from warping (I. xi. III. 3 ; II. viii. II. 3). The bows of the chiefs had ornaments of ivory (II. i. VII. 5) ; others of horn (II. vii. IX. 1 ; IV. ii. III. 7). To preserve the bows they were kept in cases of tiger-skin (I. xi. III. 3), or of ordinary leather (I. vii. IV. 3). Every case contained two bows. The bow-cases and the quivers were made of the skin of some marine animal called *yu* (II. i. VII. 5 ; iii. IV. 1), which may have been a seal.]

[Bows and arrows were much used. For the various classes see *Gingell*, pp. 78–81. The former were of different sizes and variously coloured and ornamented according to the rank of the warrior (see LAWS OF INT.). Bows are referred to in *Nei tsê, Ko chih ching yüan, c.* 41, *Wu pei lei*, p. 7*a* (mulberry) ; *Hsün Tzŭ, ibid.* p. 10*b* (carved, etc.) ; *Tso chuan, ibid.* p. 11*a* (large bow) ; *Chou li, ibid.* p. 14*a* (cross bows) ; *Wu ching tsung yao, ibid.* p. 14*a* (ditto, various kinds) ; *Wu Yüeh ch'un ch'iu, ibid.* p. 14*b* (ditto) ; *Chan kuo ts'ê, ibid.* p. 14*b* ; bow-cases, in *Shih Ch'in fêng, ibid.* p. 12*b* (tiger-skin) ; bow-strings, in *Yüeh chüeh shu, ibid.* p. 12*a* ; thumb-hook and "release," in *Shih Ch'in fêng, ibid.* p. 12*b* ; arrows made from sedge, in *Tso chuan, ibid.* p. 19*b* ; *Tz'ŭ lin hai ts'o, ibid.* p. 20*a* ; the "8 kinds of arrows," in *Chou li, ibid.* p. 21*a* ; *Shih chi, ibid.* p. 21*b* ; *Tso chuan, ibid.* p. 21*b* ; arrow-barbs of metal, stone, and bone, in *Li shu, ibid.* p. 20*a* ; arrow-tubes, in *Shih i wên, ibid.* p. 23*a* ; *Tso chuan, ibid.* p. 23*b* ; ivory bow-tip and seal-skin bow-cases, in *Shih ching jung chu, Hsiao ya, c.* 4, p. 11*b* ; and quivers in *Chou li, Ko chih ching yüan, c.* 41, p. 23*a*.]

[Clubs were used at the battle of Lang, B.C. 484.]—*Legge, Li Ki*, i. 185.

"His [Chao Yi's] opening remarks [in the *Kai-yü-ts'ung-kao* Bk. 30] are to the effect that 'the employment of fiery contrivances in warfare was resorted to in the times of antiquity, as for instance in the *Chow-kwan* . . . we read of fire-archery and *wang-she* 枉 矢 (explained by the commentators as fiery darts), which were the origin of this practice ; but the "flame-elephants," "fire-oxen," and conflagrations such as were produced at the battle of Ch'ih Pi were effected by means of straw, sticks, or reeds tied in bundles and steeped in oil or fat, and were not devices in which gunpowder was employed.' As if anticipating the misconception which has, in particular, led European writers to a belief in the early origin of gunpowder, Chao Yi goes on to remark that 'what were called *p'ao* (礮) were all engines for hurling stones by the aid of machinery.'"—*Journ. N.-C.B.R.A.S.*, N.S. vi. 76.

"Commenting on a passage in Sze-ma Ts'ien's History, Chang Yen remarks that 'in Fan Li's art of war' (B.C. 500) there occur 'flying stones' of weight of 12 *catties*, which were propelled from machines and reached a distance of two hundred *pu* (about 400 yards). This was the origin of the *p'ao*."—*Ibid.* vi. 83.

"In the ponderous *chuang-ch'ê* (撞 車), consisting in a huge beam terminating outwardly in a conical head, and slung from a massive framework which moved on low wooden wheels, we may recognize the exact counterpart of the Roman or Grecian battering-ram ; but this engine seems to have been less used than the *p'ao-ch'ê* or slings [see above] . . . of which no less than fifteen varieties are depicted in the *Wu-pei-che*. They appear to have corresponded in all respects with the *lithoboloi* of the Greeks and the *ballistæ* of Roman warfare, and to have consisted in a beam working upon an axle supported by a massive wooden framework, and attached at its outer extremity to a rope the farther end of which was fastened by thongs to pegs at some little distance from the machine. Upon this rope a pad of leather was fixed, affording a resting place for the missile about to be discharged. The inner extremity of the beam was furnished with a number of ropes upon which the working party hauled, giving leverage sufficient, it would seem, to project the stone with great force from the pad on which it rested." Some were mounted on wheels, "but other kinds, corresponding to garrison artillery, were simply built up on the walls of cities, whilst others, again, had several beams working simultaneously within a single framework. Of the simplest description *Wu-pei-che* states that forty men were required to work it, with one as 'captain of the gun' to govern the discharge. It threw a stone weighing 2 *catties* (2⅝ lbs.) a distance of fifty *pu* (about 100 yards). The larger *ballistæ* were much more powerful than this, as, for instance, one which discharged missiles from two pads at once, worked by one hundred men, launching stones of 25 *catties* (about 33 lbs.) to a distance of 80 *pu* (160 yards). It is not, however, in the *ballistæ* only that we are able to trace a similarity between the Chinese devices and those of the Greeks and Romans ; the incendiary projectiles eventually launched from these machines bore a strong resemblance to the fireballs, made of tow saturated with oil or resin, that were cast by the Grecian slingers, whilst the mantlets of wood or leather hung over city walls to defend them from the assault of the battering ram, the grappling irons used in harassing stormers, and the huge moveable towers under cover of which a besieging party advanced with impunity to the foot of an enemy's wall, may be seen delineated in the *Wu-pei-che* in precisely the forms that we find described by the classical military writers."—*Ibid.* vi. 87–9.

"The 'cloud-ladder' (雲 梯) *yün t'i*) [a scaling ladder] was made by Kung-shu Pan of the Lu State ; it was used in the attack on the city of Sung. It could stand without any support. In the book *T'ai pai yin ching* it was called 'flying ladder' (飛 梯 *fei t'i*)."—*Hsü shih shih, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 29*a*.

"The *kou yüan* (鉤 援) was a hook-ladder, used to hook upon a city wall and ascend by. It was the same as the 'cloud ladder.'"—*Mao shih chu, ibid.* p. 29*a*.

[The chariots possessed by the States of Chou are said to have enabled them to easily defeat the Jung tribes, who fought on foot. See *Legge, Ch. Class.*, V. i. Prol. p. 123.]

"The war-carriage had no cover when a nobleman drove in it ; by his side a man standing on a nave held a bamboo umbrella to protect him from the cold or heat of the sun ; it was called *li ku* (笠 轂), 'sunshade carriage.'"—*Tso chuan chu, Ko chih ching yüan, c.* 29, *Chou chü lei*, p. 4*b*.

[Other war-chariots are described in *Li chi chêng i, ibid.* p. 8*a* ; and *Tso chuan, ibid.* p. 29*a* (巢 車 *ch'ao ch'ê*, "nest carriage" with elevated "crow's-nest").]

[War-junks are referred to in *Pai pien, ibid. c.* 28, *Chou chü lei*, p. 9*b* ; *T'ai pai yin ching, ibid.* p. 10*a* ; *Yüeh chüeh shu, ibid.* p. 10*a* ("turret-junk," "bridge-junk," etc.) ; and *Hai wu i ming chi, ibid.* p. 10*a*.]

Defensive.—"The *lung tun* (龍 盾), 'dragon shield,' was a shield on which a dragon was painted as an ornament."—*Tsao lin, ibid. c.* 42, *Wu pei lei*, p. 26*a*.

[The 擩 *po* was a large shield.]—*K'ung Tzŭ shih chia, ibid.* p. 26*a*.

[A shield made out of twigs is mentioned in *Hsüan An ch'un ch'iu, ibid.* p. 26*b*.]

[The princes and regular warriors wore helmets. Those of the princes of the blood were adorned with shells strung on red cords (*Shih ching*, IV. ii. IV. 5).]

"Ch'üan Jung [an ancient region in the N.W. of Yünnan] made helmets of leather painted red."—*Kuang chih, ibid. c.* 41, *Wu pei lei*, p. 1*b*.

"'The soldiers in the chariot beat the "advance" on the drum, and the gagged foot soldiers advanced.' Chêng's Commentary [says] : 'The gag was like a chopstick—it was placed in the mouth and both ends tied with cords round [the back of] the neck, in order to prevent the soldiers speaking and thus give cause for suspicion [of their movements to the enemy].'"—*Chou li, ibid. c.* 42, *Wu pei lei*, p. 29*b*. See also MILITARY.

"In ancient times the cuirass was made of leather and called *chia* (甲), [a scale, as it is like the scale of a fish protecting the body]; but in the present age it is made of metal and called *k'ai* (鎧)."—*Chou li ssŭ chia chu, ibid.* c. 41, *Wu pei lei*, p. 2*a*.

"The *chia ko* (鉀 革) and *chung ko* (重 革) worn on the breast [generally beneath the clothes] afforded protection against weapons."—*Kuan Tzŭ Hsiao k'uang p'ien chu, ibid.* p. 2*b*.

[Armour is further referred to in *Tso chuan, ibid.* p. 2*b*; p. 4*b* (varnished); *Wu Yüeh ch'un ch'iu, ibid.* p. 4*b*; etc.]

"Fu Ch'a, King of Wu, had 3,000 soldiers wearing armour made of rhinocerous hide."—*Kuo yü, ibid.* p. 4*b*.

[The mailed warriors had bucklers (*Shih ching*, I. i. VII. i.; III. ii. VI. i.).]

"Have in good repair your coats of mail and helmets; have the laces of your shields well secured: presume not to have any of these but in perfect order."—*Shu ching*, Pt. V. Bk. XXIX. 2, *Legge, Ch. Class.*, III. ii. 622.

"The 'coats of mail and helmets' were made of leather, which may have been studded or fenced with more or less of steel."—*Legge, ibid.* p. 623, note.

"Armour made of rhinoceros hide consisted of 7 folds; the armour made of wild buffalo-hide, 6 folds; and that of both together, 5 folds. The rhinoceros armour could last 100 years, the wild buffalo armour, 200; and the mixture of both, 300."—*K'ao kung chi t'ung*, c. I, p. 57*b*.

"*Ch'ien* (甲) was the armour of a horse; its plates were made of metal."—*Mao shih chih nan t'u, Ko chih ching yüan*, c. 29, *Chou chü lei*, p. 35*b*.

"The *ta hou* (搭 後) was the back part of a horse's armour; the *chi hsiang* (雞 項), the neck part; and the *t'ang hsiung* (盪 胸), the breast part."—*Shih wu kan chu, ibid.* p. 35*b*.

"The 'wolf-tooth striker' (狼 牙 拍 *lang ya p'o*) was made of elm; on the top were fixed nails and on the four sides blades, the front and back being fitted with rings for attaching ropes. It was used by being suspended from the city wall in order to strike an enemy attempting to scale it."—*Kan chu, ibid.* c. 42, *Wu pei lei*, p. 29*b*.

[For bow and arrow used in hunting, see ARTS.]

[For the method of protecting the war-chariot and the mail of horses, and the use of scaling ladders, see MILITARY.]

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

Offensive.—[After the general disarmament on the establishment of the Ch'in dynasty, weapons were surreptitiously made of wood and bamboo.]—*Kuang chih p'ing lüeh*, c. 25, *Chou tai ping chih*, p. 2*b*.

[Long and short sharp swords and cross-bows were used against the Hsiung Nu.]—*Han shu Chao Ts'o chuan, Tzŭ shih ching hua*, c. 74, p. 9*a*.

[Swords are often mentioned in the literature of the period: see *Wu hou ching, Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 3*a*; *Pai pien, ibid.* p. 3*b*; p. 4*b*; p. 5*a*; *K'ung Ts'ung Tzŭ, ibid.* p. 3*b*; *Ts'ui Pao ku chin chu, ibid.* p. 4*a*; *Tung ming chi, ibid.* p. 4*a*; *Hsü Han shu, ibid.* p. 4*a*; *Ying shao Han shu chu, ibid.* p. 4*b*; *Hsiang yen lu, ibid.* p. 4*b*; *Wei Wên Ti tien lun, ibid.* p. 4*b*; *Tao chien lu, ibid.* p. 4*b*; p. 5*a* (thrice); p. 9*b* (*bis*); 14*b*; p. 15*a* (*bis*); p. 15*b*; p. 16*a* (*bis*); p. 16*b*; *Shu wu i ming su, ibid.* p. 5*a* (scimitar); *Han shu Chien pu i chuan chu, ibid.* p. 7*b*; *Chou ch'ien yü fu tsa shih, ibid.* p. 8*a* (two-edged sword); *K'ai Yüan li i tsuan, ibid.* p. 8*a*; *Fang yen, ibid.* p. 8*a*; *Ts'ao Chih ch'i ch'i, ibid.* p. 14*a*; *Hsü Ch'i hsieh chi, ibid.* p. 14*b*; *San fu huang t'u, ibid.* p. 15*a*; *Hsi ching tsa chi, ibid.* p. 15*b*; *Han Wu Ti nei chuan, ibid.* p. 16*a*; *Kai nu chuan, ibid.* p. 16*a*; daggers are mentioned in *Shih chi, ibid.* p. 18*b*; and *Tien lun, ibid.* p. 18*b*.]

"In the Ch'in dynasty the long-handled iron axe was changed into the *huang* (鎲), which was made by the Emperor Shih."—*Ku chin chu, K'ang Hsi tzŭ tien, Chin pu*, p. 44*b*.

[The 槍 *ch'iang*, spear, was lengthened: see *Shih wu kan chu, Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 24*b*; the 3-pointed lance continued to be used and is mentioned in *Pai shih, ibid.* p. 22*a*; *Shuo wên, ibid.* p. 22*b*; *Han tsa shih, ibid.* p. 22*b* (where it is stated that it now supplanted the axe); *Fang yen, ibid.* p. 23*a*; and bamboo lance in *Hsü shih shih, ibid.* p. 24*b*.]

[Bows and arrows continued to be used in warfare: they are mentioned in *Huai-nan Tzŭ, ibid.* p. 11*b*; *Tz'ŭ lin hai ts'o, ibid.* p. 11*a*; *Hsü Han shu, ibid.* p. 12*a* (horn); *Wei chih, ibid.* p. 12*a* (the *i lou* 挹 婁, 4 feet long); *Nan Man chuan, ibid.* p. 12*a* (short bamboo bow and poisoned arrows); *Yen Shih-ku Han shu chu, ibid.* p. 13*b* (crossbow); *Han shu Han Yen-shou chuan, ibid.* p. 14*a* (*ditto* with the *lan* 闌, arrow-case, which was carried by a man: *Shuo wên, ibid.* p. 23*a*); *Chih ku tzŭ, ibid.* p. 15*a* (the *pa niu* 八 牛, "eight-oxen" cross-bow, which could shoot arrows 10 *li*); *Kuo P'o Fang yen chu, ibid.* p. 17*b*; *Ch'i wu tsa shuo, ibid.* p. 17*b*; and *Tung Kuan Han chi, ibid.* p. 22*a* (3-barbed arrows).]

[Ballistæ shot stones weighing 12 catties 300 paces.]—*Pai pien, ibid.* p. 27*b*.

["Rushing carts," opposed by stones slung from slings, are mentioned in *Shih wu yüan shih, ibid.* p. 17*b*.]

[The "light carriage" (輕 車 *ch'ing ch'ê*) was the war-chariot of ancient times. Its wheels and body were a deep vermilion colour with no screen or cover; on it were erected a hooked spear, three-pointed lance, streamer, and signal.]—*Hou Han shu Yü fu chih, ibid.* c. 29, *Chou chü lei*, p. 27*b*.

Defensive.—"The meaning of *tun* (盾), shield, is 'to protect,' as it was used to protect the body and cover the eyes."—*Shuo wên, ibid.* c. 42, *Wu pei lei*, p. 25*b*. Shields are further mentioned in *Fang yen, ibid.* p. 26*a*; *Ch'iu Kuang-t'ing Chien ming shu, ibid.* p. 26*b*; *Êrh i shih lu, ibid.* p. 27*a*.

"The standing shield (立 牌 *li p'ai*) was made of bamboo or of wood; it was 5 feet long and 3 feet broad. At the back was a cross-bar, 3 feet long, used as a handle. The sentinels on the city walls used it to protect themselves from arrows or stones."—*Shih wu kan chu, ibid.* p. 27*a*.

"Head armour was called *tou mou* (兜 鍪), an ancient helmet with a flaring brim worn by officers; it was also called *chou ching* (胄 頸) and defensive armour was called *a tuan* (錏 鍛)."—*Shuo wên, ibid.* c. 41, *Wu pei lei*, p. 1*b*.

"'Wearing mail (甲 *chia*) and *t'i mou* (鞮 鍪).' Shih Ku's Commentary [says]: '*T'i mou* was the helmet.'"—*Han shu Han Yen-shou chuan, ibid.* c. 41, *Wu pei lei*, p. 1*b*.

[Strong mail, in addition to the offensive weapons above-named, were used against the Hsiung Nu.]—*Han shu Chao T'so chuan, Tzŭ shih ching hua*, c. 74, p. 9*a*.

"The ancient sages made *hsi ssŭ* (犀 兕), leather mail, but now there were iron mail and neck-greaves."—*K'ung jung jou hsing lun, Ko chih ching yüan*, c. 41, *Wu pei lei*, p. 2*a*.

"Greaves on the arm were called *han* (釬)."—*Shuo wên, ibid.* p. 2*b*.

"The 'iron chamber' (鐵 室 *t'ieh shih*) was an iron mail covering the whole body—*i.e.*, it was like a chamber affording shelter to the body. It was invented by Han Fei-tzŭ."—*Liu ching jih cha, ibid.* p. 2*b*.

"Wu Tzŭ (Prince of Wu) once said to Prince Wên of Wei: 'Now you in all seasons send men to collect skins and hides of the *li* (離) [a kind of horse] cover them with red varnish, paint them various colours, and adorn them with ivory from the rhinoceros and elephant.' From this it is known that in time of war mail made of hide was allowed, but not necessarily that made of iron. Chang Tsun Ch'ang says: 'In ancient times the chariot was used in warfare, so that it was not necessary to make mail of iron. In modern times, if mail were made of hide to withstand the strong crossbow, the troops would be defeated and slain.' Evidently in the later Han dynasty mail had iron plates, but we do not know what it was made of in the former Han dynasty."—*Yen fan lu, ibid.* p. 3*a*.

"The imperial bodyguard wore the brass-cuffed armour and iron helmet of Chu-Ko Liang."—*Nan shih, ibid.* p. 5*a*.

"Fu Chien ordered Nêng Miao to make fine gold and silver defensive armour (鎧), which was sewn together with gold wire."—*Chü lei Ch'in shu, ibid.* p. 5*a*.

"Shih Chi Lung had a bodyguard of 10,000 around him, all clothed in the five-coloured fine armour, the brilliancy of which dazzled the eye."—*Lung Hui-tsung chung chi, ibid.* p. 5*a*.

"The *Shih Shih* (事 始) says: 'The "iron calthrop" and "iron thorny seed" or "reed points" were invented when the Emperor Yang of Sui invaded Liao Tung; they were scattered on the high road or placed in the water in order to endanger the enemy or injure the horses' feet.' This was not the case, as may be ascertained by noting that when Chu-ko Liang and Ssŭ-Ma I fought against each other at Wu Kung in Wu Chang Yüan on hearing that Liang was dead, I advanced his force, but Liang had already ordered Yang Yi, a sub-magistrate, to scatter many 'iron thorny seeds' on the ground. This shows that they had already been brought into use in the time of the Three Kingdoms, and so were not invented by the Emperor Yang of the Sui dynasty."—*Pai shih lei pien, ibid.* c. 42, *Wu pei lei*, p. 29*a*.

"In *Suggestions for Guarding the Frontier* (*Shou pien i*), written by Chao Ts'o in the time of the Emperor Wênof the Han dynasty, it says: 'The casting-stone (藺 石 *lin shih*) should be provided and *ch'ü ta* (渠 答) scattered.' The Commentary says: 'The *ch'ü ta* was the "thorny seed" resembling the calthrop which was originated in the Han dynasty.'"—*Pai shih lei pien, ibid.* p. 29*a*. The *Wu yüan* ascribes the invention to Sun Wu (6th cent. B.C.).

Period of Disruption (221 *to* 589).—*Table IV.*

Offensive.—[Swords of many kinds are mentioned: see *Sung hui yao, Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 1*b* ("from the Chin down to the Sung dynasty there were 'Imperial swords,' made with black scabbards, decorated with gold flowers; the sword-handle adorned with silver and the head case woven of red and blue silk"); *Êrh i shih lu, ibid.* p. 1*b* (swords which could protect a battalion, kill 1,000 oxen, etc.); *Ts'ao Chih Pao tao fu hsü, ibid.* p. 1*b*; *Pai pien, ibid.* p. 2*a* (wooden sword-handles better than those made of goat's horn); p. 5*b* ("five-coloured"); *Ku chin ming hsien chi, ibid.* p. 2*a*; *T'ao Kung-ching Ku chin tao chien lu, ibid.* p. 3*b*; p. 4*b* (iron); p. 5*a*; p. 5*b*; p. 6*a* (5 feet long); (with jade ring); p. 10*a* (of 5 metals); *Hsi ching tsa chi, ibid.* p. 4*a* (copper); *Hsi shang fu t'an, ibid.* p. 4*a*; *Fu hsien tsou shih, ibid.* p. 5*a* (brass); *Hsieh Shang yü yang chêng nan shu, ibid.* p. 5*a* (5-foot gold-headed); *Shui ching chu, ibid.* p. 5*b* (refined steel, with ring on back); p. 14*b*; *Nan shih, ibid.* p. 1*a*; p. 6*a* (embossed with silver); p. 7*b*; *T'ung tien, ibid.* p. 6*a*; *K'ai Yüan li i tsuan, ibid.* p. 8*a* (two-edged sword worn with Court costume changed under the Chin dynasty to a wooden one); *Chin Tung Kung chiu shih, ibid.* p. 8*a* (jade-handled two-edged); *Ch'ing i lu, ibid.* p. 8*a*; p. 18*a*; *Pao Pu Tzŭ, ibid.* p. 8*b* (hard copper two-edged); *Shan hai ching chu, ibid.* p. 12*b*; *Tung Kuan Han chi, ibid.* p. 16*a* (bis); *Ku chin chu, ibid.* p. 16*b* (6 valuable two-edged); *Pei shih, ibid.* p. 17*a*; and *Cha'o yeh chien tsai, ibid.* p. 17*a*.]

[The axe is mentioned in *Hsi chi ts'ung yü, ibid.* p. 20*b*.]

[Three-pointed halberds are mentioned in *Sung shu, ibid.* p. 21*a*; "cockerow lances" (鷄 鳴 戟 *chi ming chi*) in *Chin Tung kung chiu shih, ibid.* p. 22*a*; *Ts'ui Pao Ku chin chu, ibid.* p. 22*b*; *Ming wu k'ao, ibid.* p. 22*b*; *Pei shih, ibid.* p. 23*a* ("prick-leopard spear"); p. 23*b* (hooked spear enlarged); *Lung yü ho t'u, ibid.* p. 23*b* (*ditto*); *Chin Pa wang ku shih, ibid.* p. 23*b* (iron spear, 18 feet long); *Nan shih, ibid.* p. 23*b* (ditto, the "tree-feller"); and *Pei shih, ibid.* p. 24*a* (ditto, ornamented with silver).]

[Bows of 2,000 catties (used on foot) and 600 catties (on horseback) are mentioned in *Liang shu, ibid.* c. 41, *Wu pei lei*, p. 7*a*; large black-varnished 400-catties bow, in *Nan shih, ibid.* p. 11*a*; cross-bow (called 百 步 王 *pai pu wang*, "king of 100 paces"), in *Ch'ing i lu, ibid.* p. 13*b*; cross-bow discharging 10 iron arrows at a time, in *San kuo chih, ibid.* p. 15*a*; *Hsieh Shih shih yüan, ibid.* p. 17*b*; *Hou Wei shu, ibid.* p. 20*b*; *Pei Ch'i shu, ibid.* p. 20*b*; and gold arrow-stands and bow-cases, in *Chao shu, ibid.* p. 23*b*.]

Chu-ko Liang "invented a bow for shooting several arrows at once."—*Giles, Bio. Dic.*, p. 181.

[A stone-hurling machine is mentioned in *Wei shu, Ko chih ching yüan*, c. 29, *Chou chü lei*, p. 27*a*.]

Chao Yi "brings forward . . . from the History of the Three Kingdoms (which was written about A.D. 350) a passage stating that 'Yüan Shao threw up mounds of earth and high towers in order to attack Ts'ao Ts'ao with his archers; whereupon the latter made use of "thunderbolt carriages" (霹 靂 車 *P'i-li-ch'ê*) to discharge stones with which he destroyed the towers Yüan Shao had constructed.' From this period downward, the mention of machines for discharging stone projectiles becomes more and more frequent."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 84.

"Ma Kiün [Ma Chün] of the Wei dynasty 魏 馬 鈞 constructed *pao-chang* 爆 仗 (crackling or exploding staves)."—*Wu Yüan, ibid.* vi. 80. See also *Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 27*a*.

[War-junks holding 2,000 men are mentioned in *Chin shu, Ko chih ching yüan*, c. 28, *Chou chü lei*, p. 10*b*; smaller war-junks, in *Nan shih, ibid.* p. 10*b*; p. 11*a*; p. 12*b* (made of skin); *Wang Chün chuan, ibid.* p. 7*b* ("melon-peel boat"); and armed turret-junks in *San fu chiu shih, ibid.* p. 7*a*.]

Defensive.—["Tiger-head shields" are mentioned in *Pei shih, ibid.* c. 42, *Wu pei lei*, p. 26*b*.]

"By heaping up loadstones on both sides of the road the enemy's troops wearing iron mail would not be able to advance. For this reason it was that Ma Lung clothed his troops in mail made of rhinoceros horns and led them to meet the enemy, so that they were not hindered at all [by the attraction of the loadstones]."—*Chin shu, ibid.* c. 41, *Wu pei lei*, p. 5*a*.

"The men of Wu made sharp-pointed iron tools for placing in the important places of shallow rivers. Each tool was more than one *chang* long. They secretly scattered them in the river so as to obstruct the enemy's war junks. Wang Chün made several tens of rafts more than 100 paces in area, on which he set straw men wearing armour and holding battle-axes, and then ordered good swimmers to pull the rafts after them. As soon as the iron sharp tools struck the rafts they were totally destroyed."—*Chin shih Wang Chün chuan, ibid.* c. 28, *Chou chü lei*, p. 16*b*.

From the Restoration of Unity to the End of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

Offensive.—"*Chang* (仗) was the general name given to the five kinds of sharp weapons. Under the T'ang system the bodyguard was called *chang*."—*Shih wu yüan shih, ibid.* c. 41, *Wu pei lei*, p. 1*b*.

"The shape of the *huang* (鍠), halberd, was like that of the two-edged sword, but with three edges. Together with the handle it was three feet five inches long. Its case was made of tiger or leopard's skin. At the present time it was carved out of wood, and carried in processions in front of a chariot. It was [then] called *i huang* (儀 鍠), 'ceremonial (lit., dignified) *huang*.'"—*K'ai Yüan i li, ibid.* p. 19*b*.

[Under T'ai Tsung the weapons and armaments of the men were improved, the pike being lengthened, and a stronger bow supplied.]—*Boulger, Short Hist.*, p. 28.

[Swords, daggers, lances, and bows and arrows continue to be frequently alluded to: see *Shan t'ang ssŭ k'ao, Ko chih ching yüan*, c. 42, *Wu pei lei*, p 6*a*; *T'ang shu, ibid.* p. 6*b* (bis); *Yü T'ang hsien hua, ibid.* p. 7*a* (hooked sword); *Ch'ing i lu, ibid.* p. 17*a*; *Tu Yang tsa pien, ibid.* p. 17*b*; *Mêng chi pi t'an, ibid.* p. 18*a*; *Yen t'ieh lun, ibid.* p. 18*b* (dagger); *Fêng t'u chi, ibid.* p. 21*b* (3-pronged lance used for thrusting, beating, stabbing downwards or upwards); *Pai liu t'ieh, ibid.* p. 23*b*; *Yu Yang tsa tsu, ibid.* p. 24*a* (poisoned lance used by southern aboriginal tribes); *T'ang shih, ibid.* p. 24*b*; *K'ung liu t'ieh, ibid.* p. 24*b*; *Shih wu kan chu, ibid.* p. 24*b*; *Pi ts'ung, ibid.* p. 24*b*; *Shih wu yüan shih, ibid.* p. 25*a*; *I su chi, ibid.* p. 25*a* (hooked lance, used for "thrusting or bringing back"); *T'ung chien pên chi, ibid.* c. 41, *Wu pei lei*, p. 9*a* (bows); *T'ang liu tien, ibid.* p. 11*b* (bows of mulberry wood, horn, etc., also bow for shooting at close range, and ornamental bow); *Yu Yang tsa tsu, ibid.* p. 14*a* (strings for cross-bows made from bamboo); *T'ung lüeh, ibid.* p. 21*a*; and *T'ang liu tien, ibid.* p. 22*a* (bamboo, wooden, iron, and cross-bow arrows).]

"Cross-bows which could shoot arrows 300 paces [步] are mentioned in the T'ang annals [伏 遠 弩]."—*Ch. Rev.*, xv. 188.

"As early as the 7th century Li Mih [*Mayers*, No. 359], 'used machines for ejecting stones' called 將 軍 礮."—*Ibid.* xv. 253.

[Ballistæ are mentioned in *T'ang shu, Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 27*b*.]

"We read that Li Kwang-pi employed machines at the defence of T'ai Yüan (about 750 A.D.) enabling him to project enormous stones, which, in falling, crushed scores of the enemy at one time. In later centuries, similar notices occur in profusion."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 84.

"The Emperor Yang Ti of the Sui dynasty added thereto [to the crackling or exploding staves made during the Wei dynasty, v. *supra*] fireworks of gunpowder—*yih-i-huo-yao-tsa-'hi* 益 以 火 藥 雜 戲."—*Wu Yuan, ibid.* vi. 80. See also *Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 27*a*. It seems doubtful, however, whether they were used for other than sporting purposes.

[For war-junks see *Sui shu, ibid.* c. 28, *Chou chü lei*, p. 11*a* (五 牙 *wu ya*, 5-deckers, 100 feet in height, holding 800 warriors; 黃 龍 *huang lung*, "yellow dragon," holding 100 warriors; and other smaller ones); *Tz'ŭ lin hai ts'o, ibid.* p. 11*a* (水 龍 *shui lung*, "water-dragon"); etc.]

Defensive.—[Many of the troops wore armour.]—*Boulger, Short Hist.*, p. 28.

[Helmets continued to form part of armour. Armour made from the carapaces of turtles is mentioned in *Shih i chi, Ko chih ching yüan*, c. 41, *Wu pei lei*, p. 2*b*; armour suited to height of soldiers, affording ease in movement, in *T'ang Ma Sui chuan, ibid.* p. 2*b*; mail made on the "5-ring" system (when the first ring was pierced the next fell into its place), in *Chêng Tzŭ t'ung, ibid.* p. 5*a*; *Sui shu, ibid.* p. 5*b*; and yellow-varnished armour in *T'ang shu, ibid.* p. 5*b*.]

[The iron "thorny seed" is mentioned in *Ch'ing i lu, ibid.* c. 42, *Wu pei lei*, p. 29*b*.]

[Artillery is said to have been used for the first time at the successful defence of Taiyuen, by a lieutenant of the Emperor Su Tsung in A.D. 757.]—*Boulger, Short Hist.*, p. 32.

907–960.

Offensive.—[Two-edged swords are mentioned in *Wu Tai shih, Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 18*a*.]

"The period of the Five Dynasties is that in which we find the greatest advances made in the use of numerous contrivances for use in warfare; and although history has preserved no continuous record of the gradual progress that was achieved, it is nevertheless evident that invention and improvement were steadily at work."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 87.

"There can be little doubt that a time like this was highly favourable to the spread of destructive inventions. Thus . . . we find in the *Wu-pei-che* an extract from the national historians in which a substance resembling 'Greek fire' is for the first time mentioned, in reference to this period. The passage is as follows: 'The sovereign of Wu sent to Apaoki, the sovereign of the Kiehtan (Liao), a furious fiery oil, which oil, on being set alight and coming into contact with water, blazed the more fiercely. It could be used in attacking cities. Apaoki was filled with joy, and took at once a chosen force of horsemen with whom he was minded to attack Yewchow; but his queen, Shulü, laughed at him and said: "What man has ever bethought him of attacking a kingdom with oil? Is it not better rather to take three thousand horsemen and lie in wait on his borders, and lay his country waste, so that the city shall be without food? By this means before a few years are gone they will be brought to straits—what boots this hurry and rashness? Think you not you may be worsted, and be mocked at by China, and our own people may fall away?" Therefore he went no further in this design.' "—*Ibid.* vi. 86.

Defensive.—[Helmets are mentioned in *Hou Chou shu, Ko chih ching yüan, c.* 41, *Wu pei lei*, p. 2*a*.]

Sung Period (960 *to* 1280).—*Table VI.*

Offensive.—[Swords are referred to in *Ch'ang pien, ibid.* c. 42, *Wu pei lei*, p. 6*b* (blade 3 feet long); *Chi yün, ibid.* p. 7*a* (two-edged); *Tzŭ lin, ibid.* p. 7*a*; *Kuang ya, ibid.* p. 11*a*; *Wên hsüan chu, ibid.* p. 11*a*; *Sung shu, ibid.* p. 16*b*; halberds, in *I ya, ibid.* p. 22*a*; spear used on horseback, in *I ya, ibid.* p. 23*b*; javelin, in *Pai pien, ibid.* p. 25*a*; harpoon, in *Sung ch'ao hui yao, ibid.* p. 27*a*; rocket and "fire-spear," in *Ch'un shu k'ao so, ibid.* p. 28*b*; *c.* 41, *Wu pei lei*, p. 22*b*; bows and arrows, in *Ch'ang pien, ibid.* p. 9*b*; *Shan t'ang ssŭ k'ao, ibid.* p. 11*b*; cross-bows, in *Yen fan lu, ibid.* p. 13*b*; *Féng kuan hsiao lu, ibid.* p. 15*b*; *Pi t'an, ibid.* p. 16*a*; *Shan hu kou, ibid.* p. 16*a*; *Pai pien, ibid.* p. 16*b* (used by Southern and South-western tribes); arrows, in *Yen fan lu, ibid.* p. 21*a*; *Yüeh chih, ibid.* p. 22*b* (with blackstone barbs); *Hsiao Ta-hsiang I su ku, ibid.* p. 22*b*; *Pai pien, ibid.* p. 23*a* (short and without feather, but deadly, used by Li aborigines of Hainan); *I wu chih, ibid.* p. 23*a* (made of dark granite); *Pai pien, ibid.* p. 23*a* (poisoned).]

At the siege of Kaifong "the Mongols employed their most formidable engines, catapults hurling immense stones, and mortars ejecting explosives and combustibles."—*Boulger, Short Hist.*, p. 56.

I-ssŭ-ma-yin, in 1273, "planted a mangonel at the south-east corner [of Hsiang-yang]. Its weight was 150 catties (over 200 lbs.); and when the machinery was discharged, the noise 'shook heaven and earth.' It broke down all before it, and pierced the ground to a depth of seven feet."—*Giles, Bio. Dic.*, p. 351.

After the siege of Siang yang fu had lasted three years, the great Kaan sent word that it must be taken. "Then spoke up the two brothers, and Messer Marco the son, and said; 'Great Prince, we have with us among our followers men who are able to construct mangonels which shall cast such great stones that the garrison will never be able to stand them, but will surrender incontinently, as soon as the mangonels or trebuchets shall have shot into the town.' . . . Accordingly they made three fine mangonels, each of which cast stones of 300 lbs. weight and more."—*Yule, Marco Polo*, ii. 120.

Wei Shêng (d. A.D. 1164) "is said to have been the first general to have used gunpowder in warfare. His powder, however, seems to have been nothing more than a kind of Greek fire."—*Giles, Bio. Dic.*, p. 866.

"Probably the first disquisition relating to gunpowder that exists in Chinese literature is that which occurs in the work entitled *Wuh-li-siao-she* . . . by Fang I-che, who flourished during the last reigns of the Ming dynasty. . . . In Book VIII. of this production . . . a section is devoted to 'Explosive Compounds' under the title *Huo-Pao* 火爆, and this commences with the following statement: 'Gunpowder (*huo-yao* 火藥) came from the outer barbarians. It is recorded that in the second year of K'ai Pao of the Sung dynasty—969 A.D.—Yoh I-fang laid fire-arrows (*huo-tsien*) before his Majesty; and Chang Ho-chung relates that Yü Yün-wên discharged "thunder-bolt projectiles" from his vessels at the battle of Ts'ai-she. These were made of paper, filled with lime and sulphur, and on falling into the water they burst into flames which leapt upwards.' "—*Journ. N.-C.B.R.A.S.*, N.S. vi. 74.

"Chao Yi observes, 'the art of battering, in successive ages, appears to have been principally confined to the launching of stones with the help of machinery; but the use of fiery projectiles (*huo p'ao*) certainly dates its commencement from the period of the Southern Sung dynasty, the Kin, and the Mongols (*i.e.*, the latter half of the 12th century). The historians of the Sung period recount that Yü Yün-wên, at his battle at Ts'ai She (near Nanking), threw thunderbolt projectiles, which were made of paper filled with lime and sulphur. When these fell into the water, fire leapt out from them, the paper burst, and the lime diffused itself in a dense vapour, which blinded both men and horses, thus causing defeat to the enemy. Again, Wei Shing invented [or originated the use of] projectile carriages (*pao ch'ê*) from which he launched "fire-stones" to a distance of 200 *pu* (400 yards). In the manufacture of his fire-drug, nitre, sulphur, and willow charcoal were employed. This was the origin of the pyrotechnics in vogue in modern times.' "—*Ibid.* vi. 84.

"The next great step to which we are led, after chronicling the introduction of the 'fiery oil,' brings us to the period of the Nü-che Tartars, whose rulers, supplanting the Kiehtan dominion, began in the 11th century increasingly to press upon the North-western regions of China, where they annexed by degrees enormous tracts of territory, and founded a dynasty with the title of Kin, which maintained during a century or more almost unintermitting warfare with the decaying House of Sung. That a compound practically identical with the modern gunpowder was used during the engagements which took place between the contending armies of these rival powers during the middle decades of the 12th century seems to be clearly ascertained, although the propulsive forces of the new agent remained as yet unknown; but whether the invention first gained ground among the Chinese forces or with their Northern enemies is a question the solution of which cannot be ventured upon. As regards direct testimony, such evidence as we possess assigns the distinction of the first employment of 'villainous saltpetre' to the Sung commander Wei Shing [see above]."—*Ibid.* vi. 87.

"Gunpowder was probably known to the Chinese in the latter part of the Han dynasty (A.D. 250), but its application in firearms at that period is not so plain. The exploits of Kung-ming in that period owe their interest to his use of gunpowder in modes like the Greek fire of the Byzantines, though the animated narratives of Lo Kwan-chung (A.D. 1300) in his *History of the Three States*, are not reliable history in this particular. Grosier (Vol. VII., pp. 176–200) has adduced the evidences proving the use of powder at or before the Christian era. The inferences that Europe obtained it from India rather than China have, however, a good deal of weight. Early Arab historians refer to it as Chinese snow and Chinese salt—a fact which only shows its Eastern origin—while the Chinese compound term of *huo-yioh*, or 'fire-drug,' rather indicates a foreign source than otherwise."—*Williams, Midd. King.*, ii. 89–90.

"From engines for casting heavy masses of stone to the propulsion of incendiary projectiles by similar means was an obvious step, and accordingly it is found that the *p'ao-ch'ê* or projectile carriages assumed ere long the title of *huo-p'ao* or fire launchers. In Vol. 41, *kiüan* 122, the *Wu-pei-che* presents an illustration . . . under the title *Sung-huo-p'ao*, or the fire-launcher of the Sung dynasty. The descriptive passage appended simply states: 'This engine cast various incendiary missiles, such as fire-balls, jars, spears, etc. This was the forefather of all guns (*p'ao*).' The first mention of its use occurs, apparently, in a description of the defence of K'ai-fung Fu against the assaults of the Kin by Li Kang, the celebrated minister of K'in Tsung of the Sung dynasty, A.D. 1127, of whom it is recorded that he constructed ballistæ which launched fire-balls, besides preparing stores of incendiary oil, etc., etc. In addition to the above-mentioned engines, he had machines for discharging flights of arrows from enormous cross-bows—the 'catapults' of the Romans—to which practice, it may be noted, the common phrase in use at the present day to describe a 'volley' or heavy discharge of artillery, viz., *she-shih-ping-fa* 矢石並發, or 'darts and stones discharged simultaneously,' may no doubt be traced."—*Ibid.* vi. 89–90.

"Numerous passages might be quoted from the minor historians of this period with reference to the use of incendiary projectiles in various forms; . . . they played a conspicuous part in the warfare carried on during the 12th and 13th centuries between the Chinese, Kin, and Mongols."—*Ibid.* vi. 90.

"After the period of Wei Shing, and throughout the second half of the 12th century, the notices of incendiary arrows and similar devices grow more and more conspicuous in history. We learn, for instance, that in executing the daring achievement of breaking the blockade of Siang-yang Fu, and introducing provisions into the beleaguered city at its utmost need, Chang Shun, the devoted hero of this exploit, had 'fire-spears and fire *ballistæ*' on board the boats, with which he forced a passage through the Mongol lines. This was in 1272, in the fifth year of the siege, but the relief afforded by this dashing exploit delayed only for a short time the inevitable issue. Siang-yang and its suburb, Fan Ch'êng, fell in 1273, and it is interesting . . . to note that the capture of Fan Ch'êng (which entailed the surrender of Siang-yang) is stated in all the Chinese histories to have been achieved by means of mechanical devices for projecting stones, as Marco Polo also observes, although the credit of inventing these engines is attributed to other persons than the 'two Venetian brothers,' whose 'reputation and credit,' says Messer Milione, were increased through this prompt result of their ingenuity, in the opinion of his Majesty and of all his courtiers."—*Ibid.* vi. 92–3.

"According to the *Shén Pao*, firearms were first introduced into China at the battle of 采石 [see Mayer's Manual, No. 955], about the middle of the 12th century A.D."—*Ch. Rev.*, xv. 183.

"The Sung armies marched in five columns, the three first being armed with swords and spears, the two rear with bows and cross-bows, supported by 'artillery' [虎蹲弩 and 床子弩]. The 論衡 [*Mayers*, 795] also mentions a 十石弩."—*Ibid.* xv. 188. Cf. MILITARY.

"Gingals and matchlocks were known . . . in all the eastern and central regions of Asia, but none of those people could forge or cast large artillery, owing to their imperfect machinery."—*Williams, Midd. King.*, ii. 90.

[Covered war-chariots with four wheels, adapted for charging in various directions, are mentioned in *Chung hsing hsi nien lu, Ko chih ching yüan, c.* 29, *Chou chü lei*, p. 27*b*; and chariots for attacking city walls in *Yün fu, ibid.* p. 27*b*.]

[A "flying-tiger war-vessel," with four paddle-wheels, is mentioned in *Chung hsing hsi nien lu, ibid. c.* 28, *Chou chü lei*, p. 11*b*.]

Defensive.—"Formerly Wu Shu had strong troops who wore defensive armour tied by rush-cord. Three men formed a *lien* (聯) called *kuai tzŭ ma* (拐子馬). The government troops could not resist them."—*Sung shih Yo Wu chuan, c.* 74, p. 11*b*.

KIN.

"On the city wall of Hsi An were old iron cannon called *chên t'ien lei* (震天雷), 'heaven-shaking thunderers,' in shape like two bowls placed together; the top had a hole allowing the insertion of one finger. They had not been long in use in the army; they were the weapons of the men of Chin [Kin] who used them when defending Pien. It is related in the history that an iron bottle filled with powder was ignited. When the shot issued forth the sound was like thunder, and could be heard 100 *li*, the heat extending for half a *mou* (acre). When these weapons were fired they could penetrate armour. Those made of earthenware were strong, but the iron ones were more violent. If sufficient iron could not be obtained [in places where] the army [was], earthenware ones were used."—*Pai pien, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 28*a*.

"That the armies of Genghis Khan and his immediate successors, during their invasions of Northern China, were unacquainted with the use of gunpowder and even of less recondite devices in military pyrotechnics, may be inferred from numerous passages in Chinese literature; but the Kin Tartars, on the other hand, who first bore the brunt of their lust for dominion, undoubtedly employed a variety of such means in the course of various sieges. Thus during the defence of Loh-yang, when siege was laid to this city by Subutai, the lieutenant of the son of Genghis in 1232 A.D., we find from a record of the Sung historians which is copied by the annotators to the *T'ung-kien-kang-mu* and embodied also in the *Wu-pei-che* with even greater fullness that 'the Kin at this time had *huo-p'ao* called *chên-t'ien-lui* 震天雷 (heaven-quaking thunderers). They employed iron vessels filled with a drug, which they lighted with fire, and these when launched forth and set blazing, gave forth a sound like that of thunder, which could be heard beyond the distance of 100 *li* (about 33 miles!). Their effect was felt over an area of half a *mow* (or about the twelfth part of an acre). No armour could withstand their shock. The Mongols constructed arched ways, covered with bullock's hide, which they pushed to the foot of the walls in order to undermine them, the hollow being of sufficient size to allow men to pass underneath, and the garrison could do nothing against them, until a man among the *Kin* brought forward an invention which consisted in suspending the "heaven-quaking thunderers" by iron chains and letting them down into the places excavated, where the fire burst out from them, utterly destroying every fragment of the bullocks' hides and of the men they sheltered. They had also "flying-fire spears" to which the drug was applied, and which, on being ignited, burnt forward with a sudden flame to a distance of ten paces and upwards, so that no one durst approach them. The Mongols feared nothing but these two devices.' " "It is impossible to doubt that the *explosive* qualities of gunpowder had now been fully ascertained and utilized, and in the fire-spear, which 'burnt, or threw fire forwards,' the first glimmering of its projectile capabilities seems to have been recognized."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 90–2. See also the *Ko chih ching yüan*, where the shell is said to have been "like two cups joined together" with a small orifice at the top; and the *Wu pei chih* for an illustration of the fire-spear.

[The *Wu yüeh* (武鉞), battle-axe, of the Yin dynasty, is said in the *Yün yen kuo yen lu, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 20*a*, to have come into possession of the Great Chin.]

[The Nüchên (Chin or Kin) were clothed in strong cuirasses, and armed with swords, short pikes, bows and arrows or javelins.]—*Boulger, Short Hist.*, p. 41.

Mongol Period (1280 *to* 1368).—*Table VII.*

"Although we have at length reached a period when the composition and forces of gunpowder must, it is evident, have been understood, some time will still elapse before we are able to detect any marked advance in the methods of its employment. Throughout the Mongol (Yüan) dynasty, embracing the greater portion of the 14th century, no mention is to be found of any improvement on the inventions of an earlier age."—*Journ. N.-C.B.R.A.S.*, N.S. vi. 93.

"We see that three different notices of the siege of Siangyang, Chinese, Persian [Rashiduddin], and Venetian [M. Polo], all concur as to the employment of foreign engineers from the West, but all differ as to the individuals. [The Chinese authorities say that two engineers were sent for from Persia,—Rashiduddin, that one came from Damascus or Baalbec.] We have seen that one of the MSS. makes Polo assert that till this event the Mongols and Chinese were totally ignorant of mangonels and trebuchets. This, however, is quite untrue [see previous Period], and it is not very easy to reconcile even the statement, employed in all versions of the story, that mangonels of considerable power were unknown in the Far East, with other circumstances related in Mongol history. The Persian history called Tabakat-i-Násiri speaks of Aikah Nowin, the Manjaniki Kh'as, or Engineer-in-Chief to Chinghiz Khan, and his corps of 10,000 Manjanikis, or Mangonellers. The Chinese histories used by Ganbil also speak of these artillery battalions of Chinghiz. At the siege of Kai-fung-fu on the Hoang-ho, the latest capital of the Kin Emperors, in 1232, the Mongol general Subutai threw from his engines great quarters of mill-stones, which smashed the battlements and watch-towers on the ramparts, and even the great timbers of houses in the city. In 1236 we find the Chinese garrison of Chincheu (I-chin-hien on the Great Kiang near the Great Canal) repelling the Mongol attack, partly by means of these stone shot. When Hulaku was about to march against Persia (1253) his brother, the Great Kaan Mangu, sent to *Cathay* to fetch thence 1,000 families of Mangonellers, naphtha-shooters, and arblasters. . . ." "It is evident, therefore, that the Mongols and Chinese *had* engines of war, but that they were deficient in some advantage possessed by those of the Western nations. . . . Now, in looking at the Chinese representations of their ancient mangonels, which are evidently genuine, . . . I see none worked by the counterpoise; all . . . are shown as worked by man-ropes. Hence, probably, the improvement brought from the West was essentially the use of the counterpoised lever. . . ." "It is worthy of note that in the campaigns of Alaudin Khilji and his generals in the Deccan, circa 1300, frequent mention is made of the *Western Manjaniks* and their great power. . . ."—"Before quitting this subject, I will quote a curious passage from the history of the Sung Dynasty, contributed to [MM. Reinaud and Favé's *Du Feu Grégeois*] by M. Stanislas Julien. 'In the 9th year of the period Hien-shun (A.D. 1273), the frontier cities had fallen into the hands of the enemy (Tartars). The *Pao* (or engines for shooting) of the Hwei-Hwei (Mahomedans) were imitated, but in imitating them very ingenious improvements were introduced, and *Pao* of a different and very superior kind were constructed. Moreover, an extraordinary method was invented of neutralizing the effects of the enemy's *Pao*. Ropes were made of rice-straw, 4 inches thick and 34 feet in length. Twenty such ropes were joined, applied to the tops of buildings, and covered with clay. In this manner, the fire-arrows, fire-*pao*, and even the Pao casting stones of 100 lbs. weight, could cause no damage to the towers or houses.' (*Du Feu Grégeois*, p. 196)."—*Yule, Marco Polo*, ii. 130–1.

In 1352, T'o-t'o "captured the stronghold of Hsü-chou in Kiangsu by means of powerful ballistæ."—*Giles, Bio. Dic.*, p. 739.

"The first [?] coats of mail were made in China in 1288; perhaps the idea was obtained from the Malays or Arabs."—*Ch. Rev.*, xxiv. 205.

Ming Period (*Restoration of Chinese Supremacy*) (1368 *to* 1644).—*Table VIII.*

Offensive.—[Two-edged swords were used: see *I t'ung chih, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 9*a*; infantry and cavalry lances are mentioned in *Ch'en Chi-ju Chien wên lu, ibid.* p. 25*b*; bows and arrows, in *Ming hui tien, ibid. c.* 41, *Wu pei lei*, p. 9*b* (bow now bound with silk and varnished); *Tun chia k'ai shan t'u, ibid.* p. 10*a*; *Hsiao Ta-hsiang I su chi, ibid.* p. 10*a*; cross-bows, in *Li Shan-wên Hsüan chu, ibid.* p. 20*a*; and bamboo arrows shot from catapults in *Shih wu kan chu, ibid.* p. 23*a*.]

"The *chua chien* (鎚 簡) was the large iron cudgel."—*Shih wu kan chu, ibid.* p. 29*b*.

[The first occasion on which the use of firearms for warfare is mentioned in Chinese history is in A.D. 1407 when Chang Fu defeated the Annamite troops.]—*Giles, Bio. Dic.*, p. 21.

"The fore and aft parts of the *tan shao* (單 梢) cannon consisted of four poles fitted above with bolted rods; it had four wheels above, on which the rods and boards were placed, so that it could be raised or lowered when required. The *hsüan fêng* (旋 風) cannon was placed on a wheel above the main pole. The *hu tsun* (虎 蹲) cannon had its fore and aft poles short. The submarine *lien tien* (連 天) cannon was an iron or copper cannon placed in the water and connected by a reed as a conduit pipe, inside of which the fuze was placed. It was used in naval warfare."—*Shih wu kan chu, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 28*a*.

"The rifles and cannon of modern manufacture did not carry far; unless very skilfully used the 'hits' were very few. Of late years the Lu (Tartars) did not fear them; but the 'Great General' rifle (大 將 軍 *ta chiang chün*), 'Second General' rifle (二 將 軍 *êrh chiang chün*), and 'Third General' rifle (三 將 軍 *san chiang chün*) were powerful and destructive."—*Yang I-ch'ing Chih fu tsa lu, ibid.* p. 28*a*.

"The *fo lang chi* (佛 郎 機) Frank or Portuguese gun had its barrel made of copper. The weight of the larger ones was more than 1,000 catties; the middle-sized ones were more than 500 catties; and the smaller ones more than 100 catties in weight. The shell was of iron inside and lead outside, and weighed several catties. They were made in the reign of Chia Ching [1522–67]."—*Shih wu kan chu, ibid.* p. 28*b*. See also *Tschepe, Japan's Beziehungen zu China*, p. 242.

"The 'bird's-bill wooden rifle' (鳥 嘴 木 銃 *niao tsui mu t'ung*) was obtained in the reign of Chia Ch'ing—one of them was taken when the Japanese invaded Chê Chiang. An order was then issued to manufacture [more] on the same pattern."—*Ch'i hsiu lei kao, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 28*b*.

"Among the rifles were the *chi chiao* (鷄 脚), 'bird's foot'; copper *shih yen* (十 眼), 'ten-eye'; *ssŭ yen* (四 眼), 'four-eye'; *san yen* (三 眼), 'three-eye'; *chiu yen* (九 眼), 'nine-eye'; *chiu tsŭ* (九 子), 'nine-bullet'; *chia pa* (夾 靶), 'double target'; *ta pa* (大 把), 'large-stock'; and *ch'ien li* (千 里), 'thousand *li*.'"—*Shih wu kan chu, ibid.* p. 28*b*.

"The iron calthrop (蒺 藜 *chi li*), fire ball (火 毬 *huo ch'iu*), three cornered (三 稜 *san lêng*) six-headed (六 首 *liu shou*) [bombs] had iron points; outside was a mass of powder and inside was tied with a long string. When they were fired their sound was like a thunder-clap. The 'fire ball' was made of two or three joints of bamboo filled with 30 catties of tiles or cash and mixed with powder in order to make it into a ball; both ends stuck out about an inch; the outside of the ball was smeared with powder. The 'iron-bill fire falcon' (鐵 嘴 火 鷂 *t'ieh tsui huo yao*) (a kind of rocket) had its body made of wood; its bill of iron, and tail of straw, the inside being filled with powder. The 'bamboo fire-falcon' (竹 火 鷂 *chu huo yao*) was a falcon basket made of bamboo with a large body and narrow muzzle; when filled with powder [the muzzle] was sealed up with paper; its tail was made of grass."—*Shih wu kan chu, ibid.* p. 28*b*.

"On the walls [of Ningyuen] were arranged the cannon of European construction."—*Boulger, Short Hist.*, p. 111.

"In the 2nd moon of the 3rd year of the reign Wan Li [1575] of Shên Tsung, Yang Ping, Earl of Chang Wu, Governor-General of the Forces, proposed to make war-chariots for the field pieces of the capital. It is recorded in the Lu Ko, written by Wang Ch'i, that on each chariot 3 *fo lang chi*, Portuguese machine guns, of the 2nd class, 2 guns on horses, 2 *ti lien chu*, 2 *yung chu* guns, a musket, flag and shield were used. There were also long spears and large swords."—*Hsü wên hsien t'ung k'ao hsiang chieh, c.* 18 *hsia, Ping k'ao hsia*, p. 5*b*.

"The first sovereigns of the Ming dynasty are known to have devoted serious attention to the use of gunpowder in warfare. Chao Yi . . . recalls the fact that at the battle of Tung Ch'ang (in 1401) the armies of the Prince of Yen (afterwards the Emperor Yung Loh), were defeated with great slaughter owing to the use of fire-weapons; and he further gives prominence to the use of combustibles by the General Chang Fu, in his campaign against the Tonquinese in 1407. Of this transaction the historians of the Ming dynasty relate that Chang Fu, making a nocturnal assault upon the city of Topang, was met by a charge of elephants; but that he routed these animals 'by means of horses disguised as lions, which rushed forward to the attack, having fire-weapons [which were called] *shên-ki* (*i.e.*, divine enginery) attached to their sides.' The *Wu-pei-che* gives several illustrations of devices of this kind, which appear to have consisted in attaching tubes filled with inflammable materials to the bodies of horses and even of oxen. The use of the term *shên-ki* 神 機, applied by the Ming historians to these contrivances, would appear to have been used retrospectively, as the designation is expressly stated to have come into use at a later period than that of Chang Fu's invasion of Tonquin. The term, indeed, seems to have entered the Chinese language as one of the results of that invasion, and there is good reason for believing that China obtained at this period, and from her vanquished enemies, the two most powerful developments to which gunpowder has attained as a warlike engine, viz.: the *rocket* and the *cannon*. In its section on warfare, the History of the Ming dynasty, quoted from by Chao Yi, states specifically that 'on the invasion of Cochin-china during the reign of Yung Loh (1407 A.D.) the *shên-ki* method of spears and guns (*ts'iang-p'ao*) was acquired, and the *shên-ki* brigade was formed for the purpose of practising with them (*Wu li hsiao shih*). For the largest weapons, carriages were used; and for those next in size, and the smaller ones, frames, posts, or staves were employed. Those which were used on carriages correspond to the great guns of the present day (18th century) whilst the remainder answered to our modern light-artillery, and those which were used with staves were the modern fire-locks.' Chao Yi adds as a commentary on the above passage: 'It is thus seen that in the reign of Yung Loh firearms had already been obtained, but they were not permitted to be known publicly. Although in 1422 the proposition of Chang Fu for the placing of guns (*p'ao*) at the Ta T'ung and other frontier passes for defence against the enemy was acceded to, yet [these] formidable weapons were not allowed to be seen, and the Emperor set great store by them.'" "To quote again from Chao Yi:—'In the 6th year of Chêng T'ung, Hwang Chên, a military officer holding command on the frontier, organized a factory at Siüan Fu (in the Province of Chih-li) for making *shên-ch'ung* 神 銃 (divine guns); but his Majesty, fearing that if firearms were manufactured away from the capital the secret would become divulged, gave orders for the abandonment of the project. Thus previously to the reign of Chêng T'ung, firearms were not known to the public; and it was only after Kia Tsing's reign commenced (A.D. 1522) that they first became introduced in the army.'"—*Journ. N.-C.B.R.A.S.*, N.S. vi. 93–6. See also pp. 74–5.

[The appearance of novel weapons and firearms at this time was probably due to the advent of European pioneers on the coast of China.]—*Ibid.* pp. 96–7.

Some weapons also came from Japan. "Chinese writers admit that for the manufacture of improved weapons of this kind [firearms] their countrymen were indebted to Japanese ingenuity. Guided by a notice in Chao Yi's dissertation, we find that Lang Ying, a writer of the latter portion of the 16th century, in his valuable Miscellanies entitled *Ts'i-siu-lui-kao*, observes (*kiüan* 45), in connection with various inventions derived from Japan that: 'As regards the "bird-mouth" wood guns, the Japanese invaded Chekiang during the reign of Kia Tsing, and on some of their number being taken prisoner, possession was obtained of their weapons, and they were made to give instruction in the method of manufacturing them.'"—*Ibid.* vi. 97–8.

"By the beginning of the 17th century numerous devices seem to have come into vogue, among which the *ta-tsiang-kiün*, etc., or heavy cannon of small calibre and mediocre utility employed against the encroaching Manchows, are the most widely known. In the *Wu-pei-che* we find illustrations of nine kinds of match-lock, beside fourteen other weapons, more or less fantastic, for vomiting fire. One of these consisted in tubes fastened to each extremity of poles arranged in the form of a cross, which the artillerist, it would seem, was instructed to whirl around him in the centre of a *mêlee*. How ignition was to be effected is not explained. Fourteen kinds of explosive vessels are also depicted, in the shape of flasks, globes, grenades, etc. Of rocket arrows, numerous designs are given, some of which are obviously no more than crude and impracticable fancies. Of cannon, some dozen or more varieties are represented, beginning with the caliver [p. 96] . . . and extending to the unwieldy masses of metal, embedded in heavy trucks, to which the title of 'great commander' (*ta-tsiang-kiün*) was given." See diagrams, pp. 99–100. One of these weapons bore "a strong resemblance to those known in Europe during the 17th century as 'bombards,' but its use appears to have been confined to the vomitting of offensive and stifling compounds, for which many recipes are given in the *Wu-pei-che*. The designation of this weapon is given as 'the flying-cloud thunderbolt gun.'"—*Ibid.* vi. 98–100.

"As regards the construction and use of rockets, the *Wu-pei-che* leaves no doubt existing that at the time of its compilation (*i.e.*, early in the 17th century) the Chinese were fully acquainted with the propulsive powers of gunpowder, and the numerous engravings in which weapons of this kind are depicted plainly indicate the progress from a mere arrow, carrying a tube filled with combustibles attached to its stick, to the genuine rocket of modern pyrotechny." See diagrams and explanations in the *Wu Pei Chih*. The range of the "invincible bamboo commander," which closely resembled the modern form of rocket, "is stated to have been 700 to 800 *pu* (or about 1,500 yards); and its effects are alleged as being most terrific and destructive."—*Ibid.* vi. 100-2.

"Such artillery as the friar [Herrada] and his companions did see at their being there, they say it was of antiquity, and very ill wrought, and was for the most part pieces to shoot stones with, or murderers [?]; but it was given them to understand that in other provinces of the kingdom, there be that be very curiously wrought and fair, which may be of such which the Captain Artreda did see; who in a letter . . . to King Philip . . . said, the Chinos do use all armour as we do, and the artillery which they have is excellent good. . . . In every city they have certain houses, where they make their ordnance and artillery continually; they do not plant them on castles (for they have not the use of them in all the kingdom), but upon the gates of their cities, which have . . . thick walls and deep ditches, which they do fill with water out of the next river, at all times when need requireth, which they do account the greatest strength in all the kingdom."—*Mendoza, Hist.*, i. 130.

"Fire-arms of large size were introduced toward the end of the Ming dynasty by foreign instructors."—*Williams, Midd. King*, ii. 90.

"In the Japanese account of Hideyoshi's [平 秀 吉] Conquest of Corea, it is stated that, during the siege of Urusan [蔚 山] by the Chinese relieving army, the Ming troops made use of 佛 郎 機, an expression which looks like 'Frankish engines.'"—*Ch. Rev.*, xiv. 217.

"Wang Hung 汪 鋐, who was sent against the Franks, after they had built a fortified place at 南 頭 in *Tung Kwan* early in the reign of Kia-tsing (A.D. 1522–1567), recommended the use of Frankish firearms on the frontier against the invader 北 古 蠻, and they were found of very great service in protecting important or weak places."—*Ibid.* xviii. 379.

"About the year 1636, when the empire was threatened by the Manchows, the Jesuits at Peking were desired by the Emperor to instruct his people in casting some cannon."—*Davis, Chinese*, i. 230.

"The 'flying ladder' (飛 梯 *fei t'i*) [*cf.* LATER FEUDAL PERIOD] was 2 to 3 *chang* long; on its head were 2 wheels. It was leaned against a city wall to ascend by. The bamboo 'flying ladder' was made of a pole of thick bamboo on which the rungs were fitted. The 'ground-mounting flying ladder' (躡 地 飛 梯 *nieh ti fei t'i*) was like the 'flying ladder,' but between the steps was a turning wheel used for lifting the ladder; its ends were fitted with two wheels."—*Shih wu kan chu, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 29*a*.

Yü Ta-yu "seems to have achieved his greatest successes about 1561, by means of a 獨 輪 車 single-wheel chariot, an engine of some kind which destroyed the enemy wholesale."—*Giles, Bio. Dic.*, p. 960.

Defensive.—[In 1374 the mail sewn with thread was changed to that fastened by straps. The neck armour consisted of 30 plates, the body armour of 290, the arm armour of 17, and the leg armour of 20. The inside was coated with lime. See *Ming hui tien, Ko chih ching yüan*, c. 41, *Wu pei lei*, p. 4*a*; *Pai shih lei pien, ibid.* p. 4*a*; and *Chieh an man pi, ibid.* p. 6*a*.]

Noorhachu's "army had now been raised to an effective strength of 40,000 men, and the Manchu bowman, with his formidable bow, and the Manchu man-at-arms, in his cotton mail, proof to the arrow or spear, were as formidable warriors as then existed in the world."—*Boulger, Short Hist.*, p. 104.

[It was feared that the rifle, with which the *Shên Chi* division was armed, would be useless in rainfall, so the men were drilled in the use of long shields and long swords.]—*Hsü wên hsien t'ung k'ao hsiang chieh, c.* 18*b*, *Ping k'ao hsia*, p. 2*a*.

"In the 43rd year of the reign Chia Ch'ing [1564] the fighting men of the whole garrison were allowed to change the hexagonal helmet for the octagonal one."—*Ming hui tien, Ko chih ching yüan, c.* 41, *Wu pei lei*, p. 2*a*.

"The *lang hsien* (狼 筅), 'wolf stockade,' was made of large bamboo; on its upper part and four sides were branches; each corner had prongs; its breadth was two feet and length 15 to 16 feet; on the top were sharp spikes one foot long. Kuo Ying-hsiang said: 'In warfare the other weapons were too small and could easily cause soldiers to be cowards, but the *hsien* could protect the whole body; neither sword nor lance could penetrate it.'"—*Ch'i Chi-kuang Wu i p'ien, ibid.* p. 30*a*.

Manchu Period (1644 *to* —).—*Table IX.*

Offensive.—"The arms of the Chinese still consist of bows and arrows, spears, matchlocks, swords, and cannon of various sizes and lengths. The bow is used more for show in the military examinations than for service in battle. . . . The matchlock is of wrought iron and plain bore; it has a longer barrel than a musket—so long that a rest is sometimes attached to the stock for greater ease in firing; the match is a cord of hemp or coir, and the pan must be uncovered with the hand before it can be fired, which necessarily interferes with, and almost prevents its use in wet or windy weather. The cannon are cast, and although not of very uniform calibre from the mode of manufacture, are serviceable for salutes. The ginjal is a kind of swivel from six to fourteen feet long, resting on a tripod; being less liable to burst than the cannon, it is the most effective gun the Chinese possess."—*Williams, Midd. King.*, ii. 88–9.

"The matchlocks are ill-made weapons; most of their bullets, iron; and the bayonet unknown. Flint-locks, carbines, pistols, and all the other tribes of firearms are not in use. The bow is generally of the strength of forty to eighty catties; the string, silk; the arrows are well-made, feathered, and with iron or steel barbed points. This is, doubtless, the most efficient of their arms. . . . The swords are of two kinds, straight, heavy, double pointed (not unlike the Roman sword), of about two feet in length; or somewhat longer, bent in the form of a sabre; the handles of both are plain and unguarded. Those which we have seen are, in general, heavy weapons, of rather rough make, and poor finish, and of but ordinary metal; far inferior, in all respects, to those used by foreigners. Daggers and knives do not seem used for the purpose of war. The pike or lance is used of every possible variety of form; the shaft from ten to fourteen feet long, of bamboo or hard wood; some are like a halberd, a Lochaber axe, a scythe on the end of a pole, a half moon with the curve inward or outward, and sharpened to a fine edge; but the whole of them probably used more as means of domestic defence than in the field. . . . Double swords, so called, are sometimes used: these are not much longer than a large dagger; their inside surfaces are ground flat, so that when placed in contact, they lie close to each other and go into a single scabbard; the blades are wide at the hilt, and decrease regularly towards the points. When unsheathed for action, the Chinese warrior brandishes one of these blades in each hand."—*Ch. Repos.*, v. 176–7.

"The principal weapons of the Chinese are the bow, the matchlock, the sword, and the lance or pike: the use in armies of cannon, except of a small size, is, we think, but of unfrequent occurrence; the difficulty of transport of such unwieldy weapons over the bad or narrow roads, or over hills and rivers, must be greater than the gain in efficiency; we read, it is true, of Kanghe having cannon of light kind cast by the Jesuits, in order to punish some hill borderers who had rebelled; and Keënlung had them taken against the Meaou-tsze in his intended war of extermination: we also know that small pieces are used, on the backs of dromedaries, in the North-west and desert frontier; but, as constant and powerful aids to an army, the cannon of the Chinese cannot be regarded. We have never read or heard of anything approaching to the light and handy field pieces of the Western world. . . . The shot is not well made, and, as the guns are of various sizes, we apprehend that no great care can be taken to give each its own; loose and small bullets and pieces of iron are used, as well as stones, which are often fired as balls. Of shells, we believe, the Chinese have no idea; we find mention made of hollow masses of iron, filled up with powder and pieces of iron, being used to harass an advancing army, by burying them in the ground, where it is expected the next night's encampment may be made; but, as weapons of active annoyance, the Chinese have yet to learn their use."—*Ibid.* v. 176.

Adam Schaal's successor, "Verbiest, assisted the Manchu commanders during the Chinese satrap rebellions to make large cannon for use in the field."—*Parker, China*, p. 90.

Under the inspection of Ferdinand Verbiest "some hundred pieces of artillery were constructed for the Tartar Emperor Kânghy, towards the end of the seventeenth century."—*Davis, Chinese*, i. 230.

"The gunpowder is badly mixed and triturated, though the proportions are nearly the same as our own. The native arms are now rapidly giving place to foreign in the imperial army, and the establishment of four or five arsenals under the management of competent instructors, where implements of warfare of every kind are manufactured, will, ere long, make an entire change in Chinese weapons and tactics. Some of their brass guns were of enormous size and great strength, but were of little use for practical warfare, owing to the bad carriages and rude means of working them."—*Williams, Midd. King.*, ii. 90–1.

"The Chinese powder is usually coarse grained, and of uneven size; apparently, also, from the noisome smell which it leaves after firing, abounding in sulphur; it seems to be easily affected by the atmosphere, to decompose rapidly, and to leave black stain and moisture on paper when fired. For these reasons, we can understand the want of expansive force which has been noticed by all who have witnessed the discharge of Chinese artillery."—*Ch. Repos.*, v. 166.

"The cannon which are to be seen in the forts on the Canton river, and which may be taken as the best which they have, except the brass guns of the Jesuits, are worthy of the powder which is used for them. Many are Portuguese or Dutch pieces, of every age, length, shape, and calibre; and not a few of them so old and honeycombed as to be useless. Of marine cannon, properly so called, they have none, those on board the junks being field or battery pieces. . . . The native cannon are cast, and are, we believe, universally iron; the bore not drilled smooth, as in European guns; the carriages on which they rest are blocks of wood, or solid beds, on which the gun is lashed down with rattans; so that it must be impossible to fire any but point blank shots, and very difficult to direct the gun to an object, except that immediately in front of the embrasure whence fired."—*Ibid.* v. 167.

The members of the Imperial Guard "are armed at least with bows and arrows, but no mention is made of their using the musket. When escorting his Majesty, a duty apparently performed by the *Shi-wei*, or Gentlemen of the Guard, without the soldiery, a certain number carry a sort of trident-halberd nearly twelve feet long; a certain number, swords or daggers, and all the implements of archery."—*Ibid.* xx. 259-60.

"I have occasionally seen breech-loading guns at Mandarin Yamêns and on board of junks. It appears that with each gun there are four or five breech pieces (or blocks) into which the charge of powder and the bullet is inserted by an assistant; it is then put into its place in the breech of the gun and . . . retained by an iron wedge driven in by a heavy mallet or hammer; the charge is ignited by means of a slow match or joss stick."—*Ch. Rev.*, iv. 268.

"The Chinese warships (junks) are large, unwieldy looking masses of timber, with mat sails, wooden anchors, rattan cables, a considerable sheer, flat upright stems, no stern posts, enormously high sterns ornamented with gold and paintings, considerably weakened too by a large hole in which the monstrous rudder can be hoisted up and housed in bad weather; immense quarter galleries, and look-out houses on the deck; generally drawing but little water, flat-floored, painted red and black, with large goggle eyes in the bows; . . . few are over 250 to 350 tons, and the generality are armed with but two or four guns, which as we have before observed, are on solid beds, and must therefore be useless, save in the smoothest water. We have occasionally, however, seen six guns in a large war-junk. . . . The crew is composed of forty to sixty men . . . Lances, pikes, and a few swords, but plenty of good stones, make up the armament. The smaller craft are not so shapeless as the others, being built partly on the model of some foreign boats, as the Chinese acknowledge, the same as used in the hong-merchants' and the smuggling boats; these are neat in their appearance, pull from ten to sixty oars, and go very fast; they are armed with one or two small swivels, two, three, or four pounders, and the usual and favorite weapons of the Chinese, lances and stones; over the sides of the boats, as they pull, are hung shields of rattans painted into a caricature of a tiger's face, with which to protect themselves in case of attack. We have also, in some of these, seen occasionally, something approaching to boarding nettings; but their speed is what is chiefly relied on."—*Ch. Repos.*, v. 173-4.

"In offensive weapons there is remarkable variety. On the coast, its soldiers are armed with the latest rifles, while in the far interior they employ the same arms as were used by the vast hosts of Tamerlane and Genghis Khan. Taking the Empire as a whole, the student or collector can find in use to-day every weapon that has been employed within its borders since the time of Confucius. In addition to this, the mandarins and high officials arm their retinues with conventional weapons representing different periods in the history of the nation. On account of the changes wrought by time, many of these martial instruments are so incongruous as to be positively funny. Thus, for example, the Mongolian Tartars did their fighting on horseback, and one of their most formidable arms was a pole to which was attached a hook knife edged on the inside like a reaper's sickle. With this they would pull a rider from his steed, wounding or killing him in the process, or would hamstring the horse at a single blow. This pole-hook is no longer used by the few cavalry squadrons of China, but is found carried by footmen in nearly all the retinues of the great nobles. It looks formidable, but when used by infantry against infantry would be about as serviceable as an Indian club fastened securely to the end of a broomstick."—*Hongkong Telegraph*, Aug. 17, 1892.

"A glance at a collection of these arms shows that military uniformity was almost unknown to the Chinese Generals of the past, and that the armies were made up of diverse elements, armed usually with such instruments used in peaceful pursuits as can be utilized in war. A common weapon is a trident, tinned and barbed exactly as are those employed by fishermen in spearing eels. Similar to this is a three-pronged hayfork. Of equally bucolic origin is a long pole to whose end is fastened the blade of a scythe or sickle. The European mace is suggested by a long-handled light hammer similar to that with which Charles Martel is said to have won his quaint name. It is obvious that these four weapons are of harmless origin. The first was the favorite implement of fishermen, and the 2nd, 3rd and 4th of agricultural communities."—*Ibid.*

"Of the five types described there are endless varieties. The poles are bamboo or solid wood. They are plain, carved, or decorated with mother-of-pearl, metal, or cord. The heads are copper, brass, iron, pewter or steel; sometimes they are silvered and sometimes bronzed, lacquered or gilt. Handsome ones are the exception and not the rule. The average retainer of a high official carries an arm whose pole is of the commonest wood, stained red, and whose head is of the lowest kind of cast iron or impure pewter. Many of these ominous-looking affairs would not stand a light blow, both head and pole breaking at a very slight shock."—*Ibid.*

"I have never seen any lances. The deficiency is made up by a surplus of spears and halberds. Of these the designs are varied, ranging from light and efficient points and edges to grotesque and hideous shapes, that would frighten more than they would hurt. At times the workmanship is admirable. A spear captured by the French from the Black Flags in Tonquin is eight feet long. The shaft is of iron wood, round, polished and varnished and re-enforced here and there by wrapping of fine copper wire, and at the upper end is encrusted the distance of a foot with mother-of-pearl. The end is feruled with a large copper band in which is set the spearhead. This is made of fine steel six inches in length and triangular in cross-section. One face is deeply grooved so as to allow the use of a large amount of poison. These spears are used with great skill by the Chinese. Lee Yu, a famous bandit, could throw one through a man at 50 yards. In the Franco-Tonquin war, a powerful Chinese foot-soldier drove his weapon entirely through two French infantrymen. It is said that the finer and handsomer spears are not of Chinese workmanship, but are made by Japanese, Corean, Annamite and Malay ironsmiths. How true this is, I am unable to determine."—*Ibid.*

"Of halberds, there is any variety, ranging from the simple Lochaber-axe and pole-axe to the cumbrous and complicated masses of metal that were so common at the close of the Age of Chivalry. The oddest specimen was one which, instead of an axe on one side, had what seemed to be a hammer-head."—*Ibid.*

"In archery the Chinese have long been experts, especially those of Manchuria and Szechuen. Their bows are of three types: the long bow, which is over 5 feet in length, the short bow, which is about 4 feet long, and the cross-bow. The strings are made of silk, of gut, or of a very strong home-made twine wrapped with fine silk in the middle. Bows are graded according to their pull, the standard being 100 catties, about 135 lbs. To determine the pull, the bow, properly strung, is suspended from the middle and weights hung to the middle of the string, until the latter is nearly an arrow's length from the bow. Famous bowmen use bows with heavier pulls, ranging from 150 to 200 lbs., and one distinguished Chinese Robin Hood is said to have drawn a 200 catty bow (about 270 lbs.). The bows vary greatly in materials, construction, decoration and finish. They are made of one or several pieces of wood, and are frequently inlaid or engrossed until they are a true work of art."—*Ibid.*

"Worthy of mention are the tiger-bows. These are extra large and heavy, and are fastened to a frame-work near a path or road frequented by tigers and other large animals. They are set by two men and are so arranged that the moving of a cord stretched across the road disengages the string and sends the arrow on its way. The force is so great that the shaft frequently comes out of the other side of the tiger, deer or buffalo. To ensure success, the arrow is usually double-barbed and envenomed. On the mainland opposite the island of Amoy these tiger-bows are in constant use, and annually kill at least 50 of these huge cats."—*Ibid.*

Defensive.—"While China cannot compare with Europe in the beauty, richness or variety of its defensive armour, it nevertheless can show many ingenious and interesting types." "The original armour of the North (Manchuria and Mongolia) seems to have been leather, and in shape more like a blouse than a jerkin. In the course of years, the skin was doubled, trebled or quadrupled, and a Chinese lower garment that might be called leather greaves and cuirasses combined was added to the upper one. The Mongolian nomads learned at a very early age that a coat or cuirass made of sheepskin in several thicknesses made a very warm garment, and would turn spear, arrow or sword. Apparel of this class is in use to-day, and may be secured very cheaply in Shantung."—*Ibid.*

"Parallel to this alternating of leather and wool in the North, was that of paper and cotton cloth in the South of China. It seems ridiculous to call such combinations armour, and yet they make an armour superior in many instances to steel. Thirty thicknesses of alternate calico and paper will resist a pistol bullet or ball from a rifle at long range. A spearman who thrusts his weapon into a man clad in this kind of garment can neither wound his enemy nor extricate his weapon, and if the enemy is an archer or is armed with a long sword or javelin is likely to lose his life for his mischance. The suit of a famous Yunnan bandit consisted of 60 thicknesses of cotton cloth and paper and made him practically invulnerable. These suits are comparatively light, are very durable and, of course, extremely cheap. Between these extreme types lie many kinds of plate, scale and chain armour. Plate mail never reached a high development in the Far East. I cannot find that it ever passed beyond the combination of breast-plate, back-plate and shoulder-pieces. Scale mail, on the other hand, was carried at an early period to high perfection. The scales were applied to cloth or leather at first as spangles are to gauze, and later as tiles or slates are to the boards of a roof. They were composed of iron, bronze, brass, pewter, silver, gold, or of various Oriental alloys. In making a suit, scales of one kind were usually employed, but combinations were frequent in which metals of contrasting colours were used."—*Ibid.*

"The defensive armour comprises only the iron helmet and quilted dress of the Tartar, which, as Staunton says, 'seems to have the inconvenience, without the advantages of armour.'"—*Ch. Repos.*, v. 176-7.

"Rattan shields, painted with tigers' heads, are used on board the revenue cutters to turn the thrust of spears, and on ceremonial occasions, when the companies are paraded in full uniforms and equipments. . . . The cuirass is made of quilted and doubled cotton cloth, and covered with iron plates or brass knobs connected by copper bands; the helmet is iron or polished steel, sometimes inlaid, weighing two and one-fourth pounds, and has neck and ear lappets to protect those parts."—*Williams, Midd. King.*, ii. 89. See also *Davis, Chinese*, i. 229.

[For the defensive use of the pike, lance, etc., see *supra.*]

"Of the different pieces or armour, the helmet alone deserves attention. The Chinese artist worked along a different channel from his European colleague and tried to make the headpiece monstrous and terrifying rather than protective. Designs representing the jaws of serpents, griffins and dragons are very common, but such affairs as the barred and vizored helmet which Doré loved to draw are entirely unknown. Morions and skull-caps were also in general use, and are to-day. The queerest type of all is the executioner's helmet. It resembles a tall mouse-trap or fly-trap in wire, and is painted the conventional vermilion. Centuries ago the wires were flat rods, and so arranged as to defy sword and axe, and owing to their great height disconcerted the archers of the opposite army. In the North, where wood is scarce, the helmet is made from woollen cloth, leather and metal; in the West, where there are forests, wood was frequently employed; while in the South, in addition to these four materials, cotton-cloth and paper were also used."—*Hongkong Telegraph*, Aug. 17, 1892.

"Shields and bucklers have been in vogue from time immemorial. The favourite type is a bossed circle from 2 to 3 feet in diameter, similar to those employed by the old Highlanders. Its material is leather, metal, or woven split bamboo. Bamboo shields are very strong and durable. They are made of a certain variety of that vegetable, which must have attained a certain size and hardness of fibre to fit it for this particular use. The bamboo is split into pieces an inch in width and four feet long, softened and braided in basket-work over a frame the size of the desired shield. It is dried in the sun and then in a kiln, and afterwards polished and varnished. Its high elasticity, great strength and lightness render it an admirable weapon of defence. A double thickness of bamboo, the two a half-inch apart with a metal rim and boss, is better for the man behind it than any pavise or buckler of the Middle Ages."—*Ibid.*

[For targets, see IMPLEMENTS.]

ÆSTHETIC PRODUCTS.

Early Feudal Period (*c.* 2357 *to* 1122 B.C.).—*Table I.*

Object-decoration.—[The vessels of Shun are said to have been unvarnished.]—*Journ. P.O.S.*, i. 101.

[It is doubtful if the nine vases ascribed to Yü were engraved with a series of charts of the nine provinces.]—*Legge, Ch. Class.*, III. i. Prol. pp. 66-7, and note.

[Yü is said to have refused to chisel his sacrificial bowls.]—*Journ. P.O.S.*, i. 101.

"It seems to have been customary in early days to attach inscriptions, poetical and otherwise, to all sorts of articles of daily use. On the bath-tub of T'ang, founder of the Shang dynasty in B.C. 1776, there was said to have been written these words:—'If any one on any one day can make a new man of himself, let him do so every day.' Similarly, an old metal mirror bore as its legend, 'Man combs his hair every morning; why not his heart?'"—*Giles, Hist. of Ch. Lit.*, p. 55.

"I [Yü] wish to see the emblematic figures of the ancients,—the sun, the moon, the stars, the mountain, the dragon, and the flowery fowl, which are depicted on the upper garment; the temple-cup, the aquatic grass, the flames, the grains of rice, the hatchet, and the symbol of distinction, which are embroidered on the lower garment:—I wish to see all these displayed with the five colours, so as to form the official robe."—*Shu ching*, Pt. II. Bk. IV. Ch. I. 4; *Legge, Ch. Class.*, III. i. 80.

"There were twelve figures, six painted on the upper garment or robe (衣), and six embroidered on the lower garment (裳). They were called altogether 'the twelve ornaments' (十二章)."—*Legge*, III. i. 79, note.

"The ancient Chinese made great use of feathers on their flags and banners, and for ornament generally."—*Ibid.* III. i. 107, note.

[In Ch'u 8 dragons carved out of garoo-wood were adorned with gold and precious stones.]—*Tzŭ chih t'ung chien kang mu, Chi lan.*

[For decoration of weapons see WEAPONS.]

Personal Adornment.—"Yü made *fên* (粉), face powder."—*Mo Tzŭ, Ko chih ching yüan, c.* 55, *Hsiang lien ch'i wu lei*, p. 11*b.*

"Chou [Hsin] made the finger-ring out of precious wood."—*Wu yüan, ibid.* p. 9*a.*

"The bracelet was made by Chieh [the infamous Emperor of Shang] of gold and jade."—*Shih wu kan chu, ibid.* p. 10*a.*

"Chou [Hsin] made the gold head-ornament [artificial flowers.]"—*Ku chin chu, ibid.* p. 5*b.*

Architecture.—"As to architecture, the little that the Chou-king and the ancients say on the subject does not give one a very high opinion of it. The ancient characters of the house, the hall, and the apartment are not even a rough sketch of the designs they have had since. It is pretty generally maintained that that of the palace was invented under the Chang dynasty. Hoai-nan-tsée, Lu-chi, etc., describe the house of the good Yao as a labourer's hut. The roof, according to them, was of straw and earth, the summer rains caused grass to grow on it and covered it with verdure. After the entrance, which was turned to the south, came a large court, where was the audience-hall. At the end of this court surrounded by walls, was a large hall where were preserved the weights and measures for the merchants who lived within the precincts. Beyond this hall was a second court, at the bottom of which was the humble dwelling where the Prince lived with his family. The audience-hall was raised above the earth, and the steps by which it was reached were made of grass. As it was necessary to wait for one's turn to be admitted to audience, trees had been planted at the gates so that the officials and people there might be protected from the sun. The Chou-king says that Chun had impressed the four gates of the palace with an air of grandeur and majesty which inspired respect. The gates on the south, east, and west opened on to the large court, that on the north was used for the domestic purposes of the house of Yao, behind which it was. This is still to-day the plan of all the great Palaces."—*Mém. conc. les Chin.*, i. 222.

"In the plan of a house the ancients were influenced by filial piety, which caused them to begin with the ancestral hall in the south-east plot of land set apart for the building of the palace.

This, according to the *Chow-li*, was the idea of the architecture of B.C. 2200. Religion, as people then understood it, was a powerful sentiment in their minds."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 258.

"We find in the *Kaou kung ki* that the dimensions of the Hia dynasty ancestral temple are given. It is there said to have been 14 feet deep and 17⅓ feet wide. There were five rooms occupying the north-east, south-east, north-west, south-west and centre; each was fifteen feet square; the middle one was three feet wider from east to west than the others. There were nine steps on the ascent. There were windows as well as doors to each of the five principal rooms. The doors were four and the windows eight. Lime made of shells was used in ornamenting the building. At the main door was a separate hall, said by the Erya, a very ancient authority, to have been a school-room." "In this account of a Hia dynasty temple we see that the five elements' philosophy had a voice in the arrangement of rooms. The idea of the architect would be conformity to nature as interpreted by the physical theory of the time."—*Ibid.* xxiv. 257–8.

"In the Imperial temple of the Shang dynasty the idea of a double roof was introduced. The length of the hall was 56 feet. The emperor's platform was raised [to] three feet. The roof was made double on all four sides. The object in this was to lend an air of greater richness and dignity to Imperial buildings."—*Ibid.* xxiv. 258.

Painting.—"With regard to the origin of painting and to the personal history of the painters who go back to the times before the Christian era we know little enough. This secondary information is not of the kind which would have escaped intact in the great destruction of books."—*Rev. Contemp.*, xxv. 243. See also *Giles, Ch. Pict. Art*, pp. 1–3.

"Painting . . . was reckoned among the fine arts."—*Giles, Historic China*, p. 4.

Literature.—"The oldest monuments of the literature are in verse, and the symbol which designates compositions of this kind, according to the opinion of Morrison, indicates their ancient origin. It is the word 詩 *chi* (verse), a character formed of *yen* (speech) and *ssé* (temple), 'the speech of the temple.'"—*Bazin, Théatre Chinois*, Introd. pp. viii-ix.

Tchêng-ki-tong says that traditions were handed down in verse before the invention of writing. "Poetry has been in China, as in Greece, the language of the gods. It was poetry that inculcated laws and maxims; it was by the harmony of its lines that traditions were handed down, at a time when memory had to supply the place of writing, and it was the first language of wisdom and inspiration."—*Chinese Painted by Themselves*, p. 133.

[The rhymed ballads in various metres afterwards collected to form the *Shih ching*, or book of Odes (see LATER FEUDAL PERIOD), were composed between the reign of the Great Yü and the beginning of the 6th century B.C.]—*Giles, Hist. of Ch. Lit.*, p. 12.

"The earliest Chinese poetry, as we find it in the Sheeking, appears certainly to have made use of the embellishment of both measure and rhyme, but with a degree of irregularity very different from the polish of modern versification. The lines are occasionally of all lengths; and the rhyme seems to be subject to little rule. It will occasionally occur for six or eight consecutive verses, and there will sometimes be none at all." "This seeming neglect may partly result from a change of pronunciation."—*Davis, On the Poetry of the Chinese*, pp. 12, 23.

[An ancient song, descriptive of the royal perfection, and stimulating men to imitate it, is given in the *Shu ching*, Pt. V. Bk. IV. 14. "The lines are composed of four characters, and every two lines rhyme together after a fashion" (*Legge, Ch. Class.*, III. ii. 331, note).]

"It has been alleged, with more or less truth, that all Chinese poetry is pitched in the key of melancholy; that the favourite themes of Chinese poets are the transitory character of life with its partings and other ills, and the inevitable approach of death, with substitution of the unknown for the known."—*Giles, Hist. of Ch. Lit.*, p. 121.

"It is impossible to assert that before his [Confucius'] time there was anything in the sense of what we understand by the term general literature. The written language appears to have been used chiefly for purposes of administration."—*Ibid.* p. 7.

Drama.—"Play-actors were driven from the empire, Chinese history relates, in the eighteenth century before Jesus Christ."—*Ampère, La Science et les Lettres en Orient*, p. 223.

"As in the West the miracle play preceded the theatre, so the drama in China was originally sacred, and the music used was reckoned sacred."—*Ch. Rec.*, xxi. 345. *Cf.* following Period.

Music.—"Music in China has undoubtedly been known since the remotest antiquity."—*Van Aalst, Ch. Music*, p. 4.

"The first invaders of China certainly brought with them certain notions of music. The aborigines themselves (the *Li*, the *Kuei*, and the *Féng* tribes, remnants of which are said to be still in existence in South China) had also some kind of musical system, which their conquerers admired and probably mixed with their own."—*Ibid.* p. 4.

"The music is so ancient that at the time of the emperor Chun [Shun], more than 2,200 years before our era, there already existed a comptrollership of music (*Shu ching*, Sect. *Shun tien*, fol. 19)."—*Bazin, Théatre Chinois*, Introd. pp. viii–ix.

Music is "said to have been invented by Huang Ti . . ., but few traces of it survived the Burning of the Books. . . . We know that it was very powerful as an agent of good government; and Confucius himself was so impressed by the execution of a piece composed by the Emperor Shun, sixteen centuries previously, that 'for three months he could not tell one kind of meat from another.'"—*Giles, Gloss.*, p. 157.

"We read in the 通典 (*T'ung-tien*) that the music of the Emperor Fu Hsi was called 扶來 (*fu-lai*) or 立本 (*li-pên*); that of the Emperor Shên Nung, 扶特 (*fu-t'ê*) or 下謀 (*hsia-mou*); and that of the Emperor Huang Ti, 咸池 (*hsien-ch'ih*), or the 'all-pervading influence.' What the real meaning of these names was is not known, and they may be compared to the obscure musical terms of the Bible. At that time music was not regulated by any laws; each Emperor had his own system, and they did not always agree (see Preface to the 闕里舊志 which says: 五帝不相合樂由來尚矣). Beginning with Huang Ti, 'the Yellow Emperor' . . ., Chinese music assumes its characteristic form. A certain note is taken as the base; sounds are fixed, and receive names; comparisons are drawn between the notes and the celestial bodies; music becomes a necessity in the State—a key to good government. Huang Ti hears it (see 韓苑洛志樂, chap. 13). To obey the desire of his human nature, he renders it manifest through all the Empire to comply with the wishes of heaven; he practises it, to be in accordance with the rites of propriety; and he establishes it in the Empire, to render the people better and happier. The succeeding Emperors followed the system of Huang Ti, and composed hymns; the great Shun . . . composed the piece called *Ta Shao*. . . . All the philosophers are unanimous in their praise of ancient music; it was eminently sweet and harmonious, and produced inexpressible sensations of pleasure in the hearers. Therefore they lament and regret that it has been lost." "It is most probable that the merits of ancient music consisted chiefly, like that of the Greeks, in regulating the movements of dances and poetry. Indeed, the Chinese idea is that music without poetry is no music at all."—*Van Aalst, Ch. Music*, pp. 4–5.

[Giles (*Historic China*, p. 4) says both vocal and instrumental music were widely cultivated.]

[For the legendary history of the origin of the notes, see *Ch. Rev.*, i. 326; 326–9; 384–8; ii. 47–50; 257; *Ch. Rec.*, xxi. 305–6.]

The "five notes (聲) constitute the imperfect scale, common perhaps to all nations in their early attempts to form a musical system, into which no interval of less than a tone is admitted. Their names are *kung* (宮), *shang* (商), *kêŏ* (角), *che* (徵, generally read *ching*, but not in this sense), and *yu* (羽). The tubes (律) which produce and subsequently harmonize (和) these notes, are said to measure, in ninths of an inch, 81, 72, 64, 54, and 48 respectively. The next number in this series, corresponding to the octave to *kung*, should of course be ½ of 81 = 40½; and we have thus according to our notation G, A, B, D, E, G. The series is constructed, starting from 81 as a basis, by making perfect fifths ascending (3 : 2), and perfect fourths descending (3 : 4). Thus from 81 is obtained 54; 54 gives, by the second proportion, 72; 72 again gives 48; and 48 gives 64. Carrying on this process, increasing or decreasing each time, as the case requires, the following set of 12 is obtained :—81, 75⅔, 72, 67⅓, 64, 59⅔, 56⅔, 54, 50⅔, 48, 44⅔, 42⅔. (The fractions are not very accurate.) Twelve tubes of these several lengths constituted what I have called 'the standard tubes.' . . . As regards the theory of music, could we be sure that the details which have been given, had really been wrought out in Shun's time, we could not refuse them our meed of admiration. The progress of the Chinese in music has not corresponded to such beginnings. A theoretical difficulty and a practical one have hindered them. They have found it impossible in theory for A to hold the same proportion to D as D to G; and in practice they have found that while their calculations might be applied to stringed instruments, the tube G must be made considerably less than half the length of the tube G in order to sound the octave to it. Their division of the tubes into 6 律 and 6 呂, moreover, has complicated the subject, and thrown around it the perplexity of their reasonings about the *yin* and *yang* principles."—*Legge, Ch. Class.*, III. i. 48, note.

"According to Chinese tradition, the progression of fifths, which was the origin of their scale, was carried on by its inventors, Ling-lun and the Emperor Hoang-ti, until it yielded a system of twelve notes separated by semitones, like the duodecimal chromatic scale of European music. This is the system of the twelve Lu, which according to Chinese ideas is the foundation of the whole art of tone, and which they recognize, not only in theory, but in some of their instrumental forms," notably the *chê* (an instrument like the zither) as described by Amiot (*Mémoires*, p. 58) and the *pien-ching* and *pien-chung* (chimes of bells and resonant stones) as described by Van Aalst (*Ch. Music*, pp. 49, 54).—*Phil. Rev.*, i. 154.

"The use of the scale at different pitches . . . appears to have been reduced to a definite and elaborate system in Chinese theory from time immemorial."—*Ibid.* i. 71.

"Even in the time of Yao and Chun eight kinds of sounds were distinguished, produced by as many different sounding bodies, and . . . there were special instruments, designed to render audible these eight kinds of sounds. . . . Researches had been made to obtain the correct tone of each of these eight sounding bodies."—*Mém. conc. les Chin.*, vi. 33.

"The order most anciently assigned to the eight sonorous bodies which produced the eight kinds of sounds, is 1, metal, 2, stone, 3, silk, 4, bamboo, 5, gourd, 6, baked earth, 7, the tanned skins of animals, 8, wood. This order was reversed, in the lapse of time, by those amongst the literati who wished, after their fashion, to make the eight trigrams of Fou-hi agree with the eight kinds of sounds, but this arrangement did not come down further than the Sung." "1, the sound of skin was produced by drums; 2, of stone, by the *king*; 3, of metal, by bells; 4, of baked earth, by the *hiuen*; 5, of silk, by the *kin* and the *chê*; 6, of wood, by the *yu* and the *tchou*; 7, of bamboo, by the various flutes and the *koan*; 8, of gourd, by the *cheng*."—*Ibid.* vi. 34.

"These same couples of notes [alternate notes of male and female birds] were the key-notes in the music used in the worship of the different spirits."—*Ch. Rec.*, xxi. 306.

"Originally in China as elsewhere music was sacred. It was used at the worship of heaven and earth and at worship of ancestors and of Confucius."—*Ibid.* xxi. 344.

"The Yo Tien (Dictionary of Music) frequently mentions grants of musical instruments to various peoples; the Coreans being mentioned several times. They were usually grants to new temples."—*Ibid.* xxi. 344.

"Music at ancestral worship comes down from the very earliest times. At death of Emperors, Empresses and Imperial concubines, however, all music was stopped for a given time." [*Cf.* FUNERAL RITES.]—*Ibid.* xxi. 344.

"Tradition relates: 'The knowledge of tones and sounds has a close connection with the science of government, and he alone who understands music is capable of governing.' That is why the founders of the Chinese dynasties, to give proof of their intelligence, nearly all inaugurated their accession to the throne by introducing into the empire a new system of music."—*Bazin, Théatre Chinois*, Introd. p. ix; *Li chi*, Sect. *Yüeh-chi*, comm. p. 1. The number of musicians allowed to the feudal barons was proportioned to his assiduity in rightly governing his State (*Journ. N.-C.B.R.A.S.*, N.S. v. 38-9.)

"The Chinese, though they have given to music a very conspicuous place in their social-political system, have not even reached the ancient Greeks in respect to variety and completeness They have only developed one of the Greek systems, and strange to say the worst of them, which, at a later period . . . was called the Lydian Music [see *Ch. Rev.*, ii. 48–9]. The Chinese themselves seem not to be aware of their defects in this respect; they talk even to the present day of their superior music in ancient times, which, as they like to believe, has unfortunately been lost in later ages."—*Ch. Rev.*, i. 325.

"The characteristic features of the Lydian or Chinese music are (*vide* Marx) the H and the sharp fourth (*übermässige Quarte*). In other respects it resembles our Major. Only for this H the Lydic music is deficient of a tonic harmony on the subdominant, and cannot, of course, have modulations to it."—*Ibid.* ii. 48.

"What was the real pitch of the first *huang-chung* tube? The size, capacity, and material of the tubes have so often been changed during the successive dynasties that it has become almost impossible to form any acceptable conclusion on this subject."—*Van Aalst, Ch. Music*, p. 13.

"In our Western music the position of a note on the stave determines its pitch. In ancient Chinese music, with only five characters to represent the different sounds, it must have been next to impossible to read a written piece of music."—*Ibid.* p. 17.

"During the Yin Dynasty . . . and the centuries preceding it, only the five principal tones were in use."—*Ch. Rev.*, i. 386.

[The invention of the following instruments are ascribed to the mythical rules :—*pien ch'ing* (編 鐘), chime of 12 bells, agreeing with the *lü*; *ch'in* (琴), originally with only 5 chords, subsequently increased to 6 and 7; *sê* (瑟), originally with 50 strings; *hsüan* (壎), ocarina; *p'ai hsiao* (排 簫), Pandean pipes, a collection of 10 tubes, gradually decreasing in length and connected together in a rough manner, by a silk cord. In subsequent ages the number of tubes was increased. It was invented before the *shêng* (笙), an instrument consisting of a body or wind-chest made of gourd, and tubes of different length forming the upper part, and may have been its prototype.] —*Van Aalst*, pp. 51, 52, 54, 59, 62, 82; *Ch. Rev.*, Aug. 1882; *Legge, Ch. Class.*, III. i. Prol. p. 75; *Journ. N.-C.B.R.A.S.*, N.S. viii. 113; *Giles, Dic.*, No. 2109. See also description of the *ch'in* in *Williams, Midd. King.*, ii. 99–100, and of the Pandean pipes in *Ch. Rev.*, xiii. 402-3.

"The ancient Chinese had both the lyre, *kin* or *shih*, and the pipes 龠 *yoh*, before historic times, as is evident from the primary ideographic characters, but they also assign a higher antiquity to the lyre than to the wind instrument. Shun's great musical instrument was the lyre or harp which accompanied the singing. The full band introduced afterwards in the *Shooking* may be regarded as an anachronism."—*Ch. Rev.*, xiii. 402.

"The Chinese were the first to give stone a place in music; their classics frequently mention the stone-chime as being known by the ancient Emperors and held in great esteem."—*Van Aalst*, p. 48.

"From the remotest ages the Chinese seem to have been acquainted with instruments of percussion, of which the tanned skin of animals was the vibrating medium. Drums made of baked clay, filled with bran and covered with skin were the first in use. The idea of drums seems, however, to have come from the nations of Central Asia (see 羯鼓錄 by 南卓)."—*Ibid.* p. 75.

"The *tsu-ku*, or *p'an-ku* (盤 鼓), mentioned in the Shih-ching, was a barrel-shaped drum fixed upon an upright with a cross-shaped foot." "It is supposed to date back to about 2205 B.C., being in use at the time of the Great Yü."—*Journ. N.-C.B.R.A.S.*, N.S. viii. 100.

"When music had been instituted, the instruments called the *tau*, or hand-drum; the *ku*, or common drum; the *ky'ang*, or wooden tapper; the *kyih*, or sonorous lion; the *hyün*, or earthen-egg pipe; and the *chz*, or flute, were constructed. These six sorts of instruments produced sounds in harmony with virtue. The bell, the sonorous stone, the *yü* pipe and the *seh*, or twenty-five stringed lyre followed, to harmonize with them."—*Yüeh chi*, trans. *Journ. N.-C.B.R.A.S.*, N.S. v. 48.

"The *Shêng* in course of time lost its original form and was divided into two distinct instruments, the *Ch'ao* and the *Ho*. The scale of these two must have been different, as the one had 19, the other 13 reeds. It seems further that the *Ho* was subordinate to, or only played in connection with, the *Ch'ao*. . . . The *Ho* may have been played in fifths, that is, either a fifth above or below the *Ch'ao*; for . . . the modern performers on the *Shêng* frequently use the fifth as an accompaniment to the melody."—*Ch. Rev.*, ii. 38.

"There is no reason to think that the compass of these instruments extended beyond one octave, at first giving the five principal notes and the octave to the fundamental one, or in later times perhaps two octaves with one or two semitones. Nor is there any reason to think that any of these instruments was tuned or constructed by exact arithmetical calculations, or on any theory at all, but simply by the ear, with of course a general conception that the longer the tube the deeper the note."—*Ch. Rev.*, xiii. 402–3.

Dancing.—"A kind of solemn posturing filled the place that has been occupied by dancing among nations farther to the west."—*Giles, Historic China*, p. 4.

"They danced with shields and feathers between the two staircases of the court" (*Shu ching*, Pt. II. Bk. II. Ch. III. 21). "The 舞 was more a posture-making than what we call *dancing*" (*Legge, Ch. Class.*, III. i. 66, note). See, however, *Giles, Ad. Sin.*, No. 5, p. 119, who quotes Chu Tsai-yii as saying that "the dancers of old did not hold either shields or feathers, but danced with empty hands, and without hats." It seems doubtful if the dance was as yet divided into civil and military, of which the feathers and shields were the respective symbols.

Later Feudal Period (1122 *to* 221 B.C.).—*Table II.*

Object-decoration.—[The ends of horses' reins had metal rings, and there were gilt buckles for the inner reins (*Shih ching*, III. iii. VII. 2, *et al.*); the ends of the shafts of lances were gilt; shields were "feather-figured" or "dragon-figured" and bow-cases were of tiger-skin with carved metal ornaments on the front. The ends of bows were often ornamented with wrought ivory (II. i. VII. 5). See also WEAPONS.]

[For the ornamentation of the royal standard, military banners and flagstaffs, see MILITARY.]

Architecture.—In classical Chinese architecture ***there is no distinction of an essential kind between sacred and secular buildings.*** The farther we go back the more clear does it

appear that the palace was a temple and the temple was a palace. . . . The . . . fact appears in the old Chinese records. . . . The emperors formerly came, when they visited Tai shan, to hold here a great feudal assembly, to sacrifice to ancestors, to sacrifice to heaven and to reside in it [the Ming T'ang] themselves during their stay."—*Journ. N.-C.B.R.A.S.*, N,S. xxiv. 254–5.

"The principal roof of the Ming tang was circular. The building beneath was square at the base. The idea was that of imitating the form of heaven and earth. It had nine rooms and eight windows." "There were two other chief buildings called Pi yung and Ling tai."—*Ibid.* xxiv. 257.

"In the Chow dynasty temple the breadth was 54 English feet and the depth 42 feet. The height of the Imperial dais was six English feet."—*Ibid.* xxiv. 258.

"The double roof mentioned as an accession of luxury, when compared with the simplicity of the Hia, and ascribed to the Shang dynasty, B.C. 1766, has always continued to be a favourite ornament with the Chinese. . . . A desire was felt to increase the appearance of gorgeousness in the Imperial dwelling, and magnify the difference between the king's house and that of the common people. This effort became greatly intensified in the Chow dynasty. Then the palace assumed the majesty and beauty of the Ming tang. Many separate buildings began to be erected for each function of the king. The servants of the king or emperor (we may call him by either title) had the most multifarious duties to perform, and the officers were multiplied almost beyond belief."—*Ibid.* xxiv. 258–9.

"Architecture was at first geometrical. Houses were built to the southward, and they faced north, south, east and west. The circle and the square were both introduced in imperial architecture. The simplest geometrical forms constituted the basis, and ornament was added later. The ancient Chinese built of brick with a wooden framework. The provinces which the nation then occupied are chiefly plains and broad valleys. The chief constituent of the soil is the loess, which is partly a subaerial deposit and has partly become diluvial and alluvial by the action of rivers overflowing every summer. There is also a good deal of yellow clay. Bricks were easily made out of these constituents. The climate was milder than it is now, and the labours of house-building were carried on in the winter. Nothing was found so convenient as brick for house-building and nothing lends itself more readily to geometrical manipulation."—*Ibid.* xxiv. 259.

"Architecture then had nothing to do at first with the imitation of tent forms. The suggestion has been made that the concave shape of the eaves of Chinese buildings shews that the people love to remember the nomade life which they once led when they occupied tents of a conical form or shaped like a house-roof. No such concave curve is seen in any old roofs in sculptures hitherto brought to light. In the Chinese books which contain illustrations to the classics the roofs of temples are indeed turned up at the eaves, but this, I think, must be an error. It would arise partly from an incorrect way of representing in perspective the lines round a corner, and partly from the habit which most people have of carrying the present into the past and making their ancestors responsible for their own peculiarities. The early architecture of the Chinese was plain, geometrical and practically useful. The love of fantastic curves in the lower part of roofs came into vogue later, and must be sought rather in Buddhism."—*Ibid.* xxiv. 259–60. See also pp. 303–6, 311–19.

The grandfather of Wen Wang "built a new home, and in erecting it used the plumb-line and a wooden wall-frame. Boards are roped together and earth is filled in between them. Such earth hammered down constitutes a wall, and this is still the mode of building used in the north in making earthen walls. When the wall is washed away by rain they build another. This simple style was adapted to an undeveloped state of society, and building by this method allowed houses to be very rapidly erected. Two doors were sufficient—the *kau men*, or 'high' gate or outer enclosure gate, and the inner or answering or central gate."—*Ibid.* xxiv. 260.

"Beside the *kau men* and *ying men*, there was a gate called the 'tiger gate,' from a picture of a tiger drawn there, as the symbol of bravery. This was to add to the dignity of the master of the house. It was outside the *kau men*. Within was the 'pheasant gate,' from the representation probably also of that bird drawn there. Outside of it were lofty pillars or flag-posts, and standard measures for markets to follow."—*Ibid.* xxiv. 261.

"The classical architecture had square and round buildings and double roofs, but it lacked the arch, and the modern *t'ing-tsz* was still undeveloped."—*Ibid.* xxiv. 262.

"According to the *Chow-li* the ancient art of house-building was controlled by astronomy. It is mentioned that the mason's rule—*kwei*—was placed level with the sun at his rising and at his setting. The builders also looked at stars by night to ensure a perfect level, and to obtain an exactly south façade. In the old architecture of China this was viewed as very important, as it was also in Egypt and Babylon."—*Ibid.* xxiv. 263–4.

Painting.—"On the walls of the Hall of Light [the audience chamber at Lo] were paintings of the ancient sovereigns from Yaou and Shun downwards, their characters appearing in the representations of them, and words of praise or warning being appended. There was also a picture of the duke of Chow sitting with his infant nephew, the king Shing, upon his knees, to give audience to all the princes. . . . In the hall of the ancestral temple there was a metal statue of a man with three clasps upon his mouth, and his back covered over with an enjoyable homily on the duty of keeping a watch upon the lips."—*Legge, Ch. Class.*, i. Prol. p. 66.

Literature.—"In B.C. 551 Confucius was born. He may be regarded as the founder of Chinese literature. During his years of office as a government servant and his years of teaching and wandering as an exile, he found time to rescue for posterity certain valuable literary fragments of great antiquity, and to produce at least one original work of his own. . . . Many utterances . . . of early, not to say legendary, rulers had been committed to writing at one time or another, and such of these as were still extant were diligently collected and edited by Confucius, forming what is now known as the *Shu Ching* or Book of History. The documents of which this work is composed are said to have been originally one hundred in all, and they cover a period extending from the twenty-fourth to the eighth century B.C. They give us glimpses of an age earlier than that of Confucius, if not actually so early as is claimed."—*Giles, Hist. of Ch. Lit.*, p. 7.

"Those two hundred years [1000–770 B.C.] in the dynasty to which he [Confucius] himself belonged were left by the sage a blank. This fact is sufficient to prove that Confucius did not compile the Shoo as a history of his country, or even intend that it should afford materials for such a history. His design, we may rather judge, was to bring together such pieces as might show the wonderful virtue and intelligence of ancient sovereigns and statesmen, who should be models to those of future ages. But in all the space of time of which I am writing, there was neither sovereign nor statesman to whom it could give him pleasure to refer."—*Legge, Ch. Class.*, III. ii. 613, note.

"The Duke of Chow, whom Confucius regarded as his patron saint and good genius, is credited with the composition of many of the documents of the Shoo, as well as of many poems in the Book of Odes and of the Rites of Chow; but he is the last of the ancient Chinese magnates who aims thus at the direct instruction of the people." "These documents answer to the inscriptions of Egyptian and Assyrian kings, and with their cessation the power of the pen passes into the hands of the literary class, to which the official historiographers themselves belong. The native writers expressly state that the practice of making verses to satirize and condemn the government was introduced in the reign of King E (934–909 B.C.); and a very considerable proportion of the classic odes, the study of which was enthusiastically recommended by Confucius, are of this character."—*Simcox*, ii. 24.

"The two ideas of historical veracity and the sacredness of letters are closely associated in China, and for nearly thirty centuries successive rulers of the Middle Kingdom have been exposed to the tacit censorship exercised by the remorseless faithfulness of the 'pencil of the recorders,'" who have occasionally suffered death rather than not record the truth. "While thus resolute to record all the truth, it was equally a point of honour to set down nothing but the truth, and 'the historiographer would leave a blank in his text' (*Analects*, xv. 25) rather than risk misinforming posterity by guess work."—*Ibid.* ii. 24–5.

"There is so little innovation in China that it is fair to assume this standard of historical virtue also to be derived from antiquity, and there is thus a sort of retrospective witness in favour of the authenticity of documents which can now be neither controlled nor confirmed by direct positive evidence. Chinese self-esteem and Chinese want of imagination together guarantee us against the danger of being seriously misled by accepting as approximately true native traditions, which in any other country would need to be submitted to minute and suspicious criticism."—*Ibid.* ii. 26.

"The modern Chinese speak of 'the three dynasties' as if the records of all alike belonged in the same sense to their ancient history. But for portions of the Chow dynasty . . . contemporary documents and coins are forthcoming in sufficient numbers to exclude all suspicion of legendary inventions. With regard to the preceding dynasties scepticism is possible."—*Ibid.* ii. 29.

"The next of the pre-Confucian works, and possibly the oldest of all, is the famous *I Ching*, or Book of Changes. It is ascribed to Wên Wang, the virtual founder of the Chou dynasty, whose son, Wu Wang, became the first sovereign of a long line. . . . It contains a fanciful system of philosophy, deduced originally from Eight Diagrams consisting of triplet combinations or arrangements of a line and a divided line, either one or other of which is necessarily repeated twice, and in two cases three times, in the same combination. Thus there may be three lines ☰ or three divided lines ☷, a divided line above or below two lines ☳ ☶, a divided line between two lines ☲, and so on, eight in all. These so-called diagrams are said to have been invented two thousand years and more before Christ by the monarch Fu Hsi, who copied them from the back of a tortoise. He subsequently increased the above simple combinations to sixty-four double ones, on the permutations of which are based the philosophical speculations of the Book of Changes. Each diagram represents some power in nature, either active or passive, such as fire, water, thunder, earth, and so on." "The text consists of sixty-four short essays, enigmatically and symbolically expressed, on important themes, mostly of a moral, social, and political character, and based upon the same number of lineal figures, each made of six lines, some of which are whole and the others divided. The text is followed by commentaries, called the Ten Wings, probably of a later date and commonly ascribed to Confucius, who declared that were a hundred years added to his life he would devote fifty of them to a study of the *I Ching*." "No one really knows what is meant by the apparent gibberish of the Book of Changes. This is freely admitted by all learned Chinese, who nevertheless hold tenaciously to the belief that important lessons could be derived from its pages if we only had the wit to understand them. Foreigners have held various theories on the subject."—*Giles, Hist. of Ch. Lit.*, pp. 21–3.

"From . . . examples adduced from the Great Symbolism it is clear that, so far as its testimony bears on the subject, the trigrams of Fû-hsi did not receive their form and meaning with a deep intention that they should serve as the basis of a philosophical scheme concerning the constitution of heaven and earth and all that is in them."—*Legge, Yi King*, Introd. pp. 37–8.

"The stone drums of the Chow Dynasty should probably be counted as authentic monuments of the 9th century B.C., and the Annals of the Bamboo Books may rank with the Babylonian chronicles in authority for the whole of the Chow Dynasty, while for earlier days they are based on materials which the scientific historian will find far from useless."—*Simcox*, ii. 27.

[For a summary of the discovery, wanderings, etc., of the stone drums, see *ibid.* ii. 27–8.]

"The Bamboo Books were discovered nearly four centuries earlier than the drums. In the 5th year of the first emperor of the Tsin Dynasty (279 A.D.), it is recorded that 'some lawless parties in the department of Keih dug open the grave of King Seang, of Wei (who died 295 B.C.), and found a number of bamboo tablets, written over in the small seal character, with more than 100,000 words, which were deposited in the Imperial library' (C.C., iii. Shoo-King, Prol., p. 106)." "The earlier records, from the mythical emperors onwards, have mainly to do with prodigies; but the entries respecting the Shang Dynasty—beginning in the 18th century B.C.—have an historic sound, and contain just such information as one would suppose ancient historiographers to preserve. The founder of the dynasty, Thang the Successful, is said, in the 21st year of his reign, to have cast metal money. In other reigns it is said where the king dwelt, what cities he walled, what sacrifices he ordered, what expeditions he conducted, whom he appointed minister, and so forth. A 'great hunting' is mentioned in the 22nd year of Te-Sin, otherwise the wicked Chou, with whom the dynasty ends, 1049 B.C."—*Ibid.* ii. 28.

"Until the time of the Ming dynasty, A.D. 1368, another and much older work [than the *Li chi*, *v. infra*], known as the *Chow Li*, or Rites of the Chou dynasty, and dealing more with constitutional matters, was always coupled with the *Li Chi*, and formed one of the then recognised Six Classics. There is still a third work of the same class, and also of considerable antiquity, called the *I Li*. Its contents treat mostly of the ceremonial observances of everyday life."—*Giles, Hist. of Ch. Lit.*, pp. 24–5.

The *Ch'un ch'iu*, or Spring and Autumn Annals, the last of the Five Classics as at present constituted, "is a chronological record of the chief events in the State of Lu between the years B.C. 722–484, and is generally regarded as the work of Confucius, whose native State was Lu. The entries are of the briefest, and comprise notices of incursions, victories, defeats, murders, treaties, and natural phenomena." "The Spring and Autumn owes its name to the old custom of prefixing to each entry the year, month, day, and season when the event recorded took place; spring, as a commentator explains, including summer, and autumn winter. It was the work which Confucius singled out as that one by which men would know and commend him, and Mencius considered it quite as important an achievement as the draining of the empire by the Great Yü. . . . Consequently, just as in the case of the Odes, native wits set to work to read into the bald text all manner of hidden meanings, each entry being supposed to contain approval or condemnation, their efforts resulting in what is now known as the praise-and-blame theory. The critics of the Han dynasty even went so far as to declare the very title elliptical for 'praise life-giving like spring and blame life-withering like autumn.'"—*Ibid.* pp. 25–6.

"The importance attached to it may be explained if it were the first example of a general history of China, published independently by a private person, as distinct from the official records kept in each State for the benefit of posterity, and probably quite inaccessible to private citizens."—*Simcox*, ii. 25.

"Such is the *Ch'un Ch'iu*; and if that were all, it is difficult to say how the boast of Confucius could ever have been fulfilled. But it is not all; there is a saving clause. For bound up, so to speak, with the Spring and Autumn, and forming as it were an integral part of the work, is a commentary known as the *Tso Chuan* or Tso's Commentary. Of the writer himself, who has been canonised as the Father of Prose, and to whose pen has also been attributed the *Kuo Yü*, or Episodes of the States, next to nothing is known, except that he was a disciple of Confucius; but his glowing narrative remains, and is likely to continue to remain, one of the most precious heirlooms of the Chinese people."—*Giles, Hist. of Ch. Lit.*, p. 26.

"What Tso did was this. He took the dry bones of these annals and clothed them with life and reality by adding a more or less complete setting to each of the events recorded. He describes the loves and hates of the heroes, their battles, their treaties, their feastings, and their deaths, in a style which is always effective, and often approaches to grandeur. Circumstances of apparently the most trivial character are expanded into interesting episodes, and every now and again some quaint conceit or scrap of proverbial literature is thrown in to give a passing flavour of its own."—*Ibid.* pp. 26–7.

"There are two other commentaries on the Spring and Autumn, similar, but generally regarded as inferior, to the *Tso Chuan*. They are by Ku-liang and Kung-yang, both of the fifth century B.C."—*Ibid.* p. 29.

The first of the Four Books, "as generally arranged for students, is the *Lun Yü* or Analects, a work in twenty short chapters or books, retailing the views of Confucius on a variety of subjects, and expressed so far as possible in the very words of the Master. It tells us really all we know about the Sage, and may possibly have been put together within a hundred years of his death. From its pages we seem to gather some idea, a mere *silhouette* perhaps, of the great moralist whose mission on earth was to teach duty towards one's neighbour to his fellowmen, and who formulated the Golden Rule: 'What you would not others should do unto you, do not unto them!'"—*Ibid.* p. 32.

"Next in educational order follows the work briefly known as Mencius. This consists of seven books recording the sayings and doings of a man to whose genius and devotion may be traced the final triumph of Confucianism. . . . His criterion was that of Confucius, but his teachings were on a lower plane, dealing rather with man's well being from the point of view of political economy. . . . The works of Mencius abound, like the Confucian Analects, in sententious utterances."—*Ibid.* pp. 35–9.

"In the *Ta Hsüeh*, or Great Learning, which forms Sect. xxxix. of the Book of Rites, and really means learning for adults, we have a short politico-ethical treatise, the authorship of which is unknown, but is usually attributed partly to Confucius, and partly to Tsêng Ts'an, one of the most famous of his disciples."—*Ibid.* p. 41.

"One more short treatise, known as the *Chung Yung*, which forms Ch. xxviii. of the Book of Rites, brings us to the end of the Four Books. Its title has been translated in various ways. Julien rendered the term by 'L'Invariable Milieu,' Legge by 'The Doctrine of the Mean.' Its authorship is assigned to K'ung Chi, grandson of Confucius. He seems to have done little more than enlarge upon certain general principles of his grandfather in relation to the nature of man and right conduct upon earth."—*Ibid.* pp. 41–2.

"Names of the authors who belong to this period, B.C. 600 to B.C. 200, and of the works on a variety of subjects attributed to them, would fill a long list. Many of the latter have disappeared, and others are gross forgeries, chiefly of the first and second centuries of our era, an epoch which, curiously enough, is remarkable for a similar wave of forgery on the other side of the world. As to the authors . . . the Chinese even went so far as to create some of these for antiquity and then write up treatises to match."—*Ibid.* p. 43.

"There was Sun Tzŭ of the 6th century, B.C. He is said to have written the *Ping Fa*, or Art of War, in thirteen sections."—*Ibid.* p. 43.

"The *Erh Ya*, or nearing the Standard, is a work which has often been assigned to the 12th century B.C. It is a guide to the correct use of many miscellaneous terms, including names of animals, birds, plants, etc., to which are added numerous illustrations. It was first edited with commentary by Kuo P'o [*d.* A.D. 324] . . . and some Chinese critics would have us believe that the illustrations we now possess were then already in existence. But the whole question is involved in mystery."—*Ibid.* pp. 44–5.

"There are some interesting remains of a writer named T'an Kung, who flourished in the 4th and 3rd centuries B.C., and whose work has been included in the Book of Rites."—*Ibid.* p. 45.

"Han Fei Tzŭ, who died B.C. 233, has left us fifty-five essays of considerable value, partly for the light they throw upon the connection between the genuine sayings of Lao Tzŭ and the *Tao-Tê-Ching*, and partly for the quaint illustrations he gives of the meaning of the sayings themselves."—*Ibid.* p. 71.

"The philosopher Hsün Tzŭ of the 3rd century B.C. is widely known for his heterodox views on the nature of man, being directly opposed to the Confucian doctrine so warmly advocated by Mencius."—*Ibid.* p. 47.

"The *Hsiao Ching*, or Classic of Filial Piety, is assigned partly to Confucius and partly to Tsêng Ts'an, though it more probably belongs to a very much later date. Considering that filial piety is admittedly the keystone of Chinese civilization, it is disappointing to find nothing more on the subject than a poor pamphlet of common-place and ill-strung sentences, which gives the impression of having been written to fill a void."—*Ibid.* p. 48.

"The *Chia Yü*, or Family Sayings of Confucius, is a work with a fascinating title, which has been ascribed by some to the immediate disciples of Confucius, but which, as it now exists, is usually thought by native scholars to have been composed by Wang Su, a learned official who died A.D. 256. There appears to have been an older work under this same title, but how far the later work is indebted to it, or based upon it, seems likely to remain unknown."—*Ibid.* p. 48.

[The *Tao-Tê-Ching* is said to have been written by Lao Tzŭ on leaving the State of Chou at the request of the Frontier Warden Yin Hsi. "Chu Hsi, Shên Jo-Shui, and many others, declare emphatically against the genuineness of the *Tao-Tê-Ching*. . . ." It is interesting as a collection of many genuine utterances of Lao Tzŭ, sandwiched however between thick wads of padding from which little meaning can be extracted except by enthusiasts who curiously enough disagree absolutely among themselves.]—*Ibid.* pp. 57–8.

Chuang Tzŭ "'wrote,' says the historian Ssŭ-ma-Ch'ien, 'with a view to asperse the Confucian school and to glorify the mysteries of Lao Tzŭ. . . . His teachings are like an overwhelming flood, which spreads at its own sweet will. Consequently, from rulers and ministers downwards, none could apply them to any definite use.'" "Here we have the key to the triumph of the Tao of Confucius over the Tao of Lao Tzŭ. The latter was idealistic, the former a practical system for everyday use. And Chuang Tzŭ was unable to persuade the calculating Chinese nation that by doing nothing, all things would be done. But he bequeathed to posterity a work which, by reason of its marvellous literary beauty, has always held a foremost place. It is also a work of much originality of thought. The writer, it is true, appears chiefly as a disciple insisting upon the principles of a Master. But he has contrived to extend the field, and carry his own speculations into regions never dreamt of by Lao Tzŭ."—*Ibid.* p. 60.

"Before [the third and fourth centuries B.C.] Chinese literature was realistic and legend was rare. But Tso kien ming and Lie tsze set the example of writing romance with pleasure. Chinese style became modified by the infusion of creative imagination. . . . Scraps of knowledge, and crude narratives brought from other lands . . . became the basis on which was built up a fairy structure, which pleased the new spirit of the age, and has produced on the literature of the country ever since a permanent impression."—*Journ. R.A.S.*, xviii. 23.

Poetry.—"To the classic epoch belong the Che-King, or Book of Odes, one of the five classics; the ancient hymns and old songs, artless and childish, of primitive times. These imperishable monuments form, so to speak, the key of all Chinese poetry."—*Imbault-Huart, La Poésie Chinoise*, p. viii.

[Forke says that the earliest period of Chinese poetry, the era of genuine folk-song, was the Chou dynasty, the best of whose productions have been preserved in the *Shi-King*.]—*Blüthen chinesischer Dichting*, Introd. p. ix.

"There are three schools of Chinese poetry which may be characterized by three words: Nature, Art, and Genius. The poetry of the Shi-king, the odes before the time of Confucius which he collected and published, are the poetry of Nature. Among their authors, Chow kung was the chief in amount of work and poetic power."—*Journ. P.O.S.*, ii. 203. See also ABSO. MON. and REST. OF UNITY.

"The Book of Verses, or Historical Songs, is a collection of odes, all of which are anterior to the seventh century B.C.; they were sung in town and country. [Their] style is characterized by great simplicity, and at the same time variety. They represent the archaic manners of China with all the natural simplicity of the earliest ages." Some go back to the Shang dynasty. They are frequently sung at the present day.—*Tchêng-ki-tong, Chinese Painted by Themselves*, p. 135; see also pp. 133, 138, 139; and *Giles, Hist. of Ch. Lit.*, pp. 12–17.

"Many of the Odes deal with warfare, and with the separation of wives from their husbands; others with agriculture and with the chase, with marriage and feasting. The ordinary sorrows of life are fully represented, and to these may be added frequent complaints against the harshness of officials, one speaker going so far as to wish he were a tree without consciousness, without home, and without family. The old-time theme of 'eat, drink, and be merry' is brought out." "The Odes are especially valuable for the insight they give us into the manners, and customs, and beliefs of the Chinese before the age of Confucius. How far back they extend it is quite impossible to say. An eclipse of the sun, 'an event of evil omen,' is mentioned in one of the Odes as a recent occurrence on a certain day which works out as the 29th August, B.C. 775; and this eclipse has been verified for that date."—*Ibid.* pp. 12–17.

"It may be allowed that the natural tendency of the She as a whole is not to excite a military spirit, but to dispose to habits of peace; yet as a matter of fact there has not been less of war in China than in other lands."—*Legge, Ch. Class.*, IV. i. Prol. p. 141.

"Rhythm is not allied to innovation, but is in many respects its antagonist. It has received in China a development proportionate to the conservative element of the national character: a love of orderly and periodical recurrence. Life is here a series of returns on familiar tracks; a chant of burdens and refrains, like those which look so childish in the oldest Shi-king odes."—*Johnson, Or. Rel.—Ch.*, p. 511.

"Lines of four words, with a more or less regular observance of rule, is . . . the normal measure of the ancient odes in the Book of Poetry." "While lines of four characters are the rule in the pieces of the She . . . lines of other lengths, from two characters or syllables up to eight, are interspersed in them."—*Legge, Ch. Class.*, IV. i. Prol. pp. 117–8. See also *Ch. Rec.*, ix. 50–1.

The "love of recurrent form is shewn in a trick of the older poets, who liked to use sounds without meaning, merely to emphasize this safe return to the same impression; as if we should add the mere sound, 'alas,' to every line, even where there was no reference to grief. Parallelism, beginning in the four-line strophe of the Shi-king, was extended prescriptively from a rhyming accord of accent and of tone to every word in the two successive lines of a distich; 'full' and 'empty' words must be opposed to each other, and the successive steps by which the idea of the verse must be evolved were defined by rule."—*Johnson, Or. Rel.—Ch.*, p. 512.

"The measure of seven words is well adapted to the language, and is that which, subject to certain regulations . . . , is preferred above all others at the present day. Instances of its use occur in the She and the Elegies of Ts'oo, and in the pieces [given on pp. 13–22 of the Prolegomena] . . . , so that the critics are in error who attribute the origination of the seven-words measure to Pih Lëang (柏 梁) of the reign of Woo in the Han dynasty."—*Legge, Ch. Class.*, IV. i. Prol. p. 120.

"The second of the beautiful religious poems of the fourth century B.C., known as the 九 歌, suggests connection with Semitic thought. The high priest was in the habit of presenting himself in sackcloth and ashes before God (太 一)."—*Ch. Rev.*, xiii. 430.

[For specimens of ancient poetical compositions besides those contained in the Book of Poetry, *v. Legge, Ch. Class.*, IV. i. Prol. pp. 13–22.]

"The poetry which is representative of the period between the death of Confucius and the 2nd century B.C. is a thing apart. There is nothing like it in the whole range of Chinese literature. It illumines many a native pronouncement on the poetic art, the drift of which would otherwise remain obscure. For poetry has been defined by the Chinese as 'emotion expressed in words.' . . . 'Poetry,' they say, 'knows no law.' And again, 'The men of old reckoned it the highest excellence in poetry that the meaning should lie beyond the words, and that the reader should have to think it out.' Of these three canons only the last can be said to have survived to the present day. But in the fourth century B.C., Ch'ü Yüan and his school indulged in wild irregular metres which consorted well with their wild irregular thoughts. Their poetry was prose run mad. It was allusive and allegorical to a high degree, and now, but for the commentary, much of it would be quite unintelligible."—*Giles, Hist. of Ch. Lit.*, p. 50.

"Ch'ü Yüan is the type of a loyal Minister. He enjoyed the full confidence of his Prince until at length the jealousies and intrigues of rivals sapped his position in the State. Then it was that he composed the *Li-Sao*, or Falling into Trouble, the first section of which extends to nearly 400 lines."—*Ibid.* pp. 50–1.

"The Chinese, like the Hebrews, have a typical elegy on the vanity of life, the Li-sao,—a strange, sad poem, made up of faith in duty and unbelief in men, which marks the dismal epochs of the T'sin conquests, but outlived its fires, and has been in highest honor ever since, as the keynote of a favourite national mood. Its allegory takes the flowers for symbols of virtues and emotions, of experiences that the poet gathers up, or fates by which he is drawn. In disgrace for loyalty to the old paths of right, he explores all spaces and elements, the homes of gods and men, philosophy and magic,—vainly searching for sympathy, a good wife, a good prince, sustained only by the perfumes of the flowers at his girdle. Alas! the ideal is not found:—

> 'What is the sun of art and talent in this age of ours?
> To turn the back on square and compass, to follow crooked ways as freedom:
> To lay plots with evil means, and make them serve for laws.
> 'Tis all in vain; there is not one who knows me.'

On the luminous summit his heart gives out; he will go no further. Filled with the thought of his native land, he 'goes to rejoin Pang-kien,'—in death."—*Johnson, Or. Rel.—Ch.*, p. 525.

"The Confucian age produced no poetry brilliant enough to be preserved. The tone of thought was prosaic at that time. After the close of the Book of Odes, B.C. 585, to the year B.C. 312, the date of Ch'ü Yuen's being disgraced at the court of Ch'u, there elapsed 273 years during which there appeared no poetry of any importance. The literati did not encourage it and, if it was written, no students cared to preserve it. There is quite a large space of time to be filled up merely by prosaic literature. No doubt much was written and lost, but if so, no whisper of its existence has been preserved."—*Journ. P.O.S.*, ii. 201.

"From B.C. 312 onwards, much poetry was written and an unbroken succession of poets maintained a position of influence in the literary firmament. He [Chü Yüan] took a position of great distinction as a man of genius and became founder of poetical style, as Tso Chieu-ming had become the founder of prose style." Chü Yüan's "chosen sphere was that of human feeling and duties and speculations." He embodied the ancient traditions "in his verses, and took pleasure in adding the Tauist ideas which then prevailed in that part of China where he lived." He was the founder of the Han and Wei school of poetry.—*Ibid.* ii. 201–2.

"The poetry of the school of Chü Yuen was that of Art. Much greater effort and length of time were spent in composition by this school than by the former [Pre-Confucian]. There is a sustained attempt to complete an elaborate picture."—*Ibid.* ii. 203.

"In the *Li sau*, we find the imagination of Lie tsz and Chwang tsz reduced to an artistic and metrical form. The influence of these writers on the poet must be admitted."—*Ibid.* ii. 204.

"The metre of the *Li sau* may be called the Chinese descriptive metre. It has a cæsura which is constant and is marked by the syllable *hi*. . . . Two lines are joined by *hi* and every two pairs of lines thus joined rhyme together. The whole poem consists of stanzas made up of two pairs of lines formed in this way. Each line is a single sentence which may have from four to ten words. Four words are rather the exception. The poet takes pleasure in long sentences clearly connected and extremely regular in syntax. The greatest number of his sentences, in this poem, are probably of seven words in the first clause and five or six in the second. The tones are regular and agree with those of the Book of Odes. The tones are three and there is no departing tone." "In the use of long balanced sentences, the poet adopts the literary style introduced by Tso Ch'ieu-ming in the *Tso chwen*."—*Ibid.* ii. 207–8.

"Another style of poetry adopted by Chü Yuen was composed of four word sentences. Here he was more descriptive and less passionate in his emotion. One composition of this kind consists of 336 lines in all. It is called *T'ien wên*, 'Question about Heaven.'" "The versification was that of lines usually of four words each made to rhyme with the even, the rising and the entering tones." "We do not find that the 'Questions about Heaven' gave origin to a school as the *Li sau* and other poems undoubtedly did. But as the work of the same man, it received no little attention, and its versification would have a share in fixing the metrical structure of the poetry of the Han period, which also is often formed of four-word lines rhyming together."—*Ibid.* ii. 212.

"The mythology and supernaturalism of the times after Confucius were a powerful factor in originating the school of poetry which Chü Yuen and his fellow poets of the third century B.C. united to establish. It operated on their minds as it did on the minds of Chwang tsï in prose. . . . Our poet gave himself up to be under the control of legend and fancy, and, at the same time, was swayed by the most sincere and deeply laid loyalty and love of country. His fondness for vigorous conceptions, the rapidity of his transitions, his luxuriant imagery, the evident pleasure felt by him in personification of the elements, the agreeable balance of his sentences, the impetuosity of his style, and the richness of his vocabulary are features that command our literary admiration, while his depth of sincerity and patriotic eagerness ensure our moral sympathy." "There were three disciples of Chü Yuen who helped to form the Ch'u school of poets of the period of the Contending States. They were Sung Yü, King Cha and T'ang Le. Among them, the greatest master of rhyme and language was Sung Yü. The impressive grandeur of wild scenery moved him to write charming poetry." "The poems of Sung Yü, the most distinguished pupil of Chü Yuen, may be regarded as an important link between those of his master and those of the Han dynasty."—*Ibid.* ii. 206–7, 212–3.

"The poems of this school are irregular in metre; in fact they are only approximately metrical. The poet never ends his line in deference to a prescribed number of feet, but lengthens or shortens to suit the exigency of his thought. Similarly, he may rhyme or he may not. The reader, however, is never conscious of any want of art, carried away as he is by flow of language and rapid succession of poetical imagery."—*Ibid.* p. 54.

"Several other poets, such as Chia I and Tung-fang So, who cultivated this particular vein, but on a somewhat lower plane, belong to the second century B.C., thus overlapping a period which must be regarded as heralding the birth of a new style rather than occupied with the passing of the old."—*Ibid.* p. 54.

Drama.—"They seem to have had theatrical representations of some kind, though it is difficult to say of what nature these actually were."—*Giles, Historic China*, p. 4.

"Before Hiouen-tsong, there existed amongst the Chinese, as in all the countries of the world, games and festivals, ballets and pantomimes; but these pastimes had nothing in common with the foundation of science plays, a foundation which does not date back further than the 8th century of our era."—*Bazin, Théatre Chinoise*, Introd. p. vii.

"The first Chinese customs of a dramatic nature of which we know are mentioned in the Chou-li, and they were intended by a formidable procession and music to drive away evil spirits. The fiercer the appearance of the masquers, the more effective it was thought would be the performance. The Chinese think evil spirits are easily frightened. . . . The drama began with poetry set to music, and men of poetic genius vied to produce pieces which should most deeply touch the feelings. The basis of the Chinese drama consists of sketches of songs. Between these the story of a play is introduced."—*N.-C. Daily News*, 15th Dec., 1885.

"In a discourse of a celebrated minister under the Tcheou dynasty . . . are found these words: 'The king is considered to know how to govern when he allows poets liberty to make verses, when he permits the people to act plays,'" etc.—*Ampère, La Science et les Lettres en Orient*, p. 223.

Music.—"The next most ancient music (professedly) [*v. supra*, EARLY FEUDAL PERIOD] is that sung to the ancient odes, unless we except the original music of the song of Moses, which the Jews say they still possess. It is from a standard work published in 1544, and purports to have come down through Chu Hi of the 11th century."—*Ch. Rec.*, xxi. 307.

"Be these fabulous stories and ancient music what they may, we know for certain that before Confucius there were national music teachers, that in the time of Confucius (B.C. 500) music was one of the six arts to be learned, and that Confucius accompanied his own songs with musical instruments. Ancient books on education say that thirteen was the proper age for boys to begin to learn the art of music and to read poetry."—*Ibid.* xxi. 307.

"The other particulars regarding music, which we are perfectly certain existed long before the burning of the books (3rd century B.C.), are the following:—1. The twelve semitones composing an octave divided into six male notes and six female notes. 2. The five notes of the ancient Pentatonic scale. 3. The eight different kinds of sounds produced by eight kinds of instruments, viz., metallic, stone, earthen or porcelain, leathern, stringed, wooden, melon or wind, and reed. 4. The six kinds of dances with which music is accompanied."—*Ibid.* xxi. 307.

"In the beginning of the reign of the Chow the two great intervals of A—C and D—F were reduced by the repetition of C and F. But in the repetition they were flattened to *Ces* and *Fas* or *H* and *E*. E is the *Pin-kung* 變 宮, and H the *Pin-chi* 變 徵."—*Ch. Rev.*, i. 386.

"The earliest instrumental notes . . . are 12, equivalent to our chromatic scale of 12 semitones. They are called the 12 *lü* or pitch-pipes . . . These give the names to the key-notes. These existed before . . . 3rd century B.C."—*Ch. Rec.*, xxi. 309.

"It is a striking fact that in the history of the same theoretical scale among the Greeks there arose likewise an alternative usage involving the difference of a semitone in one of its steps, and that the note affected was the same in Greece as in China. This was the note since called Si in the diatonic scale, and its different pitch was the basis of the distinction between the disjoined and conjoined tetrachords of Greek theory. The double intonation continued during the middle ages, and was the germ from which has grown the whole system of modern modulation. While it

is open to us to suppose that the appearance of the same phenomenon in Chinese musical history is due to the influence of Western civilization, we are not told that the Mongols brought the varying usage with them, but that it arose when their scale met that of China. Perhaps both the theory of conjoined and disjoined tetrachords and the story of the Mongol scale are equally unreal hypotheses invented to explain the expedients by which the Greeks and the Chinese met each in their own way a practical difficulty arising in diatonic music."—*Phil. Rev.*, i. 65.

"Up to the time of the Yin dynasty [*v.* previous Period] . . . only five notes—the sounds emitted by the five first *lüs* . . . —were in general use. . . ." "But at the beginning of the Chou dynasty . . . two more notes (the sounds emitted by *lüs* Nos. 6 and 7 . . .) were introduced."—*Van Aalst, Ch. Music*, p. 14.

"The ancient scale was therefore as follows. Like the European diatonic scale, it is composed of five full tones and two half-tones; but one of the half tones is found in the Chinese gamut between the fourth and fifth degrees, whereas in the Western gamut it stands between the third and fourth degrees."—*Ibid.* p. 14.

"This scale remained in use unchanged until the rise of the Yüan dynasty [*v.* Mongol Period]."—*Ibid.* p. 15.

"The period at which their five-toned scale was enlarged to seven tones has been described by Chinese theorists as the commencement of the decadence of their musical system."—*Cassell, History of Music.*

"To the primitive system of the Lu were eventually added another at the octave above and another at the octave below, but the compass of this scale being greater than that of the voice, Prince Tsai-Yü (1596) reduced it from thirty-six to twenty-four Lu by admitting only the lower six of the upper Lu and by admitting the upper six of the lower Lu. This restriction gives a scale having a compass of one semitone less than two octaves, from the sixth semitone below the primitive Huang-chung to the fifth semitone above its higher octave."—*Phil. Rev.*, i. 156.

"In this account of the origin of their five and seven step octaves, the Chinese base them upon an achievement of theoretical grasp and practical skill which must certainly be assigned to a much later date than the appearance of scales in their music. Moreover, the choice of five or seven steps is still unexplained, for the fifth progression affords scales of any number up to twelve. Evidently the opposite derivation is the true one."—*Phil. Rev.*, i. 157.

For the "ancient octave forms themselves another origin must be sought; we may, perhaps, surmise that they are what may be called the natural precipitates of all simpler melody."—*Ibid.* i. 157.

"With the idea of each of the twelve possible embodiments of the scale in the Lu became combined the notion of another, in notes bearing definite relations of pitch (which might be unison) to those of the first. Now this conception of the relation in pitch between two embodiments of the same scale is exactly what is known in European music as a Key. The various possible identifications of the scale with different selections of Lu came therefore through the mingling with them all of the notion of one primal scheme of coincidence, to be so many keys."—*Ibid.* i. 159.

"It is said that a little drum filled with chaff was used to mark the time in the Chow dynasty."—*Ch. Rec.*, xxi. 312.

At the court of the duke of Ts'e "the music of the ancient sage-emperor, Shun, originally brought to T'se from the State of Ts'in [Ch'ên], was still preserved."—*Legge, Ch. Class.*, i. Prol. p. 67.

"In the days of Mencius the ordinary notes in use for singing were 5, called Kung, Hsiang, Kioh, Ty, Yü, equivalent to the 1st, 2nd, 3rd, 5th, and 6th of our modern scale, and can easily be found by playing only the black keys of a piano." The "Pentatonic scale, then, was *certainly* known in China 300 B.C.—how much earlier we cannot tell."—*Ch. Rec.*, xxi. 310.

[The matured theory of music, said to have been introduced about the second century B.C., was, if it existed at all, probably of foreign origin. See *Ch. Rev.*, xiii. 403–5.]

"Music used at worship of Confucius has no time marks. It is so slow, each note seems a bar in itself."—*Ch. Rec.*, xxi. 312.

"Tsz-hya replied [to Prince Wên]: 'The airs of Ch'in lean towards depraved thoughts; the airs of Sûng are full of lewd ideas; the airs of Wéi are lively, and inflame lustful passions; the airs of Tsí excite arrogance and pride. All four kinds tend to drown men in the pleasures of lust, and are an injury to virtue, for which reason they are not used in the sacrifices."—*Yüeh chi*, trans. *Journ. N.-C.B.R.A.S.*, N.S. v. 48.

[Of stringed instruments, the most important was the *ch'in*, or scholar's lute (for description, see *Ch. Rep.*, viii. 39–42); others were the *p'i pa*, balloon-shaped guitar (pp. 42–3); *san hsien*, three-stringed guitar (p. 43); *yüeh ch'in*, full moon guitar (p. 44); *érh hsien*, two-stringed fiddle or rebeck (pp. 44–5). Among instruments of percussion "the great bell claims the first place, both on account of the importance it had in the musical system and the care which the ancient Chinese took to delineate and preserve its proportions. It was the regulator of the harmonic scale, as it gave the fundamental note. . . . In ancient times the bell was used for recording the twelve periods into which a lunation or synodical revolution of the moon was divided, . . . it stood as the regulator of the musical system, as the grand referee in statics and all matters of mensuration, as the recorder of the fleeting periods of the month."—*Ch. Rep.*, viii. 45–8. Others of this class were the *ku*, drum, of different forms and sizes (*Ch. Rep.*, viii. 48) [*v.* following extracts]; *ching*, sounding stones (p. 49); and *lo*, gong (p. 49). Wind instruments were the *huang teh*, large fife; *hsiang teh* and *hao tung*, clarinets; *cha chüeh*, horn; *chih teh*, flute or vocal reed; and *shêng*, reed organ of two kinds, the *ch'ao*, or "bird's nest," and *ho*, or "sweet concord" (pp. 50–4). See also *Du Halde, Desc. de la Chine*, Vol. iii; *Journ. N.-C.B.R.A.S.*, N.S. viii. 93–132; *Williams, Syll. Dic.*, p. 742 (1874); *De Guignes, Dic. Chin.*]

"The Sheng is sacred to Confucius, and on feast-days is carried around the temple in the hands of the priest."—*Ch. Rev.*, ii. 41.

[Besides the above among instruments mentioned in the *Shih ching* are the *shih*, another guitar with 25 strings (I. i. I. 3; II. vi. IV. 4); the *ching*, or jingles, used in war (II. iii. IV. 3); the *hsüan*, or porcelain whistle (II. v. V. 7); the *ch'é*, a kind of cornet made of bamboo, pierced in the side with 6 holes (*ibid.*); the *ch'ing*, or sonorous stone chime, which was used to accompany the flute (II. vi. IV. 4; IV. iii. 1). The *Chou li* gives many details about the instruments of music in Book XXII. See also *Mém. conc. les Ch.*, Vol. VI.]

[Bells are frequently mentioned in the Classics. They were first suspended during this Period.]—*Van Aalst, Ch. Music*, p. 52.

[The Chou dynasty had chimes (編 鐘) of six and nine bells, decreasing gradually in size and diameter.]—*Ibid.* p. 54.

"In subsequent ages various kinds of chimes were made . . . this instrument underwent the same changes as the 'stone chime.'"—*Ibid.* p. 55.

"Anciently the bells were quadrate."—*Ibid.* p. 55. But the *Wei-shan* (雖 鐔) was balloon-shaped (p. 56). They were without tongues, being struck with a stick on the rim, and were ornamented. There were several kinds.—*Journ. N.-C.B.R.A.S.*, N.S. viii. p. 106.

[The *Chan-ku* (戰 鼓), or 'War drum,' was originally used by soldiers only (*Journ. N.-C.B.R.A.S.*, N.S. viii. 102).]

[The *ying-ku* (應 鼓), 'Echoing drum,' *chin-ku* (晉 鼓), *kao-ku* (鼛 鼓), *lu-ku* (路 鼓), *yao-ku* (鐃 鼓), *ti-ku* (鞮 鼓), etc., are mentioned as being used at this Period. Some of them were military drums (*Ibid.* viii. 102–3).]

A Chinese account says that the fife (簥 *yüeh*) "was first used in the time of the Chou dynasty at official sacrifices. The sons of Prince Wan of Chow studied this instrument." It is also, however, said to have been introduced by Fu Hsi.—*Ibid.* viii. 110. *Cf.* previous Period.

[The Su chun, or 'Standard Lute,' of Prince Tsai Yü, in form between the *ch'in* and the *chieh*, belongs to this Period (*Ibid.* viii. 116).]

[According to Chinese authorities, the *ling-ku* (靈 鼓) and *tao ku* (鼗 鼓) both date from the time of the Chou dynasty (*Ibid.* viii. 101).]

The *ling* was "a six-faced instrument, and chiefly used in sacrifices to the 社 or tutelary (stone) gods of hamlets, while the *tao* was more especially used in sacrifices at ancestral temples, and in the Imperial orchestra, where the Emperor conferred titles of nobility upon his subjects."—*Ibid.* p. 101.

Dancing.—[To the sound of music they executed various dances. Military dances were called *wan* (萬) and civil dances *wu* (舞) (*Shih ching*, I. iii. XIII. 1; IV. ii. IV. 4; iii. I.). The dancers held in their hands a flute named *yo* (籥), to the music of which they danced. They varied the position of the body by bending and then straightening themselves. They also danced holding a feather in the right hand and a flute in the left (I. vi. III; iii. XIII. 3). The *Chou li* enumerates various kinds of dances in Chapter XXII.]

"Going back to pre-Confucian or legendary days, we find that from time immemorial the Chinese have danced set dances in time to music on solemn or festive occasions of sacrifice or ceremony. Thus we read in the Odes:—

'Lightly, sprightly
To the dance I go,
The sun shining brightly
In the court below.'

The movements of the dancers were methodical, slow, and dignified. Long feathers and flutes were held in the hand and were waved to and fro as the performers moved right or left. Words to be sung were added, and then gradually the music and singing prevailed over the dance, gesture being substituted. The result was rather an operatic than a dramatic performance, and the words sung were more of the nature of songs than of musical plays. In the *Tso Chuan*, under 545 B.C., we read of an amateur attempt of the kind, organised by stable-boys, which frightened their horses and caused a stampede. Confucius, too, mentions the arrogance of a noble who employed in his ancestral temple the number of singers reserved for the Son of Heaven alone. It is hardly necessary to allude to the exorcism of evil spirits, carried out three times a year by officials dressed up in bearskins and armed with spear and shield, who made a house-to-house visitation surrounded by a shouting and excited populace. . . . Some writers have associated this practice with the origin of the drama in China. All we really know is that in very early ages music and song and dance formed an ordinary accompaniment to religious and other ceremonies, and that this continued for many centuries."—*Giles, Hist. of Ch. Lit.*, pp. 256–7.

"So far back . . . as the Chou dynasty . . . the dance was already divided into military and civil, and these were performed by sixty-four dancers in each case, with shield and banner, feather and flute, respectively. They were accompanied by song, and were known as *wu* . . . 'operatic ballets.' . . . The suzerain was limited to eight, the feudal nobles to six, Ministers of State to four, and ordinary officials to two." "There were six dances officially recognized under the Chou dynasty, namely: (1) the split-feather dance, used for purposes of exorcism or lustration . . . ; (2) the whole-feather dance, used in worship; (3) the regulating dance, used against droughts; (4) the tail dance, an ox's tail, symbol of agriculture, being grasped by the dancers; (5) the shield dance, symbolical of a defensive, as opposed to an aggressive, military attitude; (6) the battle-axe dance, symbolical of preparedness to strike if necessary. To these is added a seventh, humanity dance, in which battle-axes, whole-feathers, and ox-tails are mere ornamental accessories, the purport of the dance being conveyed by means of gesture with hand and foot."—*Giles, Ad. Sin.*, No. 5, p. 121.

"As to dancing, everyone knows that it formed part of the religious worship. It is said in the *Li-ki* that the morals of a nation were judged by its dances" (*Gaubil, Chou-king*, p. 329). "The greater part were figurative, and represented the labours of husbandry, the joys of harvest, the fatigues of war, the pleasures of peace. The dancers carried shields, battle-axes, and standards, according to the different religious ceremonies, as the sacrifices to the mountains, to the rivers, and to the earth."—*Bazin, Théatre Chinois*, Introd. pp. ix–x.

"In his notes on the Chou-king Père Gaubil speaks of a Chinese treatise on dancing. The author there gives the following description of an ancient pantomime: 'The dancers emerged from the northern side. Scarcely had they gone some paces than all at once changing the order in which they had come they represented by their attitudes, their gestures, and their evolutions, an order of battle. In the third part the dancers advanced further towards the south; in the fourth they formed a kind of line; in the fifth they represented the two ministers, Tcheou-kong and Tchao-kong, who aided Wou-wang with their counsels; in the sixth they remained immovable as mountains.' This dance was a history of the conquest of China by Wou-wang, who, entering the empire, defeating king Cheou, penetrates still further, and having assigned boundaries to his states governs them by the wise counsels of his ministers."—*Ibid.* pp. x–xi.

Carving?—"The people of Sung made a mulberry leaf for their king, finishing it in 3 years. If put among real leaves it could not be picked out."—*Lieh Tsü, Yüan chien lei han*, c. 357, *Ch'an yeh pu*, p. 30*v*.

Absolute Monarchy (221 B.C. *to* A.D. 221).—*Table III.*

Object-decoration.—It "appears that there has been a period in which a School of Art existed in China of a very important kind. We are led to think that this art must in some way have had a foreign origin; it so nearly resembles in all its principles the art of the Mohammedan races, that we may presume it was derived from them. It would be no difficult task to take a work of ornament of this class, and by simply varying the colouring and correcting the drawing, convert it into an Indian or Persian composition. There is, of course, in all these works, something essentially Chinese in the mode of rendering the idea, but the original idea is evidently Mohammedan."—*Jones, Ex. of Ch. Orn.*, p. 5.

"The Moors of the present day decorate their pottery under the same instinct, and follow the same laws as the Chinese obeyed in their beautiful enamelled vases. The Moorish artist takes a rudely-fashioned pot or other object, and by a marvellous instinct divides the surface of the object, by spots of colour, into triangles of proportionate area, according to the form and size of the object; these triangles are then crossed by others, formed with spots of a different colour. All these spots are then united by a continuous line, suggested by the peculiar form they have taken on the surface of the object. The spaces thus created are filled in with other spots and lines, in the direction of, or in contrast to, the leading lines, and are then still further filled up by smaller spots, till the whole presents an even tint or bloom." "The Chinese . . . must have proceeded in the same way. The position of the larger flowers was first fixed in the position most suited to develop the peculiar form of the vase, and the whole surface was set out by these flowers into symmetrical proportional areas; here law and order were abandoned, and the instinct and caprice of the artist came into play, in uniting all these fixed centres by a flowing line. This flowing line then dividing the different triangular spaces irregularly, masses of intermediate size, either as flowers or large leaves, were put in, springing from the continuous line; the secondary masses also balance triangularly, but in a less rigid manner than with the larger flowers: the process is continued by the introduction within the intermediate spaces of still smaller forms, buds, or stalks, till the whole is filled up, and repose is obtained by evenness of tint. This method of composition is followed in all the Oriental styles of ornament: what is peculiar to the Chinese, especially in their large enamelled objects, is the large relative size of the principal flowers which mark the triangulation of the areas; and it will be seen . . . how cleverly this apparent disproportion of the principal points of the composition is got over by the detail on the surface of the flower, so that the desirable evenness of tint is preserved." "In the Chinese ornamentation, triangulation is the main feature, the geometrical arrangement is absolute and undisguised, but softened by a free treatment of the intermediate spaces left by the triangulation."—*Ibid.* pp. 5–7.

"The scheme of colouring of the Chinese is peculiarly their own. They deal principally with broken colours; pale blue, pale green, and pale pink for the masses; dark pink, dark green, purple, and yellow and white, in much smaller quantities. There is nothing crude or harsh in any of their compositions; the eye is perfectly satisfied with the balance and arrangement of both form and colour; but there is an absence of that purity in the drawing which we find in the works of the ancient Greeks, Arabs, and Moors, and even in the works of our own day, of all the Mohammedan races."—*Ibid.* p. 8.

"The Chinese learned the effective use of gold in ornamentation from the Buddhists."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 279.

[Swords were ornamented with figures of dragons, bears, and birds; silks and embroidery with figures of the sun, moon, and pheasants; and the "phœnix-flag carriage" had a copper phœnix on its balustrade (an ornament which was thus used from the Ch'in dynasty to the Sung).]—*Ko chih ching yüan*, c. 42, *Wu pei lei*, p. 1*b*, c. 15; *Kuan fu lei*, p. 4*b*, c. 29; *Chou chü lei*, p. 17*a*.

Personal Adornment.—"Ho-tê gave to Tei-yen a spherical jewel ear-pendant."—*Shih lei t'ung pien, Hsi ching tsa chi*, c. 60, p. 34.

"Chu-ko K'o said: 'A mother's love for her daughter is innate, how then can she do violence to this inward and spiritual love by piercing her ears to hang ornaments on them?'"—*Shih wu yüan hui*, c. 26, p. 7.

"In the reign of Wu Ti of the Han dynasty during the summer solstice lizards (or chameleons) were caught and fed on powdered cinnabar. They were then brayed and pricked into the arms of the palace women, so as to resemble [natural] red spots. Washing or soaking would not remove them, but if [the women] committed any indiscretion with the male sex [the spots] vanished: hence the name *shou kung*, 'guarding the palace [maids].'"—*Ibid.* c. 39, p. 16.

Architecture.—"The architecture of the time when the power of the sovereign had declined in China became special by the changed conditions. Feudal chiefs ascended independent thrones and fought with each other for supremacy. A struggle for hegemony became an evil which was chronic. There was a two hundred years' war. . . ." "This state of things led to rivalry in palace building. The imperial revenue was in the hands of the feudal chiefs, and with the peoples' money they built beautiful palaces and surrounded them with pleasure-gardens. Among them may be particularly mentioned the park and palace of the Wizard Mountain, just beyond I-chang, at the entrance to the beautiful land of Szchwen. . . . The fact that the gorges should have been selected as the spot chosen for the site of a feudal palace plainly shows that poetic feeling ruled. In fact, at that time, there sprang up a school of vigorous poetry which has never failed since to influence the literature of this country. The romantic element could not fail, therefore, to appear in architecture, and so we find it."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 266.

"In the palace they recognized the need of depth in the suite of rooms or courts through which the visitor is conducted to the audience-chamber. The architect built with this in view; he had to conceal the sovereign and his family within a succession

of courts. He had to provide him with pleasure-gardens. This was imitated by the sovereigns of all the kingdoms of the Chinese heptarchy. Their palaces and parks became all the property of the Chin dynasty in the end of the third century before Christ. "By the Chin Emperor's command a palace was built in the Wei valley, near Hien Yang, the capital, to represent that of each defunct kingdom, and the peculiar construction employed in erecting the palaces of each with their ornaments would here be reproduced. The Ah fang was the most splendid, being the favourite palace of the Chin Emperors. We can tell the style of the architecture, for it is believed by Chinese critics to be represented in the Chia-siang sculptures. In the scene referred to we find roofs, pillars, low couches, and various architectural details fully represented. There is an audience-chamber in a pleasure-garden; above it is a gallery, and in front of it a large high tree. . . . The gallery of the roof has men for its supports, that is to say, the pillars of the roof are Caryatides, and like Mount Atlas personified. The roof of the audience-chamber is supported by round pillars having three simple straight mouldings above, which relieve the angularity. The round wooden pillar rests on a round stone as now in the modern Chinese style. The roof is tiled without the modern concave. At the ends of the upper roof-line large bricks are deflected upwards and outwards to a point, to remove the angularity there. Peacocks and monkeys are sculptured on the roof-line, as also winged men and various birds walking or resting."—*Ibid.* xxiv. 267–8.

"In the architecture of the Han dynasty there is a most remarkable grouping of romantic creations with a reproduction of historic scenes of an exciting and didactic kind, for there are both."—*Ibid.* xxiv. 266.

"The historic groups on the sculptured walls of the Chia-siang ancestral chapel are an example of how architecture makes use of history as a teacher. The great men of past times live again before the visitor's eye. As he passes along the ancestral chapel in its three compartments the guide points out to him on the eastern wall of the central hall the sculptured form of Fu hi, founder of the national civilization, who was, as I suppose, an ancient Chinese monarch, who received reverently from Babylon certain instructors in architecture and civilization, and to express this thought vividly he appears with the mason's rule in his hand. . . . The termination of his body is partly that of a fish. It ends with a fish tail, denoting that the sculptured idea is foreign. In the classics, Fu hi had not a fish tail. He was a man like other men, but we are now in the age of mythological architecture. He is closely joined by intertwining of the tail with that of Tsang kie, who also holds a mason's rule right-angled. Shen nung follows with the plough, and the Yellow Emperor, who first taught the people in the loess country to dig wells, to divide their fields evenly for irrigation, and to wear dignified robes with broad sleeves and a girdle. The Emperor Yau follows, who taught morality; Shun succeeds him, who taught astronomy; and Yü, founder of a great dynasty, who, when immense floods checked the labours of agriculture and drove the people to the high grounds to live in tents, undertook the control of the rivers, and restored the land to the cultivators. Then the rise of the Chow dynasty is pointed out with scenes from the history and poetry of the classics. This is followed by groups of an exciting character, such as assassinations and battles from the age of Confucius and the two centuries which followed. The rise of the Chin dynasty is also sculptured. Here battles on bridges and in rivers and in the air occur, with tiger-hunts, grotesque groups to excite laughter, and many festive scenes." "With such sculptured groups the emperors and princes of the Han dynasty adorned their palaces."—*Ibid.* xxiv. 268–9.

"Lieutenant D. Mills, in his visit to the Chia-siang inscriptions *in situ*, observed no traces of wooden beams in any of the stones belonging to the original chapel buildings."—*Ibid.* xxiv. 270.

China "was well wooded, and, therefore, wooden pillars and beams continued to be used." "In the case of monasteries, pagodas, tombs and bridges, with certain other structures, stone was held to be better as a material. Civilization, commerce and national intercourse brought more and more wealth to the communities, and these buildings were erected by the gifts of individuals. In such cases there would be a tendency to imitate Western art. This would gradually lead to the arch in bridge-building. So also the broad verandah, necessary in India to shade a bungalow from the sun, would lead to broad roofs, which were afterwards imitated by the Chinese."—*Ibid.* xxiv. 272–3.

"The third period of Chinese Architecture is the Buddhist. When the Hindoo Missionaries came to China to propagate their religion, they were lodged in an official building, called a *sï*, and in consequence of this their monasteries were called *sï* ever after. But the form they took in building was that of the Vihara, the Sanscrit name for a Buddhist monastery. The Buddhist monastery in China may have native Chinese features in some things, as when, for example, we find there the hall for ancestral tablets, in which the deceased priests of the monastery are honoured with worship, wooden tablets being used, just as in Confucian ancestral worship. But the great outline is Indian."—*Ibid.* xxiv. 273.

"The efforts of Buddhist architects were very much directed to the provision of images of a large size and great variety. Several types grew up which had to be constantly reproduced in new erections. Buddhism teaches contemplation, and does so by images as well as by books. The propagators of this religion aimed to gain the popular ear by appealing impressively to the eye."—*Ibid.* xxiv. 276.

"Another effort made by Buddhist architects was to represent the Buddhist world in its completeness, or specially some part of it. Five towers on a lofty terrace represent the universe, as north, south, east, west and centre. Such is the Wu t'a sï, or monastery of the five pagodas, in Peking. When ordered to pray for rain, the Buddhist priests arrange the images in a square in some spot in the fields which appears suitable. The arrangement is made on this principle. Rock-work is much used to represent imaginary worlds. Mud or clay is the material, and paint of many colours is used to deck out in the gayest finery grottos, bridges, winding-ways among mountains, temples and lakes. Some scene may have been drawn by a poet, or a writer of the Buddhist book in prose. A time comes when a decoration is required in a temple under repair. The scene of a book is then realized in mortar and paint."—*Ibid.* xxiv. 276–7.

"Other features in Chinese house-building which are a tradition of the Buddhist age are the screen before the gate, and the figures on the roofs. Both these features are connected with *fêng shui*, which being an article of popular belief, it becomes requisite to protect buildings from the mischief likely to be caused by evil beings moving towards a house and capable of doing harm to the inmates." "The screen of brick-work, built like the character *pa* (eight), does not appear in old sculptures and has no ancient equivalent. It is an unpleasing feature which ought to be dismissed from modern architecture, but *fêng shui*, unfortunately, insists upon it." "So it is with the little monsters seen on the line of the roof or on the projecting ledges below. They must, like the stories of pagodas, be in odd numbers, in order that the *Yang* principle may prevail over the *Yin*. Though their forms are so sinister looking, they are all friendly, and their ugliness is put on for effect's sake. Their office is to deter evil spirits. The dragon and monkey are the types of these figures. Both are in odd numbers; the larger is the dragon, usually one only, while the smaller is the monkey, which may be three, five or more." "The result was disastrous in an architectural sense. The gate-screen conceals the entrance, and is placed where it is not wanted. It must as such be unpleasing. . . . Outside the gate there is the *pa* character wall, within the gate is a screen. On each side is a lion. On the roof of the chief building are metamorphosed monkeys and dragons."—*Ibid.* xxiv. 277–8.

"We also find bridges greatly improved in the modern style by adopting the arch. This came in with Buddhism, for we find it in the pagodas."—*Ibid.* xxiv. 287.

The *t'ing tzŭ* "first occurs in the sculptured halls of the Han dynasty. An ornamented roof rests on pillars. The pillars enclose a space which is open all round. We see it in the baldacchino of Romish cathedrals, in the Kiosk of Constantinople, in the summer-house, or arbour, or bower of a pleasure-garden, and in the building over the stage of a Chinese theatre. The roof of a *t'ing tsï* may be very simple, as when made square with four slopes, or very complicated, as when gables and slopes alternate."—*Ibid.* xxiv. 286.

Kao tsu "embellished his new capital with many fine buildings, among which was a large palace, the grandeur of which was intended to correspond with the extent of his power."—*Boulger, Short Hist.*, pp. 10–11.

Sculpture.—"They learned to take pride at this period in the sculpture, the marble terraces and balustrades, the carved lions and pictured walls which exist in the China of to-day. The new mythology and the many striking scenes of their history found suitable representation in the carved slabs of marble ornamenting their ancestral temples."—*Journ. P.O.S.*, ii. 148.

"Their sculpture is more carving than anything we know by the higher name."—*Fergusson, Hist. of Ind. and East. Arch.*, p. 710.

"Sculpture in stone seems to have made, in China, only a very short appearance before the epoch when Buddhism came to furnish new inspirations. The only relics of the first efforts which have been preserved for us are some bas-reliefs of the province of Chang-tong." "The most important group of these sculptured stones is collected at the foot of the hill called Outche-chan, fifteen kilometers to the south of the sub-prefecture of Ki-siang."—*Chavannes, La Sculp. Sur Pierre en Ch.*, Introd. p. i.

"The art of sculpture on stone . . . reached its highest point in the 2nd century of our era, and it was in Chan-tong that it produced its most remarkable works in decorating either the palaces of kings or the sepulchres of the rich. However, it also showed itself in other provinces."—*Ibid.* p. xxix.

In the Kia-siang sculptures, the "attitudes are as if imposed by tradition, in such a way that two bas-reliefs, if they represent the same scene, will be almost identical; the emotions are expressed in a childish manner: thus terror would be uniformly marked by the rising of the hair; and if the attitudes are wanting in variety, what is to be said of the faces which look like copies of one particular type?—it would be impossible to know whom they represent if a little writing did not frequently enlighten us."—*Ibid.* pp. iii-iv. A history, description, and reproductions of these sculptures are given in this work.

"Besides the sculptures collected at the foot of the mountain Ou-tche, there are to be found in Chan-tong but one important group of bas-reliefs. These are eight slabs which are on the height called Hiao-t'ang-chan, 60 *li* to the north-west of the sub-prefecture of Fei-tch'eng, in the province of Chan-tong." "Wang Tch'ang, the author of the *Kin-ché-tsoei-pien* assigns them to the beginning of the 2nd century of our era."—*Ibid.* pp. xxi-ii. For other bas-reliefs of the Han epoch see pp. xxiii–iv., and note. Chavannes remarks that the art of sculpture was more ancient and widespread than one would at first be led to believe, and "penetrated as far as the most distant provinces of China." See also *Chin shih so*, Vol. ii.

"Another very curious text tells us that this art not only existed 200 years before Christ, but moreover that it was not restricted to the decoration of tombs, and filled with its works edifices which had nothing to do with burial."—*Ibid.* pp. xxv–viii.

"Having reached the conclusion that the art of sculpture on stone had, in China, three or four centuries of original development before Buddhism, we are obliged to confess that the artists show themselves particularly lacking in invention. At a distance of three centuries, the sculptures of the Palace of Supernatural Light and those of the tombs of the family Ou must have been almost identical; in the few bas-reliefs themselves which have been preserved for us, one is struck by the servility with which the artist observes precedent. What is there to wonder at that this faint breath disappeared completely before the powerful inspiration which came from India? It would, however, be worth while to attempt to reconstruct the history of this art which, a fact perhaps unique in history, was from its inception independent of all religion and was most frequently only the figurative expression of the morality taught by history."—*Chavannes*, p. xxxii.

"It is curious that the dynasty which is best known for the destruction of books should be remarkable for the number of its inscriptions, eight of which have been preserved (*Les Inscriptions des T'sin*, par Édouard Chavannes. *Journ. Asiat.* neuvième série, i. 473–521)."—*Simcox*, ii. 100.

"The influence of Greek art would enter as an element in the Han sculptures in the following manner. The country being rich and at peace, many foreign improvements would be adopted. Workmen would be conveyed from a distance to do work for wealthy persons. These workmen would be instructed by skilled masters, who were either Greeks or the pupils of other masters who were taught by Greeks. In this way we may account for sculptured horses represented successfully in attitudes which without a long apprenticeship could not easily be produced."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 273.

[For the subject generally see also *Ou-yang Hsiu* (*Yung-shu*); *Chi ku lu*; *Chao ming ch'êng* (*Tê-fu*); *Chin shih lu*; *Hung Kua* (*Ching-po*), *Explanation of the characters li shih* and *li hsü*; *Wêng T'an-hsi* (*Fang-kang*), *Liang Han chin shih chi*; *Yüan Yüan* (*Yün-t'ai*), *Shan tso chin shih chih*; *Wang Ch'ang*, *Chin shih ts'ui pien*; *Fêng Yün-p'êng* (*Yen-hai*), and *Fêng Yün-yüan* (*Chi-hsüan*), *Chin shih so.*]

Painting.—"Pictorial art received much more attention."—*Journ. P.O.S.*, ii. 148.

"The artists of those times were extremely fond of grotesque scenes and monstrous shapes."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 269. See also *Giles, Ch. Pict. Art*, pp. 4–12.

Literature.—[In 213 B.C. literature received a check owing to the destruction by imperial command of all books except those relating to agriculture medicine, and divination.]—*Giles, Hist. of Ch. Lit.*, p. 78.

"So soon as the empire settled down to comparative peace, a mighty effort was made to undo at least some of the mischief sustained by the national literature. . . . Books were brought out of their hiding places, and scholars like K'ung An-kuo, a descendant of Confucius in the twelfth degree, set to work to restore the lost classics. He deciphered the text of the Book of History, which had been discovered when pulling down the old house where Confucius once lived, and transcribed large portions of it from the ancient into the later script. He also wrote a commentary on the Analects and another on the Filial Piety Classic."—*Ibid.* pp. 79–80.

"The *Li Chi*, or Book of Rites, seems to have been a compilation by two cousins, known as the Elder and the Younger Tai, who flourished in the 2nd and 1st centuries B.C. From existing documents, said to have emanated from Confucius and his disciples, the Elder Tai prepared a work in 85 sections on what may be roughly called social rites. The Younger Tai reduced these to 46 sections. Later scholars, such as Ma Jung and Chêng Hsüan, left their mark upon the work, and it was not until near the close of the second century A.D. that finality in this direction was achieved. It then became known as a *Chi* = Record, not as a *Ching* = Text, the latter term being reserved by the orthodox solely for such books as have reached us direct from the hands of Confucius."—*Ibid.* pp. 23–4.

Li Ling and Su Wu are both said to have written poems. "But most famous of all, and still a common model for students, is a letter written by Li Ling to Su Wu, after the latter's return to China, in reply to an affectionate appeal to him to return also. Its genuineness has been questioned by Su Shih of the Sung dynasty, but not by the greatest of modern critics, Liu Hsi-chung, who declares that its pathos is enough to make even the gods weep, and that it cannot possibly have come from any other hand save that of Li Ling."—*Ibid.* pp. 83–4.

"Ch'ao Ts'o (perished B.C. 155), popularly known as Wisdom-Bag, was a statesman rather than an author. Still many of his memorials to the throne were considered masterpieces, and have been preserved accordingly. He wrote on the military operations against the Huns, pleading for the employment of frontier tribes. . . . 'But arms' he says, 'are a curse.'" He also wrote on the value of agriculture.—*Ibid.* pp. 80–1.

"Liu An, a grandson of the founder of the Han dynasty, became Prince of Huai-nan, and it is as Huai-nan Tzŭ, the Philosopher of that ilk, that he is known to the Chinese people. He wrote an esoteric work in twenty-one chapters, which we are supposed still to possess, besides many exoteric works, such as a treatise on alchemy, none of which are extant. Like the work of Lieh Tzŭ, it is interesting enough in itself; and what is more important, it marks the transition of the pure and simple Way of Lao Tzŭ, etherealised by Chuang Tzŭ, to the grosser beliefs of later ages in magicians and the elixir of life."—*Ibid.* pp. 72–3.

"Liu Hsiang (89–80 B.C.) wrote some secret works on the black art, and carried on the publication of the commentary on the *Ch'un Ch'iu* by Ku-liang." "He also revised and re-arranged the historical episodes known as the *Chan Kuo Ts'ê*, wrote treatises on government and some poetry, and compiled Biographies of Eminent Women, the first work of its kind."—*Ibid.* p. 92.

"His son, Liu Hsin, . . . worked with his father upon the restoration of the classical texts, especially of the Book of Changes, and later on was chiefly instrumental in establishing the position of Tso's Commentary on the Spring and Autumn. He catalogued the Imperial Library, and in conjunction with his father discovered—some say compiled—the Chou Ritual."—*Ibid.* pp. 92–3.

"The works of Lieh Tzŭ . . . profess to contain the writings of a Taoist philosopher who flourished some years before Chuang Tzŭ, and for a long time they received considerable attention at the hands of European students, into whose minds no suspicion of their real character seems to have found its way. Gradually the work came to be looked upon as doubtful, then spurious; and now it is known to be a forgery, possibly of the first or second century A.D. The scholar—for he certainly was one—who took the trouble to forge this work, was himself the victim of a strange delusion. He thought that Lieh Tzŭ, to whom Chuang Tzŭ devotes a whole chapter, had been a live philosopher of flesh and blood (*v. infra*)."—*Ibid.* pp. 68–9.

[Yang Hsiung's (53 B.C.–A.D. 18) writings on ethics take a middle place between Mencius and Hsün K'uang. In his *Tai Hsüan Ching* he glorified the Book of Changes. He wrote also on acupuncture, music, and philology. The *Lun Hêng* by Wang Ch'ung (A.D. 27–97) are essays on a variety of subjects, tilting against the errors of the age and even criticizing Confucius and Mencius. His arguments against the immortality of the soul rank him as a heterodox thinker. A voluminous commentator on the Confucian classics appeared in the person of Chêng Hsüan (A.D. 127–200) the famous pupil of Ma Jung. "The *Lieh Tzŭ*, a forgery of the 1st or 2nd cent. A.D., exhibits a lower level of thought and style than the work of Chuang Tzŭ, but deserves attention as containing much traditional matter and many allusions not found elsewhere. The first Editor of *Chuang Tzŭ* was Hsiang Hsiu (3rd cent. A.D.), but owing to his death his work was not published until, in A.D. 312, Kuo Hsiang, who had purloined the manuscript, issued it as his own.]—*Ibid.* pp. 93–5.

[Though each of the writers of the period wandered into by-paths of his own, the common lode-star was Confucianism—elucidation of the Confucian Canon. "For although, with us, commentaries upon the classics are not regarded as literature, they are so regarded by the Chinese, who place such works in the very highest rank, and reward successful commentators with the coveted niche in the Confucian temple" (*ibid.* p. 96).]

"So far as China is concerned, the art of writing history may be said to have been created during" the Han dynasty. "Ssŭ-

ma Ch'ien, the so-called Father of History, was born about B.C. 145. . . . After devoting some time and energy to the reformation of the calendar, he . . . took up the historical work which had been begun by his father, and which was ultimately given to the world as the Historical Record. It is a history of China from the earliest ages down to about one hundred years before the Christian era, in one hundred and thirty chapters, arranged under five headings, as follows :—(1) Annals of the Emperors ; (2) Chronological Tables ; (3) Eight chapters on Rites, Music, the Pitch-pipes, the Calendar, Astrology, Imperial Sacrifices, Watercourses, and Political Economy ; (4) Annals of the Feudal Nobles ; and (5) Biographies of many of the eminent men of the period, which covers nearly three thousand years. In such estimation is this justly held that its very words have been counted, and found to number 526,500 in all. It must be borne in mind that these characters were, in all probability, scratched with a stylus on bamboo tablets, and that previous to this there was no such thing as a history on a general and comprehensive plan ; in fact, nothing beyond mere local annals in the style of the Spring and Autumn." "Since the Historical Record, every dynasty has had its historian, their works in all cases being formed upon the model bequeathed by Ssŭ-ma Ch'ien."—*Ibid.* pp. 102–3.

"Lexicography, which has since been so widely cultivated by the Chinese, was called into being by a famous scholar named Hsü Shên (d. A.D. 120). . . . It is by his *Shuo Wên* that he is now known. This was a collection, with short explanatory notes, of all the characters—about ten thousand—which were to be found in Chinese literature as then existing, written in what is now known as the Lesser Seal style. It is the oldest Chinese dictionary of which we have any record, and has hitherto formed the basis of all etymological research. It is arranged under 540 radicals or classifiers, that is to say, specially selected portions of characters which indicate to some extent the direction in which lies the sense of the whole character, and its chief object was to exhibit the pictorial features of Chinese writing."—*Ibid.* p. 109.

[Many Buddhist books were brought from India and translated into Chinese from A.D. 67 onwards.]

[Writings of the kind termed "Individual Collections," containing the original productions of single authors, made their appearance at an early period in the Christian era, consisting generally of post-mortem compilations. See also REST. OF UNITY.]

[The system of printing notes or comments in the body of the page, using for that purpose smaller characters cut in double columns, was introduced by Ma Jung (A.D. 79–166).]—*Giles, Hist. of Ch. Lit.*, p. 94 ; *Bio. Dic.*, pp. 567–8.

[The authorized text of the Five Classics was engraved on stone under the superintendence of Ts'ai Yung (A.D. 133–192).]—*Giles, Hist of Ch. Lit.*, p. 95.

Poetry.—"Accounts of fairy islands and plants of immortality had a stimulating effect on Chinese thought. The poetry of the time after Mencius and of the Han dynasty is tinctured with a new mythology which is distinctively Taoist and of foreign origin."—*Journ. P.O.S.*, ii. 145.

"The native critics divide the poets of the early Han, the later Han, and the Three Kingdoms into three classes. Sï ma siang ju limited himself to form and colour. His school was realistic. The second class they mention is that of the Pan family. They introduce human feelings and moral sentiments into their poetry. Poetry has become with them a moral instructor and, at the same time, touches the feelings. Their school is that of *Tsingli*. . . . The third school is that of T'sau tsi kien . . . in the time of the Three Kingdoms." [See *infra* and foll. Per.]—*Ibid.* ii. 238.

[Forke says that the second period of Chinese poetry extends from the beginning of the Han to that of the T'ang dynasty, and includes the most perfect specimens of their lyrics. The first division of this period, that of the Han dynasty, is characterised by a prevailing tendency to description, didacticism, and religious mysticism. Its productions have no great value as poetry, but are highly prized by the Chinese. This school was initiated by Li-sao's celebrated elegy [see previous Per.]. The principal didactic and religious poets of the Han dynasty are Chia-yü and Mei-chêng (also a lyric poet), Sze-ma Hsiang-yu, Yang-hsiang, and Paw-shu-pi (all between 200 B.C. and A.D. 1), Pan-ku, Tsau Ta-chia, Chang-hêng, Ma-yung and Wang Wên-kau (in the first and second centuries A.D.). The Emperor Han Wu-ti not only encouraged literature, but wrote poetry himself. The poems belonging to this and the following period are to be found in "The Jade Terrace," a collection made by Hsü-ling about A.D. 550, or earlier, and in the *Yüeh-fu-shih-chi*, published in 1340.]—*Blüthen chinesischer Dichtung*, Introd. pp. xi–xii.

"The poems of the Han period abounded in marvellous fictions, whose origin was explained by the influence of Lao-tsze's doctrines. Buddhism . . . only increased the tendency to dream of an ideal world. A literary school was formed, which devoted itself particularly to the description of the strangest spectacles of nature, the illusions produced by moonlight, the fantastic appearance of woods and rocks, caves and mountains, clouds and white mists by night,—and this in a new language, laboured, often obscure, and far removed from the simplicity of former times. This school, called *Kouaï*, 'given to be extraordinary,' presents, in its ideas and its style, surprising analogies with our modern 'romantic' poetry."—*Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, Introd. pp. xxv–vi. *Johnson* (*Or. Rel.—Ch.*, pp. 527–8) says this sensational style was but transitory.

[Poetry as an art probably did not suffer at all through the Burning of the Books. *v. Hervey-Saint-Denys*, Introd. p. xxiv.]

[For a specimen and translation of a poem in lines of three characters sung by young musicians at the sacrifice to Heaven and Earth, see *Legge, Ch. Class.*, IV. i. Prol. pp. 118–9.]

Li Ling (1st and 2nd cent. B.C.) "is said by Yen Yü to have invented the five-character line in poetry."—*Giles, Bio. Dic.*, p. 450. But see foll. extr.

"As the verses written during the last years of the Chou and the first of the Tsin dynasty, disappeared in the Burning of the Books, it is almost impossible to ascertain at what period the first stanzas in five-syllable lines arose from the need of composing regularly in a rhythm less concise than that of four syllables. We see, however, that the celebrated poem of Kin-yuen, almost contemporary with that great disaster, already contains fragments arranged in this way. Li-Ling and Su-wu, half a century later, gave a great vogue to the five-syllable verses ; and at the time of the Three Kingdoms we find them in possession of universal favour."—*Hervey - Saint - Denys, Poésies de l'Epoque des Thang*, Introd. lxv–vi. See also *Legge, Ch. Class.*, IV. i. Prol. pp. 119–20.

The Han and Wei school of poetry "is descriptive in the form known as *tsï fu*. The writing of this particular school is marked by luxuriance of language and symmetry of phrase. . . . The *fu* contains reflections on noble buildings, palaces and parks, the sea, the river, the storm, detailing their salient features and transfusing through the composition an air of sadness, of enjoyment, or of sympathy. These compositions are about as long as Byron's minor poems, and some are as short as the Elegy. They use choice language : they introduce traditional mythology and describe minutely the art of the period. It was at the head of this school that Chü Yuen was placed, and that position he has retained by common consent. It reflected the taste, the art, the sentiment of the age in a more cultured and a more elaborate form than the poets of the Western Chow had ever attempted."—*Journ. P.O.S.*, ii. 202–3.

"The measure of six words has never been a favourite, and has been pronounced ill-adapted to the genius of the language. One or more lines of this length occur occasionally in the She, and in what have been called the Elegies of Ts'oo, but the first who composed whole pieces in the measure was a Kuh Yung of the Ts'in dynasty, whose works are lost."—*Ibid.* IV. i. Prol. p. 120.

"A few fragments of six-word verses are met with in the Books of the Han and succeeding dynasties."—*Ibid.* p. 120.

"The school of Confucius had nothing to do with the development of the new poetry, which grew up in the Ch'u country amidst the beautiful scenery of western China. This new school sprang into existence as a product of the old classical poetry. That poetry was illusive (*pi*) ; or it had a double meaning, the literal and the concealed, the concealed being the more important (*hing*) ; or it was descriptive and meant what it said (*fu*). The *fu* of the Ch'u country poets is an extension of this last kind."—*Journ. P.O.S.*, ii. 218–9.

"There are at least ten eminent names among the Han dynasty authors whose poems of the class called *fu* have been preserved as examples of beautiful composition. There are Kai yi and Mei cheng in the 2nd century before Christ, and Sï ma siang ju in the 1st. Yang hiung and Pan shu pi occur in the latter part of the same century. In the first century after Christ, we meet with Pan ku and his sister Tsau ta kia as distinguished poets. Then come Chang heng the astronomer, Ma yung and Wang wen k'au. These authors all wrote descriptive poems which were presented to the Han emperors. They are of different lengths and embrace descriptions of palaces, of pleasure grounds, journeys, and hunting expeditions. They contain a large number of historical and mythological allusions, and carry the reader through a great variety of the mountain and river scenery of north China. The effect of the example of Sung yü is seen in Sï ma siang ju, whose poetry was admired by Han wu ti." "The Han poets derived the idea of metre and form from Ch'ü yuen and Sung yü. They drew on Chwang tsï for ideal loftiness and wealth of images. It may also be remarked that Mei cheng's poem led to many imitations."—*Ibid.* ii. 220–1, 223.

"The poetical compositions of the western Han poets increased till they were more than a thousand in number. Thus the literary fame of this dynasty came to be like that of the western Chou."—*Ibid.* ii. 230.

"It would be going too far to say that ideal poetry, not being found in Yang hiung, was unknown to the Chinese in the Han period. Chwang tsï had preceded the authors of that age. And some of them consenting to be his disciples, could learn wisdom from nature and make the universe their teacher. This kind of language did not a little to shake the confidence of some of the Confucianists in their idea of seeking wisdom nowhere but from the orthodox sages. But Chwang tsï wrote no poetry, and he could not be fully followed by the poets because the system he taught was not on the lines of Confucian thought."—*Ibid.* ii. 228.

"The sculptured halls of that age are reflected in the poetry, which consisted of long descriptive pieces, like Thomson's 'Castle of Indolence' or the separate books of the *Faerie Queene*."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 269.

"Women now begin to appear in Chinese literature."—*Ibid.* p. 101.

"Under the reign of . . . Hiao-ho-ti (A.D. 89–106) we find a new kind of compositions . . . long poems, half historical, half descriptive, whose origin will, by itself, show their importance. Ho-ti having manifested his intention of leaving Loh-yang, and giving another capital to his empire, an illustrious writer, Pan-ku, undertook the defence of that famous city, and gave in poetical language a detailed enumeration of its traditions and monuments. The emperor gave up his plan, and the success of the poem was such as to give rise to a whole series of works composed on the same model, if not under the same inspiration : the praise of the Southern Capital, by Chang-ping, that of Si-ngan, etc."—*Ibid.* pp. xxvi–vii.

[Seven poets are named between A.D. 196–221.]—*Giles, Hist. of Ch. Lit.*, p. 119.

"The last princes of the Han dynasty were far from showing themselves as docile to the representations of their counsellors. We find in the poetic annals of their epoch an infinity of requests in verse, written in the depths of exile by faithful servants who groaned over their disgrace, and still more over the blindness of their sovereign." These complaints were always dignified.—*Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, p. xxvii.

Drama.—"And this [self-criticism based on actual history preferred to the creations of the imagination] is the character of most plays previous to the Youen, when history became more popularised, and was treated on the stage in a more serious manner (especially in the *San-koue-tchi*, and the *Judgments of Pao-tching*, a collection of *causes célèbres* ; see *Bazin, Journ. As.*, Feb. and Mar., 1851). The plots are apt to turn on criminal trials, and their contrasts of iniquity and equity. Comedies of intrigue open the secrets of the court and the harem, and all mazes of opportunity for craft and crime in social life. Naturally little use is made of mythology, except in connection with the Tao-sse."—*Johnson, Or. Rel.—Ch.*, pp. 447–8.

Music.—"The mania which Confucianists had of fathering all these [then extant] theories [of music] on some mythical Emperor of the far past, had become such a pest that Tsin Sz-hwang determined to put an end to it by destroying most of their books ; for he had come to the conclusion that it was far better to have no books at all than to be hampered on all sides by would-be precedents. In this catastrophe about 200 B.C. perished the ancient music of China, though some writers claim that a few books on music *did* survive the general conflagration."—*Ch. Rec.*, xxi. 307.

"A long night of ignorance rested on the country, to such an extent that 'at the rise of the Han dynasty the great music-master, Chi, whose ancestors had for generations held the same dignity, scarcely remembered anything about music but the noise of tinkling bells and dancers' drums.'"—*Van Aalst, Ch. Music*, p. 5.

"The scholars of Han, while reconstructing the ancient books of China, labored hard with the theory of music, but to this day almost all declare that ancient music has been lost beyond recovery and always speak of music as a lost art, and this loss of ancient music in China, as in the West, was probably for want of a proper musical notation."—*Ch. Rec.*, xxi. 307.

"Sz Ma-ch'ien, the Herodotus of China, who died 85 B.C., gives the lengths of pitch-pipes for producing the 5 notes as follows :—Taken by 5ths they are : Do or C 81, So or G 54, Re or D 72, La or A 48, Mi or E 64. Or ascending in their order of sound : C 81, D 72, E 64, G 54, A 48. He also gives the simple rule by which he found these figures, viz., starting with 81 and subtracting $\frac{1}{3}$ and adding $\frac{1}{3}$ alternately, he finds the values by fifths. The scholars of the Han dynasty applied this rule to all the 12 semitones, and this is precisely as we reckon vibrations, and on the same principle as our tuning by fifths." "The date of fixing the measurement of strings is not so easily got at, but they got octaves by halving the lengths, and the other notes by subtracting and adding thirds. But as the lengths of octaves by halving are slightly different from the octaves got by progression, by fifths found by subtracting and adding $\frac{1}{3}$ alternately, they have to distribute the difference as best they can to suit their ears, precisely as we have to do, in tuning, with what we call the wolf." "The Chinese seem to have known about allowing a difference in the length of a pipe from that of a string producing the same sound, though perhaps they could not give a scientific reason for it any more than our musical instrument makers in the West."—*Ibid.* xxi. 312–4.

"Great attention was paid to the improvement of music" in the reign of Wu Ti (140–87 B.C.).—*Giles, Bio. Dic.*, p. 492.

"King Fang, first century B.C., is said to be the first to explain the transposition or modulation of keys. But the Yo Tien, published in 1544, says that in A.D. 471 Tow Kung, a blind musician, presented a book with mathematical tables of twelve semitones and modulator to the Emperor Hiao Wên-ti, purporting to have been an ancient book. . . . The modulator, given in Yo Tien of 1544, is a sufficiently interesting fact in itself. The scale is the old one of seven notes that has the semi-tone between 4th and 5th. It is precisely the same principle as Curwen's Modulator, but with the usual reversal of things, counting from top downwards instead of from below upwards as Curwen's does."—*Ch. Rec.*, xxi. 339.

"Hunter says :—'A regular system of notation had been worked out before the age of Panini (350 B.C. ?), and the seven notes were designated by their initial letters.' Possibly these are the same as the Chinese 七始, especially as the concordance says : 'The First Emperor changed the 周 舞 to the 五行, and the Han Emperor Kao Tsu changed the 詔舞 to the 七始 in order not to have any clashing [相襲].' It is difficult, moreover, to account for the meaning of the Chinese musical notes 角羽商徵宮 (with the two half-notes) except on some similar supposition."—*Ch. Rec.*, xv. 188.

"In the Han dynasty . . . other 2 notes were in use [besides the Pentatonic scale], viz., the sharpened 4th, called Pien-tsŭ and the 7th called Pien-kung (*i.e.*, tone below the fifth and below the key). These 7, however, are not the ordinary diatonic scale from C to C, for the semitones were between the 4th and 5th and 7th and 8th, but it is right for key of G."—*Ch. Rec.*, xxi. 310.

"A system of 60 successive tones ascending in fifths (Quints), without regard to Octaves is sometimes given. The inventor was 焦延壽 Tsiau-yen-shiau, of the Han dynasty. The changes of the 12 tones go up to 60. Those of the diagrams illustrating them extend to 64. His renowned pupil 京房 King-fong, multiplied the 60 with 6 to make the tones correspond to the 360 days of the year. It seems that he also formed the list of 12 heptatonic scales which gave 84 調 or connected tones."—*Ch. Rec.*, i. 388.

"The *Hsiao* (簫) is said to have been invented by a certain 耶 仲 (Yeh Chung) during the Han dynasty. . . . Flutes of this kind were formerly made of copper, of jadestone, or of marble, such materials being thought less liable than wood to be affected by changes of temperature."—*Van Aalst*, p. 70.

"Under the Emperor Ch'êng Ti (成 帝) (B.C. 32) a complete stone-chime was discovered in a pool, where it had been thrown, and from this model new chimes were made."—*Ibid.* p. 48.

"Bells of all sizes, from those weighing more than 50 tons down to the small ones which swing on the eaves of pagodas, used to be found all over China. Some are ornamented with characters (mostly sentences in honour of Buddha), some with designs and symbols ; some are round, some are square ; and all are used mainly for religious purposes. At the door of each Buddhist temple a bell is to be seen, which the believers strike 'to call the attention of the sleeping gods.'"—*Ibid.* p. 52.

"It would appear that at some time between the date of the earliest construction of bell racks and that of the eastern Han dynasty the use of the semitones fell into disuse, so that in a set of twelve bells five were, by the musicians of the day, unused—a practice reformed about A.D. 60 by one Pao-ye, then President of the Board of Rites."—*Journ. N.-C.B.R.A.S.*, N.S. viii. 98.

"Of gongs and cymbals but slight mention is made by the old writers ; they seem to have been, if not absolutely unknown, but seldom used."—*Ibid.* viii. 98.

"The elementary form of stringed instruments, said to have been invented by Fu-hi, was in China, as elsewhere, a simple board of dry, light wood, upon which were stretched hand-twisted silken cords. By and by they began to mould the board ; it was made convex and was constructed of certain dimensions and with greater skill, and the number of strings became fixed, until the *Chin* and *Ch'e* were at length developed. We do not find in classical writings any mention of stringed instruments more nearly resembling the guitar or violin."—*Ibid.* viii. 98.

The "flat lute" 箜篌 *k'ung hou* was "an ancient instrument used in the time of the Han dynasty, more especially in sacrificing to the God of Earth. It formerly had twenty-five strings, and was greatly cultivated." It was played with both hands.—*Ibid.* viii. 112.

"The precise origin of the *P'i-pa* is unknown, but there seems

to be evidence that it dates back to the time of the Tsin 秦 dynasty."—*Ibid.* viii. 116.

The Princess of the Wu-Sun (1st and 2nd century B.C.) "is said to have introduced the four-stringed 'balloon' guitar, known as the 琵琶 *p'i-pa*."—*Giles, Bio. Dic.*, p. 889.

Mêng T'ien (d. 209 B.C.) "is the reputed inventor of the 箏 *chêng*, a kind of harpsichord."—*Ibid.* p. 584.

Plastic Arts.—"Of porcelain, called *t'ao*, we first hear in the Han dynasty . . . as a product of the district of Hsin p'ing within the bounds of the little state of Ch'ên, . . . the modern Huai ning hsien, in the province of Honan." "*T'ao* is defined in the older dictionaries as a fine compact *t'ao*, pottery. It is distinguished from earthenware *wa* by the clear musical tone it gives when struck sharply with the finger nail. The term pottery, as with us, includes porcelain and earthenware, both glazed, *liu li wa*, and plain."—*Journ. P.O.S.*, i. 68.

Period of Disruption (221 *to* 589).—*Table IV.*

Object-decoration.—[Military standards were richly ornamented and soldiers' jackets embroidered. See MILITARY.]

"From the Chin to the Sung dynasty there were 'Imperial Swords,' which were made with black scabbards with gold flowers, the sword handle adorned with silver and the head case plaited of reddish-blue silk."—*Sung hui yao, Ko chih ching yüan, c.* 42, *Wu pei lei*, p. 1*b*.

"Mu Tsung was fond of show. Of all the palaces and lofts built by him the walls were ornamented with paper pulp and glue-water mixed with whitewash called 'snowy mud' (雲花泥 *yün hua ni*)."—*Ch'ing i lu, ibid. c.* 20, *Kung shih lei*, p. 14*b*.

"The stools (*chi*) sat on by Shih Hu [see IMPLTS.] were carved and varnished and painted with flowers of various colours."—*Ts'ung chung chi, ibid. c.* 53, *Chü ch'u ch'i wu lei*, p. 2*b*.

Personal Adornment.—[In the reign of Ch'êng Ti girls adorned themselves with white flowers.]—*Chin shu, Shih lei t'ung pien, Kuo pu, c.* 84, p. 5*a*.

Architecture.—"Many pagodas are very pretty objects, and they have come to be a special characteristic of Chinese architecture. The curling eaves of Chinese buildings are probably an imitation of some early pagodas. They were erected in large numbers from the sixth century onwards, and since China has no explanation to offer of curling eaves, it seems necessary to assign them to a foreign source." "The erection of pagodas was a test of the skill of native architects, many of them being lofty, and built without wood. That they have been fairly successful in erecting strong buildings is evidenced by the fact that there are more old pagodas existing than there are old houses or temples."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 275.

Painting.—"The great fame of the [plum] flower only dates from A.D. 300. After this time it began to be a very favourite subject for painters and poets, and was known as the queen of flowers."—*Journ. P.O.S.*, ii. 77.

Literature.—"The centuries which elapsed between A.D. 200 and 600 were not favourable to the development and growth of a national literature. During a great part of the time the empire was torn by civil wars; there was not much leisure for book-learning, and few patrons to encourage it. Still the work was carried on, and many great names have come down to us."—*Giles, Hist. of Ch. Lit.*, p. 119.

"The civil wars following on the close of the Han brought out a spirit of knight-errantry, fruitful in Oriental *minne-singing* (*v. Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, p. xxxii), with such refrains as this:—

'A fair figure captivates men's desires,
But the real perfume of a woman is modesty.'
'There is one of whom I think, a hundred
mountain leagues away;
But the same moon, the same passing wind, is
for both: I muse on our happy times.'

Less suited to the sentimental Chinese muse would seem to be the vigorous war-songs, of which the T'ang has many specimens (*v.* Yang-kiang and Li T'ai-po)." "Two companion ballads celebrate womanly sacrifice and manly devotion with great simplicity and force."—*Johnson, Or. Rel.—Ch.*, pp. 525–6.

[In classical and general literature the authors of the period produced essays, poetry, several important biographical works, works on the classics, music, philosophy, astronomy, divination, history, and a Penal Code. The idea of publishing collections of choice works of a large number of authors, which developed rapidly in subsequent periods, was started by Hsiao T'ung's *Wên Hsüan*, the first published collection of the kind.]—*Ibid. Giles, Hist. of Ch. Lit.*, pp. 137–40. See also *Wylie, Ch. Researches*, pp. 235–6.

"In the fourth or fifth century, when poetry and composition began to be more under the restraints of fixed and conventional laws, critiques on poetry and literature first made an appearance; and to this class we are indebted for a fund of information on the history, changes, internal mechanism, and chief aim of this much cultivated branch of art [see MANCHU PER.]."—*Wylie, Ch. Researches*, pp. 235–6.

The story of Mazdak (*Mohl, Le Livre des Rois*, vi. 109) "shows that Chinese literature was known to serious thinkers in other countries, though the influence of the Middle State, as a civilizing force, was strictly limited to its own subjects."—*Simcox*, ii. 130.

Poetry.—[The poetry of this period bears a certain resemblance to the mediæval romances of chivalry. The themes are now mainly unity, friendship, and gallantry. Some ballads celebrate the devoted friendship of chiefs for each other, others the charms of ladies. The number of poems dealing with love—a number which goes on increasing up to the time of the T'ang dynasty, is a marked feature of this period. They reveal a lower estimate of women than that found in the Shi-king, but, in general the thoughts are more tender and delicate than those of any period subsequent to that epoch. Another striking feature of this period is the sudden appearance of an Epicurean school of poetry consisting of lamentations over the shortness and suffering of life, and exhortations to forget them in pleasure.]—*Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, Introd. pp. xxix–xxxiv; *v.* also *infra*.

"The third school [of poetry] is that of T'sau tsi kien, of the family of T'sau t'sau, in the time of the Three Kingdoms. The critics attribute to his poetry the quality of *ch'i chü*, 'energy and substantial reality.' In his poem on 'The Goddess of the Lo river,' he begins with representing her as a spirit becoming visible to travellers. He then adds every beautiful and lovely feature causing her to surpass all merely human beauty. He had the power of imparting life to his imaginative creations. Neither of the other schools [of the Han] aimed at this."—*Journ. P.O.S.*, ii. 238.

"Poetry and criticism are flourishing" (5th cent.).—*Ibid.* ii. 149.

"As one advances and reaches the six minor dynasties which preceded that of the Thang, one notices in the versification as well as in the style a refinement which often runs to affectation."—*Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, Introd. p. xxxii.

"This literary phase, which I have signalised as an era of expansion for erotic poetry, is equally remarkable for the sudden appearance of quite a different kind. I refer to those professions of faith which, in Europe, would be called epicurean, which, most often beginning with complaints about the bitterness and brevity of life, generally end with a eulogy of drunkenness and its benefits."—*Ibid.* p. xxxiii.

"Before and during the continual revolutions which filled the 6th century in Chinese history, literature appears to feel the effects of the uncertainties of the public life. All is hesitation, groping, reminiscence. The greatest anarchy reigns in prosody; all kinds are broached, all subjects treated, but always without method and without determination. The authors seem to wish to compensate themselves for liberty in invention, which is wanting to them, by a prodigality of allusions and images as strange for us as difficult to grasp. From this period date an infinity of figurative expressions, which have passed into the stage of forms of speech in Chinese poetry, and of which the greater part would be truly incomprehensible if we had not a commentary to give the clue to them."—*Ibid.* Introd. p. xxxiv.

"Under the short Liang dynasty of which the chief is reckoned amongst the renowned poets of the Empire, they were obliged to return to the antique method; they imitated the Chi-king, but the simplicity of style is no longer found. Each thus floats undecided amid the innovations with which his rapture inspires him and his models which he admires in the past."—*Ibid.* pp. xxxiv–v.

"Pieces stamped with the Buddhist spirit begin to show themselves in sufficiently large numbers, without one noticing any diminution on that account in the compositions of the tao-sse. Even those who profess neither the doctrines of India nor the philosophy of Lao-tseu do not fail to feel the effects at times of the double influence; it leads them to that vague quietism which makes the poet Pao-tchao say:

Nothing in life is worth troubling about
. . . . . .
Let us then be neither sad nor joyful,

and renders assistance in introducing new expressions, become necessary to express sentiments unknown to the ancient Chinese."—*Ibid.* p. xxxv.

[The more prized forms of versification, which only completed their development in the T'ang dynasty, began to grow up at the time when the tonal system and the more exact definition of the rhyming endings was introduced; that is, all through the many short-lived dynasties which succeeded to that of Tsin. See *Legge, Ch. Class.* IV. *i.* Prol. p. 121, and REST. OF UNITY, *infra*.]

[Forke says that Chinese love-lyrics were most fully developed under the Tsiu and (northern) Sung, and more especially under the Liang dynasty. The Emperor Liang Wu-ti, and his sons, Wên-ti and Yuan-ti, were among the foremost lyrists of their time: Chien Wên-ti, indeed, might be reckoned as the greatest.]—*Blüthen chinesischer Dichtung*, Introd. pp. xi-xii.

[He also says that feelings dealt with in the lyric poetry of the fifth and sixth centuries are simple, and comparatively narrow in range. Most of them are inspired by love, and the number of themes is limited, which must be set down to a want of imagination. The changes are rung on the separation of lovers, and the treachery of one or the other. But they compare not unfavourably with the lyrics of Greece and Rome, of India, of Persia and Arabia. In the first-named, love has a very insignificant share. Indian lyrics are sensual in tone, while in the Persian and Arabian, the poetry is lost in Philosophical reflections, contrasting with the simplicity of feeling in the Chinese.]—*Ibid.* p. xiii.

"True and deep poetical feeling, purity, and tenderness of perception, a loving delight in the beauty of Nature are the leading excellences of a number of the poems reproduced in this volume."—*Ibid.* p. xiii; and v. pp. xiii to xvi.

[In political and allegorical poems authors were obliged, for their own safety, to skilfully veil their allusions. See *Giles, Hist. of Ch. Lit.*, p. 127.]

[The line of five syllables was the favourite measure in this Period.]—*Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, Introd. p. lxvi.

Music.—"The general disorder which the almost perpetual wars carried on for nearly four centuries after the extinction of the Hans produced throughout the Empire; the manners of the Tartars which the same wars introduced in the provinces lying nearest to these tribes, and the preference there given to arms over literature, caused the study of the ancient principles of music to be neglected. But in the southern provinces some writers of the first rank united for the purpose of preserving the ancient customs in all their purity; and as music was connected with the majority of these customs they preserved it just as they had received it from their ancestors. They made no change in the instruments; but applied themselves on the contrary to develop the method on which they had been constructed; and in comparing them with the statements concerning them in the most authentic books, with the descriptions made in the earliest times, and with that which an uninterrupted tradition assured them had been settled by Hoang-ty himself, they persuaded themselves that in the matter of music, as in everything else, that which came to them from the ancients was preferable to the constant innovations of people of modern times. If, in turning over the leaves of the books and special mémoires treating of the *lu*, they did not re-discover in them the principle in which they were founded and on which the first inventors had based the whole edifice of music, they, at least, by their writings, placed those who would come after them in the way which could lead them to that discovery."—*Mém. conc. les Ch.*, vi. 30.

"Under the subsequent dynasties great efforts were made to revive music. Ancient books and instruments were discovered in the places where they had been concealed at the time of the destruction of books, new books were written, instruments made, but the frequent political changes to which this country has been subject since the beginning of our era has not allowed of much time being devoted to music. Moreover, the authors who then wrote on the subject of music do not agree in their theories, and their successors have confused the different systems."—*Van Aalst, Ch. Music*, pp. 5–6.

"In the reign of Wu-ti (561–78) the K'iu-tsï nation, from Turfan in Central Asia, brought new music to China. Their 7 notes, though called by different names, were the same as those the Chinese already had, with semitones between 4th and 5th and 7th and 8th."—*Ch. Rec.*, xxi. 310.

[During this and subsequent dynasties the *lüs* were no longer made of bamboo, but of copper, marble, or jadestone. See EARLY FEUDAL PERIOD.]

Yüan Chi (A.D. 210–63) "was a fine musician, and made the best *chêng* (a kind of harpsichord), his instruments being the 'Strads' of China."—*Giles, Bio. Dic.*, p. 965.

"In the 6th and 7th centuries original and foreign music was introduced, Indian music being introduced by the Buddhists."—*Ch. Rec.*, xxi. 308.

"As to beating time, when the music of the Shih Liang (near Central Asia) came to China, they beat time and called it 'p'o pan,' that is, striking the board. A time baton is mentioned in one place as among the musical instruments."—*Ibid.* xxi. 312.

Dancing.—"For many centuries after Thespis arranged the Greek stage, and Æschylus wrote, the Chinese were ignorant even of the name of a theatre, and it was not until the sixth century (A.D.) that some travelling gymnasts from India initiated the people into the delights of the rude pantomimic dances and acrobatic performances of their native land. In these exhibitions the actors dressed themselves in the skins of wild animals, and astonished the spectators by the rapidity with which they transformed themselves from the likeness of one beast to that of another, and by the agility with which they danced among upturned naked swords, or walked on the tight-rope. The advance from these wild performances to dramatic recitation was due, as has been the case with many other benefits the world has received, to the misfortunes of an individual.

'Think you if Laura had been Petrarch's wife
He would have written sonnets all his life?'

And in like manner, if a certain Chinaman who disgraced the seventh century had refrained from grossly ill-treating his beautiful and talented wife, she would never have given vent to her feelings in the dramatic recitations she was the first to introduce, and the invention of which might, but for her misfortunes, have been delayed for centuries. The example set by this unfortunate lady was soon improved upon by others, and the further introduction of dialogue with the subsequent dramatic surroundings speedily followed."—*Contemp. R* xxxvii. 123.

From the Restoration of Unity to the end of the Five Dynasties (589 *to* 960).—*Table V.*

589–907.

Object-decoration.—[From the Arab accounts of China in the 9th century (*Ancient Accounts of India and China*, etc., trans. *Renaudot*, p. 20) it appears that the men adorned their girdles with gold, silver, pearls, silk, tortoise-shell and ivory.]

[Military flags continued to be richly ornamented. See MILITARY.]

[Under the T'ang dynasty the imperial chariot began to be ornamented with the "squatting dragon."]—*Po ku t'u, Ko chih ching yüan, c.* 29, *Chou chü lei*, p. 8*a*.

In the construction of the Yü-hua palace "no ornament or painting was applied to the clay-work, and no engraving or carving to the wood-work."—*Shih chi, Shih lei t'ung pien, Kung lei*, p. 4*a*.

Personal Adornment.—[Girls selected for the imperial seraglio were tattooed on the arm with ointment made from cinnamon.]—*Ko chih ching yüan, c.* 12, *Shên t'i lei*, p. 11.

"Women, when dyeing their finger nails, used red [dye]. According to the *Shih wu k'ao*, when Yang kuei-fei was born the nails of her hands and feet were red, and it was said she had the spiritual essence of the silver pheasant. The [maids of the] palace imitated her, and this was the origin of dyeing."—*Shih wu yüan hui, c.* 40, p. 7.

"There was a custom in Po [Chou] of cutting [tattooing] the face, and dyeing [the marks] black."—*T'ang shu Nan Mang chuan, P'ei wên yün fu, c.* 76, p. 24.

"Their fine hair done up hung at the back of their heads, bamboo tubes 3 inches [long] stuck obliquely through their ears, the rich ornamenting theirs with jewel pendents."—*T'ang shu Nan Mang chuan, ibid. c.* 22 *hsia*, p. 154*b*.

"At the end of the Yüan Ho period women did not use rouge or powder but only black grease to spread on the lips."—*Wu hsing chih, Yüan chien lei han, c.* 260, p. 12*b*.

"Artificial flowers and cicadas were worn as ornaments."—*Fang hwai chi, Ko chih ching yüan, c.* 55, *Hsiang lien ch'i wu lei*, p. 11*a*; *Mêng hua lu, ibid.* p. 7*b*.

[Suleyman says that the Chinese women wear ivory combs—sometimes to the number of twenty—and other ornaments in their hair, and go about with their heads uncovered. He further remarks that the women let their hair grow long (instead of cutting it, like the Arab women; see note (98) *ib.* Vol. II. p. 31).]—*Reinaud, Relation des Voyages*, i. 23, 47.

Hsüan Tsung (712–55) forbade "the palace ladies to wear jewels or embroideries, considerable quantities of which were actually burnt."—*Giles, Bio. Dic.*, p. 451.

Architecture.—"From the seventh century onwards, there are still structures of this class [pagodas]. There is an octagonal pagoda in Peking of thirteen stories, and it dates from the year A.D. 600. The sculptured figures are all of moulded brick, and this is the material which has been largely used in erecting this pagoda. It is 275 feet 5 inches in height. This building, so high and so well preserved, is a good specimen of the durability of some Buddhist work in China."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 275–6.

Painting.—"The art of painting was in the 8th century greatly improved. The greatest of Chinese painters, Wu Tau yuen flourished at this time. His execution was such that some god seemed to help him. His most successful picture was a general brandishing a sword, which he painted from the life. The use of the paint brush instead of the goose quill in Chinese education led to beautiful writing and this became the basis of excellent painting which spread into Corea and Japan and the native school of that island empire acknowledges its master to have been Wu Tau yuen."—*Journ. P.O.S.*, ii. 150.

"The older Chinese painters showed a vitality in forms akin to the wonderful Japanese art. The Arab travellers in the ninth century, not very good critics probably, declared that Chinese painting surpassed that of any other race. Painting has embodied the national history quite as earnestly as writing; and the figures on porcelain show so admirably the changes of manners and costume that it is much to be regretted that antique vases in this kind should be so rare; few, it is now said, going back beyond the fourteenth century (*Revue des Deux Mondes*, LXX. 720. The bronzes are probably much earlier; many are claimed to belong to the oldest dynasties. This would be earlier than any bronzes from either Assyria or Egypt). The early art has the advantages of a less minute mechanical formalism, and of greater freedom of conception in the workman."—*Johnson, Or. Rel.—Ch.*, p. 81.

"Under the emperor Min-Wân, of the T'ang dynasty, in the year 720 of our era, mention is made of Wân Wei. . . . His skies were light as air, and the magic of his backgrounds rivalled nature herself."—*Revue Contemp.*, xxv. 246.

"A painted scroll which I have at this moment before me, and which comes from the rich cabinet of Ki-Ing, uncle of the Emperor of China, . . . contains some written characters of the Emperor Sinen-Tsoung who lived in the 9th century. This writing, well authenticated, gives a certain date to the scroll, which is at once a valuable autographical document and a veritable masterpiece of art by an unknown author. The scroll was addressed by the Emperor to a mistress of whom he was hopelessy enamoured. At the side of a water-colour representing the pleasure house of the favourite are verses written by the Emperor to extol his idol. Quite near, on a carpet of grass and flowers, she, of ravishing beauty, listens with downcast eyes to the eulogy of her charms sung by the imperial lips." —*Ibid.* xxv. 248.

Literature.—The Sui emperors "gave some attention to letters, though the attempt to take stock of the surviving literary monuments of former ages ended in the discovery that 60 or 70 per cent. of the works known to have existed under the Hans had been lost beyond recovery."—*Simcox*, ii. 130.

"Chinese writers lay little or no stress on the effect of this invention [printing] on the advancement of literature. But there can be small doubt that the second great epoch of literary activity, which began about a century later, after thirteen hundred years of comparative torpitude, was mainly owing to the spread of education consequent on the cheapening of books."—*Meadows, Ch. and their Reb.*, p. 33-4.

"The period was one of considerable literary activity, and the brilliant original writings of the day distracted attention from the mechanical cares of bibliography, so that many works of repute were found to have disappeared when the erudite compilers and commentators of the Sung Dynasty began their researches."—*Simcox*, ii. 143.

[The classical and general literature of the period continued the tradition of the Hans, and comparatively little was achieved in the line of independent research. Some works and commentaries on the Classical and Taoist texts, on history, and some satires as well as a work on the conservation of vitality, and an elaborate treatise on the constitution appeared, and the havoc wrought by the dreaded Tartars formed the theme of many a poem in prose as well as in verse.]—*Giles, Hist. of Ch. Lit.*, pp. 189–204.

"Lexicography was perhaps the department of pure scholarship in which the greatest advances were made. Dictionaries on the phonetic system, based upon the work of Lu Fa-yen of the sixth century, came very much into vogue, as opposed to those on the radical system initiated by Hsü Shên. Not that the splendid work of the latter was allowed to suffer from neglect. Li Yang-ping, of the eighth century, devoted much time and labour to improving and adding to its pages."—*Ibid.* pp. 190–1.

"Among their other glories, the T'angs may be said to have witnessed the birth of popular literature, soon to receive, in common with classical scholarship, an impetus the like of which had never yet been felt."—*Ibid.* p. 205.

"Although nearly all the dynastic histories have a portion specially allotted to divination, there are few separate works on the subject extant earlier than the Tang dynasty. From that time on there has been no lack of a constant supply, every age having added to the accumulating mass. Under this head are included works on astrology, geomancy, divining by the tortoise, by straws, by diagrams, and in a variety of other ways."—*Wylie, Ch. Researches*, p. 231.

"Another class is termed 'Individual Collections,' containing the original productions of single authors. Writings of the kind made their appearance at an early period in the Christian era [*v.* Absol. Mon.], consisting generally of post-mortem compilations. In the sixth century these began to be divided into several sections according to time or subject. This has been a most prolific class, but one in which comparatively few authors find a place in the ranks of fame. In the bibliographical catalogues of the Sung dynasty there are not found a tenth part of the names of authors in this class contained in those of the Suy and Tang dynasties; and the catalogues of the present day scarcely contain a tenth part of the titles of those recorded as extant during the Sung. Among the most famous is found *Le Tae pih tseih*, the productions of Le Tae-pih, the renowned poet of the T'ang dynasty; also *Tung p'o tseuen tseih*, in 115 books, from the pen of the scarcely less celebrated Soo Tung-po, the Sung poet [*v.* foll. Period]. Both these have been frequently republished with commentaries. The writings of Lüh Kew-yuen, a contemporary and friend of the renowned Choo He, were arranged by his son, and edited by his pupil Yuen Sëë in the thirteenth century, with the title *Seang shen tseih*, in 28 books. This holds a prominent place among the elegant writers of the Sung dynasty, and consists of letters, memorials to the throne, records, prefaces and dedications, miscellaneous pieces, poems, sacrificial documents, epitaphs, and sepulchral inscriptions. . . . Single poems should also come within this category, such as the *Hwa tseen ke*, a love tale written in metrical stanzas."—*Ibid.* pp. 234–5.

"Under the term 'Minor Authors' are included a host of works, chiefly miscellaneous narrations, records of marvels, traditions, and anecdotes. A good specimen of the class is the *Yew-yang tsă tsoo*, in 20 books, written in the eighth century. It treats largely of the strange and the supernatural, but it is useful in the investigation of many archæological questions."—*Ibid.* pp. 232–3.

[The *Hsi yu chi*, "Record of Wanderings in the West," the result of the pilgrim Hsüan Tsang's journey to India by way of Central Asia (*Stanislas Julien, Mém. sur les contr. occid.*, etc.) and the edition of the *Tao tê ching* by the Historiographer Fu I (554–639) were prominent works of the period.]

Poetry.—"After the Sui had prepared the way by reuniting the nation, and put the old treasures into more attractive forms of writing, came a fresh age of *lyric poetry*, the immortal days of the T'ang. . . . The fragrance of this epoch exhaled in an outpouring of lyric poetry by a thousand bards (*Williams*, i. 704)."—*Johnson, Or. Rel.—Ch.*, p. 442.

"The tree of poetry, says one of them [Chinese writers], took root at the time of the Chi-king; its branches appeared with Li-ling and Sou-you; the leaves came forth in abundance under the influence of the Han and the Ouei; but it was reserved to the Thang to see its flowers and taste its fruits."—*Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, p. xxxv.

"The Odes collected by Confucius are, as we have seen, rude ballads of love, and war, and filth, borne by their very simplicity direct to the human heart. The poetry of the T'ang dynasty shows a masterly combination, in which art, unseen, is employed to enhance, not to fetter and degrade, thoughts drawn from a veritable communion with nature."—*Giles, Hist. of Ch. Lit.*, p. 232.

"The poetry of the T'ang abounds in a vague, melancholy brooding over the transientness of things, and memories of the lost."—*Johnson, Or. Rel.—Ch.*, p. 524.

The poetry of the period is remarkable for its scepticism. "The conviction of the immortality of the soul, the idea of its existence independent of the material envelope, are however reproduced in a thousand forms in the most sceptical verses, as an instinctive protest against their own incredulity. Sometimes it is the spirit of a man asleep which takes advantage of the sleep of the body to travel alone through space, traversing distances with the rapidity of thought, penetrating the walls of an inner apartment or of a dungeon, in order to see some young daughter again or to console some prisoner; sometimes it is the soul of a dead friend which is invoked, that of a killed soldier which bewails its lot; or better still that of a wife devoured by jealousy which succeeds, by a violent effort, in freeing itself from corporeal matter to fly in the wake of a husband on a voyage and to watch over him without his knowledge."—*Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, p. xl.

"It remained for the authors of the Tang dynasty to combine Taoism and Confucianism, with a mixture of Buddhism, in a newly created poetry which was destined to raise literary art to a higher elevation than it had ever attained in China."—*Journ. P.O.S.*, ii. 228.

["The first ages of the T'ang period were under the influence of religion," and many religions and philosophical poems were produced while Buddhism was in the ascendant. Then followed a period of scepticism, doubt and depression, represented by Tu-fu, Li-tai-po, and Tso-ming-tong, specimens from whose lyrics are given. They sing of the beauties of nature, and like Omar Khayyam, console themselves (at least the two last named) for the shortness of life with the enjoyments to be got out of it. There are also longer, narrative poems, of vivid dramatic interest—one such by Pe-Ku-Hi, on the story of the Emperor Ming-Tsung and his favourite.]—*Tchéng-ki-tong, Ch. Painted by Themselves*, pp. 167–184.

"Li Tai-po's poems show, on the whole, the same beauties and defects as those of his predecessors, yet he has more genius than any other lyric writer, and a much more lively fancy. His power of depiction is brilliant and fascinating. The abundance of force and fire, and the joyous, often playful courage, which breathes from his hunting and war-songs, are reached by no other Chinese poet, not to mention the daring and original humour of the drinking-songs. A very poetic effect is produced by the sad feeling of the transitoriness of all earthly things which pervades his brightest poems—since for Li Tai-po no hereafter exists. His life has been often described. It is sufficient to mention that he lived from 699 to 762, was already in his youth summoned to court by the Emperor Hsüan-tsung, and loaded with fabulous honours, but never afterwards reached a high office, as the emperor's favourite, whom he had offended by satirical allusions, intrigued against him; and that he therefore led the life of a genial vagabond."—*Forke, Blüthen chinesischer Dichtung*, Introd. p. xv.

Poems are now and then to be found written in praise of the warrior and of military achievements, such as *The Soldier* of Li T'ai-po, but they are exceptional, and even in times of war the poetry did not change its character. In the midst of the troubles which presaged the end of the reign of Hsüan Tsung "guests who played on the *kin* carried 'a large sword' at their side . . . but if they departed for a time from their peaceful habits, their songs did not show the effects of it. Trees, verdure, 'streams which glide in the shade caressing the flowers on their banks'; 'silent constellations which spread over their heads a starry dais,' that is what charms and inspires them."—*Ibid.* p. xliii.

"About one hundred and eighty years ago, a *Complete Collection of the Poetry of the T'angs* was published by Imperial command. The work consists of 48,900 different pieces of all kinds, arranged in 900 books."—*Giles, Historic China*, p. 55.

"The proportion of descriptive poetry in it is small compared with the sentimental."—*Williams, Midd. King.*, i. 704–5.

"The third school [of poetry] is that of Genius, represented by Li Tai pe and Tu Fu. They returned to nature; but with the simplicity of nature, they combined the greatest possible amount of art. Rapidity of transition, depth of feeling, brevity of treatment, exactness of metre and rhyme, boldness of thought, joined with much artistic beauty in a short space, give to the T'ang poets the palm among the bards of China."—*Journ. P.O.S.*, ii. 203.

Yüan Chên's beautiful poetry "was known as the Yüan Ho style, Yüan Ho being the year title from 806 to 821; and under the Emperor Mu Tsung the ladies of the Imperial seraglio were never weary of repeating the poems which had gained for their writer the distinction of a special school."—*Giles, Bio. Dic.*, p. 964.

"In the 5th and 6th centuries the rhymes were engrossing attention."—*Ch. Rev.*, xiv. 52.

[A reform in prosody took place about A.D. 742–56.]—*Giles, Bio. Dic.*, p. 763. See also *Davis, On the Poetry of the Ch.*, p. 23.

"Chinese work-power is as wonderfully illustrated by the laws of poetic composition that had resulted from ages of incubation in the days of the T'ang, as by any of its industrial achievements. Probably no nation has such a mass of criticism on such an amount of native product in the poetic art (*Wylie*, pp. 203–4)."—*Johnson, Or. Rel.—Ch.*, p. 512.

"In stormy times greater license broke forth, and criticism itself deprecated such formal construction [as that adopted in earlier times]; but the refinement of the T'ang carried rhythm-legislation to such a degree, that Chinese poetry has acquired the bad reputation of being a mere thing of mechanical cadences and measures. A native author says that 'the parallelism should be such a chain, that not a line can be omitted without altering the point of the whole poem.' An art at least of interfusing sound and sense."—*Ibid.* pp. 512–3.

"The measure of four words, so abundant in the She, . . . continued a favourite form down to the T'ang dynasty, after which it fell into disuse, though fugitive pieces by famous names may still be culled."—*Legge, Ch. Class.*, IV. i. Prol. p. 119.

"When we come to the dynasty of T'ang, we find that various writers tried to cultivate the measure [of six words] for short descriptive pieces."—*Ibid.* p. 120. See specimen and translation on same page.

[The *tzŭ*, rhyme (in which the rhyme is repeated at the end of lines of indeterminate length) began to be used in the T'ang dynasty, but was much more common in later times (see Manchu Per.).]—*Wylie, Ch. Researches*, p. 236.

"The more prized forms of versification [measures of five and seven words and poems of not more than 16 lines], the establishment of which is generally dated from the beginning of the T'ang dynasty . . . only received then their complete development, having been growing up from the time that the tonal system and the more exact definition of the rhyming endings had been introduced;—that is, all through the many short-lived dynasties which succeeded to that of Tsin."—*Legge, Ch. Class.*, IV. i. Prol. p. 121. For details see pp. 121–5.

Drama.—"The origin of the present Chinese drama does not date back, according to M. Bazin, beyond the Tang dynasty, though many performances designed to be played and sung in pantomime had been written before that epoch."—*Williams, Midd. King.*, i. 714. It was only "thoroughly inaugurated" in the following Period: See *Journ. N.-C.B.R.A.S.*, N.S. xxiv. 268.

"The Chinese drama originating at this time is best accounted for as borrowed from India and Persia."—*Journ. P.O.S.*, ii. 150.

"The history of dramatic art amongst the Chinese is divisible, according to the evidence of the most trustworthy writers, into three distinct epochs. In the first are generally placed the plays composed under the Thang dynasty . . . called Tchhouen-khi [*chuan chi*]." The other epochs were under the Sung and Yüan dynasties.—*Bazin, Théâtre Ch.*, Introd. pp. i–ii.

"Under the Thang dynasty pieces were played of which the prologne, recited by an actor whom the historians call the *introducer of the comedy*, bore an analogy to the prologues of Plautus."—*Ibid.* p. xxxix.

[For theatrical music see *infra, Music.*]

"It is to the emperor Hiouen-tsong, of the Thang dynasty [who founded a dramatic college], that the Chinese attribute the glory of having raised, in the year 720 of our era, the first dramatic monument really worthy of the name. We should state, however, that this opinion is much controverted. There are writers who claim for Wen-ti, founder of the Sout dynasty . . . the honour of having invented the drama. Amongst the latter stands Ma-touan-lin, . . . but we prefer to the authority of Ma-touan-lin that of the editors of the dramatic masterpieces of the Youen, who appear to us to be more enlightened on this matter and who must have profited by the works published after the death of the celebrated encyclopædist."—*Bazin, Théatre Ch.*, Introd. pp. ii–iii; and see *Wên hsien t'ung K'ao*, sec. xv. p. 1, and *Far East*, i. 91.

Music.—"Music was divided into secular and sacred in the Sui dynasty. . . . The music played at marriages and on birthdays . . . may be regarded as on the borderland between secular and sacred. The music played by bands of troubadours, while one of their number tells a story, is secular." "The music played by the blind is also secular."—*Ch. Rec.*, xxi. 345–6.

"Modern music really dates from the T'ang dynasty."—*Ch. Rec.*, xxi. 308.

"Amongst the literati who applied themselves to disperse the chaos of antiquity, two savants, Sou-sieou-sun and Tchang-ouen-cheou, occupied themselves with music. They gave by means of extracts what was most essential in the works of the authors who had preceded them, and in particular of King-fang, who flourished about the year 48 of the Christian era, and of Lin-tcheou-kieou, a contemporary and friend of Confucius."—*Mém. conc. les Ch.*, vi. 31.

Ching Fang's system of heptatonic scales [see Abs. Mon.] was "objected to by Ho-ching (of the Tang dynasty) as not being in accordance with the changes of the months, which are the same every year. Ma-twan-lin remarks regarding the heptatonal scales that K'ung Shih knew only the table of 64, but that the full list of 84 tones has been spoken of as a pattern from the time of the Tang Dynasty."—*Ch. Rec.*, i. 388.

"Ballads, and ballad music, first came into use during the T'ang dynasty."—*Journ. N.-C.B.R.A.S.*, N.S. vii. 96.

The *Kun ch'iang* "takes precedence . . . of all other Theatrical music, on the score of antiquity. It is supposed to have originated during the Tang dynasty, and to have been handed down to the present time with scarcely any alterations. It is generally in somewhat slow measure and of a plaintive description. Most pieces have some portion where either the singing or music is in this style. It is greatly used in dramas where much posturing and pantomime are required. It is considered easier than the other styles, and seems naturally and appropiately to harmonise with the action of the players and does not require so much breath to sustain the singing after or during action of any kind."—*Far East*, i. 91–2.

"Music also at this time began to be popular in dramatic entertainments. Dramatic performers sang their parts in historic scenes, and music which had been used only in worship and at marriages and funerals was introduced upon the stage. The number of notes in an octave became seven instead of five. This was the result of imitation of forein usages."—*Journ. P.O.S.*, ii. 150.

[Musical notes were adjusted by means of the wooden *ch'ih*, foot measure.]—*Pai shih lei pien, Ko chih ching yüan*, c. 49, *Jih yung ch'i wu lei*, p. 5*a*, and *cf.* Exchange.

"In 785, in the reign of the Emperor Teh Tsung I, jade instruments were brought from India by the Buddhists."—*Ch. Rec.*, xxi. 342.

[The modern *ying-ku* (楹 鼓) is the *chien-ku* (建 鼓) of the Sui dynasty (*Van Aalst*, p. 75).]

"Under the T'ang and subsequent dynasties the bells were oval and were adorned with mammæ in groups of nine each; the mouth was crescent-shaped, and they were hung obliquely."—*Ibid.* p. 55.

[During the Tang dynasty the *fêng-ling* (風 鈴), or 'wind bells,' were suspended in the examination halls (*Journ. N.-C.B.R.A.S.*, N.S. viii. 106).]

[The Princess Man of Choi was famous for her mastery of the 笳 *k'a* (*chia*) (the modern 喇 叭 *hsiang t'i*, flageolet) (*Ibid.* viii. 110).]

[For the College of Music established about the middle of the eighth century see ACCESSORY INST.]

Dancing.—[For religious dancing see ECCLESIASTICAL.]

Porcelain.—"The History of Chinese Porcelain may be divided into four great periods. Period I., of which no specimens exist, extends from the disputed date when porcelain was discovered to the Sung Dynasty, which commenced in A.D. 960. Period II., from the commencement of the Sung Dynasty to the commencement of the Ming Dynasty, when there was no painted decoration (960-1368) and all colour was contained in the glaze. Period III., the Ming Dynasty, during which decoration was mainly confined to painting under the glaze and coloured glazes, but over-glaze enamels were introduced (1368-1644). Period IV., from the close of the Ming Dynasty to the present time, when decoration with over-glaze enamels was brought to perfection (1644-1901)." "We have something like trustworthy evidence that porcelain was made during this [T'ang] Dynasty, if not before." "We have Chinese records of two kinds of ware made under the Sui Dynasty (581-617) which may have approached very nearly to porcelain—(1) a green porcelain manufactured under Ho Chou, or Ho-Kuei-lin, president of the Board of Works, as a substitute for glass, the secret of making which had been lost; and (2) a ware produced by a man named T'ao-Yü, which was like jade (a semi-transparent stone like semi-opaque glass). The reputed name of the workman means 'pottery jade,' and is probably the name of the ware and not of its maker, unless it was a nickname." "At the close of the Sui or the beginning of the T'ang Dynasty a porcelain, white in colour and bright as jade, was made by Ho Chung-ch'u, a workman who came from Hsin-p'ing," a district in the province of Kiangsi corresponding with the modern Fu-liang Hsien.—*Monkhouse, Hist. and Descr. of Ch. Porcelain*, pp.13–15.

Julien's theory that porcelain was "first made between the years 185 B.C. and A.D. 907 is set aside by Dr. Hirth. . . . The latter believes it was first made during the T'ang Dynasty, . . . but there are no specimens extant before the Sung Dynasty, . . . the majority even then being of the class known as 'celadons,' which survived owing to their thickness and strength. The prevailing colour of these celadons is green, the colour of jade; and yellow is mentioned as one of the ingredients used for producing this colour. They were mostly made in the south-west of the province of Chekiang, taken by river to the Amoy waters, and thence distributed by Arab traders to Japan, Borneo, Sumatra, the west of Asia, and the east coast of Africa, in which last, curiously enough, large numbers have been discovered. They have been freely imitated, but the genuine articles may be distinguished by their extreme hardness."—*Little (Mrs. A.), Int. Ch.*, pp. 425-6. Specimens of porcelain dating from the Han period have since been discovered.

"During the T'ang Dynasty no fewer than seven different descriptions of porcelain are enumerated, called after the different places where they were manufactured—Hung-yao, Shou-yao, Yo-yao, Wu-yao, Ting-yao, Yüeh-yao, and Shu-yao. Some of these *yaos* may not have been what we call porcelain, but the Shu-yao, made at the city of Ta-i in the department of K'iung-chou, in the (present) Sze-chuan province, probably deserved this name, as it is described as snow-white in colour, with a clear ring, thin but strong, and graceful in shape."—*Monkhouse, Hist. and Descr. of Ch. Porcelain*, p. 15.

"Finally, any remaining doubt as to the manufacture of true porcelain under the T'ang Dynasty is removed by an Arab traveller of the ninth century, whose narrative is translated by Reinaud, Vol. I., p. 34. 'There is,' he relates, 'in China a very fine clay with which they make vases, which are as transparent as bottles: water is seen through them. These vases are made of clay.'"—*Ibid.* pp. 15–16.

"Porcelain made under the T'ang Dynasty, and the following five short-lived Dynasties . . . resembled the wares fabricated in later times. The majority of pieces were of that sea-green which is known as céladon, but yellow-black, blue, yellow, and white porcelain were also made. The Emperor Shih-tsung (954–960) of the After Chou Dynasty, is specially celebrated in the history of Chinese ceramics for having issued an imperial order that porcelain intended for the palace should be 'as blue as the clear sky after rain.' It was made in the district of Pien, in the province of Honan, and is described as sky-blue in colour, thin as paper, and giving out a clear musical sound when struck. It is said that in subsequent years, when it became exceedingly rare, bits of it were treasured and used as cap ornaments or pendants to necklaces. It was called Yü-yao, 'Imperial porcelain,' and after the accession of the next Dynasty (Sung) Ch'ai-yao, Ch'ai being the Emperor's family name."—*Ibid.* p. 16. *Cf. infra.*

"The safest guide to Chinese porcelain is Hsiang-tse-ching, who was collecting and cataloguing it whilst Shakespeare was writing his early poems, and whose richly illustrated catalogue has been translated. The most exquisite Chinese porcelain seems to have perished from its fragility, and the extraordinarily large demands of the Imperial Palace had apparently in old days the same effect European demands are said to have now. When the Palace ordered a hundred thousand pairs of cups or vases—the Chinese always want pairs—naturally the Government factories were obliged to supplement the most expensive and rare colours by others less costly and more simple, whilst the highest order of artistic excellence had to give way to mechanical repetition."—*Little (Mrs. A.), Int. Ch.*, p. 426.

We "find in the *Ch'a ching*, a treatise on tea, written by Liu Yu, about the middle of the eighth century, several kinds of tea-cups described and classified according to their different coloured glazes and the effect of these in throwing out the tint of the infusion. Those made at Yueh chou, the modern Shao hsing fu in Chehkiang province, were placed highest, being described as transparent like jade and so resonant as to be used in sets of twelve to play tunes upon."—*Journ. P.O.S.*, i. 69.

907–960.

Literature.—"It was not a time favourable to literary effort; still production was not absolutely at a standstill, and some minor names have come down to us." Though the art of block-printing was invented during this period, its full effects were only felt at the beginning of the Sung dynasty.—*Giles, Hist. of Ch. Lit.*, pp. 209-10.

Poetry.—"With the fall of the T'ang dynasty the poetic art suffered a lapse from which it never recovered."—*Ibid.* p. 232.

Drama.—"It is known that from the fall of the Thang dynasty until the epoch of the Song, the history of China, stamped with a monotonous savagery, no longer presents anything but hideous pictures and the spectacle of a country afflicted by all the scourges of heaven at once. Disorders and civil wars interrupted the drama, and the people, to use a Chinese expression, no longer tasted 'the joys of peace and prosperity' (*i.e.*, dramatic representations)."—*Bazin, Théatre Ch.*, Introd. p. i.

Music.—"China again became warlike; and music grew corrupt."—*Mém. conc. les Ch.*, vi. 31.

The smaller kinds of cymbals (鈸 *po*) "were invented by Mu T'u-so 穆 士 素 in the time of Nan ch'i 南 齊 in the after T'ang dynasty. The larger sort were first brought from India."—*Journ. N.-C.B.R.A.S.*, N.S. viii. 107-8.

Porcelain.—"The imperial *Ch'ai*, 柴, ware . . . is described as being as blue as the sky, as brilliant as a mirror, as thin as paper, and as resonant as a musical stone. This was made in the province of Honan near K'ai p'ing fu. There is no allusion to any kind of painted decoration before the Sung dynasty."—*Journ. P.O.S.*, i. 69.

Sung Period (960 *to* 1280).—*Table VI.*

Hui Tsung employed "thousands of workmen upon the production of curiosities in bone, ivory, rhinoceros horn, gold, silver, precious stones, and bamboo."—*Simcox*, ii. 171–2.

Object-decoration.—"Prince Ching of Sung adorned the garments of the four seasons:—for spring and summer with pearls and gems, for autumn and winter with kingfishers' feathers for warmth."—*Shih i chi, Ko chih ching yüan, c.* 15, *Kuan fu lei*, p. 9*b*.

[For ornamental promenades see LANDWORKS.]

[Incense-urns were ornamented with *liao*, white metal.]—*Ko chih ching yüan, c.* 58, *Yên shang ch'i wu lei*, p. 2*b*.

Architecture.—The spread of Taoist worship in imitation of Buddhist worship "implies a rapid spread of temple-building; that is to say, Buddhist architecture was imitated most extensively at this time. It was a foreign art in several respects, and through its being very full of idealism, it won its way to the heart of the Chinese. As to the form of the monastery and the arrangement of the halls, this imitation doubtless began in the Tang dynasty. But there was then no extensive national imitation embracing all parts of the empire. This appears to have taken place in the Sung dynasty." "An extraordinary number of new temples must have been erected in the Sung dynasty by the Tauists. . . . It was the partiality of the Sung imperial family for Tauism, and the tolerant political tone of the Sung literati, which spread this sort of temple and other types of Tauist sacred buildings throughout the empire."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 280–1.

"In the Sung dynasty, the first part of the modern age of Chinese architecture, we have the results of a devotion of the nation to Buddhism during seven centuries. Two great forces have animated the nation since that time. The one was the Confucian and Tauist revival of the Sung dynasty, the other was the school of critical research of the present dynasty. The Confucian revival led to political toleration, and so foreign architecture, for example, might be imitated without offence. The principles of the Chinese Government from the tenth century forward have allowed men of different religions to reside together, and the magistrate is expected to keep the peace between them if they offend. The consequence is, that Hindoo, Moslem and new European architecture, in the erection of the sacred buildings of each religion, are seen together in China. Toleration of foreign religious tenets has favoured the mixing of styles in buildings and in art generally."—*Ibid.* xxiv. 281.

"The Sung dynasty architecture is not specially known by examples, because it has been outshone by the works of the Yuen and the Ming dynasties, but it may be studied, because books printed with engravings exist, and there are much fuller details and materials for research in that age than previously. For the ancestral temple, for example, it is interesting to find that Chu fu tsï made enquiry into it, and determined its essential features."—*Ibid.* xxiv. 282.

Literature.—With the advent of block-printing, "we pass, as the Chinese fairy-stories say, to 'another heaven and earth.' The various departments of history, classical scholarship, general literature, lexicography, and poetry were again filled with enthusiastic workers, eagerly encouraged by a succession of enlightened rulers. And although there was a falling off consequent upon the irruption of the Golden Tartars in 1125–1127, when the ex-Emperor and his newly appointed successor were carried captive to the north, nevertheless the Sungs managed to create a great epoch, and are justly placed in the very first rank among the builders of Chinese literature."—*Giles, Hist. of Ch. Lit.*, pp. 210–1.

"The first move made in the department of history was nothing less than to re-write the whole of the chronicles of the T'ang dynasty. The usual scheme had already been carried out by Liu Hsü (897–946), a learned scholar of the later Chin dynasty, but on many grounds the result was pronounced unsatisfactory, and steps were taken to supersede it. The execution of this project was entrusted to Ou-yang Hsiu and Sung Ch'i, both of whom were leading men in the world of letters. . . . The so-called New History of the T'ang Dynasty . . . is generally regarded as a distinct improvement upon the work of Liu Hsü. It has not, however, actually superseded the latter work, which is still included among the recognized dynastic histories, and stands side by side with its rival."—*Ibid.* pp. 212–7.

"Apparently at this time, though the reigning emperor did not read what was written of his own days, the memoirs of previous reigns were open to inspection, and were edited from time to time, when the moment had come for an impartial revision. In a literary age no doubt the tendency was to abridge increasingly the conventional delays. The official history of the Tang Dynasty was not put in hand till the year 1060 [*Giles, Bio. Dic.*, p. 55, says it was completed in this year], and the incompleteness of the previous works of unofficial writers was explained by the statement that they had not had access to the documents of the Tribunal of History, which were now made public for the first time. The reigning Sung emperors apparently wished to do for their own immediate predecessors what had hitherto only been done for the preceding dynasty."—*Simcox*, ii. 202.

Ssŭ-ma Kuang's *Tung Chien* or Mirror of History, begun in 1066, "covers a period from the fifth century B.C. down to the beginning of the Sung dynasty, A.D. 960, and was supplemented by several important works from the author's own hand, all bearing upon the subject."—*Giles, Hist. of Ch. Lit.*, p. 217; *Bio. Dic.*, p. 78.

"The feuds which had raged for the last generation were inherited and continued by the scholars and politicians of the 12th century." In 1087 "the use of Taoist and Buddhist authorities in the examinations had been forbidden, together with that of Wang-ngan-shi's dictionary; but the revival of the political regulations of the Innovator, in 1093, was naturally followed by the rehabilitation of his literary authority, and ten years later an inscription defamatory of Ssema-kwang and his adherents was ordered to be engraved and posted up in all the towns of the empire," but he was reinstated in 1129. "In 1113 the laws against the Taoists were repealed, and in 1116 the emperor established public schools for the propagation of their doctrines." In 1241, Wang-ngan-shi was again degraded.—*Simcox*, ii. 206.

In 1172 Chu Hsi "completed the classical abridgment or Kang-mou of Ssema-kwang's history, a jejune abstract standing to the full history in the relation occupied by the Chun-tsew of Confucius to Tso's commentary."—*Ibid.* ii. 207.

"The name of Chu Hsi (1130–1200) is a household word throughout the length and breadth of literary China. . . . In addition to his revision of the history of Ssŭ-ma Kuang, which, under the title of T'ung Chien Kang Mu, is still regarded as the standard history of China, he placed himself first in the first rank of all commentators on the Confucian Canon. He introduced interpretations either wholly or partly at variance with those which had been put forth by scholars of the Han dynasty and hitherto received as infallible, thus modifying to a certain extent the prevailing standard of political and social morality. His principle was simply one of consistency. . . . The other best-known works of Chu Hsi are a metaphysical treatise containing the essence of his later speculations, and the Little Learning, a handbook for the young."—*Giles, Hist. of Ch. Lit.*, pp. 228–30.

"Chinese writers, within half a century of the fall of the [Northern Sung] dynasty, complain of the want of the usual records, from which statistical tables and facts of economic interest are normally compiled."—*Simcox*, ii. 189.

"Several dictionaries of importance were issued by various scholars during the Sung dynasty, not to mention many philological works of more or less value. The Chinese have always been students of their own language, partly, no doubt, because they have so far never condescended to look at any other." Ch'ên P'êng-nien (961–1017) "was employed to revise the *Kuang Yün*, a phonetic dictionary by some unknown author, which contained over 26,000 separate characters. This work was to a great extent superseded by the *Chi Yün*, on a similar plan, but containing over 53,000 characters. The latter was produced by Sung Ch'i . . . in conjunction with several eminent scholars." The *Liu Shu Ku* or Six Scripts, an examination into the origin and development of writing, by Tai T'ung, was published in 1250, or, according to some, in 1319.—*Giles, Hist. of Ch. Lit.*, pp. 238–9.

"From the rise of the Sung dynasty may be dated the first appearance of the encyclopædia, destined to occupy later so much space in Chinese literature." Wu Shu (947–1002) "may fairly be credited with the production of the earliest work of the kind. His *Shih Lei Fu* dealt with celestial and terrestrial phenomena, mineralogy, botany, and natural history, arranged, for want of an alphabet, under categories. It is curiously written in the poetical-prose style, and forms the foundation of a similar book of reference in use at the present day. Wu Shu was placed upon the commission which produced a much more extensive work known as the *T'ai P'ing Yü Lan* . . . reprinted in 1812, and . . . bound up in thirty-two large volumes." "As a pendant to this work Li Fang designed the *T'ai P'ing Kuang Chi*, an encyclopædia of biographical and other information drawn from general literature." "Another encyclopædist was Ma Tuan-lin. . . . He left behind him the *Wên Hsien T'ung K'ao*, a large encyclopædia based upon the *T'ung Tien* of Tu Yu, but much enlarged and supplemented by five additional sections, namely, Bibliography, Imperial Lineage, Appointments, Uranography, and Natural Phenomena."—*Ibid.* pp. 239–40.

"At the close of the Sung dynasty there was published a curious book on Medical Jurisprudence, which is interesting, in spite of its manifold absurdities, as being the recognised handbook for official use at the present day."—*Ibid.* pp. 240–1.

Poetry.—"Poetry now began to be, what it has remained in a marked degree until the present day, a department of polite education, irrespective of the particle of the divine gale. More regard was paid to form, and the license which had been accorded to earlier masters was sacrificed to conventionality."—*Ibid.* p. 232.

Su Shih revived "the plain speaking of the satirical odes."—*Simcox*, ii. 201.

Drama.—"The second epoch [in the history of Chinese drama] comprises the plays composed under the dynasty of the Sung . . . and called by the historians Hi-khio [*Hsi chüeh*]."—*Bazin, Théatre Ch.*, Introd. p. ii.

"Dramatic literature has obeyed forces stronger than imperial edict or social prudery, and its productive power went on increasing from the T'ang (eighth century) to its culmination in the Yuen (fourteenth century) when the drama was cultivated by literary people of both sexes (*Ampère, Science en Orient*, p. 227)."—*Johnson, Or. Rel.—Ch.*, pp. 445–6.

"The art of the novelist and the dramatist was remarkably exhibited in the 12th and 13th centuries. The mandarin tongue became an important literary medium."—*Journ. P.O.S.*, ii. 154.

Music.—"To make a show of erudition, some of the literati spoke with emphasis of different instruments of the ancients, but without in any way touching on anything which related to the principles on which these instruments had been constructed. Others descried, at great length, the dimensions of the different *lu*; but all they have said does not tend to make known the principle of these dimensions, the principle of the *lu*. They have also passed over in silence that which deals with sound, considered as a musical tone, as circumscribed within such and such limits by the principle of the *lu*."—*Mém. conc. les Ch.*, vi. 31.

"Leaving this principle on one side . . . they devoted themselves solely to small separate branches, to special systems, and even to parts of systems, because they could deduce from them with greater facility all the relations which they believed ought to be found between the trigrams of Fou-hi and all that exists in nature. It was thus that in wishing to do honour to the ancients according to their own ideas, they laboured without knowing it to deprive them of the glory of having found the true system of music."—*Ibid.* vi. 31–2.

"About the time of the conquest of England by the Normans in the 11th century, Chinese scholars again declared that, however much might be the boast of individuals here and there, ancient music was a lost art. Terribly against the prejudices of the Confucianists (as recorded in the books of that date) they had no other alternative but to adopt what to them was foreign music, or be without it altogether, for it was then that the music of the Northern Liao dynasty was generally introduced, viz., the 工 尺 system equivalent to the sol-fa of the West." "But notwithstanding this adoption of this foreign system, the Chinese throughout the ages have retained the ancient nomenclature and ancient instruments, and try on all great occasions, besides giving modern music, to give what they would fain believe to be ancient music."—*Ch. Rec.*, xxi. 308.

The *kung ch'ih* system "has the 7 notes with semitones between 3rd and 4th and 7th and 8th. . . . The Chinese had the complete names for the diatonic scale 600 years before it was completed in Europe, and . . . its so'-fa system over 900 years before Curwen (about 1840) started his sol-fa system." But "they have not yet in that system a complete scale of 12 semitones. In fact they have only one accidental—the sharpened 4th, called Ken, which was added to the new scale to make it correspond more to their previous scale, in which the sharpened 4th was a very special feature." "Owing to the imperfection of their notations for instrumental purposes, the Chinese have had to invent a new notation for almost every kind of instrument they have. The endless trouble they have had on this score makes us think more highly than ever of Guido's invention of the *stave*."—*Ibid.* xxi. 311, and note.

"It is hard to find out when the time-marks (xo) were introduced into China, but most probably it came with the *kung ch'ih* in the 10th century."—*Ibid.* xxi. 312.

"Music was again re-organized . . . in the year A.D. 964."—*Ch. Rev.*, xv. 54.

"The Emperor Tu Tsung (1056) had a flute from Sz Chuan, made of something like tortoise-shell. About the same time they had some musical instruments of red ivory. Instruments were also made of the bark of beech trees."—*Ch. Rec.*, xxi. 342.

"The Sung provided each bell with a knob, by which it could be hung in a vertical position."—*Van Aalst*, p. 55.

Porcelain.—"During this [Sung-Yüan] period porcelain was decorated with several different colours, yellow, black, purple, blue, etc., but the céladons predominated so much that it may not improperly be termed the Céladon period. They were made at several places and appear to have been of various tints and qualities, pale green, bluish green, deep onion, grass green, and the superior kind of imperial ware, emerald. These have been imitated over and over again from that time to this, and it would appear to be impossible to identify as genuine Sung pieces any except those produced at Lung-ch'üan, which had this peculiarity: The paste was of fine white clay, but where exposed to the fire the unglazed portions turned a rusty red. They are therefore identified by a ferruginous ring on the base or foot where they were unglazed. There are some céladons made of clay which is itself red, and many imitations in which the clay is white and the red ring has been artificially coloured. The same peculiarity seems . . . to have belonged to some later céledons made by the brothers Chang. . . . The older Lung-Ch'üan dates from the end of the tenth or the beginning of the eleventh century, the céladons of the brothers Chang (Ko-yao, or Chang-yao) to the twelth century, but all seem to have been produced in the Lung-ch'üan district. But the most beautiful of all the céladons, superior to the imperial (Kuan-yao) and the Ko, were called pi-yao, and made at Juchou."—*Monkhouse, Hist. and Desc. of Ch. Porcelain*, pp. 17–18.

"The decoration of céladons, and indeed of all Sung porcelain, was confined to engraving and modelling under the glaze, and though the terms painting and shading are used by Tzŭ-ching, it is evident that he refers only to the application of more than one shade of glaze for the sake of variety or for the emphasis of certain parts of the engraved pattern."—*Ibid.* p. 20.

"The coloured glazes other than green used in the Sung period were pale blue (called by the Chinese moon-white, by the French *clair de lune*), white, purple and black, red, deep blue, and glazes, variegated in colour by accidental changes in the kiln. The pale blue was probably an imitation of the Shih-tsung, or Ch'ai 'blue as the clear sky after rain' colour. It is also probably confounded with the céladons. But such pieces of the pale blue of the Sung dynasty as have survived are clearly of a pale cobalt blue tinged with lavender, or light purple from manganese. The pieces are generally finely crackled, and often have streaks or 'clouds' of the warmer purplish colour—sometimes approaching red. The most celebrated of the factories was that of Ting-chou, where brilliant white, purple, and black were produced from 1111 to 1126. This was afterwards called Pei-ting or Northern Ting, to distinguish it from the ware of the same description afterwards made at Hang-chou, which was called Nan-ting or Southern Ting. It often had marks like tears, due, it is supposed, to the glaze being sprinkled or blown on (*soufflé*). The white in Tzŭ-ching's time was the most plentiful, then the purple, and rarest of all the black, of which he had seen only one specimen. He describes this as well as six of the white and four of the purple."—*Ibid.* pp. 20–1. See also *Julien, Hist. et Fabr. de la Porce. Ch.*, p. 17.

"The place at which the greatest variety of colours was produced was Chün-chou. . . . It is evident that Chün porcelain varied much in quality, and had increased in estimation in course of time. The potters of Chün seem to have attempted innovations in both design and decoration, a dangerous thing to do in so conservative a country as China, and the 'transmutation' vases, in which the colours were accidentally variegated by the action of the kiln, were at first looked upon as failures."—*Monkhouse, Hist. and Desc. of Ch. Porcelain*, pp. 22–3.

The Emperor Ching-tê (after whom Ching-tê-chên was named) "ordered date marks to be inscribed under pieces [of porcelain] made for the palace."—*Ibid.* p. 17.

Engraving.—"Wood engravings became common for the illustration of natural history, cosmogony, biography and geography in the form of diagrams, maps, portraits and imaginary scenes."—*Journ. P.O.S.*, ii. 151.

Liao and Kin.

Personal Adornment.—[Ladies in the palace blacked their eyebrows.]—*Yang Chên Wai chi, Ko chih ching yüan*, c. 37, p. 22*b*.

Architecture.—"The Chinese art of the Golden Dynasty in North China remains in a few octagonal pillars inscribed with Buddhist charms. Sanscrit and Chinese characters are here seen cut in limestone."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 282.

Literature.—"In 1176 the history of the eastern Hans was translated into Nutche for Oulo, one of the ablest and most humane of the Kin emperors."—*Simcox*, ii. 175.

Music.—[For the introduction of the *kung ch'ih* system of the Liao into China see *supra*.]

"The Liao dynasty had instruments made of leaves, also of cocoa-nut."—*Ch. Rec.*, xxi. 342.

Mongol Period (1280 *to* 1368).—*Table VII.*

Object-decoration.—[Porcelain painted with flowers was a product of the Fu Chou and Chien Chang Departments.]—*Monkhouse, Hist. and Descr. of Ch. Porcelain*, p. 25.

Personal Adornment.—[Odoric describes the splendid pearls used for the decoration of the ladies of the court.]—*Simcox*, ii. 232.

"When you have left Carajan [Yünnan] and have travelled five days westward, you find a province called Zardandan. The people are Idolators, and subject to the Great Kaan. The capital city is called Vochan [Yung chang fu or Wunchen, in Western Yünnan]. The people of this country all have their teeth gilt, or rather every man covers his teeth with a sort of golden case made to fit them, both the upper teeth and the under. The men do this, but not the women. The men also are wont to gird their arms and legs with bands or fillets pricked in black, and it is done thus: they take five needles joined together, and with these they prick the flesh till the blood comes, and then they rub in a certain black colouring stuff, and this is perfectly indelible. It is considered a piece of elegance, and the sign of gentility to have this black band."—*Yule, Marco Polo*, ii. 69.

Architecture.—"Art rose higher in the Yuen dynasty, and the Chü yung kwan arch and inscription, which has stood for six hundred years, shew that China at that time undertook to develope new types of architectural work."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 282.

"Its date is said to be 1345. It is a triumphal monument erected in memory of a victory." There are eleven voussoirs. "One striking peculiarity is, that the inside of this arch is cut into three plain surfaces; these surfaces being elaborately sculptured with Buddhist figures. This monument has great importance to philologists, because there is an inscription repeated in six different characters."—*Trans. of Ryl. Inst. of Brit. Architects*, 1874, p. 45. See also Land-works.

Painting.—"One still meets with several works of a celebrated painter of horses, who lived about the year 1300. . . . M. Thiers . . . possesses a fine authentic water-colour of this master. The drawing of the horses is of an uncommon firmness, and the grooms attending them have a strength of touch quite unusual, at the same time that, following the Chinese custom, they turn slightly towards caricature."—*Rev. Contemp.*, xxv. 247.

Literature.—"The fame of . . . Wang Ying-lin (1223–96), is likely to last for a long time to come, not because of his association with one of China's greatest patriots, nor because of his voluminous contributions to classical literature, including an extensive encyclopædia . . . but because of a small primer for schoolboys, which, by almost universal consent, is attributed to his pen. For six hundred years this primer has been . . . the first book put into the hand of every child throughout the empire. It is an epitome of all knowledge, dealing with philosophy, classical literature, history, biography, and common objects. It has been called a sleeve edition of the Mirror of History. Written in lines of three characters to each, and being in doggerel rhyme, it is easily committed to memory, and is known by heart by every Chinaman who has learnt to read. This Three Character Classic [*San Tzŭ Ching*], as it is called, has been imitated by Christian missionaries, Protestant and Catholic; and even the T'ai-p'ing rebels, alive to its far-reaching influence, published an imitation of their own."—*Giles, Hist. of Ch. Lit.*, p. 250.

In pursuance of the policy of obliterating the sharp distinction between Mongols and Chinese "we find the tribunal of public Works presenting a Treatise on the Cultivation of mulberries to the Emperor in 1318."—*Simcox*, ii. 230.

"It was also under the Mongol dynasty that the novel first made its appearance—a fact pointing to a definite social advancement, if only in the direction of luxurious reading. Three out of the *Four Wonderful Books*, as four leading Chinese novels are collectively styled, belong to this period; one of these being the *Romance of the Three Kingdoms* . . . another, an apocryphal account of the travels of Hsüan Tsang, the Buddhist priest, to India and back, six centuries before, in quest of books and information relating to the new religion of Buddha."—*Giles, Historic China*, p. 86.

"The origin of the Chinese novel is unknown. It probably came from Central Asia, the paradise of story-tellers, in the wake of the Mongol conquest. Three centuries had then to elapse before the highest point of development was reached. Fables, anecdotes, and even short stories had already been familiar to the Chinese for many centuries, but between these and the novel proper there is a wide gulf which so far had not been satisfactorily bridged. Some, indeed, have maintained that the novel was developed from the play, pointing in corroboration of their theory to the *Hsi Hsiang Chi*, or Story of the Western Pavilion. . . . This, however, simply means that the *Hsi Hsiang Chi* is more suited for private reading than for public representation, as is the case with many Western Plays."—*Giles, Hist. of Ch. Lit.*, p. 276. See *Drama*.

"The Chinese arrange their novels under four heads, as dealing (1) with usurpation and plotting, (2) with love and intrigue, (3) with superstition, and (4) with brigandage or lawless characters generally."—*Ibid.* p. 276.

"The *San kuo chih yen i*, attributed to one Lo Kuan-chung, is an historical novel based upon the wars of the Three Kingdoms which fought for supremacy at the beginning of the third century A.D. It consists mainly of stirring scenes of warfare, of cunning plans by skilful generals, and of doughty deeds by blood-stained warriors. Armies and fleets of countless myriads are from time to time annihilated by one side or another—all this in an easy and fascinating style, which makes the book an endless joy to old and young alike. If a vote were taken among the people of China as to the greatest among their countless novels, the Story of the Three Kingdoms would indubitably come out first."—*Ibid.* p. 277.

[Amongst the other chief novels of the period are:—the *Shui Hu Chuan*, said to have been written by Shih Nai-an of the thirteenth century. "Some of it is very laughable, and all of it valuable for the insight given into Chinese manners and customs." "The graphic and picturesque style in which this book is written, though approaching the colloquial, has secured for it a position rather beyond its real merits." The *Hsi Yu Chi*, or Record of Travels in the West, is "a favourite novel written in a popular and easy style. It is based upon the journey of Hsüan Tsang to India in search of books, images, and relics to illustrate the Buddhist religion; but beyond the fact that the chief personage is called by Hsüan Tsang's posthumous title, and that he travels in search of Buddhist books, the journey and the novel have positively nothing in common. The latter is a good sample of the fiction in which the Chinese people delight."]—*Ibid.* pp. 280–2.

"Kublai Khan, who was a confirmed Buddhist, paid great honour to Confucius, and was a steady patron of literature."—*Ibid.* p. 247.

Poetry.—"The modern epoch embraces a period of nearly eight centuries, from the end of the Soung dynasty (12th century) to our own times. During this period we see some true poets fighting against the commencement of the decadence of poetry in China, and trying to save poetry from vulgarity, from false erudition, from superficiality: few they were in number, but they certainly deserved well of the Chinese muses for their courage and tenacity in struggling in the midst of their contemporaries. They, moreover, raised themselves above the existing mob of versifiers who had neither inspiration, nor ideas, nor imagination, and whose only object was to make correct verses in order to succeed at the literary examinations."—*Imbault-Huart, La Poésie Ch.*, pp. ix–x.

"A considerable amount of poetry was produced under the Mongol sway, though not so much proportionately, nor of such a high order, as under the great native dynasties. The Emperor Ch'ien Lung published in 1787 a collection of specimens of the poetry of this Yüan dynasty. They fill eight large volumes, but are not much read."—*Giles, Hist. of Ch. Lit.*, p. 252.

"One of the best-known poets of this period is Liu Chi" (1311–75). His prose writings "are much admired for their pure style, which has been said to 'smell of antiquity.'"—*Ibid.* p. 253.

The epoch "furnished one hundred and sixty-five poets of sufficient merit to have a place in the imperial libraries."—*Bazin, Le Siècle des Youen*, quot. *Hervey-Saint-Denys, Poésies de l'Epoque des Thang*, pp. xlvii–viii.

[For a specimen and translation of a poem of this period in lines of two characters, see *Legge, Ch. Class.*, IV. i. Prol. p. 118.]

Drama.—The third epoch in the history of Chinese drama "embraces all the plays which were composed under the dynasty of the Kin and that of the Youen . . . and which are now known by the names of *Youen-pen* and *Tsa-ki*."—*Bazin, Théatre Ch.*, Introd. p. ii.

"The great age for the growth of elegant amusements in China was that of T'ang Ming Huang. . . . But what they [the play-actors] learned at the time in the Emperor's school was more music than the drama. China had to wait still for the romance age of her literature before the drama could arise. At last in the thirteenth century novels and plays grew up together with the new colloquial known as *kuan-hua*."—*N.-C. Daily News*, 15th Dec. 1885.

"With the exception of dramatic writing the period of the Mongol dynasty is not conspicuous for any literary excellence."—*Contemp. Rev.*, xxxvii. 124.

"The drama was cultivated by literary people of both sexes (*Ampère, Science en Orient*, p. 227. Eighty-one *littérateurs* are mentioned as authors of four hundred and forty-eight plays)."—*Johnson, Or. Rel.—Ch.*, pp. 445–6.

"If the Mongol dynasty added little of permanent value to the already vast masses of poetry, of general literature, and of classical exegesis, it will ever be remembered in connection with two important departures in the literary history of the nation. Within the century covered by Mongol rule the Drama and the Novel may be said to have come into existence." "Nothing . . . which can be truly identified with the actor's art seems to have been known until the thirteenth century, when suddenly the Drama, as seen in the modern Chinese stage-play, sprang into being. In the present limited state of our knowledge on the subject, it is impossible to say how or why this came about. We cannot trace step by step the development of the drama in China from a purely choral performance, as in Greece. We are simply confronted with the accomplished fact." "It would seem that the drama is not indigenous to China, but may well have been introduced from Tartar sources. However this may be, it is certain that the drama as known under the Mongols is to all intents and purposes the drama of to-day."—*Giles, Hist. of Ch. Lit.*, pp. 256–8.

The number of plays was very great. "The plays written under the Youên dynasty alone already make a collection of five hundred volumes."—*Tcheng-Ki-Tong, Le Théatre des Chinois*, pp. 45–6.

"Generally speaking, whatever strictures may be made upon the management of the plot, exhibition of character, unity of action, or illustration of manners, the tendency of the play is on the side of justice and morality."—*Williams, Midd. King.*, i. 714. See also *Contemp. Rev.*, xxxvii. 124.

"The Chinese plays of the Yuen Dynasty, the period . . . when the art of dramatic writing reached its highest excellence, treat either of historical or domestic subjects. In the historical plays, the chivalrous deeds of the favourite emperors and heroes of bygone ages are narrated, and the vices of sensual monarchs are shown up with no sparing hand. The domestic plays relate to the deeds of every-day life, and may be accepted as very truthful representations of Chinese manners and customs of the present day, since these, being based on the dicta of Confucius, are as unalterable as the laws of the Medes and Persians. The dramas are generally divided into four or five acts, but as these divisions are entirely arbitrary, marking no new departure in the circumstances of the play, and as there is a total want of scenery, they are not noticeable to the spectator."—*Ibid.* xxxvii. 126.

"As a natural expression of this universality [of the Sung dynasty literature], followed the epoch of *dramatic art*. From the Mongol dynasty (Yuen) comes the national collection of the 'Hundred Plays,' from which the most popular pieces have always been taken."—*Johnson, Or. Rel.—Ch.*, p. 442.

"This dramatic literature grew up against the influence of the mandarins, and purely out of *popular impulses*. Few or none of the higher classes have dared to claim authorship in these attractive pictures of common life and genial satire, interwoven with lyric snatches and a familiar use of the old poets that was for them wholly out of order. The Mongols brought their latitudinarianism to letters."—*Ibid.* pp. 442–3.

"The Chinese drama is a thorough self-criticism by the social consciousness of the people. It prefers the materials of actual history to free creations of imagination. It completes the bald annals by giving the form and features of ages, whereof these yield only the facts and names. No pictures of manners can be more vivid than those in the plays of the Youen. The writers have a keen eye for the faults of classes and schools of official and domestic life. In prevalent forms of juggling and superstition, they find no end of comic situations and strange adventure. It was in the popular taste for burlesque and good-natured farce that the Chinese drama, like the Greek and Roman, found its first impulse."—*Ibid.* p. 447.

"The characters of Chinese drama may be drawn indifferently from mythology, fable, or history. In plays of pure fiction, the characters are invented by the authors." From the absence of caste in the Chinese social system "it has resulted that the attributes of dramatic personages have never been limited and fixed beforehand; that no rule emanating from a constitution (founded on caste) which the founder of the Sui dynasty vainly tried to introduce amongst his compatriots, has appeared to fetter the development of the characters, and for this development the Chinese poets have always enjoyed a pretty wide latitude."—*Bazin, Théatre Ch.*, Introd. pp. xviii, xx-xxi.

"It was the Youén period that authors for the first time attempted to depict selected characters in their works."—*Tcheng-Ki-Tong, Le Théatre des Ch.*, p. 181.

"Amongst the dramatic characters there figures a class of voluptuous women who, to the charms of figure and a refined elegance, join all the attractions of manner and a pretty thorough acquaintance with *belles-lettres* and the philosophers. We refer to the *learned courtesans* of China who must not be confounded with those who lavish their smiles in public, as the poets say, and run after lust. The former (and it is rarely that the others are referred to in the drama) are called *chang-ting-hang-cheou*."—*Bazin, Théatre Ch.*, Introd. pp. xxiv–v.

"In the plays of the Yüen dynasty, the prologue is in dialogue and often intermingled with verse. The sections correspond to the divisions which in Europe we call acts."—*Ibid.* p. xxxix.

The *i ch'iang* or *kao ch'iang*, "high tunes, takes its rise from the Manchu Tartars; and is of a peculiarly sad nature—'linked sweetness long drawn out.' Old persons particularly delight in listening to it or singing it. . . . The words of the plays, too, in which this style is sung, generally convey the most melancholy ideas."—*Far East*, i. 92.

"Of all plays of the Mongol dynasty, the one which will best repay reading is undoubtedly the *Hsi Hsiang Chi*, or Story of the Western Pavilion, in sixteen scenes. It is by Wang Shih-fu, of whom nothing seems to be known except that he flourished in the thirteenth century, and wrote thirteen plays, all of which are included in the collection [*Yüan ch'ü hsüan tsa chi*, Miscellaneous Selection of Mongol Plays]. . . . 'The dialogue of this play,' says a Chinese critic, 'deals largely with wind, flowers, snow, and moonlight,' which is simply a euphemistic way of stating that the story is one of passion and intrigue. It is popular with the educated classes, by whom it is regarded more as a novel than as a play."—*Giles, Hist. of Ch. Lit.*, p. 273.

[There was a popular school of dramatic chorus songs, but it did not last long.]—*Journ. P.O.S.*, ii. 239.

Music.—The scale adopted during the Chow dynasty "remained in use unchanged until the rise of the Yüan dynasty. . . . The invading Mongols brought with them a scale and a system of notation different from that used by the Chinese (see scale, p. 15). . . . This new notation rapidly became popular on account of the simplicity of the characters compared with the complicated signs of the ancient scale. But confusion was naturally created by some musicians using F natural, while others used F♯. Kublai Khan, who always paid strict regard to the ancient laws and customs of the conquered Chinese, endeavoured to reconcile the two scales by introducing F♯ in the modern gamut under the name of 六 (*kou*)."—*Van Aalst, Ch. Music*, p. 15.

"The Mongol dynasty . . . had its *national* music" besides that played at the sacred games.—*Ch. Rec.*, xxi. 345.

[The *hsiao* (簫), flute, was introduced into ritual music during the Yüan dynasty (*Van Aalst*, p. 70).]

Porcelain and Pottery.—"The manufacture of porcelain is said to have deteriorated, but little is known about it." "The Shu-fu porcelain . . . was copied from the Ting chou porcelain of the Northern Sung Dynasty."—*Monkhouse, Hist. and Desc. of Ch. Porcelain*, pp. 23–4.

[The 14th century is considered the time when the art of manufacturing hard china reached its perfection.]—*De Courcy, L'Emp. du Mil.*, p. 456.

"Probably many of the porcelains existing during the thirteenth century and previously were of such delicate make as to be unfit to survive even to the Ming dynasty, whereas the strong kinds, such as some of the old céladons, which were of an almost imperishable hardness and thickness, or the heavy Chün-yao porcelains, have lasted to the present day."—*Hirth, Anc. Porc.*, p. 9.

Ibn Batuta "describes the dishes of lacquered ware" he saw in China.—*Simcox*, ii. 235.

Ming Period (Restoration of Chinese Supremacy) (1368 *to* 1644).—*Table VIII.*

Object-decoration.—"Painted on the upper garment were 6 figures, viz., the sun, moon, stars, heavenly bodies, dragon on a hill, and pheasant, and embroidered on the lower garments were [also] 6 figures, viz., the apt, aquatic plant, fire, rice, axe, and 黻—the two together making 12 figures."—*T'ai Shên Shang shu chu, Ko chih ching yüan, c.* 15, *Kuan fu lei*, p. 4*a*.

Personal Adornment.—"All of them do suffer their nails of the left hand to grow very long, but the right hand they do cut; they have long hair, and esteem it very much and maintain it with curiosity: of both they make a superstition, for they say that thereby they shall be carried into heaven [!]. They do bind their hair up to the crown of their head, in cauls [nets] of gold very curious, and with pins of the same."—*Mendoza, Hist.*, p. 30.

Architecture.—"The Yuen dynasty architecture was surpassed by that of the Ming dynasty. It was then that Chinese art rose to its greatest height. The Emperor Ch'eng tsu, of the Yung lo period, was the greatest of the Ming line. It was he that made Peking what it is. The plan of the city, the tombs, the great bell, the fortified passes in the Great Wall are his. These and the grandeur of the city gates and wall belong to the Ming dynasty, and to him in particular. In the time of Shun chi and Kang hi, an effort was made to improve the astronomical observatory."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 282–3.

"The influence of the Emperor Chien lung was directed to the production of substantial architecture in various styles. His Buddhist, Confucian, Moslem and Italian erections were well done in their day." "In the changes made by the Emperor Chien lung in the temple of Confucius there is a distinct aim to restore the ancient classical structure, the Pi yung kung. The brevity of classic texts renders exact restoration to a large extent conjectural. In this case there is a circular marble tank. In the centre is a hall in which is a throne for the Emperor when he expounds the classics. The south face of this hall consists entirely of lofty doors admitting light through thin bamboo paper."—*Ibid.* xxiv. 283.

"In the Ming tombs we have the perfection of Chinese power of arrangement. It is a ride of seven miles from the entrance of the valley to the tomb of Yung lo. The valley is occupied by the thirteen tombs. At the entrance the marble gateway attracts special attention. Ninety feet long by fifty high, composed of marble, and seeming to be roofed with tiles, it is seen from a great distance, and it has stood for three centuries and a half. On nearer inspection it is found that the roof is cut marble, and when this fact is observed, the whole structure is seen to be a remarkable triumph of architecture. The P'ai leu of China takes the place of the triumphal arch of Europe, and this one at the Ming tombs is the best in the country. It was erected at a time when the Chinese building and bell-casting art reached their culminating point. The original red and green colours have long since withered down to a sober grey. Passing this we proceed through several avenues of trees and several gateways till the avenue of animals is reached—a truly striking feature [see FUNERAL RITES]. Lions, unicorns, camels and elephants stand and kneel in pairs. The four elephants are each cut from one stone. They are 13 feet high and 14 feet long. . . . Then the hall for sacrifice is the third great feature. It is 70 yards long by 30 deep. The teak pillars, 12 feet round and 32 feet high, are 32 in number. The building is 64 feet high. It is reached by a marble ascent of 18 steps, and is surrounded by beautifully carved balustrades. The roof juts out 10 feet beyond the walls on which it rests. The fourth great feature of the Ming tombs is the tomb itself, above this passage. In front of it is a mass of solid stone-work which supports the monumental stone on which is inscribed in characters of enormous size the posthumous name of the Emperor Yung lo, who died A.D. 1425. Beneath is the coffin-passage, 39 yards long, conducting to the tomb door, and the visitor arriving there ascends to the platform above by a long staircase. Here the stone, three feet thick, two yards wide, and high in proportion, with the Emperor's name on it, may be observed. It was originally painted with vermilion. Then there is the mound, half a mile in circuit, containing a hemispherical chamber, in which is the coffin. The chamber is large enough to hold probably 400 persons." "In this work of construction we see Chinese architectural skill at its acme of power. So many remarkable features combine in the Ming tombs that we must in this instance award to Chinese architecture the praise of success in imparting to the imperial tombs an air of great dignity and solemnity."—*Ibid.* xxiv. 284–5.

[The Temples of Heaven and Earth at Peking are said to have been erected about the year 1420.]—*Fergusson, Hist. of Ind. and East. Arch.*, p. 691.

"Of those [pagodas] which existed in China in our own time the best known is the celebrated porcelain tower at Nankin [destroyed in the T'aiping rebellion]. Commenced in the year 1412, and finished in 1431, it was erected as a monument of gratitude to an empress of the Ming family, and was, in consequence, generally called the Temple of Gratitude. It was octagonal in form, 236 feet in height, of which, however, about 30 feet must be deducted for the iron spire that surmounted it, leaving little more than 200 feet for the elevation of the building, or about the height of the monument of London. From the summit of the spire eight chains depended, to each of which were attached nine bells, and a bell was also attached to each angle of the lower roofs, making 144 bells in all, which, when tinkling in harmony to the evening breeze, must have produced an effect as singular as pleasing. It was not, however, either to its dimensions or its bells that the tower owed its celebrity, but to the coating of porcelain which clothed its brick walls, as well as the upper and under sides of the projecting roofs, which mark the division of each storey. The porcelain produced brilliancy of effect which is totally lost in all the representations of it yet published, but which was, in fact, that on which the architect almost wholly relied for producing the effect he desired, and without which his design is a mere skeleton."—*Ibid.* pp. 695–6.

"In this kingdom in all places, there be men excellent in architecture, and the necessaries they have to build with is the best that is in the world. . . . They have a kind of white earth of the which they make bricks, of so great hardness and strength, that for to break them, you must have pickaxes. . . . [The viceroys' palaces, built at the emperor's cost] are wrought by marvellous art, and as big as a great village" [enclosing gardens, parks, and woods.]—*Mendoza, Hist.*, i. 26.

"In the city of Fucheo, there is a tower, right against the house of the king's chief receiver, and it is affirmed by those that have seen it, to surmount any building that hath been amongst the Romans; the which is raised and founded upon forty pillars, and every pillar is of one stone so big and so high that it is strange to tell them."—*Ibid.* i. 27–8.

Sculpture.—"The Ming tombs are approached by lines of colossal monoliths in marble for half a mile. Similar avenues are not unfrequent as approaches to tombs (*Girard*, ii. 87; *Pumpelly*; *Hübner*). Jesuit letters of the sixteenth century speak of statues in the temples, of very great size and covered with beaten gold (*Alvarez*)."—*Johnson, Or. Rel.—Ch.*, p. 80.

Literature.—"The literature of the dynasty is copious and correct, but less original and varied than that of the Sung."—*Simcox*, ii. 237.

"The literature of the Ming Dynasty, in so far as it has been made accessible to European readers, does not throw much additional light upon the social and economic condition of the people. Philosophic historians, who had witnessed the expulsion of the Mongols, reproduced in picturesque language the doctrine of the alternation of growth and decay, which was already a commonplace in the time of Ssema-tsien. Nothing human can last for ever, and no human foresight can guard against the ever-varying dangers which prove fatal at last to each State or Dynasty in turn. Even the sages of antiquity had no thought of avoiding this doom of change, and were content if, by following truth and virtue, they might earn so much of the blessing of Heaven that the evil days were deferred to another generation (*Giles, Gems*, pp. 244, 288). This philosophy was not new in China, but some practical difference arises when, as now, it is professed by scholars who find in it an excuse for political inaction, instead of representing the conclusions of statesmen who, having done their best, discern with rational stoicism that even the best action has but a finite scope."—*Ibid.* ii. 252.

In 1369 the first Emperor of the Ming dynasty "appointed Sung Lien (1310–1381), in conjuction with other scholars, to produce the History of the Mongol Dynasty. . . . Apart from the history . . . and a pronouncing dictionary on which he was employed, his literary remains fill only three volumes."—*Giles, Hist. of Ch. Lit.*, pp. 291–2.

"It has long been the custom in China to publish large collections of separate works, under the name of *Ts'ung shoo*, sometimes confined to specialities, but very often ranging over the whole field of literature, and containing some choice or rare treatises in each department, according to the compiler's taste or fancy. These may consist of a few or many volumes, some collections extending to hundreds. By this means many works are preserved, which would otherwise probably be lost sight of altogether. As an example of these, the *Han wei ts'ung shoo* is a collection of 96 works written during the Han and Wei dynasties, and re-published in the Ming dynasty by Ch'ing Yung in the above form."—*Wylie, Ch. Researches*, p. 237.

Hui Ti [1399–1403] "ordered the compilation of a great encyclopædia, which was never printed on the ground of expense; but a single imperfect copy of it was said subsequently to have preserved 385 ancient and rare works that would otherwise have been lost."—*Simcox*, ii. 239–40.

The third Emperor [Ch'êng Tsu, 1403–25] of the Ming dynasty "caused to be compiled what is probably the most gigantic encyclopædia ever known, the *Yung Lo Ta Tien*, to produce which 2169 scholars laboured for about three years under the guidance of five chief directors and twenty sub-directors. Judging from the account published in 1795, it must have run to over 500,000 pages. It was never printed because of the cost of the block-cutting; but under a subsequent reign two extra copies were taken, and one of these, imperfect to the extent of about 20,000 pages, is still in the Han-lin College at Peking [but was destroyed when the College was burnt in 1900]. The others perished by fire at the fall of the Ming dynasty. Not only did this encyclopædia embrace and illustrate the whole range of Chinese literature, but it included many complete works which would otherwise have been lost. Of these, no fewer than 66 on the Confucian Canon, 41 on history, 103 on philosophy, and 175 on poetry were copied out and inserted in the Imperial Library."—*Giles, Hist. of Ch. Lit.*, p. 296.

"Li Shih-chên completed in 1578, after twenty-six years of unremitting labour, his great Materia Medica. In 1596 the manuscript was laid before the Emperor, who ordered it to be printed forthwith. It deals (1) with Inanimate Substances; (2) with Plants; and (3) with Animals, and is illustrated by over 1100 woodcuts. The introductory chapter passes in review forty-two previous works of importance on the same subject, enumerating no fewer than 950 miscellaneous publications on a variety of subjects. The famous 'doctrine of signatures,' which supposes that the uses of plants and substances are indicated to man by certain appearances peculiar to them, figures largely in this work."—*Ibid.* pp. 307–8.

"Hsü Kuang-ch'i (1562–1634) is generally regarded as the only influential member of the mandarinate who has ever become a convert to Christianity. . . . In 1604 he enrolled himself as a pupil of Matteo Ricci, and studied under his guidance to such purpose that he was able to produce works on the new system of astronomy as introduced by the Jesuit Fathers, besides various treatises on mathematical science. He was also author of an encyclopædia of agriculture of considerable value, first published in 1640. This work is illustrated with numerous woodcuts, and treats of the processes and implements of husbandry, of rearing silkworms, of breeding animals, of the manufacture of food, and even of precautions to be taken against famine. The Jesuit Fathers themselves scattered broadcast over China a large number of propagandist publications, written in polished book-style, some few of which are still occasionally to be found in old book-shops."—*Ibid.* p. 308.

"Novels were produced in considerable numbers under the Ming dynasty, but the names of their writers, except in a very few cases, have not been handed down. The marvellous work known as the *Chin P'ing Mei*, from the names of three of the chief female characters, has been attributed to the grave scholar and statesman, Wang Shih-chêng (1526–93); but this is more a guess than anything else. So also is the opinion that it was produced in the seventeenth century, as a covert satire upon the morals of the Court of the great Emperor K'ang Hsi. The story itself refers to the early part of the twelfth century, and is written in a simple, easy style, closely approaching the Peking colloquial. It possesses one extraordinary characteristic. Many words and phrases are capable of two interpretations, one of which is of a class which renders such passages unfit for ears polite. Altogether the book is objectionable and would require a translator with the nerve of a Burton."—*Ibid.* p. 309.

[The following are named among the principal novels of the period:—"The *Yü Chiao Li* is a tale of the fifteenth century . . . of an unusually moderate length. The ordinary Chinaman likes his novels long, and does not mind plenty of repetitions after the style of Homer, which latter feature seems to point in the direction of stories told by word of mouth and written down later on, and may be taken in connection with the opinion . . . that the Chinese novel came originally from Central Asia."—"The *Lieh Kuo Chuan*, anonymous as usual, is a historical novel dealing with the exciting times of the Feudal States, and covering the period between the eighth century B.C. and the union of China under the First Emperor."

—"The *Ching Hua Yüan* is a less pretentious work . . . but of an infinitely more interesting character" dealing with the visit of a young graduate and his friends to the Country of Gentlemen.—"The *Chin Ku Ch'i Kuan*, or Marvellous Tales, Ancient and Modern, is a great favourite with the romance-reading Chinaman. It is a collection of forty stories said to have been written towards the close of the Ming dynasty by the members of a society who held meetings for that purpose. The style is easy, very unlike that of the *P'ing Shan Lêng Yên*, a well-known novel in what would be called a high-class literary style, being largely made up of stilted dialogue and over-elaborated verse composed at the slightest provocation by the various characters in the story."—"The *Erh Tou Mei*, or 'Twice Flowering Plum-trees,' belongs to the sixteenth or seventeenth century, and is by an unknown author. It is a novel with a purpose, being apparently designed to illustrate the beauty of filial piety, the claims of friendship, and duty to one's neighbour in general. Written in a simple style, with no wealth of classical allusion to soothe the feelings of the pedant, it contains several dramatic scenes, and altogether forms a good panorama of Chinese everyday life."]—*Ibid.* pp. 309–24.

Poetry.—"Though the poetry of the Ming dynasty shows little falling off, in point of mere volume, there are fewer great poets to be found than under the famous Houses of T'ang and Sung. Hsieh Chin (1369–1415), chiefly known as the author of what appears to be a didactic poem of about 150 lines, and Fang Shu-shao, who got into his coffin and wrote a farewell poem to the world, are the principal names mentioned."—*Ibid.* pp. 329–34.

"The courtesans of ancient and mediæval China formed a class which now seems no longer to exist. Like the *hetairæ* of Greece, they were often highly educated, and exercised considerable influence. Biographies of the most famous of these ladies are in existence, extending back to the seventh century A.D." "The poetical effusions, and even plays, of many of these ladies have been carefully preserved, and are usually published as a supplement to any dynastic collection." "This small department of literature . . . if deficient in work of real merit, at any rate contains nothing of an indelicate character." —*Ibid.* pp. 332–3.

Drama.—"With the return of the Chinese to power in 1368 the pens of authors were once again employed in the paths of literature, which commended themselves more especially to the inherent classical taste of the nation. Thus it came about that dramatic writing fell into the hands of inferior authors, who proved most conclusively their incompetence, and wrote themselves down dullards or plagiarists on every page of their compositions. Being unable to furnish any scenes of intelligent interest, they attempted to supply the want by the introduction of the grossest indecencies in both speech and action, and, though exceptions are to be found, such has continued to be the characteristics of Chinese playwrights down to the present time." —*Contemp. Rev.*, xxxvii. 124.

"The production of plays was well sustained through the Ming dynasty, for the simple reason that the Drama, whether an exotic or a development within the boundaries of the Middle Kingdom, had emphatically come to stay. It had caught on, and henceforth forms the ideal pastime of the cultured, reflective scholar, and of the laughter-loving masses of the Chinese people." —*Giles, Hist. of Ch. Lit.*, p. 325.

"The *P'i Pa Chi*, or 'Story of the Guitar,' stands easily at the head of the list, being ranked by some admirers as the very finest of all Chinese plays. It is variously arranged in various editions under twenty-four or forty-two scenes; and many liberties have been taken with the text, long passages having been interpolated and many other changes made. It was first performed in 1704, and was regarded as a great advance in the dramatic art upon the early plays of the Mongols. The author's name was Kao Tsê-ch'êng, and the hero is said to have been taken from real life in the person of a friend who actually rose from poverty to rank and affluence." —*Ibid.* pp. 325–6.

Music.—"The Ming . . . adopted the Yüan gamut, but excluded all the notes producing half-tones, and so obtained a pentatonic scale" (see p. 16).—*Van Aalst, Ch. Music*, p. 16.

"There is no such thing as part singing in China, nor have we met tunes harmonized in any book; only the melody is written. But the rudiments of harmony are to be found in a book published as early as 1525; how much earlier they were in possession of these rudiments we cannot tell. Their various instruments in the various keys are tuned in fifths and made to respond to one another in fifths. The *sêng* is often played in fifths and octaves. The Lama priests in Wu Tai San entone their prayers in very deep notes a fifth apart or an octave apart. *When* they began to do this we have no means of knowing." "The only harmony they [the Chinese] think of is the harmony of the different sounds of their eight kinds of instruments, that is, using only the instruments that sound well together and are appropriate to be used on any given occasion."—*Ch. Rec.*, xxi. 340.

"It was from these sources [the works on music preserved by the Sung scholars], as well as from the Classics and from the memoirs which were used in the composition of the three first dynasties, that the illustrious Prince Tsai-yu, of the imperial family of the Ming, assisted by the cleverest scholars of his time, drew the true system of ancient Chinese music, which he set forth in a work on the *lu*."—*Mém. conc. les Ch.*, vi. 32–3.

"In the 5th year (1372) of Hung Wu the Board of Ceremonies was ordered to make musical instruments and distribute them through all the Confucian colleges in the empire."—*Ch. Rec.*, xxi. 342.

Mendoza says that it was common for musicians and singers, both male and female, to perform at banquets; and that Chinese solemnized their festivals "with much music and new inventions." At the New Year, in particular, "all people generally sport themselves with great singing and sounding of instruments, in the which they are very cunning. Such instruments as the Augustine friars did see were lutes, gitterns, viols, rebecks, wayghtes [*sic*], virginals, harps and flutes, and other instruments which we do use, although they do differ something in the fashion of them, but yet easy to be known. They do tune their voices unto their instruments with great admiration; they have all commonly very good voices."—*Mendoza, Hist.*, pp. 138, 139, 140. All the above, except flutes and perhaps "wayghtes" were stringed.

"The 'tub-like drum,' 'stone mortar,' or large earthenware jar, were played with the palms of the hands or soles of the feet."—*Shih wu kan chu, Ko chih ching yüan*, c. 60, *Wan hsi ch'i wu lei*, p. 12*b*.

Porcelain.—"The Ming porcelain is naturally somewhat coarse in make faulty in shape, and decorated with paintings which, though characterised by boldness of design, have usually been executed without much care."—*Little (Mrs. A.), Int. Ch.*, p. 426.

[Great quantities of porcelain of all kinds were produced during the 16th century.]—*Journ. P.O.S.*, i. 99–100.

"Art as well as literature profited by the internal peace which prevailed under the native dynasty, and the sites of the most famous porcelain works were fortunately at a safe distance from the disturbed frontiers. The china made during the reign of the usurper Yung-lo is counted as the third best of the dynasty [*cf. infra.*] The reign of his grandson (1426–35) is the period from which the finest dates. Deep red and sky-blue vases, tea-cups of pure white with exquisite paintings, choice specimens of crackle and enamel and pieces of the most varied colour and design were produced by the artists of the day, and all were equally excellent of their kind. Imperial patronage contributed a good deal to the development of the art, a kind of porcelain known as 'magistrates' china' being now made for the first time, by processes too costly to be tried at the expense of private individuals."—*Simcox*, ii. 256. *Cf. infra.*

"By a curious refinement of dilettantism, the colour of choice cups was designed to blend with that of the liquid for which they were used, so that the description of their beauties always specifies, not merely the colour of the cup when empty, but also the shade which appears when it is filled with tea or wine as the case may be. The imitations of Chinese designs in Persian pottery, with vague scrawls to represent Chinese characters, probably belong for the most part to this dynasty; and their existence shows that the overland export trade in porcelain must have reached a considerable development, to introduce the fashion for forgeries in a country with a vigorous native art of its own."—*Ibid.* ii. 257.

"Among other things for which the reign of Wan li was celebrated were the white censers, made in imitation of the censers of Ting chou of the Sung dynasty, fashioned after antique bronze designs; the red cups of 'liquid dawn tint' and the egg-shell wine cups, weighing only one forty-eighth part of an ounce each, of Hao Shih chiu a famous potter of Ching tê Chên. We have nothing worthy of mention to represent the later reigns of this dynasty, which were fully occupied with combating the rising Manchu power." —*Journ. P.O.S.*, i. 115–6.

"During the long and famous native Dynasty of the Mings the manufacture of porcelain progressed and flourished greatly. In both skill of execution and beauty of decoration it may be said to have grown to full manhood, though it yet had many graces to acquire. Great quantities of polychrome porcelain were produced . . . but the manufacture of what we call 'blue and white' so predominated that it may not be improperly called the 'Blue and white' period." [But it must be remembered that most of the blue and white, and the céladon also, in modern collections, were made during the Manchu period, which began in 1644.] . . . "There is probably no 'blue and white' porcelain of an earlier date in existence, but Chinese writers speak of porcelain painted with flowers under the Yüan dynasty in the departments of Fu-chou and Chien-chang, and both these descriptions (called Liu-ch'üan-yao and Nan-fêng-yao respectively) are said to have been preferred to the productions of Ching-tê-chên. If this be true it would account for the popularity of similar decoration in the early years of the Ming Dynasty. In 1369 a special factory was established at Ching-tê-chên for the use of the palace, where a ware of a specially fine quality was produced for magistrates. In the same reign (Hung-wu, 1368–1399) the Emperor ordered vases to be inscribed with the date mark of four or six characters, the former giving the imperial name, or *nien-hao*, and the latter the name of the Dynasty also. Similar orders had been given by the Emperor Ching-tê (1004–1008) . . . but . . . for practical purposes date marks may be taken as commencing with Hung-wu. . . . In this reign the colours were blue, black, and the purest white, and among the pieces of the special ware manufactured at Ching-tê-chên were: (1) blue flower jars painted, with the dragons sporting among the clouds; (2) large blue jars, with two dragons as above, and flowers of the Nymphœa lotus; (3) jars of white porcelain with blue flowers; (4) large jars, ornamented with four blue dragons arranged in an arch, sporting in the waves of the rising tide; (5) jars with blue flowers for containing fish; (6) porcelain jars, of pea-green colour, etc."—*Monkhouse, Hist. and Desc. of Ch. Porcelain*, pp. 25–6.

"The most celebrated (amongst Chinese connoisseurs) of the earlier Ming periods was that of Yung-lo (1403–1425). The blue and white porcelain produced in this period was regarded as third in rank, being excelled only by those of Hsüan-tê (1426–1436) and Ch'êng-hua (1465–1488). The blue employed is stated in the annals of Fouliang to have been brought from some Mohammedan country (probably Persia) as tribute, and was known as Mohammedan blue, to distinguish it from the inferior native blue. It was called Su-ma-ni blue in the periods Yung-lo and Hsüan-tê, and also Su-ni-po in that of Ch'êng-hua. Further supplies were obtained during the periods Ch'êng-tê (1506–1522) and Chia-ching (1522–1567)." "The period of Yung-lo is also marked by the introduction of very thin or eggshell porcelain."—*Ibid.* pp. 26–7.

"The period of Hsüan-tê (1426–1436) was the most celebrated of all the Ming periods for 'blue and white' on account of the fine Mohammedan blue." "The characteristics of Hsüan-tê blue appear to have been pale, but in that and other periods no doubt there was a deep as well as a pale blue." "The glaze of this period was sometimes marked with faint millet-like elevations, and . . . the blue is described as 'brilliant,' 'dazzling,' and 'deep.'" "Celebrated as was the 'blue' of Hsüan-tê, the 'red' was prized still more highly. So brilliant was it that Tzŭ-ching states, no doubt erroneously, that it was derived from powdered rubies. It was sometimes used to colour the glaze, sometimes for painted decoration under the colourless glaze. Specially celebrated were the cups with red fish or peaches on a white ground, or with red dragons in high relief coiled round the top. It is variously described . . . as 'the colour of fresh blood,' 'brilliant red colour dazzling to the eyes,' and 'vermilion,' and, according to Dr. Bushell, was a copper silicate." "In this reign is said to have been introduced a new method of decoration by perforation, or cutting out of a pattern through the body of a piece, and then dipping it in the glaze and baking it, the result being that the perforations are filled up with a film of glaze, and the pattern is shown in transparency. This has been imitated in Persia, at Worcester, and elsewhere."—*Ibid.* pp 27–31.

"During the reign of Ch'êng-hua (1465–1488) the supply of 'Mohammedan' blue failed, and polychrome decoration was preferred. This decoration was partly under the glaze (blue and sometimes red) and partly with coloured glazes, red, green, yellow, and purple brown, but there was little or no painting over the glaze before the latter part of the period Wan-li" (1573–1620).—*Ibid.* p. 32.

"It would appear . . . that there was a great progress in naturalistic decoration during these reigns, that flowers and insects were the object of fresh studies, and that the best painters were employed to make designs, if not to paint upon the china itself."—*Ibid.* p. 34.

"During the reign of Hung-chih (1488–1506), says Tzŭ-ching, light yellow was the colour most highly valued, but enamelling in other colours was also employed. There were several shades of yellow. That of a freshly husked or boiled chestnut seems to have been the favourite. Others of the colour of the hibiscus flower and of orange are also mentioned. Yellow glazes were continued in the subsequent reign of Chêng-tê (1506–1522). . . . But in this reign the Governor of Yünnan succeeded in obtaining supplies of the Mohammedan blue, and 'blue and white' came into fashion again. So fine was this blue that imitation sapphires were made of it. . . . Two brilliant kinds of red were also prized, and over-glaze decoration is mentioned. In the next reign, Chia-ching (1522–1567), a great deal of 'blue and white' was made. The blue was preferred to be very dark in colour, differing from the pale Hsüan-tê blue, and the best was a mixture of the foreign and native cobalt, as the former was apt to 'run' in baking. . . . The Mohammedan blue, however, failed again in the later years of this reign, and finally disappears from Chinese ceramic history."—*Ibid.* p. 34.

"Dr. Bushell records that the reign [Chia Ching, 1522–1567] was remarkable for pieces with a mottled blue ground lined with canary and coral decoration, and for blue paintings relieved by red, blue, and yellow. He also notes that very large pieces were then made, some round dishes being over three feet in diameter; that a turquoise blue from copper was used; that a coral red glaze produced by roasting crystals of iron sulphate was substituted for the old copper red, and that the designs were principally derived from embroidery and coloured silks." "Although the Chia-ching white is generally yellowish, this reign was noted for a ware like white jade, intended for use on the palace altars." "In this reign were also produced examples of what is probably a much older kind of decoration, by coloured glazes on 'biscuit'—*i.e.* ware baked but not glazed. The pieces were 'washed' rather than painted with coloured glazes, often of very rich tones, red, blue, aubergine, yellow, and turquoise. When the decoration was in relief, or, in the case of a statuette, the differences in level would suffice to keep the different colours distinct. Thus a slightly relieved dragon could be made red, and the parrot in the round could be given a green body and maroon wings, and be made to stand on a yellow rock, and figures could be draped in coloured mantles. In other cases the surface of a vase is often covered with a pattern outlined in relief, making compartments to keep the different colours in their places. The pieces, especially the turquoise pieces, are often curiously carved or perforated."—*Ibid.* pp. 35–6.

"The porcelain produced during these two reigns [Lung Ch'ing (1567–1573) and Wan Li (1573–1620)] is very much alike. The disorder in the empire and the enormous supplies of porcelain ordered for the use of the palace contributed to the deterioration of the wares produced at the imperial factories, and the supplies of good blue and good clay also failed. The production, however, was enormous . . . yet some of the blue is fine in colour. . . . There was also much advance made in painting in colours over the glaze. The pieces so decorated are divided into 'three colour' and 'five-colour' pieces. . . . The 'three' colours are yellow, green, and purple. The yellow is usually dull, of a buff or 'nankeen' colour, and the purple from a brownish or mouse to prune colour. To the 'five-colour' pieces a red over the glaze and blue underneath it were added to the 'three' colours. They are, in fact, 'blue and white,' with other colours added over the glaze. The portions of the design that were meant to remain blue were first painted, and the pieces were then glazed and baked. Then the rest of the decoration in other colours was added over the glaze in enamel colours, and the piece was baked again at a lower temperature. . . . Over-glaze decoration is mentioned . . . as early as the reign of Hung chih (1488–1506), and Dr. Bushell states that in the reign of Chêng-tê (1506–1522), blue and red under-glaze were combined with over-glaze decoration. It is probable, however, that this kind of decoration was imperfectly developed till Wan-li's time, when the beautiful class of Chinese porcelain, happily named *famille verte* by M. Jacquemart, may be said to have commenced. It is not so perfect in execution, and it is rougher in design than the exquisite *famille verte* of the period of K'ang-hsi (1662–1723) but it is essentially the same in artistic intention. It has one difference, however . . . the blue is always under the glaze, whereas in the K'ang-hsi period a blue vitreous enamel was used over the glaze. In Wan-li's time the inequality of glaze-surface, sometimes compared to orange-peel, was much prized." —*Ibid.* pp. 36–7.

"The remaining reigns of the Ming emperors count for little in the history of ceramics. They were constantly at war with the Manchu Tartars, and the factories at Ching-tê-chên fell into decay and were finally closed. The marks of T'ien-chi (1621–1628) and Ch'ung-chên (1628–1644) are found on a few pieces of porcelain," but "they do not say much for the ceramic skill of the period."—*Ibid.* p. 37.

[The Ch'ai and Ju porcelains had ceased to exist before the end of the Ming dynasty.]—*Hirth, Anc. Porc.*, pp. 10–11; but see *Journ. P.O.S.*, i. 70, 80–1, 84.

Manchu Period (1644 *to* —).—*Table IX.*

Object-decoration.—"In their decoration, both painted and woven, the Chinese exhibit only just so much art as would belong to a primitive people. Their most successful efforts are those in which geometrical combinations form the basis; but even in these, whenever they depart from patterns formed by the intersections of equal lines they appear to have a very imperfect idea of the distribution of spaces. Their instinct of colour enables them, in some measure, to balance form, but when deprived of this aid they do not appear to be equally successful [see plates in work quoted]. . . . The Chinese are certainly colourists, and are able to balance with equal success both the fullest tones of colour and the most delicate shades." "They are not only successful in the use of the

primaries, but also of the secondaries and tertiaries; most successful, perhaps, of all in the management of the lighter tones of pure colours,—pale blue, pale pink, pale green prevailing."—*Jones, Grammar of Ornament*, ch. xiv. p. 2.

"In their ornamentation, with which the world is so familiar through the numerous manufactured articles of every kind which have been imported into this country, they do not appear to have gone beyond that point which is reached by every people in an early stage of civilisation; their art, such as it is, is fixed, and is subject neither to progression nor retrogression. In the conception of pure form they are even behind the New Zealander; but they possess, in common with all Eastern nations, the happy instinct of harmonising colours. As this is more a faculty than an acquirement, it is just what we should expect: the arriving at an appreciation of pure form is a more subtle process, and is the result of either more highly endowed natural instincts, or of the development of primitive ideas, by successive generations of artists improving on each other's efforts."—*Ibid.* ch. xiv. p. 1.

"Of purely ornamental or conventional forms, other than geometric patterns, the Chinese possess but very few. . . . They have no flowing conventional ornament—such as we find in all other styles; the place of this is always supplied by a representation of natural flowers interwoven with lineal ornament. . . . In all cases, however, their instinct restrains them within the true limit; and although the arrangement is generally unnatural and unartistic, they never, by shades and shadows, as with us, violate consistency. In their printed paper-hangings, the whole treatment, both of figures, landscape, and ornament, is so far conventional that, however we may feel it to be unartistic, we are not shocked by an overstepping of the legitimate bounds of decoration. In their floral patterns, moreover, they always observe the natural laws of radiation from the parent stem, and tangential curvature; it could not well be otherwise, as the peculiarity of the Chinese is their fidelity in copying: and we hence infer that they must be close observers of nature. It is the taste to idealise upon this close observation which is wanting."—*Ibid.* ch. xiv. p. 2; and see plates.

"The Chinese frets are less perfect than any of these [Greek, etc.]. They are formed, like the Greek, by the intersection of perpendicular with horizontal lines, but they have not the same regularity, and the meander is more often elongated in the horizontal direction. They are also most frequently used fragmentally,—that is, there is a repetition of one fret after the other, or one below the other, without forming a continuous meander."—*Ibid.* ch. iv. p. 3.

"On the whole, Chinese ornament is a very faithful expression of the nature of this peculiar people; its characteristic feature is oddness,—we cannot call it capricious, for caprice is the playful wandering of a lively imagination; but the Chinese are totally unimaginative, and all their works are accordingly wanting in the highest grace of art,—the ideal."—*Ibid.* ch. xiv. p. 2.

"Ranged in octagon form, these eight trigrams [the *pa kua*, *v. Divination*] are very extensively used as decorative objects, on dishes, vases, bells, utensils, the lintels of doors, the gables of houses, the ceilings of rooms, and a numberless variety of other positions, being rated to comprise a vast amount of hidden wisdom."—*Wylie, Ch. Researches*, pp. 209-10.

"The symbolism of the Chinese has not attracted the notice of foreign writers so much as it deserves. It meets us everywhere—on plates and crockery, on carpets, rugs, vases, wall pictures, shop signs, and visiting cards. Certain animals stand for well-understood characters in the language, and convey their sense to the native without any confusion. Owing to the similarity of sound, *fuh* denotes *bat* and *happiness*, and *luh* stands for *deer* and *official emolument*. The character *shao* [*shou*], meaning 'longevity,' is represented in many ways—an old man leaning on his staff; a pine tree cut into the form of the character; a tortoise, which is among the longest-lived reptiles; a stork, supposed to be a bird which attains a great age, and a fabulous peach which is a thousand years ripening. A dragon and a phœnix, or *lung-whang* [*lêng-huang*], are emblems of a newly wedded pair, and various modes of combination are adopted to represent marriage relations." "A rug will sometimes tell a story very neatly to the eye. In the centre is the *swastica*, or 'hammer of Thor,' which denotes *all*, and symbolizes all happiness that humanity desires. On the right is the *luh*, or 'deer,' which denotes honor and success in study, carrying the *yü-i*, or Buddhist sceptre, in its mouth, meaning success in literary labors. On the left is pictured a goose, indicating domestic felicity, and two bats complete the rug, with its good wishes." "The visiting card and note paper often indicate in their adornments a good wish and a motto which does credit to the taste and heart of the designer. A most graceful and not uncommon way of wishing a guest good luck is to depict some happy emblem or a sentence of the language with a fortunate meaning on the bottom of his tea-cup. The characters 'May your happiness know no bounds' frequently occur in this position, and the oft-recurring five bats or three peaches can be employed with like signification. The mandarin duck is a well-understood emblem for conjugal affection; again, a cock and hen standing on an artificial rock-work symbolize the pleasures of a country life. Sometimes the eight symbols peculiar to the Buddhist sect, or the *pah sien* [*pa hsien*] ('eight genii') indicative of their protection, are seen in the border of a plaque amid a device of running arabesques. The favorite dragon, in an infinite diversity of shapes, adorns the finer qualities of cups, plates, bowls, and vases, to represent imperial grandeur, but common people are not wont to use such patterns."—*Williams, Midd. King.*, ii. 111–3.

[Lanterns were variously and often beautifully decorated.] —*Ibid.* i. 817-8.

"However admirable and ingenious the modern Chinese may be, it is in the minor arts—such as carving in wood and ivory, the manufacture of vessels of porcelain and bronze, and all that relates to silk and cotton manufactures" that they certainly excel and in these "reached a high degree of perfection while Europe was still barbarous, but in all the higher branches of art they take a very low position, and seem utterly unprogressive."—*Fergusson, Hist. of Ind. and East. Arch.*, p. 710.

"The Chinese workmanship in chased, repoussé, and carved work of gold and silver—baskets, card-cases, teapots, combs, etc.—is almost unequalled. Their jewellery, too, admirably exhibits the delicate filigree work which agrees so well with their genius. Flower-baskets with chased flowers and figures of various sorts enamelled on the outside of the open work of wire, and set with precious stones, may perhaps be regarded as the masterpiece of native art in the working of metals."—*Williams, Midd. King.*, ii. 19.

"Fans and card-cases are carved of wood, ivory, and mother-of-pearl in alto-relievo, with an elaborateness which shows the great skill and patience of the workman, and at the same time his crude conception of drawing, the figures, houses, trees, and other objects being grouped in violation of all propriety and perspective. Beautiful ornaments are made by carving roots of plants, branches, gnarled knots, etc., into fantastic groups of birds or animals, the artist taking advantage of the natural form of his material in the arrangement of his figures. Models of pagodas, boats, and houses are entirely constructed of ivory, even to representing the ornamental roofs, the men working at the oar, and women looking from the balconies. Baskets of elegant shape are woven from ivory splinths; and the shopmen at Canton exhibit a variety of seals, paper-knives, chessmen, counters, combs, etc., exceeding in finish and delicacy the same kind of work found anywhere else in the world. The most elaborate coat of arms, or complicated cypher, will also be imitated by these skilful carvers. The national taste prefers this kind of carving on plane surfaces; it is seen on the walls of houses and granite slabs of fences, the woodwork of boats and shops, and on articles of furniture. Most of it is pretty, but the disproportion and cramped position of the figures detract from its beauty when judged by strict rules of Western art."—*Ibid.* ii. 60.

"Few products of their skill are more remarkable than the balls containing ten or twelve separate spheres one within another. The manner of cutting them is ingenious. A piece of ivory or wood is first made perfectly globular, and then several conical holes are bored into it in such a manner that their apices all meet at the centre, which becomes hollow as the holes are bored into it. The sides of each having been marked with lines to indicate the number of globes to be cut, the workman inserts a chisel or burin with a semicircular blade, bent so that the edge cuts the ivory, as the shaft is worked on the pivot, at the same depth in each hole. By successively cutting a little on the inside of each conical hole, the incisures meet, and a sphericle is at last detached, which is now turned over and its faces one after another brought opposite the largest hole, and firmly secured by wedges in the other apertures, while its surfaces are smoothed and carved. When the central sphere is done, a similar tool, somewhat larger, is again introduced into the holes, and another sphere detached and smoothed in the same way, and then another, until the whole is completed, each being polished and carved before the next outer one is commenced. It takes three or four months to complete a ball with fifteen inner globes, the price of which ranges from twenty to thirty dollars, according to the delicacy of the carving." —*Ibid.* ii. 59–60.

Besides numerous articles worn on the person (see *Pers. Adornt.*), ornamental silver work comprised "household ornaments, such as match-boxes, ash-cups, joss-stick bowls, sandal-wood urns, plates for opium-pipes, button-boxes and so on without end." Another class "includes filigree-work and tissues made from fine silver wire and is marked by the highest eloquence. It is a favorite kind of work among the Chinese and has been so for centuries. . . . One from Foochow consisted of a bouquet over which was loosely wrapped a silk veil. It was so perfectly done that the veil looked as if it might blow away at any moment. Through its filmy folds, the flowers and leaves were all visible. Another gem was a slight bouquet, in which ferns, lilies of the valley and similar delicate organisms were practically photographed in metal."—*Hongkong Telegraph*, Aug. 17, 1892.

"Nothing is wasted in China. The stones of various fruits and the shells of nuts are cleaned, dried and carved into ornaments of the most graceful kind. Among the stones used are the olive, plum, peach, laichee and cherry; and of the shells the walnut and cocoanut."—*Ibid.* Aug. 17, 1892. For process see *ibid.*

"A third class, and by far the most interesting, comprises groups of human figures representing scenes in history, poetry, mythology, and the drama. The workmanship is often so fine as to be microscopic in its delicacy. In fact the finishing touches are made by the artist while using a magnifying glass of at least fifty diameters. On stones not over an inch in length along their major axis, it is not uncommon to find eight, nine and ten characters in different attitudes and costumes. Unlike most phases of Chinese art, there is much regard paid to perspective and shortening. Some of these pieces might have been made by Hindoo or Italian artists, so free are they from local or racial conventionalism. Nevertheless, in the main, conventionalism is all-prevailing. Dignity always wears a beard and low comedy with villainy are disguised with queer markings and quaint attitudes. The horse has a head twice too large and the dragon carries a tail which in real life would have insured his prompt destruction. Gods wear queues and goddesses stroll about with compressed feet. But was there ever a school of art of any sort free from conventionalism? Even were there one, it would probably be as unsatisfactory as the most artificial systems of our own civilization or of this strange and mighty one upon the borders of the China Sea." —*Ibid.* Aug. 17, 1892.

"'Wind Glasses,' 嗡 碼 *Hsiang-ma*, fancifully called 'the hibiscus suspended by golden threads,' are small pieces of glass suspended from hoops by silken strings, and driven against each other by the wind, so producing a tinkling noise. About ten or twenty are generally suspended from one hoop. They are a common ornament of summer houses, etc."—*Journ. N.-C.B.R.A.S.*, N.S. viii. 108.

"With these flowers [water-lily], the Chinese decorate their houses."—*Gray, China*, ii. 195.

"Each garden is provided with its complement of garden houses. Some of these bowers are built in the form of pagodas; others of flower boats, and not a few of domed towers. They are furnished with chairs, couches, and tables, remarkable for their simplicity and neatness."—*Ibid.* ii. 197.

"'They like to bring together in gardening, in the same view, cultivated grounds and arid plains; to make the field uneven and cover it with artificial rock-work; to dig caverns in mountains, on whose top are arbors half overthrown, and around which tortuous footpaths run and return into themselves, prolonging as it were, the extent of the grounds and increasing the pleasure of the walk.'"—*Williams, Midd. King.*, i. 735.

"A fish-pond, supplied by a rivulet running wildly through the grounds, forms a pretty feature of such gardens, in which, if there be room, a summer house is erected on a rocky islet or on piles over the water, accessible by a rugged causey of rock-work. The nelumbium lily, with its plate-like leaves and magnificent flowers, is a general favorite in such places; carp and other fish are reared in their waters, and gold-fish in small tanks. Whenever it is possible a gallery runs along the sides of the pond for the pleasure and use of the females in the household. A tasteful device in some gardens, which beguiles the visitor's ramble, is a rude kind of shell or pebble mosaic inlaid in the gravelly paths, representing birds, animals or other figures. . . . The pieces of rock-work are cemented and bound with wire; and in fish-pools, grottos, or causeways this unique ornament has a charming effect, the moss and plants which grow upon it adding rather to its appropriateness."—*Ibid.* i. 735.

"In the style of their notes and letters, the Chinese show both neatness and elegance; narrow slips of tinted paper are employed, on which various emblematic designs are stamped in water lines, and enclosed in fanciful envelopes."—*Ibid.* i. 600.

Personal Adornment.—A "species of ornamentation resorted to by girls and young women, till middle life is reached or widowhood ensues . . . the painting of the face, a practice which is so universal in China among the [wealthier] classes. . . . Much time is in this way spent at the toilette by Chinese ladies. . . . The three marks of beauty in the female are from the Chinese point of view coral or peach lips, almond-shaped eyes, and dark high eyebrows. These it is sought to obtain by artificial means. . . . They do not as a rule paint their own faces artistically according to Western ideas, great daubs of rouge being laid upon the centre of the lower lip and the upper eyelids. . . . According to the European taste, the painting of the face is excessive, and the coiffure is laden with flowers and ornaments of gold, silver, and jade. The brilliancy of the colouring of the rich silks and satins lends additional lustre to the decoration. The painting of the lips red is unlike the pricking of them and dyeing them blue of the Arab women, although both doubtless have the same object, that of being considered handsome. The one chooses the arterial, the other the venous, colour of the blood as the distinctive mark of beauty. . . . The palms of the hands and the white lunated portions of the nails of the fingers are also painted [or, in the North, dyed with the Henna flower]. The different estimate in which moles are held by Eastern and Western sisters is perhaps here worthy of remark. The former have recourse to medicines—will endure any pain or give any money to get rid of these dark spots which spoil the complexion. The same holds good of freckles. . . . Another mark of beauty . . . is the long finger nails, which require protectors, at Peking made of silver, richly ornamented, and with hanging chains, to ensure them against injury. The literary classes also strive after long nails, it being an indication of literary tastes and a position in life above the necessity of earning a living by the labour of the hands. The Chinese are very fond of long nails. They sometimes extend to one, two, three or more inches."—*Dudgeon, Diet, Dress, etc.*, pp. 150–1. See also *Journ. N.-C.B.R.A.S.*, N.S. xviii. 2.

"Chinese ladies who wish to retain their beauty, and also the better class of the demi-monde," use human milk (sometimes sold by nursing mothers) "to beautify and soften the skin, and give a complexion similar to the milk itself."—*Ch. Rec.*, iii. 79.

"The decoration of the official classes consists in their figured silks and satins, peacocks' feathers, sable tails attached to their hats, their rosaries, their extensive fur lining and edging, their girdles with their clasps, to which are attached their embroidered cases for fans, spectacles, money, watch, flint, tobacco pipe and pouch, etc.; the embroidery of the *p'u tse* on the breast and back of their outer robe, their variously coloured buttons indicating their rank, etc."—*Dudgeon, Diet, Dress, etc.*, p. 151.

"Silver jewellery and curios in China are universal. The poorest coolie's wife has usually an argent bracelet and earrings."—*Hongkong Telegraph*, Aug. 17, 1892.

"In curios and bric-à-brac, the number of silver articles is legion. The greatest manufacturing centre is Canton, but Amoy, Foochow, Nanking and Peking possess artists and guilds whose workmanship is famous over the Empire. . . . One class . . . consists of miniature reproductions of features of daily life and is adapted for earrings, watch-chains, pendants and bangle-attachments. Among the more familiar objects are the pagoda, sampan (or native boat), junk, the sedan-chair, the small-footed lady's shoe, the Goddess of Mercy, the Celestial Poodle, the king of the fishes, the sitting Buddha, the dragon, the flying serpent, the begging bonze, the tiger, lion, horse, pig, buffalo, elephant, turtle, crocodile, monkey, cat and dog. The largest does not exceed two inches in length and from this figure they diminish in size down to dainty little objects no larger than peas. The finish is admirable, the features and hair of the human beings and animals, the scales of the fish and crocodile, the markings of the carapace being reproduced with the utmost care and skill."—"Another class consists of imitation cordage . . . used for bracelets, anklets, necklaces, belts, sword-hangings and horses' harness."—*Ibid.* Aug. 17, 1892.

Architecture.—"It is extremely difficult, in the present state of our knowledge, to write anything, either conclusive or satisfactory, about the architecture of China. This may arise partly from the incuriousness of travellers, and partly because there really are no buildings in the country worthy of the people or their civilization. . . . The Chinese never had either a dominant priesthood or a hereditary nobility. The absence of the former class is a very important consideration, because, in all countries where architecture has been carried to anything like perfection, it is to sacred art that it has owed its highest inspiration, and sacred art is never so strongly developed as under the influence of a powerful and splendid hierarchy. Again, religious and sectarian zeal is often a strong stimulus to sacred architecture, and this is entirely wanting in this remarkable people. . . . In the same manner the want of a hereditary nobility, and indeed of any strong family pride, is equally unfavourable to domestic architecture of a durable description. At a man's death his property is generally divided equally among his children. Consequently the wealthiest men do not build residences calculated to last longer than their own lives. The royal palaces are merely somewhat larger and more splendid than those of the mandarins, but the same in character and erected with the same ends."—*Fergusson, Hist. of Ind. and East. Arch.*, pp. 685–8. Fergusson ascribes the absence of fortified mansions to the comparatively small risk of invasion and infrequency of internal feuds.

"In one respect, however, it [the architecture] is instructive, since the Chinese are the only people who now employ polychromy as an essential part of their architecture: indeed, with them, colour is far more essential than form; and certainly the result is so far pleasing and satisfactory, that for the lower grades of art it is hardly doubtful that it should always be so. For the higher grades, however, it is hardly less certain that colour, though most valuable as an accessory, is incapable of that lofty power of expression which form conveys to the human mind."—*Ibid.* p. 688. See also *infra.*

"Another celebrated pagoda is that known as 'Second Bar Pagoda,' on the Canton river. It is a pillar of victory, erected to commemorate a naval battle which the Chinese claim to have gained near the spot. It is, in design, nearly identical with that of Nankin, but of smaller dimensions, and is now fast falling to ruin."—*Ibid.* pp. 696–7.

"These two are of the usual and most typical form, and so like hundreds of others, that it is impossible to deduce any sequence from them with such representations as we now possess. Though pleasing and purpose-like, as well as original, they are somewhat monotonous in design. A tower divided into nine equal and similar storeys is a very inferior design to that of the minars of the Mahomedans, or the ordinary spires of Christian churches; and, if all were like these, we should be forced to deny the Chinese the faculty of invention in architecture. In the north, however, the forms seem much more various." See the instances given.—*Ibid.* pp. 697–8.

"It is extremely difficult to form a correct estimate of the artistic merits of these towers. Edifices so original and so national must be interesting from that circumstance alone, and it seems almost impossible to build anything in a tower-like form of great height, whether as a steeple, a minar, or a pagoda, which shall not form a pleasing object from its salience and aspiring character alone, even without any real artistic merit in itself. Besides these qualifications, I cannot but think that the tapering octagonal form, the boldly-marked divisions, the domical roof, and general consistence in design and ornament of these towers, entitle them to rank tolerably high among the tower-like buildings of the world."—*Ibid.* p. 698.

"In the architectural works of the present dynasty, as of the Ming, the *feng shui* ideas have never been abandoned. China has ceased to build new pagodas for the sake of riches and prosperity to a locality, but she puts the old ones in repair when money can be obtained for the purpose. The roofs of temples are still ornamented with a view to *feng shui* opposite to the openings of lanes in Peking. Lions are set up, or stones with the powerful name of the Tai shan god, to frighten away demons who might be intending to come that way. The superstition of *feng shui* is retained in house architecture even in this age of growing knowledge. In judging of Chinese architecture there are two chief divisions of work to be looked at. The one is its general excellence, the effect of dignity, solemnity, richness and grandeur on the whole. The other is the special excellence of the parts. . . . In regard to the former, it may be noticed that the greatest triumph of Chinese architecture is in the effect on the whole."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 283–4.

"Their architecture stands on the same low level as their other arts. It is rich, ornamental, and appropriate for domestic purposes, but ephemeral and totally wanting in dignity and grandeur of conception. Still it is pleasing, because truthful; but, after all, its great merit in the eyes of the student of architecture will probably turn out to rest on the light it throws on the earlier styles, and on the ethnographic relations of China to the surrounding nations of Eastern Asia."—*Fergusson, Hist. of Ind. and East. Arch.*, p. 710.

"It is not so much on its forms that Chinese architecture depends as on its colours—the pillars being generally painted red, the friezes and open work green; blue marks the floors and stronger lines, and gilding is used profusely everywhere. Whether this would improve a finer or more solid style of art may admit of doubt; but it is certainly remarkably pleasing in China, and singularly appropriate to the architecture . . . and grouped as these buildings usually are around garden courts, filled with the gayest flowers, and adorned with rock-work and fountains more fantastic than the buildings themselves, the fancy may easily be charmed with the result, though taste forbids us to approve of the details."—*Ibid.* p. 704.

"Almost the only architectural variety displayed by the Chinese is to be found in their tombs. These mansions of the dead assume every possible variety of shape, and are very commonly decorated with ill-carved representations of lions, tigers, elephants, horses, etc."—*Laou-seng-urh*, p. 114, note 15.

[For tombs see FUNERAL RITES.]

"In erecting the Pailoo, or monument, in a conspicuous place apart from the sepulchre, they seem to have shown their usual common sense, though an architect must regret that the designs of their tombs suffered in consequence, and have none of that magnificence which we should expect among a people at all times so addicted to ancestral worship as the Chinese."—*Fergusson, Hist. of Ind. and East. Arch.*, pp. 701–2.

"The cheapness of land in Chinese districts proper, allows of the great lateral extension of their buildings."—*Cycle*, 1st series, p. 487.

"The style of architecture in China deals with base buildings with no loft or storey above them. . . . Although the most settled of all the peoples of the world, the buildings of the Chinese are like those of a nomadic tribe. They resemble in fact the form of a tent with its poles and ample spread of canvas or felt. . . . The only architectural monuments in China worthy of the name are those which are occasionally raised to those who are gone to the other world. The *p'ai-fang* [or *p'ai-lou*], or honorary portals, raised to the memory of living and dead women of alarming virtue, and looking a good deal like an extensive gallows upon which to hang delinquent passers-by, are of a somewhat similar character. Their mortised masses of stone, treated as so many pieces of wood, represent the only bit of peculiar Chinese architectural mannerism which is worthy of being advanced to the dignity of a 'style.' Not a single work is known to be devoted to the subject of architecture proper in the whole range of Chinese literature. The only books containing anything bearing on the subject are those which treat upon the selection of sites for tombs. . . . With the exception of such buildings as the Altar to Heaven in Peking, the tombs to Emperors, and a few others, the entire architectural display in China, not excluding imperial palaces, is made up of mere lath and plaster."—*Ibid.* p. 487. For causes see *ibid.*

"Their origin is as distinctly Indian as the other, though, from their nature, being easily overthrown, but few examples can be found in a country that has so long ceased to be Buddhist. Fortunately, however, we still possess in the gateway of Sanchi . . . the typical example of the whole class; and we find them afterwards represented in bas-reliefs and in frescoes in a manner to leave no doubt of the frequency of their application." "In China they seem almost universally to be employed as honorific monuments of deceased persons—either men of distinction, or widows who have not married again, or virgins who have died unmarried. Frequently they are still constructed in wood, and when stone is used they retain to this hour the forms and details of wooden construction. Whatever the material they consist of either two or four posts, set either on the ground, so as to allow a passage through, or on a platform. . . . This is as usual a form as the other, and shows how inapplicable the term gateway is to these monuments. The posts always carry a rail or frieze, bearing an inscription, which is, in fact, the object for which the monument was erected. Above this are various architectural details, which complete the design in a manner both original and artistic."—*Fergusson, Hist. of Ind. and East. Arch.*, pp. 700–1.

"In an historical point of view, the most curious thing connected with these Pailoos seems to be, that at Sanchi, about the Christian Era, we find them used as gateways to a simulated tomb. In India both the tumulus and the Pailoo had at that time passed away from their original sepulchral meaning; the one had become a relic-shrine, the other an iconostasis. Two thousand years afterwards in China we find them both still used for the purposes for which they were originally designed."—*Ibid.* p. 702.

"So far as we know, no great structural dagobas ever existed in China, so that their form is generally unfamiliar to the people."—*Ibid.* p. 701.

"The ordinary form of a temple, as seen in the villages or towers in China, is extremely simple, and seems to be the same, whether dedicated to Buddha or to the Queen of Heaven, or to any other deity of the strange pantheon of the Celestial Empire. It generally consists of a square apartment with a highly ornamented roof, and with one of the side-walls removed. The entrance is never at the end, nor the end wall ever removed, as would be the case in the West, but always the side; and it is by no means clear that it is not the right and reasonable way of arranging matters. In very small temples a single beam supports the eaves, and a screen inside forms the back of the porch and the front of the temple. In larger temples two or more pillars are introduced, but the other arrangements remain the same. . . . As architectural objects, they depend for their effect principally on colour, which is applied with an unsparing hand in the form of glazed tiles, painted ornaments, and frequently also paintings, such as landscapes and figure subjects. Gilding is also employed to a great extent, and with good effect."—*Ibid.* p. 694.

"It is in their domestic architecture, if in any, that the Chinese excel; there we do not look either for monumental grandeur or for durability, and it is almost impossible to resist being captivated by the gaiety and brilliancy of a Chinese dwelling of the first class, and the exuberant richness and beauty of the carvings and ornaments that are heaped on every part of it."—*Ibid.* pp. 702–3.

"One of the most remarkable peculiarities of their houses is the almost universal form of roof, which writers on the subject have generally referred to as a reminiscence of the tent of the Tartars, who are supposed to have introduced it. The authors of this theory, however, forgot that the Chinese have been longer out of tents, and know less of them, than any other people now on the face of the globe. The Tartar conquest, like our Norman one, has long been a fusion rather than a subjection, and does not seem to have produced any visible effect on the manners or customs of the original inhabitants of China. It may also be observed that the typical form of the roof of a Tartar tent was and is domical, like those represented in the Assyrian sculptures, and seldom, if ever, constructed with a hollow curve; so that the argument tells the other way. Be this as it may, the form of roof in question arose from a constructive exigence, which others would do well to imitate. In a country like China, where very heavy rains fall at one season of the year, tiled roofs, such as they almost universally use, require a high pitch to carry off the water; but the glaring sunshine of another season renders shade to walls and windows absolutely necessary. If . . . the slope of the roof is continued so far out as to be effective for the last purpose, the upper windows are too much darkened, and it is impossible to see out of them. To remedy this defect, the Chinese carry out their eaves almost horizontally from the face of the walls, where a leak becomes of slight importance; and then, to break the awkward angle caused by the meeting of these two slopes, they ease it off with a hollow curve, which not only answers the double purpose of the roof more effectually, but produces what the Chinese think—and perhaps rightly—the most pleasing form of roof."—*Ibid.* p. 703.

"The only parts of such a roof that admit of decoration by carving are evidently either the central or angular ridges; and here they exaggerate their favourite hollow curve to an extent unpleasing to a European eye—the angles being, in some instances, actually turned back, and the ridge being also ornamented by upturned ornaments at its ends, to an extent we cannot reconcile with our notions; nor indeed is it possible we should, when they are overloaded with grotesque ornaments to the extent too often found."—*Ibid.* pp. 703–4.

[For further details as to roofs, plan of construction, etc., see *ibid.* p. 704.]

"Columns are, at least, as frequent in the buildings of the Chinese as in those of Europe. They serve to support the roof, and are commonly of wood, with stone or marble bases. They have no capitals; but instead thereof the upper part of the shaft is pierced by the beams, and generally surrounded with several little consoles that help to support them. Their height is from eight to twelve diameters; they are diminished gradually from bottom to top, and the bottom of the shaft finishes in a quarter-round, turned inwards: a particularity which is likewise to be met with in some of the designs lately published by Capt. Norden of the antiquities of Egypt. The bases are of a number of different profiles, none of them very beautiful."—*Chambers, Designs of Ch. Buildings*, pp. 11–12; and see Plates.

"In the modern style we find the shaft of a column carved with dragons, and this mode of ornamentation has lately become commoner than it was. It is observable in the guild-houses of Ningpo and Hankow."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 286.

The architecture "is essentially wooden, and these wooden forms may be found, as in other countries, repeated in stone and marble. Many important buildings are yet wholly of wood. Stone is largely used for bridges, gateways, and for public works; while ornamental structures in gardens, for balustrades, surrounding tombs and important buildings are generally of marble. Brick may be said to be the principal building material of China."—*Trans. of Ryl. Inst. of Brit. Arch.*, 1874, p. 33.

"At present it [the arch] is used when it is desired to span rivers by bridges. Made with an arch for foot-passengers, such structures look well to the eye, but they are inconveniently steep, being often 30 feet in height. Such bridges are made with steps so that they are crossed easily by burden-bearing coolies. Beasts, however, cannot easily use them, which is a great defect. . . . These bridges . . . last long, because the superincumbent weight is efficiently sustained in the most economical manner by the arch. Many bridges in modern style would be better for not being so steep as they are, and for not being made with steps."—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 287.

"One very distinctive feature of this Architecture is what I may call the 'frieze,' but I confess that the term is doubtful when applied to this part of Chinese construction. It reminds one of the bracket capital of Hindoo architecture, and no doubt it had a similar origin. It is now a complicated triple succession of small brackets, which project forward, giving increased breadth on the top for the support of the roof. . . . Although evidently constructive in its origin and purpose, it is the most ornamental portion, and its complexity makes it perhaps the most striking feature of Chinese architecture. All buildings with anything like architectural pretensions will be found to have this peculiar frieze. . . . Its origin is evidently wooden, but I have seen it repeated in stone, marble, majolica, brick, bronze and iron. . . . There are some varieties in the tiles of China; but those of Peking, particularly when they were of the Imperial yellow tint, suggested that bamboos had first been used for roofs, and had given origin to the round form of the upper tiles. In these cases the terminals are round, with an ornament within."—*Trans. of Ryl. Inst. of Brit. Arch.*, 1874, p. 35.

"To one who is intimate with the architecture of India, that of China seems poor in comparison. And yet it is important from its links of connection, and as illustrating a similar wooden development, more particularly the bracket, which, as a wooden piece of construction, became in both cases an ornamental feature of the architecture."—*Ibid.* p. 47.

"The Umbrella is an old symbol of dominion and power, and the Chatta of Buddha is triple, implying, no doubt, sovereignty over 'the three worlds,' which are so often referred to in the ancient classics of India. They are as old as the Ramayana. One of the most important of the insignia of the Emperor of China is a triple umbrella; and . . . the circular building on the north altar of the Temple of Heaven has a triple roof. The north and south altars have a triple terrace."—*Ibid.* p. 40.

"We also find in modern style a special development of the *t'ing tsi* [*v. supra*, ABS. MON.]. . . . Examples of rich variety in the roofing are seen in many theatres and in the corner towers of the Peking Palace wall." "In the Temple of Heaven the altar is carried to its highest point. Its circularity, its marble pavement and its numerical arrangement deserve attention." See description, pp. 286–7.—*Journ. N.-C.B.R.A.S.*, N.S. xxiv. 286–7.

"The same ephemeral system of construction which prevailed in dwellings of the rich merchants and mandarins was carried out in the royal palaces without any increase of monumental character, but, of course, with greater richness of ornament, and upon a larger scale. Like most Oriental palaces, however, those at Pekin consist of a number of detached pavilions, rather than of numerous suites of apartments grouped under one roof, as is usually the case in Europe; and they consequently never attain the magnitude essential to architectural dignity. In the Summer Palace at Pekin there were many detached pavilions . . . which, when interspersed with trees and water and rocky scenery, aid in making up a very fairy-like landscape, but in themselves can hardly be considered as objects of dignified architecture."—*Fergusson, Hist. of Ind. and East. Arch.*, pp. 704–5. For examples see *Williams, Midd. King.*, i. 730–1.

"In lighter edifices, as pavilions, rest-houses, kiosks, and arbors, there is . . . a degree of taste and adaptation that is unusual in other buildings, and quite in keeping with their fondness for tinsel and gilding rather than solidity and grandeur."—*Ibid.* ii. 117. Fergusson (pp. 706–7) says the pavilion "cannot be praised either for the elegance of its form or the appropriateness of its ornamentation."

"Perhaps their most successful efforts in this direction [solid architecture] were when they combined a solid basement of masonry with a light superstructure of wood, as in the Winter Palace at Pekin. . . . In this instance the height and solidity of the basement give sufficient dignity to the mass, and the light superstructure is an appropriate termination upwards."—*Ibid.* p. 707.

"A few years hence it may be possible to attempt to write a history of architecture in China. . . . It is still doubtful whether the materials exist in China for any extended history of the art. Such facts as have come to light are not encouraging. Wood has been far too extensively used throughout for any very permanent style of architecture ever having been employed. But there are things in Cambodia, and other neighbouring states, which seem to have come neither from India, nor from any other country we are acquainted with, but are nevertheless of foreign origin, and must have been imported from some extraneous land; and it is difficult to say where we are to look for their originals if not in central or western China."—*Ibid.* pp. 708–9.

[See also *Cycle*, 1st series, p. 487; *Chambers, Designs of Ch. Buildings*, Pref. and pp. 7–8; *Williams, Midd. King.*, i. 726–7; *Journ. N.-C.B.R.A.S.*, N.S. xxiv. 285–7; and *Trans. of Ryl. Inst. of Brit. Arch.*, 1874, pp. 33; 44–6; and for process of building, ARTS.]

Sculpture, etc.—"Statuary is confined chiefly to moulding idols out of clay or cutting them from wood, and carving animals to adorn balustrades and temples. Idols are generally made in a sitting posture and dressed, the face and hands being the only parts of the body seen, so that no opportunity is afforded for imitating the muscles and contour of the figure. The hideous monsters which guard the entrance of temples often exhibit more artistic skill than the unmeaning [*sic*] images enshrined within, and some even display much knowledge of character and proportion. Among their best performances in statuettes are the accurate baked and painted models of different classes of people;

Canton and Tientsin artists excel in this branch."—*Williams, Midd. King.*, ii. 114–5.

"Even purely human statues do not often stand free,—the Chinese not apprehending individuality as the Greeks did,—but rest on a background of wall. Yet China is sprinkled with popular statuary; mainly of symbolic Buddhist or other imagery, generally in grotesque or exaggerated forms. . . . Their allegorical sculpture is described as no less charming than it is in appearance burlesque; its lions and tigers certainly suggesting the fact that these creatures do not frequent the Chinese Empire. But, like every other product, it is almost without limit in amount and elaboration. Bastian saw stone figures of men and animals at intervals all the way to Kalgan."—*Johnson, Or. Rel.—Ch.*, pp. 79–80.

"Even more astonishing is the quantity and quality of minute sculpture. The great pagoda of Nan-king was beset with innumerable images. The Chinese are elaborate workmen in ivory, horn, mother-of-pearl, jade, and bronze. The cutting of many a jade vase must have cost the labour of a lifetime, and this toilsomeness, hinted in their jade the emblem of all virtues, enforced at last the substitution of their equally beautiful porcelain (*Chefs d'Œuvres of Industry*, p. 132)."—*Ibid.* p. 80.

"The proportions of the human body are almost unknown to the Chinese, and never, at any time, have painting and sculpture of the kind which studies beauty in the nude had any place in their customs. The whole empire does not contain two statues worthy of mention. They adorn their temples with colossal idols, covered with enamelled terra-cotta or with porcelain; the fronts of palaces, the gates of cities, the balustrades of bridges, with immense stone statues which have for their sole merit a certain expression, when they are not deformed and monstrous."—*Revue Contemp.*, xxv. 236–7.

"Animals are sculptured in granite and cast in bronze, showing great skill and patience in the detail work. . . . Images of lions, tigers, tortoises, elephants, rams, and other animals ornament bridges, temples, and tombs. The elephants in the long avenue of warriors, horses, lions, etc., leading up to the tomb of the Emperor Hungwu at Nanking are the only tolerable representations of their originals; the gigantic images guarding the tomb of Yungloh, his son, at Changping, near Peking, are noticeable for size alone. The united effect of the elaborate carving and grotesque ornaments seen upon the roofs, woodwork, and pillars of buildings is not devoid of beauty, though in their details there is a great violation of the true principles of art, just as the expression of a face may please which still has not a handsome feature in it. Short columns of stone or wood, surmounted by a lion, and a dragon twining around the shaft, the whole cut out of one block; or a lion sejant with half a dozen cubs crawling over his body, are among the ornaments of temples and graves which show the taste of the people."—*Williams, Midd. King.*, ii. 115.

"By far the best specimens of sculpture are their imitations of fruits, flowers, animals, etc., cut out of many kinds of stone, from gnarled roots of bamboo, wood, and other materials; but in these we admire the unwearied patience and cunning of the workmen in making grotesque combinations and figures out of apparently intractable materials, and do not seek for any indications of a pure taste or embodiment of an exalted conception. Inscriptions of a religious or geomantic character are often cut upon the faces of rocks, as was the case in India and Arabia, and the picturesque characters of the language make a pretty appearance in such situations."—*Ibid.* ii. 115–6.

Painting.—"Painting is rather behind sculpture, but neither can be said to have advanced beyond rude imitations of nature." "Even the best painters have no proper idea of perspective or of blending light and shade, but the objects are exhibited as much as possible on a flat surface, as if the painter drew his picture from a balloon, and looked at the country with a vertical sun shining above him. As might be inferred from their deficiencies in linear drawing and landscapes, they eminently fail in delineating the human figure in its right proportions, position, and expressions, and of grouping the persons introduced into a piece in natural attitudes. The study of the human figure in all its proportions has not been attended to by painters any more than its anatomy has by surgeons. Shadows upon protraits are considered a great defect, and in order to avoid them a front view is usually taken. Landscapes are also painted without shading, the remote objects being as minutely depicted as those in the foreground, and the point of view in pieces of any size is changed for the nearer and remote parts. There is no vanishing point to their pictures, as might be inferred from their ignorance of perspective and the true elements of art."—*Ibid.* ii. 105–6.

"As for painting, ornamentation is its triumph: it concerns itself at the present day only with colour, very little with form, still less with the human soul." "The reason of this art is what it has been. Quite in keeping with the laws, customs, and moral character of the Chinese people, it interdicts the smallest innovation; and instead of asking themselves how things should be done, the artists trouble themselves as to how things were done at the dawn of the ancient dynasty of the Sung, the epoch of the creation of the style which flourishes at the present day."—*Revue Contemp.*, xxv. 237.

"Their colouring is executed with great skill and accuracy—too much, indeed, in many cases, so that the painting loses something of the effect it would otherwise have from the scrupulous minuteness of the detail, though it looks well in paintings of flowers, animals, costumes, ornaments, and other single objects where this filling up is necessary to a true idea of the original. The tints of the human countenance are no better done, however, than its lineaments, and the lifeless opacity suggests the idea that the artist was not called in until his patron was about to be entombed from the sight of his sorrowing family. The paintings obtained at Canton may, some of them, seem to disprove these opinions of the mediocrity attained by the artists in that country, but the productions of the copyists in that city are not the proper criteria of native uneducated art. Some of them have had so much practice in copying foreign productions that it has begun to correct their own notions of designing. These constitute, however, a very small proportion of the whole, and have had no effect on national taste. The designs to be seen on plates and bowls are, although not the best, fairer specimens of art than the pieces sometimes procured at Canton. The beautiful fidelity with which engravings are copied at Canton is well seen in the paintings on ivory, especially miniatures and figures, some of which fully equal similar productions made elsewhere."—*Williams, Midd. King.*, ii. 106–7.

"Their painting never rose much above the scale of decoration."—*Fergusson, Hist. of Ind. and East. Arch.*, p. 710.

"Without perspective, shadows, or emphasis in tone,—all of which are rejected as optical illusions,—their paintings excite our wonder by skilful management and intense purity of colour; whether heightened by the soft hazy texture of their pith paper, or imitating the primal greens, golds, and blues of earth and sky on their pagoda roofs. There are descriptive accounts of celebrated painters, one of which enumerates fifteen hundred names (*Wylie, Ch. Literature*, pp. 108, 110); and full treatment on painting as an art. Their devotion to ornamental work is mechanized by the use of classic books of conventional forms, and each workman gives his whole attention to one kind of pattern (*Chefs d'Œuvres*, p. 146). So much is art a matter of mechanical dexterity, that the painters have learned a wonderful sleight in managing two brushes at once. Artists lecture to crowds by the blackboard, and execute pictures of birds and beasts with their finger tips, with great address (*Lockhart, Med. Miss.*, p. 105). Paintings from Buddha's life in the recognized attitudes cover the temples."—*Johnson, Or. Rel.—Ch.*, p. 80. For a description of the paintings on pith-paper, or rice-paper, see *Williams, Midd. King.*, ii. 113–4.

"In general, pettiness and confusion of details, defect of dramatic grouping, isolation of forms, absence of shadow and perspective, a constant and rigid turn of portraits to face the spectator, with other ever-recurring childish traits, show that the fine arts are stunted by constitutional absorption in concrete things."—*Johnson, Or. Rel.—Ch.*, p. 81.

"After numerous viscissitudes, painting flourished again to some extent under the Emperor Khang-Hi; but under Khien-Loung, there remained only paint-boxes, there were no more artists, and the European missionary painters were almost the only ones in the Celestial Empire who retained some artistic feeling. To idea had succeeded imitation; to invention, the knowledge of how to do it; to composition, counterfeiting and copying. In fact, from the time of Gherardini, of Castiglione and of Attiret, the system of painting in China had become for many long years a kind of game of patience. By means of pieces selected from the masters, they had composed courses of drawing, cut on wood, sometimes illuminated, which furnished models of everything living or dead, a kind of encyclopædia of practical art full of recipes for procuring genius." Some examples showing great skill are quoted on pp. 250–1.—*Revue Contemp.*, xxv. 248–9.

"If the modern painters, Europeanised or non-Europeanised, possess much of the lustre of the colouring of the ancients, with some of their imagination, they have neither the originality of invention and of character, nor the felicity of composition, movement, line, and outline of the masters. Anyone who has seen the productions of some has seen those of the others, for all, every one of them, follow the same routine and shake from their horns of plenty albums always renaissant with mandarins, birds, landscapes, flowers, butterflies, junks, gallant and immodest rarities, in a word with the curious and superfine illuminations with which Europe is inundated. In their better moments, they paint on screens, cartels, and scrolls for Chinese apartments, youthful divinities rising from leaves or from lotus flowers, mythological personages surrounded by figures of talismans, which preserve them from all harm; mandarins extending at their ease the dignity of their large stomachs, or riding in sadness by hills and valleys towards the deserts of snowy Tartary; poets seeking inspiration, at the expense of their nails and their foreheads, on the borders of an azure lake; slender young girls playing on the jade flute," etc.—*Ibid.* xxv. 258.

"Art in China is only but a sad memory of itself. Following times and circumstances it flourished or faded, rose or subsided. It is in the epoch anterior to the Soung, and above all during their dynasty, that one sees opening out in China the most abundant efflorescence of masterpieces. Then, without any apparent reason, the sap grows cold in the veins of the painters. For a moment it regains some fecundity in the XVIIIth century, but this factitious renaissance was only a distant reflection, a more or less clever copy of the past. Thus and worse still is the art of our day. . . . The Soung painters were artists; those who hold the brush to-day are scarcely more than artisans, veritable painting machines."—*Ibid.* xxv. 260. See also generally *Giles, Ch. Pict. Art.*

Drawing.—"Outline drawing is a favourite style of the art, and the wealthy adorn their houses with rough sketches in ink of figures and landscapes; but the humblest of such compositions as are common in the galleries and studios of Western countries have never been produced by Chinese artists. Some of their representations of abstract ideas are at least singular to us, and, like many other things brought from their country, attract notice from their oddity."—*Williams, Midd. King.*, ii. 106.

"The qualities which most please the Chinese in drawing are "largeness of feature and bold touches."—*Lay, Chinese As They Are*, p. 269.

"The Chinese never seem to have had any turn for geometrical investigation. . . . In theory, I believe, they do not [recognize] the art of perspective, and not always in practice. Still, they are not altogether strangers to the subject, for, while in China, I saw views exposed for sale in a painter's shop, wherein objects diminished in size as they receded from the point of view; and in a work which I have on Chinese husbandry there are many landscapes which show that the artist felt himself obliged to lessen the more distant objects, lest he should fail [to get them into] his picture. . . . [But all the lines are as distinct in the background as in the foreground.] Of practical perspective the Chinese know a little; [of] the mathematics of stereographic projection, nothing; and I know not whether they have surmises about aerial perspective. This is about the sum of the matter, taken from a reference to some of their best productions. . . . I have several native treatises on drawing, wherein the art is treated with great minuteness and particularity; but the arrangement of objects, so as to secure the maximum of pictorial truth and emblazonry, is not touched upon in any part of them; which is a little surprising, as the Chinese have long been celebrated for their skill in combining objects in a garden or pleasure-grounds, so as to render the art and design recognizable by the spectator. As draughtsmen [they copy details faithfully]. The human face has been dissected, its parts severally named, and their relative proportions and general harmony keenly studied. . . . The principal varieties of each feature are enumerated, and marked by proper epithets. . . . The head is supposed to revolve upon an axle, and to present itself under ten different phases. . . . They hold [the pencil] nearly perpendicular to the paper, and are therefore able, from the delicacy of its point, to draw lines of the greatest fineness, and at the same time, from the elastic nature of the hairs, to make them of any breadth they please. The broad sweeps in the drapery, and the fine strokes for the eyelash and the beard, are alike executed by a single effort of the pencil. . . . A few [curves], well selected, and exactly drawn afford a portrait at once. . . . A Chinaman . . . takes several preparatory sketches in succession, till he is satisfied, and then . . . [copies] all the perfections of his last trial, without any of its blemishes. A few lines [suffice for] the rest of the figure, and all the labour is reserved for the dress. . . . The sentiments and occupations of men are faithfully pourtrayed, and with so much feeling, that each one at first sight tells its own story. Excessive grief, rage, and terror [are seldom depicted]. The ordinary employments of life, and their attendant satisfactions, are the general themes. . . . [Great attention is paid to the drawing of birds. Their outline is divided into 9 or 10 different parts, each of which is studied separately; then the living bird is drawn in every possible attitude. The same method is followed in flower-painting, first, accurate study of every detail, then faithful copying of the plant, as it grows.] The Chinese are not contented with a faithful outline of a plant, tree or shrub; they watch its bearing and attitude when acted on by the wind, and go so far as to tell us how much each particular kind of wind will modify . . . the flowers and foliage."—*Ibid.* pp. 219–23.

Literature.—"In spite of war and rebellion, which must have encroached seriously upon his time, he [K'ang Hsi] found leisure to imitate and carry out, with the aid of the leading scholars of the day, several of the greatest literary enterprises the world has ever seen. The chief of these are (1) the *K'ang Hsi Tzŭ Tien*, the great standard dictionary of the Chinese language; (2) the *P'ei Wĕn Yün Fu*, a huge concordance to all literature, bound up in forty-four large closely-printed volumes; the *P'ien Tzŭ Lei Pien*, a similar work, with a different arrangement, bound up in thirty-six large volumes; (4) the *Yüan Chien Lei Han*, an encyclopædia, bound up in forty-four volumes; and (5) the *T'u Shu Chi Ch'êng*, a profusely illustrated encyclopædia, in 1628 volumes of about 200 pages to each. To the above must be added a considerable collection of literary remains, in prose and verse, which, of course, were actually the Emperor's own work. It cannot be said that any of these remains are of a high order, or are familiar to the public at large, with a single and trifling exception. The so-called Sacred Edict is known from one end of China to the other. It originally consisted of sixteen moral maxims delivered in 1670 under the form of an edict by the Emperor K'ang Hsi. His Majesty himself had just reached the mature age of sixteen. He had then probably discovered that men's morals were no longer what they had been in the days of 'ancient kings,' and with boyish earnestness he made a kindly effort to do something for the people whose welfare was destined to be for so many years to come his chief and most absorbing care. The maxims are commonplace enough, but for the sake of the great Emperor who loved his 'children' more than himself they have been exalted into utterances almost divine."—*Giles, Hist. of Ch. Lit.*, pp. 385–6.

"K'ang Hsi's son and successor, Yung Chêng, caused one hundred picked scholars to submit essays enlarging upon the maxims of his father, and of these the sixteen best were chosen, and in 1724 it was enacted that they should be publicly read to the people on the 1st and 15th of each month in every city and town in the empire. This law is still in force. Subsequently, the sixteen essays were paraphrased into easy colloquial; and now the maxims, the essays, and the paraphrase, together make up a volume which may be roughly said to contain the whole duty of man."—*Ibid.* p. 387.

"New editions of important historical works and of encyclopædias were issued by Imperial order, and under the superintendence of the Emperor [Ch'ien Lung] himself. In 1772 there was a general search for all literary works worthy of preservation, and ten years later a voluminous collection of these was published, embracing many rare books taken from the great Encyclopædia of the Emperor Yung Lo. A descriptive catalogue of the Imperial Library, containing 3460 works arranged under the four heads of Classics, History, Philosophy, and General Literature, was drawn up in 1772–1790. It gives the history of each work, which is also criticised. The vastness of this catalogue led to the publication of an abridgment, which omits all works not actually preserved in the Library. The personal writings of this Emperor are very voluminous. They consist of a general collection containing a variety of notes on current or ancient topics, prefaces to books, and the like, and also of a collection of poems. Of these last, those produced between 1736 and 1783 were published, and reached the almost incredible total of 33,950 separate pieces. It need hardly be added that nearly all are very short. Even thus the output must be considered a record, apart from the fact that during the reign there was a plentiful supply both of war and rebellion." "His Majesty's poetry, though artificially correct, was mediocre enough."—*Ibid.* pp. 387–8.

Ku Chiang's "writings on the Classics, history, topography, and poetry are still highly esteemed. To foreigners he is best known as the author of the *Jih Chih Lu*, which contains his notes, chiefly on the Classics and history, gathered during a course of reading which extended over thirty years. He also wrote many works upon the ancient sounds and rhymes."—*Ibid.* p. 391.

Chu Yung-shun "was the author of commentaries upon the Great Learning and the Doctrine of the Mean, and of other works; but none of these is so famous as his Family Maxims," which owe "much more to literary form than to subject-matter."—*Ibid.* pp. 391–2.

Lan Ting-yüan's "complete works have been published in twenty small octavo volumes, of which works perhaps the best known of all is a treatise on the proper training of women, which fills two of the above volumes. This is divided under four heads, namely, Virtue, Speech, Personal Appearance, and Duty, an extended education in the intellectual sense not coming within the writer's purview. The chapters are short, and many of them are introduced by some ancient aphorism, forming a convenient peg upon which to hang a moral lesson, copious extracts being made from the work of the Lady Pan of the Han dynasty." "Two more of the above twenty volumes are devoted to the most remarkable of the criminal cases tried by him during his short magisterial career." He also wrote on trade and general intercourse with foreign nations.—*Ibid.* pp. 392–5.

"The *Ming Chi Kang Mu*, or History of the Ming Dynasty, which had been begun in 1689 by a commission of fifty-eight scholars, was laid before the Emperor only in 1742 by Chang T'ing-yü (1670–1756), a Minister of State and a most learned writer, joint editor of the Book of Rites, Ritual of the Chou Dynasty, the Thirteen Classics, the Twenty-four Histories, Thesaurus of Phraseology, Encyclopædia of Quotations, the Concordance to Literature, etc. This work, however, did not

meet with the Imperial approval, and for it was substituted the *T'ung Chien Kang Mu San Pien*, first published in 1775. Among the chief collaborators of Chang T'ing-yü should be mentioned O-érh-t'ai, the Mongol (d. 1745), and Chu Shih (1666–1736), both of whom were also voluminous contributors to classical literature." "These were followed by Ch'én Hung-mou (1695–1771), who, besides being the author of brilliant State papers, was a commentator on the Classics, dealing especially with the Four Books, a writer on miscellaneous topics, and a most successful administrator."—*Ibid.* pp. 404–5.

"Yüan Mei (1715–1797) is beyond all question the most popular writer of modern times. At the early age of nine he was inspired with a deep love for poetry, and soon became an adept at the art. . . . His letters, which have been published under the title of *Hsiao Ts'ang Shan Fang Ch'ih Tu*, are extremely witty and amusing, and at the same time are models of style. Many of the best are a trifle coarse, sufficiently so to rank them with some of the eighteenth-century literature on this side of the globe." "Yüan Mei's poetry is much admired and widely read. He is one of the few, very few, poets who have flourished under Manchu rule." "It sounds like an anti-climax to add that this brilliant essayist, letter-writer, and composer of finished verse owes perhaps the chief part of his fame to a cookery-book. . . . His cookery-book is a gossipy little work, written, as only such a scholar could write it, in a style which at once invests the subject with dignity and interest."—*Ibid.* pp. 405–9.

[A work on gardening was published in 1783 by Ch'én Hao-tzŭ. Chao I (1727–1814) wrote a history of the wars of the present dynasty, a collection of notes on the current topics of his day, historical critiques, and other works. He was also a poet. Yüan Yüan (1764–1849) was a voluminous writer on the Classics, astronomy, archæology, etc., and various important collections were produced under his patronage. Among these may be mentioned the *Huang Ch'ing Ching Chieh*, containing upwards of 180 separate works, and the *Ch'ou Jên Chuan*, a biographical dictionary of famous mathematicians of all ages, including Euclid, Newton, and Ricci, the Jesuit Father. He also published a Topography of Kuangtung, specimens of the compositions of more than 5000 poets of Kiangsi, and a large collection of inscriptions on bells and vases. He also edited the Catalogue of the Imperial Library, the large encyclopædia known as the *T'ai P'ing Yü Lan*, and other important works.]—*Ibid.* pp. 413–8.

[Giles gives an account of some popular educational works, such as may be bought for a few cash at stalls in the street. Among these is a treatise on Ethnology and Zoology, published in 1783, full of descriptions of fabulous beings, such as the headless, three-headed, feathered, long-legged, etc., nations. Works on topography are numerous, but geography, properly so-called, is almost entirely neglected, and the only European treatise known to the scholars Giles had met was the mutilated edition of Verbiest's hand-book. Other popular books for children are "a guide to the Fauna and Flora of China, and "Philosophy for the Young," which demonstrates that it is better to work than to be idle, "and that the strength of three men is powerless against *Li* ('abstract right')."]—*Ch. Sketches*, pp. 27–30.

"Two religious works, associated with the Taoism of modern days, . . . have long been popular throughout China. . . . They are not to be bought in shops, but can always be obtained at temples, where large numbers are placed by philanthropists for distribution gratis. The first is the *Kan Ying P'ien*, or Book of Rewards and Punishments, attributed by the foolish to Lao Tzŭ himself. Its real date is quite unknown; moderate writers place it in the Sung dynasty, but even that seems far too early. Although nominally of Taoist origin, this work is usually edited in a very pronounced Buddhist setting, the fact being that Taoism and Buddhism are now so mixed up that it is impossible to draw any sharp line of demarcation between the two. . . . Prefixed to the *Kan Ying P'ien* will be found Buddhist formulæ for cleansing the mouth and body before beginning to read the text, and appeals to Maitrêya Buddha and Avalôkitêsvara. . . . The text consists of a communication said to have been uttered by Lao Tzŭ, and directed against evil-doers of all kinds." "The second . . . is the *Yü Li Ch'ao Chuan*, a description of the Ten Courts of Purgatory in the nether world."—*Giles, Hist. of Ch. Lit.*, pp. 418–20.

[Giles says that most educated Chinese are fond of books of travel, and many have taken long journeys to distant parts of the empire in order to compose such works. These books abound in incredible marvels, some at least of which would seem to have been deliberately invented; but all are implicitly believed by Chinese readers. Lin-ch'ing (Acting Governor-General of the two Kiang), father of Ch'ung-hou, wrote a book of travels in six thin quarto volumes, containing, among other wonders, an account of the *Loom Rock*, in the Chang-chow prefecture in Hunan, which is described as perfectly inaccessible to man, yet a loom, and other articles used in housekeeping, such as tea-pots, &c., can be distinguished in the caves hollowed out in its sides.]—*Ch. Sketches*, pp. 161–3. See also *Balfour Waifs*, pp. 149–52.

"The present age has seen the birth of no great original writer in any department of literature, nor the production of any great original work worthy to be smeared with cedar-oil for the delectation of posterity. It is customary after the death, sometimes during the life, of any leading statesman to publish a collection of his memorials to the throne, with possibly a few essays and some poems. Such have a brief *succès d'estime*, and are then used by binders for thickening the folded leaves of some masterpiece of antiquity. Successful candidates for the final degree usually print their winning essays, and sometimes their poems, chiefly for distribution amongst friends. Several diaries of Ministers to foreign countries and similar books have appeared in recent years, recording the astonishment of the writers at the extraordinary social customs which prevail among the barbarians. But nowadays a Chinaman who wishes to read a book does not sit down and write one. He is too much oppressed by the vast dimensions of his existing literature, and by the hopelessness of rivalling, and still more by the hopelessness of surpassing, those immortals who have gone before."—*Giles, Hist. of Ch. Lit.*, pp. 429–30.

"All literature in China is pure. Novels and stories are not classed as literature; the authors have no desire to attach their names to such works, and the consequence is a great falling off from what may be regarded as the national standard. Even the *Hung Lou Méng* contains episodes which mar to a considerable extent the beauty of the whole."—*Ibid.* p. 433.

As an example of the critiques on poetry and literature (which first made their appearance in the fourth or fifth century: see PER. OF DISR.) "may be noticed the *She hëŏ uen ke hwo fa ta ching*, in eighteen books, by Yu Seang, issued in 1697. The various objects of the themes of poetry are detailed in the order of a cyclopædia. The theme is first explained, then its various applications, followed by quotations from the poets, the ideas embodied, and the application in the successive parts of a poem. This is followed by a kind of rhyming dictionary, in which a number of quotations are given, under each rhyme, and notes for the artistic management of the same."—*Wylie, Ch. Researches*, pp. 235–6.

"A notable work of this kind [anthologies: see PER. OF DISR.], with the title *Koo wăn yuen keen*, in 64 books, was published by imperial commission in 1685. It gives an uninterrupted succession of choice literary selections, from the time of the Tso chuen down to the end of the Sung dynasty. The annotations of five eminent scholars are appended. A huge compilation of the poetry of the Tang dynasty, under the title *Tseuen t'ang she*, in 900 books, was issued in 1703, by imperial commission."—*Ibid.* pp. 235–6.

[Giles, in his article headed "Literature," says that Chinese literature, as a whole, is not worth translating, and its value has been greatly exaggerated, by Gumpach and others.]—*Ch. Sketches*, pp. 23–6.

Romance.—"Although native scholars altogether exclude novels from a place in their literature, yet they are in fact a very important and influential class of reading, forming as they do the views and opinions of the large mass of the people on the history of their own country, being almost the only source from which they gather any ideas on the subject at all. They are not so numerous, however, as might be expected under the circumstances; nor do they to their readers lose any of their freshness with age. They are more or less colloquial in language."—*Wylie, Ch. Researches*, p. 226.

"Works of fiction are amongst the most popular and exceptionable books the Chinese have, and those which are not demoralizing are, with some notable exceptions, like the *Ten Talented Authors*, generally slighted. The books sold in the streets are chiefly of this class of writings, consisting of tales and stories generally destitute of all intricacy of plot, fertility of illustration, or elevation of sentiment. They form the common mental aliment of the lower classes, being read by those who are able, and talked about by all; their influence is consequently immense. Many of them are written in the purest style, among which a collection called *Liao Chai*, or 'Pastimes of the Study,' in sixteen volumes, is pre-eminent for its variety and force of expression. The preface is dated in 1679; most of the tales are short, and few have any ostensible moral to them, while those which are objectionable for their immorality, or ridiculous from their magic whimsies, form a large proportion." "Rémusat compares the construction of Chinese novels to those of Richardson, in which the 'authors render their characters interesting and natural by reiterated strokes of the pencil, which finally produce a high degree of illusion. . . .' He briefly describes the defects in Chinese romances as principally consisting in long descriptions of trifling particulars and delineations of localities, and the characters and circumstances of the interlocutors, while the thread of the narrative is carried on mostly in a conversational way, which, from its minuteness, soon become tedious. The length of their poetic descriptions and prolix display of the wonders of art or the beauties of nature, thrown in at the least hint in the narrative, or moral reflections introduced in the most serious manner in the midst of diverting incidents, like a long-metre psalm in a comedy, tend to confuse the main story and dislocate the unity requisite to produce an effect." "Chinese novels, however, generally depend on something of a plot, and the characters are sometimes well sustained. 'Visits and the formalities of polished statesmen; assemblies, and above all, the conversations which make them agreeable; repasts, and the social amusements which prolong them; walks of the admirers of beautiful nature; journeys; the manœuvres of adventurers; lawsuits; the literary examinations; and, in the sequel, marriage, form their most frequent episodes and ordinary conclusions.'" "There is little or nothing of high-wrought description of passion, nor acts of atrocious vengeance introduced to remove a troublesome person, but everything is kept within the bounds of probability; and at the end the vicious are punished by seeing their bad designs fail of their end in the rewards and success given those who have done well. In most of the stories whose length and style are such as to entitle them to the name of novel, and which have attained any reputation, the story is not disgraced by anything offensive; it is rather in the shorter tales that decency is violated."—*Williams, Midd. King.*, i. 692–6. See also *Johnson, Or. Rel.—Ch.*, pp. 451–2; *Giles, Hist. of Ch. Lit.*, pp. 341–3.

"The *Hung Lou Méng*, conveniently but erroneously known as 'The Dream of the Red Chamber'" is a work "touching the highest point of development reached by the Chinese novel. It was probably composed during the latter half of the seventeenth century. The name of its author is unknown. It is usually published in 24 vols. octavo, containing 120 chapters, which average at the least 30 pages each, making a grand total of about 4000 pages. No fewer than 400 personages, of more or less importance, are introduced first and last into the story, the plot of which is worked out with a completeness worthy of Fielding, while the delineation of character—of so many characters—recalls the best efforts of the greatest novelists of the West. As a panorama of Chinese social life, in which almost every imaginable feature is submitted in turn to the reader, the *Hung Lou Méng* is altogether without a rival. Reduced to its simplest terms, it is an original and effective love story, written for the most part in an easy, almost colloquial style, full of humorous and pathetic episodes of everyday human life, and interspersed with short poems of high literary finish."—*Ibid.* pp. 355–6.

[Other well-known romances are minutely described in *Johnson, Or. Rel.—Ch.*, pp. 452–61. For illustrations of character of romance, see *Davis, Sketches; Duhalde and Julien's* translation of the *Kan-ying-p'ien; Wuttke, Geschichte d. Heidenth.*, ii. 130, 132; *Mayers*, in *Notes and Queries*, i. 10–12.]

"The short stories, of which the number is immense, combine moral interest with fanciful belief. These generally purport to be historical, and abound in admirable maxims. The larger portion are of Tao-sse origin, and embody the peculiar supernaturalism of this school. Spiritist machinery is exploited to the fullest extent, in apparitions, resurrections, judicial remandings back and forth between the worlds, and transmigrations into human bodies, which bring the departed into as intimate connection with this world as the strongest believer in Western séances could imagine (see *Plath, Bay. Ak.*, Feb. 1868; *Ch. Repos.*, April and May, 1842). Scarcely more rational, though more refined, is the large class of stories which substitute a subtle special providence for the direct intrusion of genii and dead people into human affairs. Good actions, shaped in this way from above, with such manipulations as are familiar to the editors of Christian manuals and Sunday-school books, bring about shifts of fortune, preservations, deliverances, or justifications, highly agreeable to the popular taste for ethical finish. It is the *imperium in imperio* which belongs to virtuous maxims. Events are set in form of riddle for providential solution. The philosophy is of the 'poor Richard' type, and never was honesty proved 'the best policy' with more unshrinking inventiveness, which might even afford many shrewd suggestions to our own artists in this line. A merchant, finding money, restores it, and thereby recovers a lost son. With the reward received from the owner, he is about to make a religious donation; but, reflecting that 'saving life is better than maintaining priests,' he offers it to any who would save a shipwrecked company: one of the rescued is found to be his own brother, returning from a vain search for him made at the entreaty of his wife. Further, the wife's fears for his safety have been aggravated by the persecuting suit of a relative, which drives her to attempting suicide. A curious turn of events foils this offender; while the arrival of the husband and long-lost son puts all to rights, and shows what blessings hang on a single honest or benevolent action." "A dreadful series of misfortunes in which a poor scholar is involved by the craft of an enemy, to the point of death, is cleared away by providential skill; whereat magistrates are warned to regard the life of a man more than that of a plant, and never to act as if at child's play, but as performing the duties of a parent (*Du Halde, Hist.*, iii.)."—*Johnson, Or. Rel.—Ch.*, pp. 457–9.

Poetry.—"The poetry of the present day is based on old rules and old sounds. The freedom which genius loves is checked. The consequence was that there was first a popular school in the Yuen dynasty of dramatic chorus songs, but it did not last very long. When this dramatic school of popular poetry died away, China returned to the five-word and seven-word versification and has ever since held to the poetry of the T'ang dynasty as a standard."—*Journ. P.O.S.*, ii. 239.

Tcheng-ki-tong says that modern poets have not kept to the metres of the Shi-King. In Chinese prosody, each word counts a foot, and lines consist of either 5 or 7 feet. "Chinese poetry admits rhyme, but it occurs only in alternate lines. Thus in a stanza of 4 lines there are two rhymes,—at the second line and the fourth. Our poets also use pretty often a particular form which is called parallelism and consists in the correspondence of one line with another, or in the opposition of words expressing two contrary sentiments." Ancient poetry was purely religious and moral, the modern became sentimental and descriptive. However, later on (p. 139) he says that "sentimental poetry begins to make its appearance" before the age of Confucius.—*Ch. Painted by Themselves*, pp. 133–9.

"The poetry of China, from the Tāng dynasty (when this art attained its highest perfection) down to the present time, is in point of *mere versification* a vast improvement on the Sheeking. It would be strange indeed, if this people were an exception to a rule so general; if an art, in which they took so much delight, had not improved by cultivation, or were, at the present day, devoid of so essential a qualification as the harmony of numbers."—*Davis, On the Poetry of the Ch.*, p. 13.

"Now, in modern times, although every student 'can turn a verse' because he has been 'duly taught,' the poems produced disclose a naked artificiality which leaves the reader disappointed and cold."—*Giles, Hist. of Ch. Lit.*, pp. 232–3.

"Taken altogether, the poetry of the present dynasty, especially that of the nineteenth century, must be written down as nothing more than artificial verse, with the art not even concealed, but grossly patent to the dullest observer. A collection of extracts from about 2000 representative poets was published in 1857, but it is very dull reading, any thoughts, save the most commonplace, being few and far between. As in every similar collection, a place is assigned to poetesses."—*Ibid.* pp. 416–7.

"Without extensive knowledge of their ancient poetry, and the customs and manners of the country, it is very difficult to understand their poetical compositions. The very point and beauty of the piece often depends on some slight allusion, which a foreigner does not perceive; added to which, the style is peculiarly concise, and unusual words are introduced."—*Morrison, Gram. of the Ch. Lang.*, p. 275.

"The usual charge brought against Chinese poetry, of pedantry, is very unjust. People with such strong national instincts will always . . . refer to their national heroes, and there must consequently be many allusions in their poetry that, to foreigners not imbued with the same historical enthusiasm, must seem pedantic."—*Ch. Rev.*, i. 250.

"In poetry and poetic literature, the writings of the Chinese are very voluminous. Their poems are most frequently descriptive of nature and natural scenery, domestic life, or the cares of the world. Martial odes are not infrequent. Epic poetry is almost unknown in China; but we find occasional details of historical events."—*Wylie, Ch. Researches*, p. 234.

"With the exception of the epic, which implies ability to combine all experiences under inspiration of a great religious faith and national ideal, the Chinese have worked up their syllabic signs and meagre rhymes into every form of poetic composition. In odes, idylls, epigrams, ethical and didactic poems, proverbs, effusions of all moods, their fertility has equalled, if it has not greatly surpassed, that of any nation in the world."—*Johnson, Or. Rel.—Ch.*, p. 513. See also p. 516, and *Davis, Poetry*, p. 83.

"The old measure of four words, or feet, is now seldom adopted, being from its shortness unsusceptible of much melody. At the same time it does occasionally occur, chiefly for moral and didactic purposes."—*Davis*, p. 13.

"The improved system of versification consists in lines of *five* words or feet, as well as in the longer and still superior measure of *seven*. These now constitute what are properly called *Shee*, or regular poems."—*Ibid.* p. 14. See also *Ch. Rev.*, xii. 204.

"Verses containing the number of six, or eight, or more words form no part of regular poetry in modern times; though they are occasionally found alternated with others, in pieces which do not aspire to regularity of structure, but whose figurative style elevates them above the level of mere prose. Lines of every length are used in those measured couplets, or sentences in pairs, so nicely balanced both in words and sense, which are adopted in the inculcation of ethical precepts."—*Davis, Poetry*, pp. 16–17. See also *Legge, Ch. Class.*, IV. i. Prol. pp. 120–1.

"No *sentential* pause ever occurs in the middle of a verse; at least, none which could be punctuated with anything beyond a comma in English. Every line is complete within itself; there is nothing of what the French call *enjambement*." But a marked

second caesura occurs near the middle of the line.—*Davis, Poetry*, p. 47.

"Of rhymes, it is chiefly to be observed, that they occur, in regular poetry, at the end of the alternate verses which answer to the even numbers,—that is, at the termination of every second verse. The first one of all frequently gives the rhyme to the whole stanza; but the rest of the uneven-numbered lines seem subject to no rule, and end with any sounds indifferently. The length of the stanza is determined by the recurrence of the same rhyme, and, in a poem of any continuity, it is generally of four lines only—that is, a quatrain, whose second and fourth lines rhyme together; but occasionally it consists of eight verses, of which four have the same ending. Stanzas, however, or rather short pieces of poetry, are very common of twelve, and even sixteen lines, some of which might, with no great impropriety, be assimilated to what we call sonnets. In the stanza of four lines it cannot be objected that the rhyme is too frequent; and even in that of eight, it should be considered, that only the second line of every couplet possesses the rhyme; while the intermediate ones are blank, and thus afford a relief to the ear. . . . The Chinese, however, do not seem to have a very nice ear for the perception of true rhymes; and this inaccuracy may partly arise from their not possessing such precise symbols, or marks of sound, as our alphabetic letters."—*Ibid.* pp. 22–3.

Rhymes "are by no means confined to regular verse; . . . being very apparent in . . . a species of composition called *Tsze*, something between prose and poetry, in which the rhyme is repeated at the end of lines of indeterminate length."—*Ibid.* p. 25.

"A large work of this [it is] class is the *Yu kung k'ih tsz' pu*, in 100 books, published by imperial commission in 1707. This is a comprehensive collection of the choicest rhymes, from the commencement of the art in the Tang dynasty down to the end of the Ming, comprising 1,340 articles, making upward of 9,000 verses." A list of rhymes is included. "The *Tsz' k'ih*, or songs, embrace dramatic compositions, these being in great part lyrical effusions. These are barely acknowledged by literary men as forming a part of the literature of the nation, although they are to be found in every book store. A much valued work of the kind is the *Yuen jin pih chung k'ih*, or 'Hundred Plays of the Yuen Dynasty,' being a selection from the productions of more than 200 dramatists who wrote about that period. As a dramatic composition the *Se siang ke*, or 'Record of the Western Pavilion,' holds the highest place in native estimation, and next to it ranks the *Pi-pa-ke*, or 'Tale of a Guitar.' A well-known collection of recent date is entitled the *Chung pih k'ih*, numbering several tens of dramatic pieces."—*Wells Williams, Ch. Repository*, p. 236.

"There is a common species of composition called *Kwo* which cannot be better rendered than by Song or Rhapsody. Its structure is as wild as the thoughts and imagery which it generally contains, the lines being of every length, but distinguished by recurring rhymes at intervals."—*Davis, Poetry*, p. 48.

"The antithesis is perfect in sentiment, both in sentiments and terms." "But the antithetic parallel is used not merely to give a force to aphorisms. It appears occasionally, though perhaps somewhat less often, in the course of poetry; and is found to exist in every degree, from the strong sentinel opposition of *all* the corresponding words in a couplet, to that of only *some* of them." The kind of parallel in which "noun answers to noun, verb to verb, member to member, negative to negative, interrogative to interrogative" "is by far the most common species of parallelism with the Chinese." The parallel *synonymous* and the parallel *antithetic* (p. 28) "are generally accompanied by this last [the *synthetic*]—the correspondence of sense, whether consist in equivalency or opposition is almost always preceded by correspondence of construction; the latter is often found without the former, while the converse seldom takes place. It pervades their poetry universally, forms its chief characteristic feature, and is the source of a great deal of its artificial beauty."—*Ibid.* pp. 29–30, 32.

"If the epithets habitually employed by Chinese poets are less varied and frequent than those used by the Latins, the number of figurative expressions is perhaps not so great in any other poetic language than in that of China. The majority are drawn from history, mythology, popular usages, traditions, or sacred books."—*Hervey Saint-Denys, Poésies de l'Epoque des Thang*, p. xxiii. See also *Davis*, pp. 65–71.

"Besides the *Tsz'* . . . there is a still less lettered species—a kind of impassioned prose, into which the writer of a narrative now and then breaks forth, when inspired by the occasion."—*Ibid.* pp. 70–1.

"In modern times, if odes are expressly composed for great court ceremonials, . . . [no] proof yet met with any—such ceremonials are frequently accompanied by music, but that there are words to the music has not been as clearly ascertained."—*Ibid.* p. 48.

"Popular songs and ballads hold but a low rank in the literature of the country; and if we should even go so far as to include under this denomination the detached snatches of irregular verse (also called *Kwo* [*v. supra*]) which are met with in their drama, the truth of the position would not be materially affected. . . . The Chinese cannot strictly be said to possess *dramatic* poetry, in the sense which the term bears among ourselves. . . . They make no distinction between tragedy and comedy in their stage pieces, the dialogue of which is composed in ordinary *prose*: while the principal performer now and then chaunts forth, in unison with music, a species of 'song or vaudeville.'"—*Ibid.* pp. 50–1.

"There is another description of poetry which we should not look for in China, namely, the Pastoral."—*Ibid.* p. 58.

There is "a large class of poetry which may be properly styled Moral or Didactic. . . . There are innumerable poems, or rather metrical essays, whose object it is to convey the doctrines and precepts of the great national sages and others."—*Ibid.* pp. 61–2.

"In the course of their lighter works, Chinese writers frequently introduce moral reflections in verse with very good effect. A couplet, a quatrain, or a passage of eight or more lines, agreeably engages the reader's attention in his progress through a romance or novel, and generally accompanies the transition to some other part of the story. They are not altogether unlike the rhymes at the close of the scenes in our older plays, and usually consist, as those did, of some reflection upon what has gone before, or what is immediately to follow."—*Ibid.* pp. 62–3.

"Satire, viewed as a means of recommending virtue by discrediting vice, cannot be said to exist in any regular form, or to constitute a particular branch of literature. Some of the ancient pieces in the Shooking have been considered as levelled at persons existing when they were composed; but they have no more claim on this account to the name of satire, than Horace's ode 'In Mœviam.' There is no country, at the same time, in which anonymous lampoons, and similar vehicles of invective or ridicule, are more common. They form one of the most ordinary outlets for the ebullitions of public feeling; and must be considered by every person who has had opportunities of making the observation, as a very important check, under so absolute a despotism, upon the conduct of Chinese rulers. The highest officers of Government are not exempt from these covert attacks, which are constantly made, notwithstanding the severest punishments in case of detection."—*Ibid.* pp. 63–4.

Drama.—The sacred character of the drama survived, at least generally. "To the present day, with the exception of the theatres at the ports, Peking and perhaps large provincial capitals, theatricals . . . are generally given as an expression of thanksgiving, *e.g.*, for rain or good harvest."—*Ch. Rec.*, xxi. 345.

"In the department of plays and dramas, Chinese literature shows a long list of names, few or none of which have ever been heard of away from their native soil." "Besides plays in the higher walks of the drama, which form the principal part of the performances at theatres, there are by-plays or farces, which, being confined to two or three interlocutors, depend for their attractiveness upon the droll gesticulations, impromptu allusions to passing occurrences, and excellent pantomimic action of the performers. They are usually brought on at the conclusion of the bill, and from the freedom given in them to an exhibition of the humour or wit of the players, are much liked by the people."—*Williams, Middl. King.*, i. 714–5.

"No nation has such a store of plays in constant use, although . . . sometimes have suffered contempt, and have even been persecuted by special edict. Many plays have been written by women, though the sex is forbidden to act, and the female parts are taken by boys."—*Johnson, Or. Rel.—Ch.*, p. 445.

"The great Manchu, Kien-lung, did not share the prejudices of his scholars, who are said to have excluded plays from his library; he even took a player for a second wife. This passion for the stage has grown with time; the superstitions of Buddhists and Tao-sze have furnished machinery, and the history of China is quarried for material. Such is the force of nationality in the popular mind. Plays are the cheapest things circulated, and are even sometimes used as currency (*Grard*, ii. 301)."—*Ibid.* p. 448.

"The merit of the plays performed is not on a level with the skill of the performers. A Chinese audience does not go to hear the play, but to see the actor." "Most plays are simple in construction and weak in plot. They are divided into 'military' and 'civil,' which terms have often been wrongly taken in the senses of tragedy and comedy, tragedy proper being quite unknown in China. The former usually deal with historical episodes and heroic or idiot acts by historical characters; and Emperors and Generals and small armies rush wildly about the stage, sometimes engaged in single combat, sometimes in turning head over heels. Battles are fought, and rivals or traitors executed before the very eyes of the audience. The 'civil' plays are concerned with the entanglements of every-day life, and are usually of a farcical character [*cf. Far East*, i. 91]. As they stand in classical collections or in acting editions, Chinese plays are, as unobjectionable as Chinese poetry and general literature. On the stage, however, actors are allowed great licence in gagging, and the direction which their gag takes is chiefly the reason which keeps respectable women away from the public play-houses."—*Giles, Rest. of Ch. Lit.*, p. 201.

"Even the longer and more elaborate plays are proportionately wanting in all that makes the drama piquant to a European, and are very seldom, if ever, produced as they stand in print. Many collections of these have been published, not to mention the acting editions of each play, which can be bought at any bookseller's for something like three a penny. One of the best of such collections is the *Yuan-chen hsien-tsa chi*, or Miscellaneous Selection of Mongol Plays, bound up in eight thick volumes. It contains one hundred plays in all, with an illustration to each, according to the edition of 1615. A large proportion of these cannot be assigned to any author, and are therefore marked 'anonymous.' Even when the authors' names are given, they represent men altogether unknown to what the Chinese call literature, from which the drama is rigorously excluded."—*Ibid.* pp. 268–9.

"There is apparently no attempt whatever at passion or pathos in the language—at any rate, not in the sense in which these terms are understood by us. Nor are there even rhetorical flowers to disguise the expression of common-place thought. . . . There is much, too, of a primitive character in the setting of the play. Explanatory prologues are common, and actors usually begin by announcing their own names and further clearing the way for the benefit of the audience."—*Ibid.* p. 270.

"As far as I am able to judge, the Chinese have the exact equivalents for all our different styles of plays. They have Tragedies, Comedies, Operas, Farces, Burlesques, etc."—*Far East*, i. 91.

"We have not in our drama religious plays properly so-called; but there exists a great number of comedies which are concerned with Buddhism and Taoism."—*Tcheou-Ki-Tong, Le Théâtre des Ch.*, p. 122.

"The majority of our celebrated comedies, I mean those which are of value on account of their style, contain piquant satires on our morals and are interesting on that account if on no other."—*Ibid.* p. 211.

"Chinese dramas have usually an ethical purpose. Like the histories and the political writings, they generally assert poetic justice. Elaborate villainies, often woven into a complex web which betrays real familiarity with crime, are constructed so as by their natural consequences to justify the righteous side through whatsoever sufferings they cause. . . . Nowhere is the marriage tie disparaged, amidst the satire that assails all classes and sects. The national reverence for those natural relations on which society is based is always treated with respect. Gratitude, defence of the wronged, humanity, power of 'the right way' to deliver from life-weariness and despair, are all enforced in special plays (see *The Deliverance of Ts'ai-hing*, and Design of *Lan-shang-yin*, *Journ. Asiat.*, 1851)."—*Johnson, Or. Rel.—Ch.*, pp. 449–7.

"Chinese plays seem to be the most realistic to be found in any country. They do not transcend the actual. Nor do they make any use of supernatural elements. They aim to exalt virtue, to exhibit the pathetic and the comic, and to hold up fidelity and self-sacrifice to admiration."—*Journ. N.C.B.R.A.S.*, N.S. xx. 195. See also *Johnson, Or. Rel.—Ch.*, pp. 445–9.

"Theatrical pieces are divided into sets or 折 (*chê*), and are often preceded by a prologue or 楔子 *(hsieh tzŭ)*, in which the various personages come on the stage to explain their names, qualities, and the part they are to play."—*Van Aalst, Ch. Music*, p. 37. See also *Laou-seng-urh*, pp. xliii-iv.

"Singing is the privilege of the principal actor in the piece. He represents generally a person of great virtue and moral qualities, and his singing consists in pompous eulogies of what is good and commendable. The singing is not unfrequently in the 'recitative' style, and the way the orchestra accompanies, in broken, sudden chords or in long notes, bears a striking resemblance to our European recitative."—*Van Aalst*, p. 37.

"If they are unable to reach a high standard of dramatic writing they show considerable skill in inventing incidents and in introducing clever and humourous dialogues. Thus they startle and amuse more than they interest, and cater for the eye and ear rather than for the mind."—*Contemp. Rev.*, xxxvii. 126–7.

"The lyrical compositions, which prevail more in tragedy than in comedy, certainly bear a strong resemblance to the chorus of the old Greek tragedy; like the chorus too, they are sung with an accompaniment of music."—*Laou-seng-urh*, p. xlii.

"One defect in Chinese Theatricals that strikes foreigners is the introduction of so many gods, demons, fairies, etc. This, to our modern rationalistic notions, detracts greatly from the interest we would otherwise feel, and makes what ought in reality to be an historical piece of sterling worth, descend to a mere spectacle, or worse still, a burlesque."—*Far East*, i. 93.

"There are no plays in which are depicted any of the events that have occurred during the present dynasty. This is accounted for by the fact that the historical records of one dynasty are not published until it is superseded by another. . . . It is only at a theatre that costumes worn by the various classes of men in any particular dynasty, or in ancient times generally, can now be seen, as well as the curious weapons used by them—queer head-dresses and armour, with all the paraphernalia of court or camp."—*Ibid.* i. 92–3.

"The best . . . Plays relate to events which occurred during the Han, T'ang, Sung and Ming dynasties: the most popular of all with northerners, are derived from the San-kuo Chih—'History of the three kingdoms,' and represent the famous deeds of the heroes of the Han dynasty; every character of which is known and dear to the heart of the play-goer, and indeed to all Chinese."—*Ibid.* pp. 93–4.

"The heroes of Chinese plays are performed by the 生, who are divided into 小 老 and 武, according to the parts they play, like our 'first' and 'walking' gentlemen. The female characters are always performed by the 旦, of whom there are very similar sub-divisions. The 淨 take the parts of ghosts, great criminals, monsters, savages, etc., and paint their faces black and red. The favorite roles of thieves, clowns, etc., are taken by the 丑. Finally the 'lowest' comedy is performed by the 末, who act the parts of beasts, rustics, and persons of low degree."—*Ch. Rec.*, xxii. 30.

[For a description of the five kinds of theatrical music see *Far East*, i. pp. 91-2, and for dramatic poetry, *see supra, Poetry.*]

Music.—"There are two kinds of music, known as the Southern and the Northern, which differ in their character and are readily recognised by the people. The octave in the former seems to have had only six notes, and the songs of the Miaotz and rural people in that portion of China, are referable to such a [five-step] gamut, while the eight-tone scale [seven-step] generally prevails in all theatres and more cultivated circles."—*Williams, Midd. King.*, ii. 95.

"During the present dynasty the Emperors K'ang Hsi and Ch'ien Lung have done much to bring music back to its old splendour, but their efforts cannot be said to have been very successful. . . . The musical art, which formerly always occupied the place of honour, is now deemed the lowest calling a man can profess. There is still in Peking a Board of Music connected with the Board of Rites (just as the Romans had a college of flute-players), but the officers seem little anxious to distinguish themselves." "Serious music, which according to the classics is considered a necessary complement of Education, is totally abandoned. Very few Chinese are able to play on the *ch'in*, the *shing*, or the *pan-hu*, and still fewer are acquainted with the theory of the *lüs*."—*Van Aalst*, p. 6.

Modern music is "sub-divided into ritual music, which is generally of a minor character; and popular or theatrical music. The notation is cumbrous. . . . [see *infra, Van Aalst*]. The characters 合 四 乙 上 尺 工 凡 六 五 correspond to our five lines and four spaces. Rests are marked, but their duration is a matter of taste."—*Giles, Gloss.*, p. 157.

"The Chinese have various kinds of music to suit the five kinds of etiquette: 1. For joyful occasions. 2. To be used under calamities. 3. That for hosts welcoming their guests. 4. Martial music. 5. That used for congratulations."—*Ch. Rec.*, xxi. 345.

"The music used at worship of Confucius is very slow, and the notes within a small compass. The reason given for this is that as Confucius was the great exponent of the 'Doctrine of the Mean' it was not proper to have notes either too high or too low!" The notes range generally from A second line below the treble stave to A second space of treble stave, exactly one octave. Confucian music of the last and present dynasties is still preserved."—*Ibid.* xxi. 344.

To perform popular music (theatrical, ballad, processional, and ordinary street music), "none but common instruments are used. In the principal cities there are concert-halls, to which Chinese are admitted for a few cash to hear a song or a ballad. The orchestra ordinarily consists of two balloon-shaped guitars (played by girls who sing at the same time), one three-stringed guitar, one or two violins, one small drum to beat time, one flute, and one *yang-ch'in*. All these instruments play, or at least try to play, in unison; still it seems to a foreigner not acquainted with their music that each performer has a part of his own, and that each aims to distinguish himself above his colleagues by making as much noise as he can. The impression produced on foreign ears is anything but favourable. Still, if patient attention be paid, it is soon discovered that the performers play in time and well together!"—*Van Aalst*, p. 36.

"What information we possess about later Chinese musical theory gives reason to believe that the Chinese recognise either of two notes as the fundamental one in the diatonic scale; that these two are Do and La; and that in theory, therefore, music in China exhibits the same division into a major and minor system which it appears to have reached in Europe only after a long course of development into an entirely different form from that of the Chinese art."—*Phil. Rep.*, i. 167.

"The Chinese scale may be said to be neither major nor minor, but to participate of the two. Chinese melodies are not majestic, martial, sprightly, entrancing, as is our music in the major mode; and they lack the softness, the tenderness, the plaintive sadness of our minor airs."—*Van Aalst*, p. 22. See also *Ch. Rec.*, x. 530–40.

"The Chinese have a scale composed of 12 semitones (that is, the 12 *lü*), which may be called the chromatic scale. This scale is used to transpose their diatonic gamut in any of the 12 keys, but never to play chromatic runs on the instruments, nor to write music proceeding with half tones." "Each degree is named from the *lü* producing its sound, but in its name only the first syllable is used. . . . . "The 12 *lüs*, originally monotones of three sounds, are now eleven unknown. Nevertheless certain instruments created on the principle of the *lüs*, as the *pien-k'ing*, the *pien-chung*, etc., are still in use, and so the guardians of the 12 semitones." "The transposition of the diatonic scale from one tone to another is very curious, and is worthy of the Chinese." "The scientific Chinese have a circular diagram . . . on which the names of the *lüs* are written in order, with the names of the hours, moons, etc., to which they correspond. . . . their aim being to prove the profitable analogy of their music with astronomy and Nature." "When playing or singing, the Chinese succeed perfectly in flattening or sharpening certain notes. The players on the *ch'in* are especially fond of producing such effects." "In ordinary performances the existence of something resembling a chromatic scale is not even suspected."—*Van Aalst*, p. 23.

"Most of the instruments required in ritual music have a particular kind of musical notation adapted to the exigencies of their conformation. For instance, a piece written for the *ch'in* presents a complicated combination of strokes difficult to learn and to decipher. Still it is an ingenious and abbreviated kind of notation." "Neither time nor movement are ever mentioned at the beginning of a piece; and crescendo, decrescendo, legato, etc., are utterly unknown to the Chinese."—*Ibid.*, p. 21.

"The [hieroglyphic notation, permitting the recognition of the pitch, as well as of the name of a written note, has spared the Chinese the use of a stave. Besides, their habit of writing characters in columns from top to bottom would never admit of the adoption of a stave-like one." "They [have not] forbidden several figures expressing its value or height. "These notes indicate simply a certain sound at a certain height, but leave the master in the most complete doubt as to their value. Sometimes signs or dots are added on the right of a note to signify that it is to be held longer than the others, but still this system is not uniform, and is found only in manuscripts."—*Ibid.*, pp. 17–18.

"This is decidedly the weakest point in Chinese musical notation. The total absence of signs showing the value, the rests, the bars, &c., makes it quite impossible to learn a tune by merely reading the written notes. The best Chinese musician could only conjecture the general form of a written piece shown to him for the first time; to be able to decypher it he must *first hear it played*."—*Ibid.*, p. 18.

The Ch'ing "reverted to the Yüan gamut, leaving out, however, the note *lan* (2*d*), which was the real *pivot-tone* of the ancient scale."—*Ibid.*, p. 16.

"Not only have the names of the notes been changed but also the principle of the scale is no longer the same. The two *pien* or half tones of the ancient scale are no longer in use; they have, it is true, never been well understood by the majority of Chinese, but now, to avoid all possible confusion, they have been carefully put aside. The present Chinese theoretically admit seven sounds in the scale, but practically they only use five, and that as well in ritual music as in popular tunes."—*Ibid.*, p. 16.

"Only the modern names of notes are used." "The ancient denominations of the notes are now only met with in books. They are the scientific terms of the five sounds. The modern names are much easier, and besides present the advantage that by means of a little sign affixed to the left of the note, the octave higher is at once expressed." "But this custom is not general, and, owing either to negligence or ignorance, many pieces are found in which there is no means of distinguishing the notes E, R, L from their respective octaves. But . . . this is the least important imperfection of Chinese solmisation."—*Ibid.*, pp. 17–18.

"The modern Chinese have a special sign for nearly every note of their melodic system. Their characters not only express the sounds, but also indicate the pitch—that is, their position in the gamut. The music of the Chinese, like their language, is written in vertical rows of characters from right to left. They never [explore beyond the limits of 14 sounds], having within this compass of that scale an infinite variety of tunes to which Chinese ears only can become accustomed."—*Ibid.*, p. 17.

"The present pitch approaches our D (901½ vibrations per second) as nearly as possible. The principal fixed instruments, as the *yün-lo*, the *shêng*, the flute, all give the *D as basis*."—*Ibid.*, p. 13.

"The Chinese gamut also contains eight degrees, but these being a series of perfect fifths brought within the compass of an octave, without having undergone any temperament, they form irregular intervals incompatible with our tempered instruments."—*Ibid.*, p. 21.

"The chief time marks in common use by the Chinese are two—a cross, thus × (called pan) and a circle, thus ○ (called yin)—the first put at side of the accented and the second at side of the unaccented note, equivalent really to the beats in our bars. If they want more than one note to be sung to the one beat, they just crowd in the number of notes to be sung to fit to the side of the pan or yen, it may be 2, 3, 4, 5, or even more. The awkwardness of this must be apparent at once. . . . On the other hand, if they want a note to last two or more beats, they crowd in the × or ○ at the side of that note." "Other times marks are used variously in different Chinese books, but there is no uniformity. The fact of the indistinctness of the time-marks, and certainly the want of them altogether (see Sung dyn.), accounts for the fact that a musician has to *hear* a tune before he can play it, and also for the fact that we hear the same tune rendered so differently in different parts of China." *Ch. Rec.*, xi. 11 *ff.* *Cf. infra.*

"The Chinese have only simple common time; so triple and compound times are novelties to them."—*Ibid.*, xxix. 312.

"The only measure scientifically recognised by the Chinese theorists is that in four time. In practice, however, several measures are admitted, especially that in three time." "Each fourth time is indicated by a small circle (○) written at the right side of the note; the three other times are marked by dots (. . .). But time and measures are not always indicated, and this deficiency, together with the total absence of signs marking the value of notes, compels the musician to learn all the tunes by tradition. The tunes, modified by the individual taste of the performer, may after a lapse of time become quite different from what they were originally."—*Van Aalst*, pp. 18–19.

"The Chinese have nothing approaching what we call sharps, flats, or naturals. . . . They remain faithful to their pentatonic scale, and find therein all the variations necessary to satisfy their ear." "In our music the number of flats or sharps at the beginning of a piece indicates the key-note or tone in which it is to be played. To attain the same end the Chinese state at the beginning of a piece to what *lü*—that is, to what tone—the key-note must correspond. This indication is used in sacred music only, this being the only systematic music of China."—*Ibid.*, p. 19.

"By means of the 12 *lüs* the Chinese are enabled to transpose their scale of 11 sounds in any of the 12 tones."—*Ibid.*, p. 20.

"Some instruments, . . . the *shêng*, the *ti*, and the *pien-chung* require, on account of their special construction, quite a different musical notation." See *infra*.—*Ibid.*, p. 17.

"It is difficult to give a correct idea of Chinese vocal music. Few foreigners are able to imitate Chinese vocalisation. The sounds seem to proceed from the nose; the tongue, the teeth, and the lips have very little to do, except for the enunciation of some labial words. Persons men and women generally sing in the kind of voice known as *voix de tête*. Chinese singing is always in unison, and usually accompanied by the guitar." "In plaintive songs the singing is of a tender, languishing character, in a kind of minor key. It is also in unison, and therefore bears a striking resemblance to the first Christian *cantus planus*. It is generally accompanied by a kind of mimed dancing, to which the different attitudes and evolutions of the persons present appear to the eye what the voice and instruments convey at the same time *to the ear*." "A remarkable peculiarity in the Buddhistic service is that although all the choristers utter the same words and follow the same rhythm, still each sings in the key most convenient to his own voice." "In theatres the singing is mostly a kind of recitative, confined to common and metaphorical language."—*Ibid.*, p. 24.

[Dr. Colquhoun says that the Chinese "do not understand *harmony*, and always play or sing in unison." In singing, they use "kind of abrupt transitions and jarring modulations," the voice "continually goes up or down, three, five, or eight tones at a time. They usually play and sing by ear, or from memory, seldom from the written notes. . . . Yet they very seldom sing out of tune."—*L'Empire du Mil.*, pp. 400–11.

"The only distinction of time or simultaneous sounds recognised by them is that produced by playing two strings (at a distance of a fourth, a fifth, or an octave) together on the *ch'in*, the *se*, or the guitar."—*Van Aalst*, p. 24. See also *Ch. Repos.*, viii. 43–4.

"I had often been kept awake by them [Chinese] by the 'catch' songs exchanged between lovers, and the airs being later attracted my attention amongst the Miao-tsz in North-West Chien. The music is shrill and weird; not without melody, but from its very nature, of course, destitute of harmony. It is quite free from the squeakiness and discord of Chinese music."—*Parker, John Chinaman*, pp. 280–7.

"The Chinese divide their *instruments* into eight kinds—1. metal, 2. stone, 3. earthen or porcelain, 4. leather, 5 silk or stringed, 6. melon or wind, 7. bamboo, 8. wood." "The Pa Yin—'eight sounds'—which the Chinese often speak about and which so many think refers to the eight notes of the scale, really means the eight sounds produced by their eight different kinds of instruments." "But of these eight kinds there are varieties, commonly—of metal 8 varieties, of stone 5, earthen 2, leather 6, silk or stringed 7, wooden 3, melon-stopped 6, and bamboo 5; in all 45 common varieties." "Besides these there were unusual kinds."—*Ch. Rec.*, xx. 341–2.

"Among the stringed instruments the *kin* is the most ancient and honorable. The *pipa*, a guitar, is of foreign origin, but has been in China considerably over 1,000 years." "Among the wind instruments is the *sw-cho-tsiang* sing with its perfect reeds." "Among the curiosities of Chinese musical instruments are the musical stones, made in the shape of a carpenter's square and suspended in two rows of six, each giving one of the twelve semitones. In a Chinese book of the 12th century there is a picture of the Jew's harp. . . . That book has a picture, too, of Pan's pipes."—*Ibid.*, xxx. 342.

"The modern Shang differs in many essential points from the ancient Ch'ao and Hsia. . . . While it preserves the general outline of the ancient instrument, it has done away with the clumsy mouthpiece and has only thirteen sound-giving reeds."—*Ch. Rec.*, ix. 39.

K'ang Hsi "abolished the ancient forms and adopted round bells, ornamented with the *po-kua* symbols, and having on the top a dragon, by which they could be suspended. Chimes were made of 16 bells, all of the same size and diameter, but differing in thickness and weight. These are the chimes now in use."—*Van Aalst*, p. 55.

"In ancient times the 16 stops represented the sounds of the 12 ordinary *lüs* and of the first four *lüs* of the same series. The present dynasty has abolished the four *sonte lü* (the four 倍 *chʻing* as they were called) and in their place the four *lüs* immediately below *kung-chʻeng* have been selected: these are called 清 (*tsʻi*) that is 'double.'"—*Ibid.*, p. 50.

The *Hun-Tun-ku* (魂敦鼓) "is used chiefly in the southern provinces at theatricals, processions, etc., and is seldom met with in North China."—*Journ. N.-C.B.R.A.S.*, N.S., viii. 402.

"*Instruments of percussion* included 30 kinds of drums, tambourines, gongs, and cymbals; several kinds of bells, sounding stones, oblong plates, whistling-pipes, clasped cups, sounding vases, musical boxes, music boxes, castanet boards, Buddhist fish, wooden fish, chalk balls, harmonicon, etc.; *stringed instruments*, the scholar's and 3 other kinds of lute, 3 kinds of guitar, 2 stringed fiddle, bass fiddle, violin, etc.; *reed instruments*, several kinds of trumpets, usually made of copper, the clarion, clarionet, flageolet, flute, fife, the conch, pandean pipe, double pandean pipe, earthen cone, organ, small music boxes, etc.; *instruments for sacking*, 2 or 3 kinds of reed-organs, etc. See *Bridgman, Ch. Chrestomathy*, pp. 338–65; *Van Aalst*, pp. 47–83; *Journ. N.-C.B.R.A.S.*, N.S. chs. 93–132.]

[For theatrical music see *Drama*.]

Dancing.—"In the present dynasty women neither play, sing, nor dance on occasions of worship."—*Ch. Rec.*, xxx. 343–4.

"A sort of mummer or posture-making is practised by persons attached to theatrical companies. . . . As acrobats the Chinese are equal to any nation, and companies have performed in many western capitals within a few years past. Some of their performances are highly exciting. . . . In dancing and other forms of graceful motion they are entirely wanting, and one would almost as soon think of associating music and medicine as that Chinese music should be accompanied by quadrilles and cotillons, or that men with shuffling patent leather feet could feel oil women with feet like hoofs through the turns and graces of a waltz or fandango."—*Williams, Middle Kingd.*, ii. 104–5.

"The use of and taste for ballets and pantomimes has always been preserved amongst the Chinese. But . . . these ballets, which were religious in origin, became so obscene, and the license of them was carried to such a point, that it often excited the attention of the Emperors, ministers, and mandarins, and drew forth all the severity of the law."—*Rémy, Théâtre Ch.*, Introd. ii. xi.

Porcelain.—"There is an interval of about half a century between the death of Wan-li and the reign of K'ang-hsi, when the imperial potteries were reopened, and it is generally easy to distinguish the painted porcelain of the two periods. This decoration in enamel colours of the new dynasty is characterised by the addition of a brilliant blue colour over the glaze to the old colours which seems never to occur in a Ming specimen. Towards the end of the reign of K'ang-hsi a new style of decoration appears in the *famille rose*, distinguished by a totally different tone of colouring with its prevailing half tints and broken colours, including pink and ruby enamels derived from gold."—*Journ. R.A.S.*, i. 418–9.

"The general forms of some of the Chinese porcelain vases are remarkable for the beauty of their outline, but not more so than the rude water-bottle of porous clay which the unlettered Arabian potter fashions daily on the banks of the Nile, assisted only by the instinct of his gentle race, and the pure form of the Chinese vase is often destroyed by the addition of grotesque or other unmeaning ornaments, built up upon the surface, not growing from it, from which so many that they can possess an appreciation of form but in a minor degree."—*Jones, Grammar of Orn.*, Ch. xv. pp. 1–2.

"Under the present [Ch'ing] Dynasty . . . the porcelain of China has culminated and declined. Under the reign of K'ang-hsi (1662–1723) it reached its zenith in the beauty of colour and artistic feeling, and in that of Ch'ien-lung (1736–1796), though with some of the finest specimens, perhaps a still greater perfection of technical execution. After that time it gradually decreased, so that till the factories of China-town were destroyed in the Taiping rebellion. Since then, at least till quite recently, no Chinese porcelain has been produced that is worthy the attention of the collector, and the latest 'revival' has been rather commercial than artistic, having produced little except coloured imitations of those old wares which realise high prices in Europe, such as the so-called 'mazarine' bits and pieces of *sang-de-bœuf*, or peach-blow. Some of the latter are described as very good, and capable of deceiving experts."—*Moseley, Hist. and Descr. of Ch. Porcelain*, p. 38.

"In addition to the imitation of all kinds of old ware great progress was made in manufacture, which reached its highest perfection, next to that of porcelain in over-glaze vitreous enamels, fixed in small kilns (muffle kilns) of lower temperature. To this Dynasty belong the perfection of the *famille rose* and the introduction and development of the *famille noire*, with its beautiful series of reds from carmine to *peau rose* pink produced from gold and also finer particles of refined and elaborate workmanship the extremely thin plates, saucers, etc., of 'eggshell china' decorated with delicately drawn figures and landscapes surrounded with many 'borders' of different but rich patterns borrowed from woven and brocaded silks. All these are decorated with over-glaze enamels in the same way as enamels on metal, and so the period may properly be called the 'enamel' period. . . . Although it produced great quantities of celadon and other coloured glazes, and blue and white ware, . . ."—*Ibid.*, pp. 38–9.

"During the . . . reign of . . . Shun-chih (1644–1662), the factories at Ching-te-chen were re-opened, but the disturbed state of the country naturally gave the Government plenty to do without paying great attention to improvements in the ceramic art." "The porcelain of the Shun-chih period was of much the same character as that of the Wan-li. But the Tartar conquerors, who were scholars as well as warriors, adopted the civilisation and the culture of the conquered, and the next emperor (K'ang-hsi) not only revived the manufacture of porcelain, but raised it to such a pitch of artistic excellence as was never reached before, and has never been reached since." "During his long reign of sixty years great advances were of course made, and the finest pieces belong probably to the latter half of the reign, but it started well, for the imperial factories at Ching-te-chen were under the superintendence of Lang-ting-shen, the Viceroy of Kiang-si, a name great in Chinese ceramic history, as the inventor of the coloured glaze called *sang-de-bœuf*. In composition it did not differ from that of other reds derived from copper, but it was so brilliant and lively as to excel them all. . . . The term *sang-de-bœuf* has been (and often is) applied to other reds and crimsons, which are streaked with blue in parts, but the *sang-de-bœuf par excellence* shows no blue, although from ruby into dense colour and it opens into a brownish red."—*Ibid.*, pp. 39–40.

"Under Lang-ting-shen was also produced a fine crackled apple-green, and both the red and the green are called by the Chinese Lang-yao, or 'Lang porcelain,' after the mandarin, who retained his office till 1688. . . . In 1675 the imperial factory was burnt during the rebellion of Wu San-kuei, but it was soon rebuilt, and in 1680 such a large order was received from the Palace that it was deemed necessary to appoint a Commissioner to see that it was properly carried out. A second Commission was appointed in 1682, and in the year afterwards Tʻang-ying-hsiian was appointed superintendent of the imperial factory. To him is credited the chief honour of the splendid renaissance of ceramic art in China in the reign of K'ang-hsi. "T'ang-yao, as the porcelain produced under the superintendence is called, is rich, thin, and translucent, and the glaze colours in which he specially excelled were an opaque green called 'snake-skin,' a brownish yellow called 'celadon,' besides a turquoise blue and a variegated yellow; but he also produced fine monochromes of other greens and yellows, and purple and red and blue, the last two being *soufflé*, or blown on to the piece through gauze. This *soufflé* blue is the famous colour called 'powder,' or 'mazarine' blue."—*Ibid.*, pp. 39–40.

ean 'blue, and by the French *fausse*. 'Peach bloom,' the colour which now fetches such extravagant prices . . . , is also said to have been first produced in the reign of K'ang-hsi, but this is doubtful. . . . Another glaze-colour, called 'metallic' or 'mirror' black, was also produced for the first time in this reign. It is much more lustrous than previous blacks, and is produced by mixing cobaltiferous manganese with the ferruginous clay used for the brown known as *fond brique*. This brown colour, which is very familiar from its employment on pieces decorated with blue and white, varies greatly, and has shades which are called 'bronze,' 'old gold,' 'chocolate,' 'dead leaf,' 'café-au-lait,' 'chamois,' and others. It is sometimes decorated with white slip, and sometimes by cutting a pattern through the bronze glaze on to the white paste—an effect which has been imitated in Persia, Holland, and elsewhere.' Among imitations of ancient wares were 'the 'turquoise,' 'peacock,' or 'Kingfisher' blue (used often in contrast to the rich 'aubergine,' or 'ripe-grape,' purple), and the soft white known as Fen-ting, after the Sung ware of the same name. There are two sorts of Fen-ting, one reticulated with brown lines and sometimes mottled with light buff clouds, and the other more delicate, like eggshell, and approaching the ivory-white of Fuchien, the *blanc de Chine*. . . . When this Fen-ting is used with blue it becomes what is known as 'soft paste' Chinese porcelain, now so greatly prized in America. It is generally crackled. The ordinary blue and white made in the K'ang-hsi period is of unequalled purity in paste and colour. The white is whiter than that of the Ming period and less chalky than that of the following reigns. The blue is of every shade and of the finest quality, varying from the very deepest sapphire to the pale *clair-de-lune* and pearly grey. The best artists were employed for the designs of decoration, which was of every kind. . . . Though more delicate and refined than that of the Ming period, K'ang-hsi 'blue and white' had a vigour which subsequently declined. It should also be noted . . . that the blue was not 'Mohammedan' but native, and that the greatest care and skill were employed in the purification of the cobalt from manganese and other constituents of the ore in which it was found.'—*Ibid.* pp. 40–2; and see pp. 70–116.

"The great progress in the reign was, however, in polychrome decoration. Large quantities were produced of the 'three-colour' pieces (green, purple, and yellow), which was imitated so cleverly in pottery by the Japanese at Kutani, while the 'five-colour' pieces differed from the Ming 'five-colour' in the use of a blue (cobalt) pigment enamel over the glaze. The greater perfection to which over-glaze painting in enamels was brought was shown especially in the glasses called *famille verte*, and for once in a way that the ceramic art of China gained something from a Japanese initiative. The beautiful, but short-lived, class of Japanese porcelain known to the French as the *première qualité ancienne*, with its charming chord of blue, apple-green and red, was made at Hizen in the seventeenth century, before the Chinese knew how to paint so delicately in those clear, crisp, vitreous enamels of the middle kiln which they afterwards brought to such perfection. This Japanese porcelain was imitated in China in the second half of K'ang-hsi's reign.'—*Ibid.* p. 42.

"The period of Yung-ching (1723–1736) is transitional in style, carrying on the traditions of K'ang-hsi, and aiming at a still more delicate and perfect execution. Dr. Bushell describes the period as one in which the strong colours and vigorous decoration of K'ang-hsi are gradually toned down until they merge into the half-tints and broken colours which mark the more regular and carefully finished designs of Ch'ien-lung. . . . During this reign [Yung-Ching] the colours were brilliant [chiefly monochrome], the forms pure, and the workmanship delicate. . . . Decoration with white flowers and gold designs on a black ground is also characteristic of this period. In *flambé* or splashed vases (*Yao-pien*) great advance was made. The chance was employed to produce effects which had at first been due to the caprices of the kiln. . . . New effects and combinations of colour were introduced. The great control they acquired over such effects is nowhere shown more clearly than in the combination of colour called 'tiger-skin.' This is found in patches of more or less regularity, dabbed with spots of yellow, green, purple, and white. It was not, however, invented under Yung-cheng, but under K'ang-hsi."—*Ibid.* pp. 43–4.

"The imitation of old wares was greatly practised as usual, a great number of genuine pieces of the Sung and Ming Dynasties being sent from the palace by Ch'ing-tê-chen for the purpose. It was in this reign that European influence began to affect the decoration of Chinese porcelain. This was greatly due to the influence of the Jesuits and to the trade with Europe, especially Holland." "The Chinese artists imitated Limoges enamels and European engravings. The manufacture of dinner and tea services of special shapes to suit the European market, often decorated with armorial bearings, was largely developed. Even on the highest class porcelain made for Chinese consumption a class of painting was introduced which was called foreign by the Chinese themselves. This represents more or less the *famille rose*, decorated with pink and crimson derived from gold, bright yellow, pale green, and a general preponderance of soft tints. Grounds of a lemon-yellow and a reddish violet appear to have been introduced in Yung-cheng's time, and to have been used in the so-called 'foreign' decoration. The colours employed in this over-glaze decoration were the same as those employed for enamelling on copper, which flourished in China at the same time. The reign of Yung-cheng was also noted for decorating in *pâte-sur-pâte*, but perhaps the most remarkable of all the innovations of the reign was the production of a highly vitreous porcelain in imitation of a kind of opaque glass made by Hu or Ku-Yüh. Hu's glass is what is known as 'Chinese glass,' that beautiful semi-transparent substance, used for those snuff-bottles and other small articles which are now so highly prized by collectors. The finest specimens are composed of layers of different colours carved cameo fashion. It is said that the Emperor Yung-cheng expressed his high admiration of their beauty, but at the same time a regret that it should not be possible to obtain the same brilliant transparency upon a ground of porcelain, and that T'ang-ying's energies were immediately devoted towards fulfilling the emperor's desire. The result was the production of a porcelain of exceptional brilliancy, which is very rare and held in great esteem."—*Ibid.* pp. 44–5.

"In the long reign of Ch'ien-lung (1736–1796) a large quantity of very beautiful porcelain was produced, much of which is prized by collectors on account of the refined beauty of its decoration, its great range of colour and perfect workmanship. It fails, however, in comparison with that of K'ang-hsi from want of vigour, from its too great formality, regularity, and insistence on complete symmetry. It is therefore comparatively mechanical and uninteresting, notwithstanding its excellence in technique. The 'blue and white' of this reign is carefully executed, but the decoration is generally conventional, the blue of a dull quality and the white pure but inclined to chalkiness. The famous director in this reign was T'ang-ying. . . . Besides making the celebrated glass-like porcelain he restored the 'Chün-chien' porcelain of the Sung Dynasty, produced new tints of turquoise and rose-red glaze, and succeeded in making again the large dragon fish-bowls, which had not been sent up to Peking for the imperial gardens since the Ming period."—*Ibid.* pp. 45–6.

"Elaborate and naturalistic floral decoration were also carried to a pitch unknown before. . . . Pieces called 'Hundred flower' vases have their surface entirely covered with leaf and blossom in a brilliant mosaic of enamels. This kind of decoration was continued with great skill under succeeding reigns. The reign of Ch'ien-lung is also noted for the introduction of the deep *gros-bleu*, known to the Chinese as 'sapphire,' for great improvements in the iron or 'coral' reds, and the invention of some new *flambé* combinations, such as 'robin's egg' and 'peadust.' Moreover, the desire to imitate other substances which had from the first animated the ceramic artists of China culminated in this reign with their mastery over colours and combinations of them. Amongst other things they copied with wonderful closeness, rare gold, silver, jade, lacquer, mother-of-pearl, shells, rhinoceros horn, bamboo, wood, gourd-skin, marble, pudding-stone, carnelian, agate, copper, rusted iron and bronze overlaid with all kinds of *patina*. They imitated also, at least in pattern and colour, bottles of Venetian glass. On the whole, the note of the Ch'ien-lung period was mastery of material, from the plain 'self-glazed' piece to the 'hundred flower' enamellings, and from the simple surface to the most elaborate modelling, carvings, and perforations."—*Ibid.* p. 46.

"Under the reign of Chia-ch'ing (1796–1821) the factories went on turning out a good deal of fine porcelain. Some of his pieces were covered with elaborate blue scrolls on a gold background, and the monochromes were highly finished; but . . . there is no new invention or special improvement to be ascribed to this period."—*Ibid.* pp. 46–7.

Tao Kwang (1821–51), in spite of political disturbances, "managed to bestow some attention on the ceramic industry. . . . The bowls made in this reign, called in the trade 'Peking bowls,' . . . have a ground of red covered with reserves decorated with sprays of flowers and fruit. . . . Other colours—pink, yellow, blue, and French grey—were also used as grounds in the decoration of these medallion bowls and small vases of similar character."—*Ibid.* p. 47.

"[The productions] of the reign of Hsien Fêng (1851–62) are marked by signs of rapid decadence. Chingtê Chên and its factories having been destroyed by the rebels, the manufacture of porcelain ceased."—*Ibid.* p. 47.

"[During the period 1862–90 the manufacture of porcelain was renewed, and much attention paid to its improvement, some decorations in sepia and a style consisting of flowers and butterflies in black and white upon a pale turquoise ground, showing considerable artistic merits. The greatest measure of success was, however, gained in the reproduction of the *famille verte* decoration of the first half of K'ang-hsi's reign, and of this ornamentation and of plum-blossom on black grounds; but the porcelain of the period still falls far short of the classic periods of Yung Chêng and Ch'ien Lung."—*Ibid.* pp. 47–8.

"More recently, . . . the so-called 'hawthorn' ginger jars, . . . *sang-de-bœuf*, and other kinds of highly prized Chinese porcelain have been imitated with such closeness as to deceive all but the most expert."—*Ibid.* p. 48.

Plastic Arts.—"An odd art-industry in Annoy is the making of tiny images, which are variously known as 'figurettes' or 'little devils.' They are statuettes ranging from ¾ inch even to three inches in length and are modelled from a paste whose composition is a trade-secret. It would be better to use the plural than the singular for each community of modellers uses a paste different from that of the others. Among the ingredients employed are hard wax, insect-wax, glue, vegetable gum, linseed gum, papier-maché, burned umber, sepia, kaolin, ultramarine, yellow ochre, chrome yellow, vermillion, white of egg and pulverized egg-shells. . . . The backbone of the figure is a stick of hard, dry wood, left rough to give a better purchase to the paste. Upon this are moulded the head, torso and one leg. The other leg and the arms are stiffened by wires or thin pieces of wood. The coarse work is done by boys, girls, women, or apprentices, who are remarkably quick and skilful. They use their fingers in outlining and a variety of little wooden tools in producing textures, hair, beards, and weapons. The figures are then handed over to the artists, who are always men. They finish off the features, give an expression to the face, and remedy any defect or mistake of their subordinates. The figures are then carefully dried. According to the composition of the paste, this is done in a warm room, in a cool current of air, a kiln, or the open sunlight. The best kinds are dried in a warm room, and require from three to eight weeks before they are thoroughly done."—*Hongkong Telegraph*, Aug. 17, 1892.

"The figurettes are divided into two classes, toys and art-objects. The former are built upon long sticks, like 'jumping jacks.' The wired arms are joined loosely to the body, so that when the stick is whirled, they gyrate in a very amusing manner. The workmanship is coarse and the cost a mere trifle." "The other kind are built upon short sticks, which are fastened into small wooden platforms so as to stand upright. Their workmanship varies, some being rude and clumsy and others very fine. Their variety is infinite. One set of 100 represents all the characters in a great classic drama. Another set of the same number embodies the various types in the armies of a heroic Chinese king and a savage monarch whom he conquered. A third consists of two hundred figures of the various vocations of daily life. 'Other sets are those of distinguished generals,' famous kings, heroic queens, poets, lawgivers, engineers, and admirals. The leading artist in this quaint industry claims to carry 5,000 separate faces in his memory, and to be able to reproduce any one of them in paste at the word."—*Ibid.* Aug. 17, 1892.

"The figurettes are made in colour or monochrome. When colors are employed, the greatest care is bestowed upon the correct tinting of details. The crown is gilt, the bracelets silvered, the coats, undercoats and trousers colored according to the style and age to which they belong. The historic accuracy in many cases is admirable. On the other hand, the modelling of colored figures is usually mediocre or worse. The features are poorly outlined and the fingers, weapons, and ornaments indicated rather than moulded." "In monochrome, the reverse is the case. The paste is dark red, brown or brown-black, and every detail is wrought out with the greatest care. On a figure an inch in height, the eyelids, earring-holes, and finger-nails are often so well executed as to bear scrutiny with a strong magnifying glass."—*Ibid.* Aug. 17, 1892.

Engraving.—"The great encyclopedia *San-thsai-thsi-hoei* contains portraits engraved on wood. But one of the most curious books of this kind is the work, in 8vo, either in three or in two volumes, according to the edition, entitled: 'Biographies illustrated by portraits by Tchou-Tchoueng, in the house of happy evenings' (*Wen-kien-Tchang-Tchou-Tchoueng-hoa-chouan*), a bizarre title like those the Chinese often use. This book, which goes back to the reign of Khien-houng, contains a text with full-length figures which excel by an infinite variety of attitudes, by the freedom and power of design, above all by the life and character. It goes without saying that these figures, cast, according to the ancient custom, on to the middle of the paper, without resting on any ground, are not shaded and recall the famous character of the German romances, Father Schlemil who had lost his shadow. They are all great men or illustrious women of ancient times, classed in the order of the dynasties."—*Rev. Contemp.*, xxv. 251.

There is "a set of engravings collected in a Chinese work entitled *Shih Sih* (1800) in which are represented [the] sculptures [in] the sacrificial temple of the Wu family [at] Kia-seang in . . . Shantung. . . . The Marquis Tsong, who had visited the Wu temple, . . . [states] that the engravings are truthful reproductions of the originals."—*Journ. N.-C. B.R.A.S.*, N.S. xviii. pp. 266–70.

"Quotations from native catalogues of collections made in the 11th century A.D., are met with in recent native works, and M. Terrien de la Couperie refers to five such of the present century which 'are remarkable for the accuracy of their reproductions of coins, engraved from actual rubbings.' (*Cat. of Ch. Coins*, p. cxvii)."—*Ibid.* p. 155.

Embroidery.—"Probably the art and industry carried to the greatest perfection in China is that of embroidery. . . . 'The best has always been done by ladies, working to hang, and putting all the fancy of a lifetime into a portiere or bed-hanging.'"—*Little* (*Mrs.*, 1), *Int. Chi.* p. 441.

Those workers in embroidery "who find chain-stitch [is] too long and troublesome, curtail the labour by means of the head which they sew in a pattern on the surface of the silk, and with which they thus make very pretty embroideries of several kinds."—*Hôu. conn. les arts*, v. 504.
